This is the most interesting and practical part of Mr. Wilson's work. Our remaining observations will therefore be limited to it. The long European peace was very favourable to material well-being. Improvements and extension of manufactures took place. Fresh means of communication afforded new openings for commerce. The gold discoveries stimulated trade. The commercial treaties enabled full advantage to be taken of these favourable circumstances. A period of great and general prosperity ensued. Enormous investments were made in foreign loans, and much capital was lodged in industrial enterprises abroad. Although this money was often grossly misapplied, it nevertheless promoted trade, but at the same time gave it unnatural dimensions. Thus there came a period of inflation, which was partially increased, to the still greater derangement of business, by the Franco-German War. Then stagnation ensued, and in this position of affairs depression soon followed. The previous state of things had been unsound, and as financial and political events also contributed to affect commerce, this depression became intense and universal, more especially as different classes of business are so closely connected that the condition of one cannot for any length of time be separated from that of others. The present state of things will necessarily prove advantageous to countries which can produce at low prices, and where hours of labour are not much restricted. The strength of our position consists in the industrial capacity and the resources of our people and country. But here perhaps, more than elsewhere, great danger exists from the confusion into which the labour system is constantly thrown by strikes, and by the claims and pretensions of the labouring classes. There can be no doubt that a protectionist reaction prevails abroad, and that foreign tariffs are being altered to the prejudice of British trade. The inevitable results would seem to be necessity for greater economy in all directions, lower prices, and lower wages. No

permanent harm need ensue unless inferior production, which is already resorted to, should prevail generally in England. On the whole, while there is much cause for watchfulness and anxiety in regard to the future industrial position of the country, there is no ground as yet for despondency. The circumstances of the time should be studied carefully and be fully accepted; and then, while making every allowance for inconvenience and even loss occasioned by the aberrations, protectionist and otherwise, of foreign countries, and perhaps of our own colonies, the commercial supremacy of Great Britain will be maintained. Only there must be watchfulness; and precautions necessary to secure British interests must not be neglected.

C. M. KENNEDY.

The Moor and the Loch. By John Colquhoun. Fourth Edition. In Two Volumes. (Edinburgh and London: Wm. Blackwood & Sons, 1878.)

THESE volumes hold, and we fancy will long hold, a distinguished place among the annals of Scottish sport. It is curious to reflect, in the presence of the wide-spread enthusiasm for Scotland, that its resources as a sporting country have only been pointed out within living memory. Nothing but the vaguest ideas prevailed about its grouse and salmon, and certainly no Sassenach dreamed of pursuing them, until the celebrated Colonel Thornton in 1804 published his quarto containing an account of his tour through part of the Highlands. He took with him for those unknown wilds, which are now yearly visited by thousands of eager sportsmen, an armament which would not reflect discredit on an African explorer: a sloop, baggage-waggons, an artist, "a good cook," and a complete camp-equipage, encamping day by day wherever tempted by sport or beautiful scenery. The next epoch in the progress of Scottish sport is marked by Mr. W. Scrope (not Scroop, as Mr. Colquhoun calls him in almost the only misprint we have noticed in his book), whose *Deerstalking and Salmon Fishing* (1838 and 1843) were followed in 1849 by the two charming works of Mr. St. John on Scottish natural history and wild sports. Mr. Colquhoun showed in the first edition of the book before us and in his *Salmon Casts and Sporting Days* (which have long been out of print, and are now incorporated in *The Moor and the Loch*), that like Mr. Knox he possessed a keen eye for sport, and an ardent love for the minutest traits in the life-history of the creatures which he shot or angled for. In the present delightful volumes, however, he presents all lovers of Scotland with the completest details of every Highland sport, on all of which he is an unexceptionable authority; and with what many will value even more, a series of life-like sketches of the rarer and more interesting animals of the country. He has thus brought up to the present level of knowledge the history of all the scarce birds and beasts of Scotland. Whether narrating his own experiences on hill or loch or subjoining the most trustworthy particulars respecting the wild creatures which frequent them, Mr. Colquhoun writes in a singularly lucid

and agreeable style. The reader is lured onward page after page, until, with sympathies strongly aroused by the observant kindly sportsman, who has a good word for poachers as well as honest men, and can see redeeming traits in animals which too many modern game-preservers trap and shoot without mercy, he is transported to sunny corries and purple moorlands far withdrawn from the beaten tracks of travel. On the snowy summit of Ben Voirla he climbs with Mr. Colquhoun for ptarmigan, or roams the recesses of the Black Mount deer-forest for a royal hart. Anon he finds himself stalking wild-fowl on Loch Lomond, and scanning the myriad screaming fowl of the Bass for a chance shot at an eider duck. On all these expeditions he is continually making the acquaintance of some scarce bird or rare animal until few indeed are the wild denizens of Scotland which have not fallen under his ken. But the spell of sport is on him still. Exchanging the fowling-piece for the salmon-rod, he now assists in gaffing leviathan salmon on the Dee or Stinchar, and capturing sea-fish in Loch Fyne. In the shade that falls on Loch Awe from the mighty Ben Cruachan he trolls for *Salmo ferax*; he disdains not, with light fly-rod, to take trout in the Almond, or even the humble moorland burn. And all the time he feels that he is being accompanied by a Master in each sport who can escort him to every nook and corner of the land, and everywhere entertain him with the lore of mountain and stream which has been patiently garnered from the close observation of half-a-century.

Over the minute instructions in all these Highland sports, the merely technical details which are invaluable to sportsmen as such, we shall pass lightly. All the rules, however, that old experience aided by the youthful enthusiasm of the author's sons for modern weapons and methods of sport could suggest will be found in these volumes. Deer-stalking, grouse, roe, blackcock and wild-fowl shooting are exhaustively treated. Mr. Colquhoun is a sportsman of the best type, uniting a keen love of exercise with much self-reliance, and an abhorrence of inflicting unnecessary pain. He naturally, therefore, despises the effeminacies of *battue* and pigeon-shooting. While condemning grouse-driving in the abstract, he can, however, recognise that when these birds increase beyond the limit that a moor can safely carry, the only remedy to prevent disease is to drive them. He is pleased to be able from experience to dissuade sportsmen from massacring the "squeakers" when the old cock and hen have been shot, from a mistaken idea that the little ones must needs die of starvation. Here is another noticeable hint:—

"I used a breech-loader for two years at open shooting; but as I found my best dogs spoilt by the quick loading, I returned to my muzzle-loader. I never yet saw the man with self-command to keep down his dogs long enough to ensure their steadiness who used a breech-loader."

The best fly-fishers for trout have long been convinced that a very few patterns will suffice for the whole year. Not so many as Walton's "jury of flies that will condemn every fish in the river" are needed. Mr. Colquhoun similarly remarks that a self-reliant salmon-fisher ought to require no

more than to know the February flies of any river he means to fish; and their variations of size and colour will suit, not only the changing moods of the water, but also the months from the beginning to the end of the season.

We should far exceed our space did we touch upon a tithe of the many fascinating notices of natural history which relieve the *minutiae* of sport in Mr. Colquhoun's pages. He is a lover of Gilbert White, and worthily has he caught the loving and observant manner of his master in his chapters on the Bass Rock and its sea-fowl, the birds of prey which yet linger in the Northern Highlands, and the natural adaptation of form and colour in Scottish wild animals to their surroundings. His careful observation of what most people would not have even noticed, the manner of life of three small trout and five eels imprisoned in a pool by the Lennie Burn, shows the patient acumen of the true naturalist who is by himself so well contrasted with the mere sportsman.

"In place of being confined to the shooting months, his sporting season comprises the whole year. The advent and departure of migrants; the discovery of a rare visitor, with perhaps the triumph of adding him to the museum; the inexpressible delight and excitement of a trip to the crags and cliffs of the ocean, swarming with their varieties of wild sea-birds with wilder cries, are now objects of even greater interest than his most successful day among the grouse or the deer."

If we have a quarrel with Mr. Colquhoun it is because he again (ii., 107) repeats the calumny we had fancied exploded against the angler's favourite bird, the water-ouzel, that it eats the roe of fish. Mr. Knox vindicated its fair fame in his *Autumn on the Spey* by repeatedly shooting these birds and proving by dissection in every case that no trout ova had been swallowed, but on the contrary many water-beetles which are known to devour fish-spawn. Prof. Newton, in his new edition of *Yarrell's Birds*, fully corroborates this, and denounces the folly of fish-preservers in destroying this bird, whereas "examination of its gizzard proves it to be one of the best guardians of a fishery." Again, Mr. Colquhoun pours contempt upon the water-rat: it is "an ugly creature," has "a disgusting look, increased by the apparent deficiency of ears," and so forth. Were it not for the last remark we should fancy that he had confounded *Mus aquaticus* with *M. decumanus*, the foul-feeding Norway rat. There is no accounting for tastes. To our mind the water-rat, as he sits like a squirrel on a raft of sticks in a trout-stream, placidly eating the sword-flags, and with bright, fearless eyes gazing on the passing fly-fisher, is one of the prettiest of our native quadrupeds. "A favourite morsel of the water-rat," adds Mr. Colquhoun, "is a bloated toad." Prof. Bell, however, in the last edition of *British Quadrupeds*, asserts that (as its dentition would seem to show) this inoffensive creature is exclusively a vegetable feeder, and that there is not the slightest foundation for believing that it lives upon small fish, insects, or even earth worms. Having ourselves closely observed this animal's habits for many years, we agree entirely with Prof. Bell. Mr. Col-

quhoun's remarks on the wild cat omit one distinguishing feature, the triangular face of the true wild cat as distinguished from the mere domestic Tom who has taken to evil courses in the woods. The latter's progeny never seem to attain this characteristic mark or the thickened tail of the truly wild animal. We do not believe that a living specimen of *Felis catus* now exists in England. The Duke of Sutherland, as head of the Clan Chattan, landably preserves the breed on his Scotch estates. Mr. Colquhoun is right in stating that no greater enemy to game can be found than cottagers' cats, which have, we will not say relapsed into wildness—for it admits of much doubt whether our tame variety is descended from the wild cat—but have adopted a wild life. The fact of Royston and carrion crows breeding together in the Highlands is a fact which will be new to most people.

Attention might be called to many of Mr. Colquhoun's anecdotes, such as his pathetic account of the destruction of the goats on Crap-na-gower, or the curious habits of the Alpine hare; but we prefer to leave readers the pleasure of discovering these for themselves. His suggestion that goats suffered to run wild in solitary districts, or at all events their progeny, might in process of time be made available for stalking, as a substitute for deer, does not appear so visionary as it seems at the first blush when taken in connexion with the history of the goats mentioned above. Waterton could not have written a more delightful chapter on owls than has Mr. Colquhoun. Indeed, his book is a storehouse of knowledge on rare and on familiar animals as well. He must, indeed, be a skilled naturalist who does not derive information from it, while it will immensely augment the delight of everyone who loves the braes and streams of Scotland. Henceforth it must necessarily find a place in the knapsack of every Northern tourist who is fond of our wild creatures, and is simply indispensable in every Scotch shooting-lodge. We heartily thank the author for the loving pains he has expended upon the fauna of Scotland. A story is told of a worthy minister who expounded all the leading doctrines of the faith in a sermon two hours and a-half long. As he was leaving the kirk the dominie remarked to a cummer:—"My certie, but that discoorse wad hae approached pairfection had the minister, douce mon, traited o' sanctification." We should be of precisely the same opinion regarding Mr. Colquhoun's book had he only given us—an index.

M. G. WATKINS.

EDGAR QUINET.

Œuvres complètes de Edgar Quinet. Lettres à sa Mère. (Paris: Germer Baillière & Cie., 1877.)

AFTER many fanciful descriptions of the life of French students who do nothing less than study, it is pleasant to fall in with a true account of the career of a young man devoted to letters. The correspondence of Edgar Quinet, so far as it has been published, covers the years of his education from 1817 to 1820, and of his struggles for daily bread, when his father left him, at the

early age of eighteen, to the tender mercies of literature, and the proverbial ministrations of *la vache enragée*. Quinet's correspondent was his mother, a woman of character and taste, who had known M^{de}. de Staël and was devoted to her memory and writings. It may be assumed that Quinet derived his love of letters from his mother, while it may be guessed that his unamiable father contributed to his character an iron resolution which is rarely found in company with the most tender heart and eager affection. If there is a fault in the character of Edgar Quinet as these letters display him, ardent, studious, enthusiastic, sincere, above all things devoted to freedom and to truth, it is the shade of sentimental weakness which naturally stole over a man compelled by fortune to be as lonely as he was loving. Constantly separated from the mother whom he adored with a filial affection rare even in France; compelled once, if not twice, to turn away from the temptations of another passion; wounded by the duplicity of his familiar friend; and, lastly, kept apart for many years from the lady to whom he was betrothed, Edgar Quinet was obliged to live on the shadows of love, on memories and distant hopes. The result, as we have said, is an amount of sentiment which English readers may sometimes find to be beyond their sympathy. This is, perhaps, the only blemish, the only feature that does not win and charm, in the personality of a man who becomes our friend as we read in these "fallen leaves that keep their green," and feel him touch us from out of the past with the strength and purity of his spirit.

Quinet's letters begin in 1817, at the moment when he was sent from his home at Charolles to the Collège de Lyon. He was at that time fourteen years of age. His education had been left to his mother, and it was intended that, after leaving Lyon, he should enter the École Polytechnique. At Lyon, the new boy found little to complain of; but his companions wearied of the eternal omelette and haricots. A mutiny broke out; the boys barred the windows and doors, extinguished the candles, and made a night of it. Next day some of the ringleaders were expelled; but this was only the beginning of evils. The second form fortified their lecture-room, set booby-traps of dictionaries, erected a barricade of benches and tables, and laid in a store of missiles and ammunition. All this was done in the dead of night, without wakening the ushers. When all the preparations were made, Jules Janin and other choice spirits raised the wild war-cry of "No more omelettes! Down with haricots!" It was no wonder, for the pupils had just supped on the thirty-ninth omelette in succession, and the twenty-seventh plate of unceasing haricots. The masters gathered in the gloom and attacked the door, but were received with a galling cross-fire of grammars and lexicons. A porter who advanced, full of courage, was carried to the rear, bleeding from a cut inflicted by a water-bottle. This gallant domestic, however, was the Arnold von Winkelried of the day: the ushers hurried through the gap which he had made, and soon won every position, swept like a torrent over the *abattis*

of benches, captured eight prisoners, and finally expelled about twenty, including Jules Janin. Fortunately for Edgar Quinet, he had adopted an attitude of judicious watchfulness, and his studies were not interrupted. It is impossible to tell all the history of Quinet's school-days with the minuteness which the revolution at the Collège de Lyon well deserves. Suffice it to say that the young fellow wrote verses and fell in love. Both the verses and the girl who inspired them were severely criticised by M^{de}. Quinet, and the flame was quenched by her judicious cold water. In September, 1820, Edgar went to Paris and suffered all that ingenuous youth endures when bidden to choose a profession. If a man has a taste for medicine, brewing, the bar, cooking, or what not, he is spared all the troubles of him who is born to be a student. M. Quinet père secured for his son a tall stool in a bank. "Il se résigna d'abord aux fonctions de commis, quoique son esprit fut déjà hanté par des travaux d'histoire et de philosophie." In this bank he was treated with stingy dishonesty, and could scarcely extort from his employers the pittance which they owed him. At this time he saw a good deal of the widow and children of Marshal Ney, who were scarcely better placed than himself. It is not easy to read between the lines of letters which the father was to see, and to discover what Quinet's manner of life really was when he deserted the bank. In January, 1822, he wrote a private letter to his mother about a book which he meant to publish, the *Tablettes du Juif Errant*. In the correspondence the volume is called *Bya*. Quinet sold part of his furniture, and printed the book at his own cost. An early copy was sent to his mother, and M. Quinet père never suspected the little plot. The *Tablettes* was very well received, and the cautious publisher was actually frightened by its popularity, and withdrew it from sale to evade the censorship. At this time Edgar Quinet wrote some articles for journals, but he soon shook himself free from the bondage of the daily press. The tone of his letters becomes more gay, he describes the little noisy street in which he lodges, where husbands, wives, parents, children, beat each other all day, and he is official peacemaker, because he alone has no one to beat. He dines for twenty sous, and dines well. He reads Scott, and especially *Pevenil*, which had just appeared, and admires the descriptions of "Charles II. and his Minister, Bolingbroke." He makes a pilgrimage to the Swiss lakes, and to the haunts of Rousseau. Quinet now devoted himself to history, and chiefly to the history of the Middle Ages. As far as one can understand from his letters, M^{de}. Quinet wished to see him engaged on lighter topics, and master of a more brilliant and Voltairean style. It was an odd preference in a lady who, for her own part, wrote essays on Prayer for her own spiritual edification. From the spectacle of France enslaved, from the serenity of the classics, Quinet gladly turned to *les siècles des mérites ignorés*, to that varied scene of contradictions and confusions, that shifting kaleidoscope of futile life, which we call the Middle Ages. All the best minds of France

were looking that way, looking for a dawn which was never to rise from that Western sky. The *Etudes sur le Moyen-Age* are still in MS.; the author turned from the records of departed life to partake of his own youth. A passion had to be conquered, and it yielded to hard work and change of scene. Quinet found that a real sorrow dissipated that vague sadness through which we all pass, *la nécessité des temps modernes*. It is interesting to note that this mood was quite unknown to M^{me}. Quinet, who attributed it to "the ignoble melancholy of pecuniary embarrassment."

Metaphysics and farming are the best refuges of a soul which has been deceived, for in them at least one cannot be the dupe of man. This opinion of M. Cherbuliez may perhaps be modified on mature reflection. The nature of things and the mother earth may not deceive us, unless "they are well betrayed whom God betrays," but fraudulent seedsmen and German philosophers may lead far astray the soul that flies to husbandry or to contemplation. Quinet, in his regret and "disillusion," chose metaphysics; he learned German, and translated Herder, when he was about twenty-three years of age. The book brought him into contact with many distinguished people, notably with Victor Cousin. He yielded to Cousin's fascinating manner, and wrote of him with a warmth of enthusiastic friendship which it is touching to read. No one was ever more generous, less envious than Quinet; to him it was more sweet to hear the praises of others than of himself. "Je suis le plus heureux des hommes! Il n'y a pas vingt minutes que M. Cousin me serrait la main et m'appelait son cher ami." In the happiness of this friendship, and in the success of the works of his own brain, Quinet could write: "J'ai une existence forte et pleine. J'ai un but assuré, je ne vais plus en tâtonnant." A short visit to England gave him much enjoyment—a walk to Harrow, in honour of Byron, and a cruise on the Thames, were the things that pleased him most. "Chaque jour m'apporte de nouvelles joies, un rapport inconnu, une vérité oubliée, un grand homme que je découvre dans l'histoire, de sublimes pensées de tous les siècles avec lesquelles je sympathise." The first use he made of his literary earnings was to send a subscription to the cause of the Greeks, then engaged in disloyal resistance to the paternal government of the Turks. "Dire que pendant ce temps je serai en repos, au lieu d'avoir une belle dans la poitrine sur les murailles de Missolonghi!" It is not easy to discover whether it was the old love-affair or a new one which drove Quinet to Strassburg and Heidelberg. At the latter university he found life very pleasant, and lived among philosophers and young ladies of happy temperament. One of the latter, of less fortunate character, had lately blown out her brains because Creutzer, of all people—Creutzer, the editor of Plotinus—being a married man and a Platonist, could not return her affection. Somewhat later the friends of another maiden told Quinet that their Flora was dying for him. Ary Scheffer thought that Quinet had the ideal head of Faust, and he must have been more handsome than the common idea of a philoso-

pher. But at Heidelberg he had engaged himself to M^{lle}. Minna Moré, and it was impossible for him to meet the advances of the unfortunate Flora. Without a profession or prospects, Quinet could not afford to marry. In 1828 he visited Greece on a scientific expedition. The country was hardly safer than it had been when Villosion traversed it. "On ne voit que des souches d'arbres calcinés, des villages rasés, quelques femmes et quelques enfants qui s'abritent sous des amas de pierres." This was in Peloponnesus. Of the Turks it may be said that "this sort goeth not out" without casting the victim into water and fire. Still, from Peloponnesus the Turks had gone out. They yet held Athens. Quinet alone ventured to explore the city and surrounding country. He bribed the abstemious Islamites with a dozen of rum. Athens was a Golgotha. "They showed me near the gardens of the Academy a field covered with the heads of men whom the Bim-Baschi had executed." This was in 1829, and to the truly gentlemanly spirit it must be mortifying to reflect that Bim-Baschis and Company were soon compelled to remove their axes, stakes, bags, baggage, and bottles of rum, from the precincts of the Acropolis.

On Quinet's return to Paris in 1830, it was easy to discover signs of the approaching changes in the State. The condition of politics made it hard for him, among the intrigues of more artful and less single-hearted men, to get the chair of a Professor in Paris or in any of the large towns. He mentions that he made the acquaintance of Sainte-Beuve, who had lately published *Joseph Delorme*. "Il le trouve intéressant, malgré sa figure joufflue et pantelante, blanche plutôt que pâle, petit, gros et surtout gauche." An enduring friendship with Michelet was cemented, and Quinet discovered that Cousin was not to be trusted.

Jules Janin, the rebel against haricots, made one of the society with which Quinet mixed, and the *Revue des Deux-Mondes* was founded. Fortunately, perhaps, though he himself regretted it, Quinet was in Germany during the days of July. The defection of Cousin was atoned for by the admiration and loyalty of Victor Hugo. Sainte-Beuve began to be alarmed at his own want of faith in St.-Simonism, and afforded an interesting study to his acquaintances. A new direction was given to Quinet's reading by his discovery of mouldering Epopées—of the twelfth century, he said—in the manuscripts of the Bibliothèque Royale. With so much knowledge and such special acquirements in many branches of research, it was only politics that kept him out of a professorship. A pamphlet on Germany and the Revolution frightened the men in power. After a tour in Italy, and after composing *Ahasuerus*, Quinet was at last enabled to marry the lady for whom he had worked and waited so long. His letters now naturally grow shorter, less frequent, perhaps less interesting. Whoever reads them must acknowledge to M^{me}. Quinet—the widow of the writer, and the editor of the correspondence—a debt of gratitude for this introduction to one of the most pure and courageous of men. The familiar letters which are to follow will be eagerly awaited. A. LANG.

Columbia and Canada. Notes on the Great Republic and the New Dominion. A Supplement to "Westward by Rail." By W. Fraser Rae. (London: Daldy, Isbister & Co., 1877.)

MR. RAE possesses qualifications which make him specially well fitted to speak on this subject. In addition to his known powers of description, and the sufficient opportunities of becoming acquainted with the United States and with Canada which he has enjoyed, he has a sympathy with America and things American on both sides of the forty-ninth parallel which makes his work a congenial one. He displays, moreover, that rarest of all faculties, one which is usually absent or else absolutely lost and destroyed in an Englishman when he begins to write of America (and equally, perhaps, in an American when he writes of England)—viz., the power of adjusting his mental vision so as to see things fairly in a fresh light from a new standpoint, free from the preconceived notions derived from a narrow home-experience. Mr. Rae has this power, and weighs differences with a tolerably impartial judgment. This spirit of fairness is, indeed, conspicuous throughout. The author does not spare criticism, and at times it is sharp enough, but it is never clearly unjust, or rude, or ill-natured. The most unsatisfactory feature of the book is its fragmentary character. The author visited North America last year, chiefly for the purpose of acquiring certain information with regard to the early annals of the country required for a History of the United States upon which, he tells us, he has been for some time engaged. He contrived, however, to kill two birds with one stone, and so timed his visit as to be present at the International Exhibition at Philadelphia. From thence he visited Washington, Boston, and Saratoga, and then crossed the frontier to Toronto. The outcome is a medley of interesting historical details, less attractive Exhibition-experiences, and shrewd and suggestive commentaries upon social and political conditions.

After giving a very complete summary of the development of the steam passage across the Atlantic, Mr. Rae adds a few desultory facts with regard to municipal corruption in New York, its newspapers, and other miscellaneous matters of no great novelty or importance. The ancient city of Philadelphia, however, rich in historical relics and associations, supplies material for many interesting pages, and of this Mr. Rae makes excellent use. Pennsylvania has always been one of the foremost States in the Union, and Philadelphia is her foremost city. The Quaker State has constantly led the way in the development of science, of philanthropy, of commerce, and of political liberty. Here was signed the memorable Declaration of Independence, a document still preserved among the State archives with many other curious relics of the stirring birth-time of the great Republic. But the Pennsylvanians have latterly shown a strange and lamentable retrogression from their ancient principles. The main cause of the separation of the thirteen colonies which the Declaration of Independence consummated was, as the author

points out, the oppressive operation of the Protective system and the Navigation Laws. Yet in this centre of light and progress, associated in its infancy with the prime revolt against this very system, Protection now finds its warmest support; and

"Navigation Laws, modelled upon those which England passed in a paroxysm of folly—laws prohibiting a citizen of the United States from purchasing a ship in the cheapest market, and sailing it under his country's flag, are considered by Pennsylvania as the inestimable gifts of a beneficent Congress."

In succeeding chapters there is a good deal about the Exhibition and the various public demonstrations by which Americans celebrated the Centenary of their Independence. There is an amusing account of the childish vanity and foolish pretence exhibited by the Society of Knights Templars; but a more worthy and attractive scene was afforded by the meeting of the Society of the Army of the Potomac, at which many of the most distinguished soldiers of the Union were present. The majority of them of course made speeches, and in these it was very noticeable how the memories of the old War of Independence have been altogether eclipsed by those of the war for the maintenance of the Union. A visit to the Federal capital, which Moore satirised in the year 1800 in words which gave such offence in the United States—

"This famed metropolis, where fancy sees
Squares in morasses, obelisks in trees,
Which travelling fools and gazetteers adorn
With shrines unbuild, and heroes yet unborn,"

leads to the question of the arbitrary selection of central capitals for the States and Union. Washington has been marvellously transformed since the days of Moore, but it has failed to fulfil the sanguine anticipations of the founder whose name it bears, and who fondly hoped it would become the commercial as well as the political centre of the States. The author hints his belief that natural laws will triumph over the artificial arrangement, and Washington have ceased to be the capital of the Union before the Republic celebrates its second centenary. With languishing, unfinished Washington, the resort of lobbyists and office-seekers, Boston, the home of refinement and intellectual culture, never ceasing to increase in wealth and power, stands in marked contrast. The high opinion entertained by the Bostonians of themselves and their city has become proverbial, partly through the happy saying by which their countrymen have satirised the foible—that they believe the universe moves round the capital of Massachusetts. They are proud of their Puritan forefathers, of their early history, of the first great step towards independence by the destruction of the tea-cargoes, and the compulsory evacuation of the city by the Royal forces. They look upon their State as the very incarnation of independence, and Boston as the centre of an intellectual supremacy which has moulded the national life. While claiming liberty and independence, however, she has ruled her own citizens with stern discipline. The cramping rigidity of law which regulated even details of dress and manner and religion has, however, been softened and relaxed. The Maine liquor law

has been replaced by a judicious system of licensing, and no man has suffered on any religious ground since one Abner Kneeland was imprisoned for blasphemy eight-and-thirty years ago. Each man may worship God in his own way, or not at all, and none can make him afraid. Religious liberty exists, but sectarian bitterness and jealousy still linger, and the Bostonians, like many other Christians of the stricter type, appear to be still open to the satire of their countryman Franklin, quoted by Mr. Rae:—

"With regard to future bliss I cannot help imagining that multitudes of the zealously orthodox of different sects, who at the last day may flock together in hopes of seeing each other damned, will be disappointed, and obliged to rest content with their own salvation."

From the home of strict propriety, we are carried by a sharp transition to the focus of fashionable dissipation, Saratoga. The name recalls something more than a mere phase of modern life. The surrender of General Burgoyne exercised such a powerful influence upon the ultimate issue of the War of Independence that Sir Edward Creasy has classed it among the decisive battles of the world. The author supplies some interesting details with regard to it and the incredible blundering of home officials which led to the disaster. He shows, moreover, that, great as the result of the capitulation undoubtedly was, the number of the British force which surrendered has been greatly exaggerated, amounting only to 3,500 men, while the victorious colonial army numbered 17,000. The forests and swamps which hampered and delayed Burgoyne no longer trouble the traveller. A city beautiful with lawns and gardens has arisen in place of the old morass and pine-barren, and 18,000 people annually dance and promenade and gamble about the once solitary medicine-springs of the Indians. Passing on to Canada, Mr. Rae was struck with the extremely "parochial" character of Colonial politics, leading to struggles as petty in object as they are fierce in conduct. But with the consolidation of the Dominion grander and wider views will be developed. Already Confederation has wrought one great result, a growing confidence in the capacity and permanence of the Dominion. This growth of pride and power, together with the unfriendliness of the United States towards Canada and the jealousy of the Union, which is increasing throughout the Dominion, renders the incorporation of the latter into the neighbouring Republic more and more impossible. Many leading American statesmen, such as Mr. Clay and Mr. Sumner for example, looked forward to this consummation as inevitable, whether effected suddenly by force of arms, or through the natural working of social and political forces leading in the fullness of time to a happier union by mutual consent. The belief in this result is less confident and active now; in Canada, where it was held by only a few, it is practically dead—killed by Confederation, which is knitting the provinces together as surely and as closely as it has bound the thirteen States of America into a nation. With this belief in future greatness has come the longing for a more distinct national life; not,

indeed, for separation from the mother-country, but that the practical independence of the Dominion should be recognised by a position of greater dignity in its relation to the mother-country than that of a mere British colony. The Canadians have, moreover, a sharp sense of neglect in the distribution of Imperial honours and Imperial appointments. The fact that while a foreigner can be naturalised in Canada he cannot claim the privilege of a British subject when he leaves Canadian territory is an old limitation of Imperial rights which still remains as a mark of colonial inferiority, and which is as useless as it is invidious. In his last and most attractive chapter Mr. Rae criticises with a just severity the various judgments passed by Englishmen and other Europeans who have written on America, on the one hand, and Americans who have written of England, on the other. The narrow prejudices, hasty conclusions, unfair, distorted views, so common in both, are paraded with a rigid and wholesome impartiality side by side, and this review will earn the approval of all generous and liberal-minded men on both sides of the Atlantic. The author's project of a common citizenship between the two countries may be chimerical, or to be realised only in the distant future, but we may cordially sympathise with him in his earnest desire for a closer amity between the great Republic and the great Republican Monarchy, and in the endeavour which he makes to promote it. W. B. CHEADLE.

Records of the English Catholics under the Penal Laws. Chiefly from the Archives of the See of Westminster. I. The First and Second Diaries of the English College, Douay, and an Appendix of Unpublished Documents. Edited by the Fathers of the Congregation of the London Oratory, with an Historical Introduction by Thomas Francis Knox, D.D., Priest of the same Congregation. (London: David Nutt, 1878.)

THE Roman Catholics in England have of late awakened to the conviction that the most effectual way of attracting attention to themselves is to point to their history rather than their theology. In an age when men have become weary of discussing the old questions on the old premises, when they are impatient of dogma and apt to treat the professed controversialist with a languid disdain, the attempt to win reception for abstract doctrines is a vain one; then is the time, if ever, to enlist our sympathies in the sufferings and perils and struggles of those champions and heroes who, in days gone by, believed themselves to be battling for the cause of God. Whether the men who played their part so stubbornly were right or wrong is a matter of very small concern to the student of the past; the truth or falsehood of this or that opinion are factors which scarcely enter into his calculations.

We have neglected too long to investigate the conflict with Rome in the sixteenth century from the Catholic side. The attitude of ignorant incredulity and timid suspicion with which most men have listened to any appeal to history which the

Roman Catholics have ventured to make has not been creditable to us; and that side occupies a "coign of vantage" which modestly appeals to the other "only to be heard."

The English Jesuits, as was to be expected, were the first to direct attention to their "Records." Unfortunately they have made a bad start. Mr. Foley's volumes, though undoubtedly they contain very valuable contributions to our knowledge, are defaced by sad inaccuracies, and even the *Troubles of our Catholic Forefathers*, edited though they be with very great literary ability, are addressed rather to the popular ear and the devout Catholic, than to the few whose business it is to scrutinise evidence and to arrive by patient research at a clear view of the meaning of events in a bygone age.

Cardinal Manning, it seems, has resolved to issue a series of Records of the English Catholics from a mass of papers which have been collected in the archives of the See of Westminster, and which date back from the beginning of the reign of Queen Elizabeth and carry us to the present day. The editing of these "Records" has been entrusted to the Oratorians; and, to judge by the way in which they have discharged their duty in the publication of this volume, the work could hardly have been committed to more competent hands. The Index by Mr. Law is carefully and thoroughly executed; the documents are printed without note or comment, the sources whence they are derived being given in full; and the elaborate Historical Introduction by Dr. Knox, extending over upwards of 100 closely printed pages, gives us, on the whole, the fullest and most satisfactory history of the English colleges of Douai and Rheims during the first twenty or thirty years of their existence that has ever yet been printed.

It is not a little interesting that the two men who must henceforth in some sort be regarded as the representatives of the new school of Catholic historians were both, if I mistake not, at Cambridge together; were both scholars at Trinity at the same time; and both threw up their prospects of an academical career, the one without taking a degree, the other, Dr. Knox, only when he had obtained a very high place on the Classical Tripos and gained one of the Chancellor's medals from such formidable competitors as Dr. Holden and the late Mr. Maclean. It was no more than we might expect that Dr. Knox should perform his task in a scholar-like manner; he tells his story in a simple unaffected way; he has spared no pains to make himself master of the facts he lays before his readers; and though of course he has his own opinions and convictions, which he takes no pains to disguise, he writes with none of the asperity of a partisan, and is fair, candid, and impartial.

As for the Diaries or Registers of the colleges of Douai and Rheims in this volume, they constitute a chronicle of daily occurrences from the first opening of Douai in 1568 down to the year 1592—i.e., little more than a year before Cardinal Allen died. And a very curious and suggestive chronicle it is for those who know how to read it. It tells how on Michaelmas Day, 1568, William

Allen, who had been Principal of St. Mary Hall, Oxford, with six associates—one of whom was a Fellow of Exeter, and another a Fellow of New, and all men of some mark—took possession of a large house, which they had hired, at Douai, and began to live in collegiate fashion on an income which did not afford them 20*l.* a year a head, and apparently without any other reserve of capital than that mighty fund of "faith" which they had at their command; how, throwing themselves upon the compassion and generosity of friends at home and abroad, they opened their doors to all such students as might offer; how students came, often penniless, always more or less needy, sometimes with the worst motives, as enemies and spies; how in less than seven years the college became renowned over Europe for the excellence of its training, the amazing intellectual activity of its staff, and the wide extent of its influence; how, after ten years of marked success, a party in the town of Douai, waxing suspicious of an institution which was notoriously under the influence of Philip II., and dreading the possible pressure which, conceivably, it might exercise in favour of the Spaniards, succeeded in closing the college and driving away the professors and students to Rheims; how at Rheims, again, they settled and prospered even more remarkably than before; how here there came flocking a host of refugees, driven from England by the penal laws, who were taken in and sent on their way without fee, without question, and during their stay entertained with a princely hospitality that might well have taxed even the largest resources; how, finally, after thirteen years at Rheims the college once more returned to its first home and began a new career under altered conditions and different auspices. Just at this point the second Diary comes to an end, and with it this first volume of Records, except that the learned editors have given us in addition an Appendix of documents of very great value collected from depositories all over Europe, about which I would gladly say somewhat if my space allowed. The letters of Gregory Martin to Campion, some extracts from which had appeared in Mr. Simpson's *Life of Campion*, however, can hardly be passed over without notice; they give us a high opinion of the earnestness and intellect of that elegant and accomplished scholar. Nor again ought the very remarkable paper on the progress of Catholicism in Balliol College to be forgotten. It irresistibly suggests that Father Parsons's expulsion from his fellowship was due to quite other causes than those which Wood has given us in the *Athenae*, and which bear improbability on the face of them. Curious, too, are the stupid and clumsy letters of Stapleton—Bellarmine's tutor at Louvain—curious because no writer of the sixteenth century can be compared with Stapleton in the nervous force and vehemence of his Latin style or the largeness of his vocabulary or the scorn that he throws into his rhetoric; but if these letters are a specimen of his English, the fewer we see of them the better.

Though, as I have said, Dr. Knox has done his work as editor very admirably—so

far as it goes—he has not by any means exhausted his subject. Perhaps it was prudent to pass over Allen's defence of Sir William Stanley with a discreet silence; perhaps the dissensions in the English college at Rome were better left undealt with; perhaps too the affair of the Appellant Priests is reserved for another volume. If so, Dr. Knox has a task of some delicacy before him, and we heretics may be forgiven if we feel not a little curious to see how he will discharge it. That next volume is to contain a collection of Cardinal Allen's letters, which are sure to be well written, and can hardly fail to be of great intrinsic value.

It seems to me a defect in Dr. Knox's Introduction that dates are not printed in the margin, or at least at the head of the page; the chronological sequence of events is difficult to follow. I have noticed very few inaccuracies, and none of any importance, in the printing of this volume, and few mistakes in Dr. Knox's Introduction. A man—even a learned man—may be excused for saying that in Queen Elizabeth's time the Franciscans "had no English subjects in their order," for it is not everyone who can be supposed to know the story of "old Father John," who lived till 1590 under the protection of the Earls of Derby, retaining to the last his Franciscan habit; or who has ever heard of Father Collier, who died in prison about the same time; or of Father John Buckley, *alias* Godfrey Jones, who, after leaving England a year or two before, returned in 1592, and was executed in 1598; or of Father Nelson, who died somewhere in Herefordshire in 1628, in extreme old age. All these were Franciscans, but the *Certamen Seraphicum* is a very rare book, and one may pass a long life without being fortunate enough to see a copy. But the most unaccountable omission in the Introduction is that of any notice of or even allusion to the literary work of these Douai scholars, at a time when their books were being sent forth in shoals. As to attempting a complete bibliography of English Catholic writers at Douai, Rheims, and elsewhere during this period, only they who have gone at all deeply into the subject can have any notion of the enormous difficulty of such an experiment. But surely, surely, the glory and the boast of Rheims is the translation of the New Testament into English as early as 1582; and though the translation of the Old Testament did not appear till twenty years afterwards, yet Allen and his coadjutors at Douai have the credit of that important undertaking, and it certainly was very far advanced during the years with which Dr. Knox's Historical Introduction is concerned.

We are promised in the next volume a further instalment of these "Diaries," comprising the years between 1598 and 1633, i.e. the years which saw the death of Elizabeth and the accession of James I., the Gunpowder Plot, the Spanish Marriage Negotiations, the union with Henrietta Maria, the mission of Gondomar, and much else that can hardly have failed to leave some trace of its influence and some memorials of the interest which it aroused at the time in the pages of the Registers of Douai.

AUGUSTUS JESSOPP.

SKEAT AND BELL'S CHAUCER.

Poetical Works of Geoffrey Chaucer; with Poems formerly printed with his or attributed to him. Edited, with a Memoir, by Robert Bell. Revised Edition, in Four Volumes, with a Preliminary Essay by the Rev. W. W. Skeat, M.A. (London: G. Bell & Sons, 1878.)

MR. SKEAT has done good service to the cause of Chaucer scholarship, not only by his Preliminary Essay to this revised issue of the stereotyped Bell's *Chaucer*, but even more by his boldly putting all the spurious poems, once wrongly attributed to Chaucer, in an Appendix comprising the last fifth of vol. iii. and all vol. iv. This is the first outward and visible sign, in an edition of the poet, of the inward conviction which we Chaucerians have for years been working to bring about, and it will, I hope, soon convert that chief sinner in this matter, who, in a well-known London College and many provincial lecture-rooms, still confuses his pupils' minds, to the wonder of the best-informed among them, by giving them "mixtelyn,"* for the pure flour of Chaucer's brain.

If only all professors of English literature and writers of articles on Chaucer could be endowed with Mr. Skeat's clear common-sense, critical power, and knowledge of the English language in all its stages from *Beowulf* to Shakspeare, Chaucer's memory and genius would soon be cleared from all the rubbish which old printers and editors heaped round it, and the absurdity of making him the author of such pieces as *The Court of Love*, *The Testament of Love*, &c. &c., would soon be stopped. Mr. Skeat says of the former—called by one writer "a light and lovely work of Chaucer's youth," and by another insisted on as Chaucer's because James I. of Scotland imitated it about 1430 A.D.:—

"Of all the pieces attributed to Chaucer, none is so utterly unlike him as *The Court of Love*. The language can scarcely be said to belong even to the fifteenth century, but belongs rather to the reign of Henry VIII., or even later."

So too in Mr. Skeat's criticisms of the other spurious poems, the reader feels that a man with *knowledge* is speaking. There is no vague windy talk, but definite assertion on the turning-points of the case, by a man who has the facts at his fingers' ends:—

"*The Flower and the Leaf* purports to have been written by a woman, and no doubt was so; the language is so clearly that of the fifteenth century (and not very early in the century either), that it is impossible to connect it with Chaucer. It contradicts the laws of prosody and of rhyme as deduced from his genuine works. The rhyming of 'pleasure' with 'desire,' in stanza 17, is enough to make the most credulous person pause and reflect."†

Of *The Romaunt of the Rose* Mr. Skeat says:—

"When it comes to be examined carefully, it presents to those who have eyes to see, and who are sufficiently acquainted with Middle-English to apprehend, such clear and consistent evidences of an original Northern origin as to settle the ques-

tion beyond all doubt.* To which may be added that it transgresses, over and over again, the laws of Chaucer's prosody as obtained from his genuine works, and contains several rhymes such as he never employs."

And so on. Now let the results of the work and knowledge implied in criticism like Mr. Skeat's be compared with that of any critic who tries to establish the genuineness of these spurious poems. The reader will soon see whom he can trust. On the point of language, surely, Mr. Skeat speaks with authority. He is one of our only three or four sound Anglo-Saxon scholars—witness his admirable Four-Text editions of the Anglo-Saxon and Early English Gospels of St. Mark and St. Luke for the Cambridge University Press: he has produced for the Early English Text Society his grand Three-Version edition of the *Vision of Piers Plowman*, by Chaucer's great contemporary, long Will: he has edited large portions of Chaucer's *Canterbury Tales* with a care and accuracy that leave nothing to be desired: and his other editions of *Havelok*, *Lancelot*, *Joseph of Armathye*, *Partenay*, &c., have established his reputation on the surest grounds. He has now confirmed and strengthened, by incontrovertible arguments, the conclusions of Mr. Bradshaw, Prof. ten Brink, and others, as to the spuriousness of these quasi-Chaucer poems, and has thus, I hope, knocked the last nail into the coffin of the superstition that has hitherto defended them.

The present edition of Chaucer contains the genuine minor poem formerly omitted from it, the beautiful *Former Age*, discovered by Mr. Bradshaw, as well as the *Envoy to Truth*, first printed by me. The Introductions and Notes to this edition, though not fully revised, render it the most useful to the student of Chaucer, that star of Early England.

F. J. FURNIVALL.

NEW NOVELS.

Benedicta. By Mrs. Alfred Phillips. In Three Volumes. (London: Macmillan & Co., 1878.)

Deceivers Ever. By Mrs. Lovett Cameron. In Three Volumes. (London: Chatto & Windus, 1878.)

Littledale. By "Sejanus." In Three Volumes. (London: Tinsley Bros., 1878.)

To the reviewer of such novels as *Benedicta* there are some three courses open. He may speak his mind frankly, and so lay himself open to the charge of illiberal ruffianism; or, disdaining to lift his pen against a woman saving in the way of kindness, he may allow himself to seem taken with the manner of the stuff on which he is sitting in judgment, and be feebly and volubly benevolent; or he may lay by the ensigns of his craft for evermore, and retire from the world of novels "into Diogenian tub or otherwise," and decline to have anything whatever to do with those who write them. Of these the first would seem to be the best; thankless though it be, the shadow of Duty

spreads over and ennobles it. The influence of that abstraction which, in Wordsworth's phrase,

"From vain temptations doth set free,"

makes it almost easy for me to say that *Benedicta* is really a very poor novel—poor in plot, poor in character, poor in dialogue, poor in English, poor in everything but ambition and the quality of innocuousness. *Benedicta* is a surprising combination of profundity and simplicity. Her simplicity is made evident by the fact that at seventeen, the daughter of a remarkable member of Parliament, "the relentless foe of crime that went hand in hand with culture," whatever that may be, she wears hobnail boots, and has to be sent from home and the discussion and expectation of the millennium with an inexorable nurse of somewhat violent religious tendencies, to be taught that after all "there is some distinction between boys and girls." Of her profundity we have ample proof in the soliloquy she makes, at the same age, over a rabbit she has just shot:—

"Does the future ever mend the past? Hardly; for the future cannot give life to the poor little rabbit I shot. The past, therefore, can only teach the future. But at what a cost! The sacrifice of a life. It is just the same with all our wrong actions; and our irrevocable deeds of the past are but the heart's blood which we shed to inform the future."

To these traits there should be added the information that her smile reminds one of her acquaintances of "sunbeams sparkling upon granite;" that, having fallen violently in love with a handsome artist, who "might have stood for a model of David or Apollo," and yielded to the need of epistolary intercourse with him so far as to write him a letter, she blushes "violently," and tears up "the tell-tale words into a hundred fragments;" and that, snubbed by the said artist, she disintegrates his letter and flings the pieces "into the basin of water in which she had previously washed her hands," watches "the floating fragments with a smile of scorn," and addresses them in a very neat and defiant little speech. It will be perceived at once that she is an extraordinary creature. Taken all round, however, she is not amusing; neither during her period of probation in the drawing-room where "statuettes of Parian commemorated Grecian beauty in various odd corners;" nor when, "in the full flush of her magnificent development," she is making everybody happy; nor when, her young days shaded by the final loss in mid-channel of him "who might have stood for," &c., she passes from us in an apotheosis of benevolence and mourning raiment, "looking thinner and paler than when first we knew her, but far more beautiful." The authoress would seem to have intended her for a sort of nineteenth-century Miranda, but she is at best a gushing hoyden, whose innocence is too fond to be other than offensive in the extreme. The characters grouped about her are unsuccessful enough to be her not unworthy companions, the least faulty being probably the Mrs. Blake who is responsible for the existence of the handsome artist. Altogether, Mrs. Phillips is not to be congratulated on what would seem to be her

* Rye and wheat ground together.

† "I have made a considerable list of rimes in the *Romaunt*, which agree, not with those in Chaucer, but with those in Barbour's *Bruce*!"—Skeat

* "I give one example. *Thore* (there) is rimed with *more*. Chaucer writes *ther, moré*, which cannot rime. Barbour writes *thar, mar*, a perfect rime. See *R.R.* 1863."—Skeat.

maiden work, nor encouraged very strongly to persevere in the difficult ways of literature.

Mrs. Lovett Cameron's new novel is not so great an advance upon her first as might have been expected. *Juliet's Guardian*, with many defects, was on the whole a somewhat promising book. In *Deceivers Ever* the promise is less, if the defects are fewer. It may be described as an outcome of the example of Miss Broughton; Miss Broughton clothed and in her right mind, as it were, with her commonplace-book beyond reach and her scepticism in abeyance. Ella Dallas, the heroine, is clearly akin to the Joans and Esthers of the world of fiction, but she is better bred than they, is not so fond of romps, is less passionate and rebellious, and is altogether of better and stronger fibre and a more wholesome habit of thought and feeling. The wicked hero, too, is very much like those monstrosities of sex with which Miss Broughton has familiarised us. Like them he is a "Viking"—that is to say he is blonde and a man of stalwart inches; though, unlike them, he is not an officer in any regiment whatever, does not rejoice in the possession of abnormal moustaches or an interesting scar, and is rather a gay deceiver than a big honest lumbering creature of impulse. And the motive of the plot, which is one of passion thwarted and of lives to all appearance broken and shattered irreparably, is one that might have come as fitly from Miss Broughton as from Mrs. Lovett Cameron. The likeness, in fact, is unmistakable, though it is tempered with the evidences of an individuality in some sort original. Mrs. Lovett Cameron is always earnest and conscientious, and writes with an appearance of reticence and restraint that in its way is commendable enough. *Deceivers Ever*, indeed, is a really readable book. The English is usually careful, its descriptions are spirited, its rhetoric is not very obtrusive nor very offensive, and its dialogue is here and there tolerably adequate. Its men, I think, are failures—one of them, Mr. Snell, being a ghastly failure—though Mr. Colthorpe, the most spirited sketch of all, is not unamusing; and Jack Ormsby, the "Viking," puppet as he is, is not bad as puppets go. The women are better; one of them, Mrs. Joo Hardy, being very aptly and spiritedly sketched indeed; while at least two others, Mrs. Jack Ormsby and Lady Althea Dallas, if their conception be somewhat traditional, are vigorous and pointed in the matter of execution. I confess a profound disbelief in the heroine, Ella Dallas, though she is quite organic compared with poor Benedicta Heathcote, and though the record of her adventures is assuredly a better book than the ordinary run of such things. If it should ever achieve the honour of a second edition, by the way, it might be worth Mrs. Lovett Cameron's while to reconsider that "cantata of Rosini," sung, among other things, by one of her young ladies in a drawing-room after dinner.

Whether "Sejanus" be a cunningly allegorical predication, or a mere anagram, or a pleasantly mysterious effort of some sort of humour, I cannot pretend to say. What is certain about it is that it is the pen-name of a gentleman who has some knowledge of

the subtleties of legal procedure, a certain faculty for the making of plots, an excessive fondness for the use of the periphrasis, a portentous gift of metaphor and analogy, and a baneful and awful tendency to the utterance of crude but solemn didactics on any and every occasion. His book is not unreadable on the whole. It contains a vast, a voluminous, a bewildering intrigue, points of which have to be brought out by means of documentary evidence originally provided by Sarsfield and Prince Eugène; a large number of characters in all ranks of life, from shoemakers and detectives to potential peers and actual Queen's Counsel, an overpowering quantity of very obvious morality or eloquence (one hardly knows what to call it), and more truisms than have ever before been brought together into the compass of a single work. It is also remarkable in the possession of a heroine who is seduced from the parson she loves (and marries after all) by the aid of such pretty tiny kickshaws as earrings and drops of gin, and of a hero who, after behaving like a finished rascal for some seven hundred and fifty octavo pages, has forced upon him a conviction of the error of his ways by having his head battered in unexpectedly, and ends by "crying out of sack and going away as it had been a christom child." Had "Sejanus" but chosen to exercise a little more judgment in the conduct of his plot, and a great deal wiser discretion in the control of his eloquence, *Littledale* would have been a better novel than it is. As it is, there is not much to be said of it, saving that, while it is somewhat too suggestive of an indigestion of romance to be altogether acceptable, it is, as some of those who read it will possibly express themselves, "not so very bad after all." W. E. HENLEY.

CURRENT LITERATURE.

The Poetical Works of Thomas Cooper. (Hodder and Stoughton.) When the history of Chartism comes to be written, especially if it be treated from its poetic side, the public at large will probably be startled to find how great an influence the life and writings of Shelley had over English Radicals thirty years ago. In 1840 the name of the author of *Queen Mab* had still an ominous and sinister sound to the respectable citizen, and the question of his position in English literature was still treated as an open one. It was, no doubt, *The Masque of Anarchy* which endeared the name of Shelley to the extreme Liberal party; that fiery hymn of revolution, bravely published by Leigh Hunt at no small personal peril, was the very gospel of Chartism, and its existence gave a sacred value to all Shelley's works in the eyes of men who sympathised with those massacred at Manchester. Among the Radical poets directly inspired by Shelley, some, like Wade, have passed away, but three, at least, of the most genuinely gifted remain in Mr. W. B. Scott, Mr. W. Linton, and Mr. Cooper. It is to be noticed that if the *Masque of Anarchy*, as seems likely, first attracted these men to Shelley, it was not that poem which finally enforced their allegiance. *The Year of the World* belongs to the school of *Alastor* just as surely as *The Purgatory of Suicides* is the result of *The Revolt of Islam*. It is more than thirty years since Mr. Cooper published his famous epic, and the circumstances that led to its publication are perhaps not clearly remembered. *The Purgatory of Suicides* was a "prison-rhyme," the solace of two years of confinement in Stafford gaol on a false accusation of

having been concerned in a violent outbreak among the Staffordshire Potteries in 1842. Sir William Follett forced a sentence out of the wavering judge, and avenged society upon the Chartists in a body. Cooper was not the most severely punished of these judicial victims, but his confinement was sufficiently rigorous and painful. He employed his leisure in composing a long poem, in ten books, and in the Spenserian stanza, in which the spirits of all the suicides of history were displayed expiating their crime in purgatory, and conversing with one another. The poem, which was full of splendid rhetorical indignation and breathed a passionate love of liberty, was dedicated to Carlyle, and obtained a great deal of public attention at its first appearance. It has long been out of print, and Mr. Cooper has done well to reproduce a work which has secured a niche in the literature of his country, and which will always be read with interest by a certain number of readers. As a specimen of Mr. Cooper's style we may quote part of a beautiful passage in which the wanderer meets the figure of Sappho bending, as if in stone, over a sepulchral urn:—

"Enrapt to ecstasy, I gazed till life
Began to fill its breast, and passion shone
Through its unmarbled eyes! Death a vain strife
Essayed, with chilly grasp around her zone,
To hold in sculptured grief that ardent one.
Lo! high immortal Love breathed vital power
On her fair limbs, and, with a gentle moan,
She raised her head—a monument no more
Of sorrow—but, for Love, a peerless cynosure.

Her islet shell the burning Lesbian took
From sad repose upon the urn that feigned
To hold the image of her grief, and strook
The matchless chords as one who pain disclaimed:
Then, proudly, though with tears, she thus complained
Of slighted tenderness, vowing to feed
Her fruitless flame till, spirit disenchained
From torture, her deep constancy its meed
Should find in some blest state for souls by gods decreed.

Phaon! beloved, unloving Phaon! thee
The mail enamoured hymns—by pain unchanged
In Hades, as by scorn on earth: on me
Let angry Jove, the Torturer, be avenged
For slighted life and order disarranged
Of his stern government: woe shall not wrest
Thy image from its throne: never estranged
Shall be her love from Sappho's faithful breast:
She can love on—unloved, despised, ache-doomed,
unblest!"

In 1873 Mr. Cooper, having undergone a complete change of religious conviction, published *The Paradise of Martyrs*, a poem in the same stanza, but with none of the fire of his early masterpiece. The present edition, which is very attractively got up, includes, beside the two long poems, a variety of lyrics mostly political in character. We warmly congratulate the veteran poet on his reappearance, and predict for him as cordial a welcome from the new generation as that which he enjoyed from the old. The poems will form the best possible commentary on his recently-published autobiography.

Studies in the Idylls: an Essay on Mr. Tennyson's "Idylls of the King." By Henry Elsdale. (C. Kegan Paul and Co.) To persons who desire to make a minute study of Mr. Tennyson's *Idylls*, this book may be recommended. It is gracefully and agreeably written, and in the main appears to be worked out with care on right lines. Perhaps Mr. Elsdale is tempted to look for a little more allegorical significance in details than the author of the *Idylls* put into his poems. It must also be confessed that to write two hundred pages upon these poems necessarily requires that the criticism be sometimes beaten thin. Only a limited number of good things can be said even of *Hamlet*: criticism gains in force by being compressed and constrained within narrow bounds. One special point of interest to which Mr. Elsdale calls attention is the season of the year to

which each Idyll belongs:—Arthur was born on the night of the new year; in May he was wedded; "Gareth and Lynette" is a poem of spring-time; "Enid" of summer; when Vivien beguiles Merlin it is a sultry summer afternoon; "The Last Tournament" is an autumn poem; finally, in "The Passing of Arthur" it is again the close and the beginning of a year:—

"And the new sun rose, bringing the new year."

And thus, as Mr. Elsdale notes, the mystic cycle is complete.

Cassell's Library of English Religious Literature. Selected, Edited, and Arranged by Henry Morley, Professor of English Literature at University College, London. (Cassell, Petter and Galpin.) A pleasant and useful volume for popular reading, of selections in prose and verse, introduced by short notices of the writers. Want of proportion and a certain want of method are the chief faults in this miscellany. Had the lines been drawn rightly and firmly throughout, the book would be far more instructive; the writers should have been carefully grouped, and minor writers have been subordinated to the leaders of religious thought and feeling. This book will remind some readers of that excellent store of well-arranged extracts and criticism, *Our Christian Classics*, by the late Rev. James Hamilton.

Echoes from Mist-land; or, the Nibelungen Lay revealed to Lovers of Romance and Chivalry. By Auber Forestier. (Chicago: Griggs and Co.; London: Trübner.) The Nibelungen story told in English prose for modern readers. We can well imagine the story better told, in simpler and sweeter and stronger English, as Charles Kingsley might have told it had he tried. But Mr. Forestier's book may have its uses of a secondary kind, and may serve to bring readers, and especially young readers, within the range of the powerful attraction of the original. The following is an instance of the clumsy modernism which offends in Mr. Forestier's style: "Gunter expressed his deep sympathy for Etzel's bereavement, and keen appreciation of the attention shown in thus officially announcing it to him." Still this is not so vicious as the spurious archaic manner.

Shakespeare's Hamlet. Edited by Samuel Neil. (Collins.) This volume of Collins's School and College Classics is a well-planned and well-prepared piece of work. In some respects it has the advantage of the Clarendon Press edition of the same play, some of the difficult questions other than textual or philological which must come before any student who reads the play being here carefully treated. The Introduction gives information with respect to the source and date of *Hamlet*. The Appendix contains articles on Hamlet's Age; the "Dozen or Sixteen Lines;" the Notes of Time in the Play; Hamlet's Madness; "Had the Queen any share in the Murder of her Husband?" &c.

The Tragedy of Macbeth according to the First Folio, with Remarks on Shakespeare's Use of Capital Letters in his Manuscript, and a few Notes. By Allan Park Paton. (Edinburgh: Edmondson and Co.) The idea of this edition is that the first folio following Shakespeare's manuscript prints with capital letters every word on which Shakespeare intended stress to be laid. Mr. Paton, from his experience in public reading, vouches for the trustworthiness of this guide to emphasis furnished by the capitals of the folio. The truth in this notion seems to be that when formal rules did not regulate the use of capital letters, writers and printers did, as Mr. Paton supposes, frequently and almost instinctively make prominent an emphatic word by the use of such capital letters. But that no system of this kind was deliberately adopted by the editors or printers of the folio is certain. Mr. Paton has thought of a charming title for an edition of the plays, "The Hamnet Shakespeare," named after Hamnet, the

dead son whom Shakspeare loved, and of whom perhaps he thought when *King John* was written.

Die Balkan-Haiduken. Ein Beitrag zur innern Geschichte des Slaventhums. Von Georg Rosen. (Leipzig: Brockhaus.) On the Eastern Question "all men are liars." Suspicion attaches even to the statements of the really well-informed and moderate writers on both sides, like the Turcophiles St. Clair and Brophy, and the Bulgrophil Kanitz, who have not disgraced and stultified themselves by the shrieks and inventions to which some eminent persons have descended. The natural German feeling toward Slavs is hatred, and their sentiment being instinctive is more bitter and permanent than our accidental jealousy. We should therefore hardly expect Rosen to be a perfectly impartial writer; but he is a thorough scholar, and, having been for some time German Consul-General at Belgrade, he has a knowledge of modern Balkan politics such as no private person could acquire. He has now translated some popular Bulgarian robber-ballads, and the autobiography of the political brigand Panajot Hitov, whose confessions throw floods of light on Bulgarian methods in robbery and massacre, and on recent Servian, Roumanian, and Panslavist intrigues in the Balkans. The word "Haiduk" originally meant a Hungarian armed shepherd, or frontier guard of the Turkish march, and was transferred to the robbers of the Balkans, who have hitherto defied every attempt to extirpate them, even when made by such energetic rulers as Trajan and Midhat Pasha. The Haiduk of late years has generally been an ordinary criminal, often of the worst hue, who has escaped from justice and banded with others of his kindred, who robs and murders Muhammadans *ad infinitum*, old men, women, and children included, but, in theory at least, spares Slav Christians. It is to be observed that some of the Bulgarian risings, of which we have occasionally heard, were mere Haiduk movements. Unlike Brophy and St. Clair, this author admits that the Haiduk is stimulated by a national feeling, but says that the political motive is as supplementary with him as with the Bourbon brigand of the Abruzzi. This, so far as we can judge, was originally the case with Panajot, who started as a bandit to gratify his own personal desires of revenge, but from being a mere Robin Hood gradually rose to the dignity of a species of Bulgarian Garibaldi. According to the ex-consul, the southern Slavs have lost all sense of humanity, so that many Bulgarians think it a good deed to cut the throats of little Turkish children. Rosen says that their present savagery of feeling and practice did not exist before the Crimean war, and that the South Slaventhum owes its progress in cruelty to the heated appeals and language of the Moscow Panslavists. In former times the misdeeds of the Haiduks were the struggles of Bulgarian criminals against the Turkish authorities. Of late years, thanks to Moscow, the war has been waged against babies and women with child. Rosen does not ascribe to the Russian Government any complicity in the intrigues of the Moscow Slavophiles, or with their system of glorifying the bloody Balkan brigandage with the halo of political martyrdom: the Cabinet of St. Petersburg is too well aware that Panslavism is a standing menace to official Russia as well as to European civilisation. Panajot's memoirs chiefly relate to the great Bulgarian brigand campaigns of 1860-67. They show the piteous plight to which the Servian Government was constantly reduced in its attempts to satisfy the Turks on one hand, and the St. Petersburg and Moscow Slavophiles on the other, when Panajot established himself in Servia on a coign of vantage suitable for incursions into Turkish territory. It was the hope of the wire-pullers that the Porte would finally lose patience with its vassal, who would call for Russian help, thus precipitating the war from which they hoped so much. So far as can be judged from Panajot's evidence, his band was supplied with money, at any rate in 1865, by

Bulgarian merchants settled in Bucharest, and there is no proof that the Servian Ministers (who finally put the Slav Fra Diavolo into prison) or the Roumanian Government did anything serious toward stirring up insurrection in Turkey. Panajot charges Russia and Prince Gortschakoff with being the worst enemies of the Slav cause, accusations in which clever persons who "from indications find directions out" will no doubt see a blind!

NOTES AND NEWS.

A MEETING of the Council of the Folk Lore Society was held last week, Mr. W. J. Thoms in the Chair. A collection of Japanese folk-tales was offered for publication by Mr. C. Pfoundes, who took them down himself from the lips of their Japanese reciters. Also a collection of tales, customs, and traditions illustrative of West Sussex folk-tale, compiled by a lady some years ago. Two letters from foreign correspondents were read, the one, from Copenhagen, referring to the proposed publication on the part of the Society of a translation of Grimm's *Deutsche Mythologie*—a task which is perhaps somewhat too heavy for a very young Society to undertake—and the other, from Canada, suggesting that application should be made by the Society to the various Historical Societies of America for leave to make use of the large collections of tales of the North American Indians, which have long been lying in their archives, vainly awaiting an editor.

It appears that a considerable feeling of distrust exists in the North of England with regard to the scheme for obtaining a University Charter for Owens College, Manchester. This feeling has taken shape in the preparation of a counter-memorial shortly to be presented to the Privy Council, and also in a letter signed by the Chairman of the Council of the Yorkshire College, Leeds. On the other hand, the authorities of Owens College, with the judicious energy that has characterised all the operations of their campaign, have anticipated their opponents by the issue of a little pamphlet forming No. 6 of the series. They undertake to show that the objections raised, so far as reasonable, have already been met either in their own original memorial, or in some portion of their subsequently published papers. At the same time, they profess themselves willing to make certain concessions, calculated to disarm the opposition of those whose disagreement is based only upon points of detail. Altogether, "his Grace the Lord President of the Council," with whom the ultimate decision rests, is placed in a position of no little responsibility.

Messrs. C. KEGAN PAUL AND Co. have published in a pamphlet form the annual address delivered by Mr. Richard Congreve on the Festival of Humanity, January 1, 1878. Mr. Congreve, as his custom is on these occasions, first reviews the condition of public affairs, and then treats of the inner life of the Positivist community. If one who is an outsider but no scoffer may be permitted to criticise, we should say that this does not rank among the most persuasive of his writings. Considering all the circumstances, it is hardly surprising that a tone of melancholy, though not of despair, should pervade the whole. His confident belief in the ultimate success of the cause, despite present appearances, seems somewhat strained. The transparent earnestness of his own convictions no one can doubt.

A GERMAN translation of Mr. Sayce's *Babylonian Literature*, which was published in January last, is in preparation.

MR. R. G. HALIBURTON is preparing a work to be entitled *Primæval Legends of the Paradise, the Deluge, of the Land of the Pleiades, and their connexion with a Divine Benefactor and the pre-Christian Cross*. Mr. Haliburton's investigations into the worship of the Pleiades and the primitive Pleiades year are well known, and the volume will contain a large mass of research.

THE Fourth Oriental Congress will be held at Florence next September, from the 12th to the 18th of the month, in the Palazzo Riccardi, lent for the purpose by the Provincial Council. An exhibition of various objects illustrative of the East, such as books, MSS., coins, maps, idols and the like, will be on view in the hall of Luca Giordano and the adjoining rooms, and contributions to the exhibition are requested. Tickets of admission to the Congress cost 12 francs, but the delegates are allowed to grant them only to scholars and other qualified persons. The Congress will hold eight sessions on North Egyptian, on the Semitic languages including Assyrian, on Iranian including Armenian, on Indian, on Indo-European generally, on Chinese, Indo-Chinese and Tibetan, on Ural-Altaic, and on Polynesian. The following is a list of the foreign delegates:—London, Prof. Th. Chénery, Robert Cust; Edinburgh, John Muir; Oxford, Prof. James Legge, Prof. A. H. Sayce; Cambridge, Prof. W. Wright; Calcutta, Rajendralála Mitra, William Stokes; Bombay, Dr. Georg Bühler; Madras, Dr. A. Burnell; Poona, Dr. Fr. Kielhorn; Lahore, Gott. Leitner; Benares, R. T. Griffith, Esq.; New York, Wells Williams; New Haven, Prof. Whitney; Paris, Ernest Renan, Karl Schefer, Michel Bréal, Barthélemy de Saint-Hilaire; Marseilles, E. Souvairé; Münster, Prof. Jacobi; Rostock, Prof. Philippi; Marburg, Prof. Ferd. Justi; Erlangen, Prof. Fred. Spiegel; Bonn, Prof. Theodor Auffrecht; Strassburg, Prof. Nöldeke; Breslau, Prof. Ad. Stenzler; Leiden, Prof. de Goeje, Prof. Kern; Louvain, Prof. F. Nève; Berlin, Prof. Rich. Lepsius, Prof. Albr. Weber, Prof. Dieterici; Leipzig, Prof. Fleischer, Prof. L. Krehl; Vienna, Prof. Fred. Müller, Von Kremer; Innsbruck, Prof. Bern. Jülg; Prague, Prof. Alfr. Ludwig; Pest, Prof. A. Vámbéry, Count Geza Kun; Dresden, Georg von der Gabelentz; Tübingen, Prof. Rudolph Roth; Jena, Prof. Gust. Stickel; Bern, Prof. A. Sprenger; Zürich, Prof. Schweizer Sidler; Göttingen, Prof. Theod. Benfey; Halle, Prof. Fred. Pott, Prof. Rich. Gosche; Giessen, Prof. Vullers; Gotha, Prof. Pertsch; Griefswald, Prof. Ahlwardt; Kiel, Prof. Pischel; Königsberg, Prof. Nesselmann; Munich, Prof. Trumpp; Heidelberg, Prof. Weil; Copenhagen, Prof. F. A. Mehren; Lund, Prof. Tegner; Christiania, Prof. Lieblein; Helsingfors, Prof. Lagus; St. Petersburg, the Committee of the Third Congress; Kazan, Prof. Gottwaldt; Dorpat, Prof. W. Volck; Warsaw, W. Tiesenhäusen; Moscow, V. Miller; Madrid, Pasquale Gayangos, Odoardo Saavedra; Oporto, Prof. Ad. Coelho; Bucharest, Prof. B. P. Hasdeu; Tiflis, Ad. Berger; Constantinople, Ahmed Vefyk Pasha; Armenia, Leonde Alishan; Cairo, Mariette Bey; Peking, T. F. Wade, J. Edkins; Yeddo, W. G. Aston, E. Satow.

WE are glad to hear that Dr. Carl Knies, Professor of Political Economy at Heidelberg, intends shortly to publish a new edition of his highly philosophical work, *Ueber die politische Oekonomie vom Standpunkte der geschichtlichen Methode*, which has been for some time out of print, and is much called for. An English translation of this excellent work would be a boon to students of philosophy generally, as well as of political economy in particular. A new edition has also been ordered of Dr. Knies's work, *Ueber die Eisenbahnen und ihre Wirkungen*. In the first edition of this book Dr. Knies showed that it was not in England that the greatest rise of prices after the discovery of the Californian and Australian mines had taken place. In Germany, where the previous range of prices had been much lower than in England, a considerably greater rise had followed the increase in the supply of the precious metals in Europe, because Germany had at the same time been put by railways into rapid communication with the best European markets. When a dear place and a cheap place are brought into proximity, prices rise in the latter. Had the new gold not been discovered, prices would have

risen in Germany, but fallen in England. The third and concluding part of Dr. Knies's *Geld und Credit* goes to press in May. In the second part, as our readers may remember, the author severely handled Mr. H. D. Macleod, and we understand that some English economists of higher reputation will meet with criticism in the concluding part.

THE *Keystone*, a journal of building, architecture, art-decoration, art, and engineering, is announced to appear on May 1. The object of the new journal, which will be published monthly, is to serve as a supplement to "any publication dealing exclusively, and therefore more minutely, with some one of those subjects which it is the province of the *Keystone* to gather together, and treat as a whole."

WE have received the first number of a new Italian Review, published at Milan, and entitled *La Rivista Repubblicana di Politica, Filosofia, Scienze, Lettere ed Arti*.

A GERMAN translation of Swinburne's *Atalanta in Calydon* has just been published by Count Albrecht Vickenburg.

BESIDE the replications of Tauchnitz and Asher, another series, comprising translations of all the best English novelists, is about to appear in Germany. *Britannia-Bibliothek* is the name of this new undertaking, which is to be published by Schultz and Co., of Strassburg. *Dita; Is he Popenjoy?* and *Young Musgrave* are to open the series.

THE death is announced of the Marquis d'Audriffet, at the age of 81. He was the author of various works on French finance, among which are his *Examen des Revenus publics* (1839), and *Le Système financier de la France* (1840). Dr. William Williams, Bishop of Waiapu, who died on February 9, aged 77, was the author of an *Essay on Christianity among the New Zealanders*, and of a *Dictionary of the New Zealand Language*.

AT a meeting of the committee of the Index Society, held on Tuesday the 16th inst., it was resolved to print an Index to the Royalist Confiscation Acts in Scobell's *Acts and Ordinances of the Long Parliament*, to be accompanied by the Acts themselves, and an Introduction. These Acts are comparatively little known, but they are of considerable interest as containing the names of all those cavaliers who were too far gone in "malignancy" to be allowed to compound for their estates. This index will therefore form a useful companion to the Royalist Composition Papers preserved at the Record Office, which will be calendared in due course. The committee hope to issue this Index of Royalists to the subscribers, with the secretary's Historical Account of Index-making, as the first two books for the present year's subscription.

MAX MOLTEE has made an excellent German translation of the "doubtful," that is, non-Shaksperean, play of *Edward III.* He, curiously enough, considers it a genuine play of Shakspere's, adopting the opinion of Tieck, which no trustworthy German Shaksperean like Prof. Delius has ever taken up.

THE *Nuova Antologia* for April 1 has a good philological article by Signor Caix on "The Roumanians and their Relation to the Latin Races," in which he points out that the Roumanian grammar and half their vocabulary are essentially Latin, and proves that the nucleus of the nation is of Roman origin, while the great number of Slavonic words shows the long influence of the Slavs on the land; moreover certain peculiarities which the Roumanian has in common with the Albanian language show that the old Dacian population was absorbed and not destroyed by the Romans. He regards Roumania as the vanguard of Latin civilisation against the Slavs. There is also a suggestive article by Signor Lozzi on "Suicide and its Remedies," in which he comments on the alarm-

ing increase of suicide in Italy, and suggests various preventives. He insists on the necessity of children being brought up as much as possible in the open air if they are to acquire a cheerful temperament, and deprecates over-much care to keep them from a gradual knowledge of the realities of life. He thinks that modern education tends to allow the young to grow up without the necessary force to face difficulties when they arise. He also urges the necessity of careful watch over all who are moody or melancholy during the time that they are suffering from abnormal depression.

THE *Rivista Europea* consists mostly of continuations in the present number. The only novelty worth mentioning is a careful study by Signor Amone on Guido Cavalcanti. We gather that the writer is engaged on a complete edition of Cavalcanti's works.

THE *Preussische Jahrbücher* for April has a valuable historical article, founded on documents in the Hanseatic archives, by Dr. Sattler, on the relations between the Hansa and the Germanic Order, and the consequent development of Prussia up to the year 1370. Herr von Holst, in an article on Captain John Brown, gives a vivid sketch of the state of things which led to the war between the Northern and Southern States; and Herr Lang has a study on modern Italian history, founded on the recently published letters of Manin and Pallavicino. Herr Bruchmann gives a careful *résumé* of the present state of the problems raised by attempts to found a philosophy of language: for this purpose he co-ordinates the conclusions of Steinthal and Pott, and indicates the lines along which future investigation must proceed.

THERE seems to be a constant succession of critical and literary journals in Germany. Each journal when it is started declares itself entirely independent of any party or clique, but after a very short time complaints are raised as to the influence exercised by one or the other university, by this or that professor and his friends, and the *beau idéal* of a really impartial tribunal seems as far off as ever. Beside the old-established *Blätter für Literarische Unterhaltung*, there is the *Literaturblatt*, the *Literarische Centralblatt*, the *Gegenwart*, the *Jenaer Literaturzeitung*, the *Pädagogische Blätter*, the *Wage*, the *Magazin für Literatur des Auslands*, besides a number of monthly and quarterly journals which devote some of their pages to literary criticism. The newest bidder for public favour is the *Allgemeine Literarische Correspondenz*, which is now in its second year, and seems as yet to have kept itself free from any literary partisanship. The reviews are written by experienced hands, and generally refer to books which really deserve to be noticed. In the last number, of April 13, there is a full account of Bayard Taylor's works, which at the present moment excite particular attention in Germany on account of the author having been named American Minister at Berlin. Next follow two biographical sketches, one of Klemens Brentano, who among other things seems to have invented the Loreley story; the other of Ernst Keil, the founder of the *Gartenlaube*, a very popular journal, which is said at present to sell 400,000 copies. Then we find a long series of short notices of books, which generally give in half a column or a column exactly what one wants to know, the contents and the general character of a work. The most useful part, and that on which great care seems to be bestowed, is the *Zeitgeschichtliche Mittheilungen*, contemporary communications on all that is going on in the literary world in Germany. We should call it *Literary Gossip*, divided under different heads. First we have notices of new German publications. Among those which would interest English readers we may mention Chavanne's splendidly-illustrated book on the Sahara; Mannhardt, on the practical results of superstition; Birch-Hirschfeld, "On the Provençal Troubadours of the Twelfth and Thirteenth Centuries;" Ebers, the popular author

of *Uarda*, "Description of Egypt," with drawings by H. Richter, Tadema, Makart, Werner, &c. Next follows an account of the most important foreign publications, which is less complete than we should have expected. The next division is assigned to prizes offered and gained. We remark that one, the Teleki prize, has been awarded to the author of the least bad play, if he will submit to the publication of the criticism passed on his work by the judges. After this comes an account of second-hand catalogues and auctions, and a column full of personal notices. Here we are pleased to learn that the German Emperor has allowed a pension of 3,000 marks to the veteran philosopher and demagogue, Arnold Ruge, who has lived for many years as an exile in England. Turgénieff, we are told, remains firm in his resolve to write no more. Next we get information on laws and lawsuits connected with the press, a chapter on art, theatre, &c., and correspondence. But even that is not all. There is a whole page of new books, arranged alphabetically; and, lastly, a page giving a list of the articles in the more important literary journals of Germany. The paper appears twice in each month, and is published at Leipzig.

THE Rev. Charles Trelawny Collins Trelawny (the representative by his mother of the Trelawny family, of Ham, near Plymouth) died at Ham on the 19th inst. He was born there on April 10, 1792, and graduated at Balliol College in 1815. From 1818 to 1826 he held a fellowship at his college, when he was appointed to the rectory of Timbury. In 1838 he took the surname of Trelawny in addition to his paternal surname of Collins. His work (*Peranzabuloe: the Lost Church Found*, 1838), an elaborate attempt to prove from the remains of that ancient edifice, long buried in the sand, that the Church of England was "a Protestant Church 900 years before the Reformation," reached a seventh edition in 1872. He published several sermons and tracts, and in 1822 edited a *Summary of Mosheim's Ecclesiastical History*.

WE understand that Mr. Ashton W. Dilke has completed a translation of Turgénieff's last novel, *Nov*, which will be published by Messrs. Macmillan and Co. under the title of *Virgin Soil*.

A SECOND edition of Mr. Parker Gillmore's new work, *The Great Thirst Land*, is now in the press, and will be ready in a few days.

MESSRS. C. KEGAN PAUL AND Co. are about to publish an authorised translation of Dr. Burckhardt's well-known work on the Renaissance in Italy. The translation is made from the third and enlarged edition which has been recently published in Germany.

NOTES OF TRAVEL.

THE fifth part of *Petermann's Mittheilungen* begins with a sketch of the origin of the Berlin Geographical Society, which completed the first half-century of its existence a few days ago. This society, which is seven years younger than that of Paris, and two years older than the Geographical Society of London, was first formed at a feast given by the geographers of Berlin in honour of Captain Reymann on the occasion of his geographical jubilee. An account by M. A. Woelfel of an important journey through the northern provinces of Japan occupies a considerable space; and Dr. Behm examines the changes in the political geography of the Balkan peninsula proposed in the treaty of San Stefano in relation to the area and population of the new divisions.

SINCE the death of Captain Crespel, the Belgian East African Expedition has been under the charge of Lieut. Cambier, and the places of its lost members are to be taken by Lieut. J. B. Wauthier, who served in the Mexican campaign, and by Dr. Dutrieux, formerly a surgeon in the Belgian army, who has been for five years resi-

dent at Cairo. MM. Cambier and Marno returned to Zanzibar on March 5 from a preliminary excursion on the mainland, and intend to set out for the Tanganyika towards the end of May; the state of the paths and the deep stream beds have decided them to abandon the plan of taking ox waggons.

IN the second number of the *Geographische Blätter* of the Bremen Society, Dr. Oscar Lenz gives a most interesting account of the existing condition of trade on the West African coast about the Gaboon and the Ogowe river, from which he recently returned. He is of opinion that the Ogowe is altogether distinct from the Congo, and in no way connected with its system.

MR. W. H. DALL, of the United States Coast Survey, continues his account of the Aleutian islands, touching in this part on their physical structure, their inhabitants, and trade.

DR. FINSCH's narrative of his recent journeys in Siberia is in preparation, and will be illustrated by sixty-nine larger and smaller drawings from his pencil.

THE General Report on the operations of the Great Trigonometrical Survey of India during 1876-77, by Colonel J. T. Walker, C.B., which has just reached this country, furnishes an account of much valuable work which has been done by the Mullah in his explorations on the unsurveyed portion of the River Indus and in and around the plateau known to the people of the country as the Kohistan, which contains the sources of the Swat and Panjkora rivers. Colonel Walker states that "the explorations of the Mullah have added much to our knowledge of the interesting regions lying beyond our northern Trans-Indus frontier," though a good deal still remains to be done. A sketch map is given, which has been constructed to illustrate the Mullah's operations, and which also shows the localities where more information is wanted. The results of a recent reconnaissance of the Karambar and the Nagar Valleys by Captain Biddulph are also given on this map.

News has just been received of the arrival at Cooktown of Mr. Morton, of the Sydney Museum, who accompanied Mr. A. Goldie in his recent journey in New Guinea. Mr. Morton states that gold was first found some fifteen miles from the coast, and it was followed up for sixty miles. The black sand is met with in considerable quantities in the river bed, and the formation is said to be blue stone and slate. At the time of Mr. Morton's departure there was a severe drought on the south-east coast of New Guinea, which was causing the destruction of plantations and even forest trees. Mr. Goldie, who, as we stated on March 30, was on a cruise down the south-east coast, had been obliged to return to Port Moresby by the hostility of the natives, who had attacked the missionary vessel at Stacey Island, the new station recently established by the Rev. S. M'Farlane.

WE hear that Mr. H. M. Stanley has promised to read a geographical paper at one of the evening meetings of the Royal Geographical Society in June.

THE ENDOWMENT OF STUDY.

AT a time when the University Commissioners both of Oxford and Cambridge are considering the methods by which "research" may recover its place as one of the prominent aspects of academical life, it is interesting to learn how the same problem is being solved on the other side of the Atlantic. Just two years ago a University was opened at Baltimore, which takes its name from a wealthy merchant, Johns Hopkins, who bequeathed a sum of 3,000,000 dols. for its endowment, and also a fine estate for its permanent site. Daniel O. Gilman is the first president, and among other eminent men Prof. Sylvester was attracted from England to occupy the Chair of Mathematics.

The peculiar characteristic of Johns Hopkins University is the recognition of the duty of mature study on the part both of the pupils and of the teaching staff. As one of the means towards this end, fellowships have been founded, which bear some analogy to the part originally filled by *soci* at our own Universities. The prospectus of the system to be adopted for the bestowal of these fellowships for the current year now lies before us, from which we shall take leave to make copious extracts, not because we imagine that they are likely to allure candidates from this country, but because we think it important at the present crisis of academical reform that every such experiment should receive attention.

"Twenty fellowships, each yielding 500 dols. [about 100*l.*] a year, are annually open in the Johns Hopkins University. They are awarded by the trustees on the nomination of the faculty [which apparently means the entire professorial staff] as nearly on the first of June as may be.

"The object of this foundation is to give to a few scholars of promise the opportunity to prosecute further studies under favourable circumstances, and likewise to open a career for those who propose to follow scientific and literary callings. The University expects to be benefited by the presence and influence of the fellows, and by their occasional services; from among the number it hopes to secure from time to time some of its teachers.

"Three of the twenty fellowships are allotted this year to each of the five departments, Greek, Mathematics, Chemistry, Physics, and Biology; and the remaining five will be awarded either in these departments or in others at the discretion of the faculty.

"Appointments will be made after a careful consideration of all the evidence submitted to the faculty. Every candidate should address a letter to the president indicating the course of his previous reading, and his general purposes with regard to future work. It is desirable for him to present in print or MS. an essay or thesis which may have been written for the occasion or for any other purpose. If he has been engaged in any scientific or literary research, he should indicate its character.

"The holders of the fellowships will be required to reside in Baltimore during the entire academic session; and they will not be permitted to engage in teaching out of the walls of the University, except for exceptional reasons. They will be expected to devote all their time to study under the guidance of one of the professors, or if there be no professor in the chosen department, under the general approbation of the faculty. Towards the close of the academic year a report of his work will be expected from each fellow.

"Although the appointments are made annually, holders of fellowships will be re-eligible for a second or third year, and, in exceptional cases, for a longer time."

It is unnecessary to criticise the details of the above scheme, which has hardly yet been long enough in operation to prove its success. The first election was held in 1876, when for only ten fellowships 152 candidates presented themselves. We must accept the assurance of President Gilman that the amount of original work already done is both creditable to the doers and of value in itself. Among the list of present fellows appended to the document from which we have quoted, are to be found graduates from some thirteen American Universities, including Harvard, Yale, and Cornell. Students of natural science, of course, predominate, but there are also representatives of Philology, Greek, Philosophy, History, and Political Science. Surely this attempt at the endowment of study deserves more of our good wishes than the efforts of Oxford and Cambridge tutors to obtain additional subsidies and new retiring pensions, or than the scheme of the Owens College professors to escape from the examination system of London University.

JAS. S. COTTON.

MAGAZINES AND REVIEWS.

THE current numbers of the older quarterly Reviews cannot be called striking, so far at least as the non-political articles are concerned. The im-

partial reader, who has time to study both the *Quarterly* and the *Westminster*, may be amused to see those old enemies fraternising over "Russian Aggression," while in the same number, and almost in the same breath, each denounces the other's views on those questions of "the Crown and Constitution" which the third volume of the *Prince Consort's Life* has brought so much to the front. Of the historical articles in the *Quarterly* we may perhaps say a few words next week.

THE *Edinburgh* contains no purely literary article that is above a very ordinary level. That on the "Age of Bronze," however, stands on a different footing, and is evidently written by a man who speaks with authority. It might with almost equal propriety have been entitled "Pre-historic Man," as sixteen of the writer's thirty-seven pages are taken up with an account of the Stone ages. Here the results obtained by Prof. Boyd Dawkins, in his "Cave-Hunting"—that palaeolithic man is represented by the present Eskimos, and Neolithic man by the present Basques—are fully accepted, and supported by the familiar arguments. The writer adds the statement of his confident expectation that remains of the palaeolithic type will be discovered in Siberia (through which the Eskimos made their way to Behring's Straits) as soon as the caves in that country come to be explored for the purpose. But the important part of the article is that which deals with its professed subject. Here a recent French work by M. Ernest Chantre on the "Bronze Age" is under review, and the facts which oblige us to suppose that the countries north of the Alps received their bronze from the south, and particularly from ancient Etruria, are skilfully put together. The writer dwells upon the early power of the Etruscan race, occupying as it did Lombardy, and extending over the Tyrol into Hungary, before the Celts drove it southwards into the Etruria of history. The remains of this Palaeo-Etruscan race have been found all over Lombardy, and among other places to the northwards, in Hallstadt near Salzburg. They were great workers in bronze, and an important recent discovery reveals the fact that tin, as well as copper, was obtained from mines within Etruscan territory. Thus the great importance hitherto given to the tin-workings of Spain and Britain will have to be somewhat modified; and the great part played by the Etruscans in the dissemination of the new metal is explained partly by their very early civilisation, and partly by their possession within their own limits of the necessary constituents. The similarity, amounting in some cases to absolute identity, between the weapons and implements found in the Swiss lake dwellings and other northern localities, and those found in Palaeo-Etruscan territory, obliges us to connect the two. A recent "find" at Reallon, a place on the route from the Durance Valley to that of the Drac, helps to show what were the channels of this connexion. An immense number of all sorts of unused bronze implements and ornaments were here found, which had once evidently formed the stock-in-trade of a merchant, who got his goods from Lombardy and passed them on northwards into Switzerland and elsewhere. Similar finds have turned up further north. We may also suppose that there was a class of "travelling tinkers" who still further helped in the dissemination of the metal. Lastly, there have also been found the remains of ancient foundries, where the pieces of bronze are all worn and broken by use, and ready for the melting-pot. The most considerable of these foundries has been discovered at Larnaud in the Jura. As for the bronze implements, still of the Etruscan type, discovered to the far north—e.g., in Scandinavia—we must here call in the assistance of the Phoenicians, whom we must also make in the last instance responsible for the pieces of Chinese jade, for the remains of Mediterranean plants (such as the Cretan catchfly), and perhaps for the glass beads discovered in

the lake-dwellings of Switzerland. The further question as to whence the Etruscans got their knowledge of bronze is met by the usual resource in such cases—a reference to Egypt—and M. Chantre's suggestion to go still further back and derive the original invention of the compound metal from Malacca, where the tin and copper are found *in situ*, is not received with favour. The upshot of the whole is that it is possible or even necessary to suppose that the introduction of bronze in North Europe was due merely to peaceful commercial intercourse, and not, as has been supposed, to the advent of a conquering race armed with weapons of the new metal. It marks, in fact, the advent of a "new civilisation," not of a new race.

THE *New Quarterly Magazine* enters, this quarter, "upon a new phase"—i.e. it has changed hands, and has received a fresh infusion of energy. It remains, of course, to be proved whether there is room for yet another magazine devoid of special or technical features; for, in spite of the statements in the publishers' advertisement, we fail to see anything very distinctive in any of the articles in this number at least. The first article, Mr. Ingram's contribution of "Unknown Correspondence of Edgar Poe," we cannot in any way welcome. It is only very rarely that love-letters will bear publishing; and they certainly will not when the author is a physical and moral wreck, as poor Edgar Poe was during the last years of his unhappy life. The publication of these letters is a bad blunder. For the rest, however, the magazine promises well. We have no space to speak of Mr. Watts's elaborate paper on Alfred de Musset, but must pass at once to Prof. Colvin's article on "The Apollo Belvedere," an admirable popular statement of the new views which are beginning to prevail about that famous statue. After telling the history of the statue—how it was found at Porto d'Anzio (Antium) towards the end of the fifteenth century, restored and furnished with a new left hand by Montorsoli, and set up by Pope Julius II. in the Belvedere of the Vatican, and how till very lately it was regarded not only as "the very perfection of sculpture," but as quite certainly representing Apollo shooting with his bow—the writer proceeds to give his reasons for dissenting from both these views, supported though they are by the great name of Winckelmann. From a study of the pose of the statue, it is easy to show either that none of the hypotheses which have been commonly received—viz. that the statue is the Pythian Apollo Kallinikos, or the slayer of Tityos, or the chastiser of the Niobidae, or the Homeric Hekatebolos, will stand; or that if any one of them is admitted it must also be admitted that the "god is represented as plying his bow very falsely and affectedly." The former alternative Prof. Colvin regards as proved by the existence of what is known as "the Stroganoff bronze," a statuette belonging to Count Stroganoff, of St. Petersburg, and described in 1860, by "one of the most learned and ingenious of scholars, Dr. Stephani," of that city. This bronze is marked by "just those correspondences with the famous statue, and just those divergences from it, which lead an archaeologist, when he observes them, to conclude back with certainty from the several works where they occur, to the existence of a common original." The bronze is more simple and natural in attitude than the marble; but the important thing is that it carries *not a bow at all*, but something which "looks like an imitation in bronze of a piece of fringed and crumpled leather." Now the only thing in ancient art of which this reminds us is the aegis; and yet the Gorgon's head is not there, and besides, Apollo is not commonly represented with the aegis. There is further evidence, however, on both points:—

"The bronze statuette" (says Prof. Colvin) "can be traced back to the possession of a Dr. Frank, who lived as physician with Veli Pasha, first at Janina in Epirus, and afterwards, between 1807 and 1810, in the Peloponnese. He had received it as a present

from his employer; it had formed part, as it appears, of a find of eighteen bronzes which had been made in the neighbourhood of Janina. Sixteen out of those eighteen had been followed, and what became of them ascertained with certainty; this Apollo made an almost equally certain seventeenth; what was the eighteenth? When we find the French consul and antiquarian Pouqueville mentioning, as in the possession of the same Dr. Frank, a bronze head of Medusa, are we not safe in concluding that this was at once the missing eighteenth piece of the Janina find, and the missing portion broken from the aegis, the Gorgoneion of the Apollo?"

The next link in the chain of evidence is the well-known passage from the fifteenth book of the *Iliad*, where Zeus, wishing Apollo to scare but not kill the Greeks, sends him his aegis to frighten them with—a passage which gives special authority for the conception of an Apollo Aigiochos and Boëdromios coming to the rescue with the aegis to scare away the foe. It remains to ask, is there any possibility of reconstructing the circumstances under which the original statue (bronze beyond doubt, for the statue as we have it, in its smooth surface, and especially in the form of its lips, is evidently imitated from bronze) was made? Prof. Colvin readily admits that here we are leaving the safe ground of fact for the uncertainty of hypothesis. But, in the first place, we can decide for certain, from evidence of style, that the Apollo is not older than the first half of the third century—say 270 B.C.; and we know, in the second place, that great statues were seldom made in Greece, except to "supply images of religion and to commemorate great persons and events." Now it happens that one of the greatest events in later Greek history took place just at the time, and it was one of which, to the religious imagination of Greece, Apollo was the hero. This was the attack of Delphi in 278, and their defeat and rout by the small band of Greek defenders, aided by the God and the white maidens; aided, that is, by storm and earthquake, and "the concentrated terrors of the sky" (see Justin, xxiv., 7, &c.). Here then is the sculptor's motive, and this is the origin and real meaning of the Apollo Belvedere—not Apollo slaying the Python, as Byron and Milman and all other poets have wished us to believe, but Apollo, the Aegis-bearer, defending his own temple against the enemy. As such he stands probably as part of a group with the "white maidens," Artemis and Athene; and it is nearly certain that, although the Athene cannot now be found, the Artemis is extant in the so-called "Diana of Versailles," the well-known "Artemis with the Stag" in the Louvre—a proposition which becomes almost self-evident the moment casts of the two statues are placed side by side.

THE March number of the *Library Journal*, which has been delayed by the new arrangements, begins a third volume; and the editors, in explaining that English articles did not reach them in time, promise that in future the librarians of the United Kingdom shall be represented as fully as those of America. As the *Journal* is now the official organ of both the Library Associations, it is to be hoped that it will be loyally supported here. The number contains two reports of committees of the American Association—one submitting a condensed statement of Mr. Cutter's rules for cataloguing, with an elaborate list of abbreviations; and the other on the vexed question of sizes of books, recommending the plan of giving the actual measurement in centimetres. A table of corresponding symbols is given for those who prefer them. These, it need hardly be said, are important steps towards co-operative cataloguing. A short paper by Prof. Justin Winsor shows how to make college libraries useful; and Mr. Schwartz explains his "combined" system of numbering books, to which, however, we still prefer Mr. Dewey's. The *Journal* also reprints Mr. E. B. Nicholson's circular, with its skilfully condensed information as to the working of our free libraries.

RECENT CHINESE BOOKS.

Kew shoo wai loo (Supplemental record of the Nine Numbers). This is a volume of mathematics, treating of logarithms, conic sections, mechanics, and hydrostatics. It is based on European works which have been translated during the last twenty years into Chinese. The author was a doctor who, when a child, his biographer says, could read before he could speak. Chinese characters were written on the wall and their sounds shouted to him as they were written. Then when the sounds were called, this wonderful boy would point out the characters without a mistake. When he grew up and went out as a doctor, he preferred to walk, and when it rained he would walk barefoot. On arriving at a rich man's house, the servant who answered the door would scarcely believe that this ill-dressed and barefooted pedestrian was the doctor. The rich man who sent for him too would wonder at him till he sat down, felt his pulse, made his diagnosis, and wrote out an elaborate statement, with numerous references to ancient medical books, proving that the sick man's malady had been misunderstood, and that it was necessary to make a complete change in the mode of treatment. The rich man would, having received the prescription, pay him his fee and order him a sedan-chair to carry him home. This would be firmly refused, the mathematical physician preferring to walk. The book still wants the preface, which the author before his death requested might be written by his friend the present mathematical professor in the Peking College. The author spent as much time as he could spare from his duties as a physician in editing old and new works in mathematics, medicine, and philosophy. Though brimful of learning, he had the look of an ordinary villager. His name was Koo Shang che.

In a recent number of the Scientific Magazine published monthly in Chinese at Shanghai, under the editorship of Mr. John Fryer, of the Arsenal, there is a portrait and biographical notice of Prof. Li, of the Imperial College in Peking. He was a personal friend of the author of the work just mentioned, and has himself prosecuted mathematical studies with great success. The portrait was lithographed in London and sent out for insertion. The biography is written by Dr. Martin, president of the college in which he is professor. Five-and-twenty years ago Prof. Li came to Shanghai a comparatively young author in mathematics. It was then I first knew him. Through him I became acquainted with several literary men, some of whom had a decided taste for mathematical and scientific studies. Several of his friends were killed in the unhappy times of the rebellion, and among them two able writers on mathematical subjects. Li himself has this advantage above his scientific friends, that he has had the opportunity of studying thoroughly European mathematics. It is much to be regretted that since his appointment to a professorship in Peking his activity has been limited to educational duties. His mind at sixty lost its original power, but his numerous works remain, a striking monument of his industry and intelligence.

At Canton three thick volumes on opium have been lately published. A tract in Chinese, issued by the London Society for the Suppression of the Opium Trade, was the instrument in stirring up the native mind at Canton. A vigorous organisation for checking the spread of opium-smoking has been formed. One mode of working is to collect and publish documents on opium-smoking and the opium trade. Prizes were offered for essays on the subject of the opium trade as presented in the above-mentioned tract. Twenty-five of the essays are here published, including four which received prizes. Some sharp criticisms on England are introduced in these essays. The religion of the West teaches that we must love our neighbours as ourselves, practise kindness towards all, and not benefit ourselves at others' expense, yet what one thing in the

world can be compared with opium for the injury it inflicts on mankind and the mischief it causes men to bring upon their neighbours for the sake of their own gain? No wonder, says the essayist who won the first prize, that mobs have burnt some of the Christian churches and put to death Western men and women. In these papers the introduction of opium into the country is plainly represented as introducing poison to destroy the lives of hundreds and thousands, and the hearts of the whole people are said to be animated with one common feeling of indignation as the victims of a great wrong. Against the might of muskets, cannon, and ships of war on the one side, are arrayed millions of the angry victims of wrong on the other. The fierceness of wrath on the part of the sufferers may not just for the time break out or cause calamity to those who have done the wrong, but after a century or more it is very certain that the day of retribution and of calamity must come. After this burst of feeling the essayist proceeds to show how the importation into China of British manufactures would be greatly promoted by the suppression of the opium trade.

CORRESPONDENCE.

OLD DEVONSHIRE NAMES.

London: April 23, 1878.

Mr. R. J. King (p. 348 of the last number of the ACADEMY) quotes the following old Devonshire family names:—Birna, Busla, Cardua, Drua, Lelya, le Metteppa, Swytta. Perhaps it may be of some interest to him to know that such names ending in a abound among the Frisians, whose modern language, as spoken in Friesland, is the nearest approach to modern English, while the ancient Frisian bears the same relation to Anglo-Saxon.

Without drawing any conclusion as to the Frisian or non-Frisian origin of these seven Devonshire names, I limit myself to quoting the following ones extracted from the Frisian subdivision of my linguistic catalogue:—Douwama, Dykstra, Epekema, Fockema, Gabbema, Halbertsma, Hettema, Salverda, Schettema, Siccama, Sytstra, Wiarda, Windsma, Zylstra.

L. L. BONAPARTE.

MR. TROUGHTON'S "NINA SFORZA."

Craven House, Queen's Elm, Brompton, S.W.: April 20, 1878.

I hope Mr. Gosse will, with your concurrence, permit me, as an old friend of the author of *Nina Sforza*, to indicate some misapprehensions in the kindly and appreciative observations which he makes on that drama, in his obituary notice of Mr. R. Z. Troughton, of Turnham Green.

Mr. Gosse says the author "was one of those who crowded around the throne, trembling with the hope of winning an Olympian nod from Mr. Macready." Naturally we may assume that a young dramatic author would place some importance on gaining the friendship of the greatest actor of his time. But this friendship, thenceforth held on familiar terms, till Macready's death, did not commence, apparently, under the conditions suggested by the above quotation, for, in the preface to the third (acting) edition (1841) the author says:—"Shortly after the publication of the tragedy Mr. Macready proffered me, unsolicited, his aid to obtain for it a trial on the stage."

At vol. ii., pp. 44-5 of Macready's *Diaries*, occur the following memoranda:—

"August 5. Finished the perusal of *Nina Sforza*, a play of great merit, with which I was very much pleased, though it cannot be successful in representation."

"August 11. Wrote note to Mr. Troughton inquiring if he was the author of *Nina Sforza*."

"August 13. Note from Mr. Troughton claiming the authorship of *Nina Sforza*."

On page 168—

"January 5. Went to the theatre, where I read the play of *Nina Sforza* in a room or rooms, for we were driven from one to another, choking us with smoke. I was glad that I had chosen the part of Spinola; I must work hard at it."

Passing other notes on the play and its author we come to page 184:—

"November 1, 1841.—Went to rehearsal of *Nina Sforza* at Haymarket Theatre. Acted Spinola well; took great pains, and carried the audience with me. Was called for, and very warmly received. Forster, Talford, Browning, Kenney, came into my room."

The Wallacks, who with G. Bennett, Howe, and others, sustained parts in the play at this time, took it with them to America; and it continued to be a favourite in her provincial engagements, especially in Scotland, with the accomplished lady—the original *Nina*—Miss Helen Faucit.

I feel sure that Mr. Gosse will rejoice, with the many other friends of the author, and the still more numerous admirers of his work, when he finds he is mistaken in identifying the Richard Z. Troughton, who lately died at the age of 94, with the author of *Nina Sforza*. The latter, son of the former, is still alive, as may be further attested, no doubt, by reference to himself at his old residence in Kensington, which any *Directory* or *Court Guide* will more particularly indicate.

R. HANNAH.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, April 29.—1 P.M. Zoological: Anniversary.
7 P.M. Actuaries: "On the Institute of Actuaries' Life Tables," by Prof. Pell.
TUESDAY, April 30.—3 P.M. Royal Institution: "Vegetable Morphology," by W. Thirlston Dyer.
8 P.M. Civil Engineers: "The Ravi, the Alexandra, and the Jhelum Bridges, P. N. S. Railway," by Messrs. Mallet, Lambert, and Avera.
8 P.M. Anthropological Institute: "On Composite Portraits," by F. Galton; "On the Origin of the Classificatory System of Relationships used among Primitive People," by C. Staniland Wake; "On Devils' Arrows," by A. L. Lewis.
WEDNESDAY, May 1.—2 P.M. Royal Institution: Annual General Meeting.
4.30 P.M. Archaeological Association: Annual General Meeting.
7 P.M. Entomological.
8 P.M. Society of Arts.
8 P.M. Microscopical.
THURSDAY, May 2.—3 P.M. Royal Institution: "Colour," by Lord Rayleigh.
8 P.M. Linnean. Chemical.
8.30 P.M. Royal.
8.30 P.M. Antiquaries.
FRIDAY, May 3.—8 P.M. Society of Art between England and India
Champain. Telegraph Routes Major Bateman-

8 P.M. Geologists' Association.

8 P.M. Philological: "Some English Derivations," by Henry Nicol.

9 P.M. Royal Institution: "Polarised Light," by W. Spottiswoode.

SATURDAY, May 4.—3 P.M. Royal Institution: "Richard Steele," by Prof. Morley.

SCIENCE.

Die aethiopische Uebersetzung des Physiologus, nach je einer Londoner, Pariser, und Wiener Handschrift herausgegeben, verdeutsch und mit einer historischen Einleitung versehen, von Fritz Hommel. (Leipzig: Hinrichs, 1877.)

THE most ancient of all extant catalogues of books to be avoided by the faithful, drawn up by a Council under Pope Gelasius I. at the end of the fifth century, makes mention of a work called *Physiologus*, "which has been composed by heretics and signed with the name of the Blessed Ambrose." The ecclesiastical censure was as ineffectual in this instance as it was in that of the "book which is called the Transit, that is, the Assumption of Saint Mary." These and other apocryphal books continued to be read, and their teachings took entire possession of every portion of Christendom. Pope Gregory the Great already quotes the *Physiologus* as an edifying book. It is really an anonymous work, and, though in the Latin version which was brought under the notice of Pope Gelasius it bore the name of Ambrose, it is found among the Greek works ascribed to St. Epiphanius; the Arabic version ascribes it to St. Gregory Nazianzen, while there is every reason for supposing it to be of much earlier date than any of these Fathers. It is apparently quoted by Origen. Pitra, the editor of the most complete form of the Greek original, considers it a Gnostic production, and Cahier strongly pleads in favour of the authorship of Tatian. It was translated into all the languages of Eastern Christendom. The existence of the Coptic version is, it must be acknowledged, only as yet a matter of inference, but the evidence for it is very strong. The Syriac, Armenian, and Arabic translations have been made known by Tychsen, Pitra, and Land. The Ethiopic translation is now published by Dr. Hommel. There are translations and imitations of the book in Anglo-Saxon, Icelandic, Old German, Provençal, and other languages of Western Christendom. Our German, French, and English Bestiaries are but forms of it. The symbolism of mediaeval art, so far as regards the animal kingdom, is entirely founded on this book, which is historically the source of many popular traditions—such as those about the phoenix, salamanders, and griffins—which have outlived the ages of symbolism.

The literary history of a work which has for many ages exercised so powerful an influence on human culture necessarily awakens an interest of a very different kind from that which would be derived from its intrinsic merits. The historian of zoology, Prof. Carus, considers it an invaluable authority as to the extent of zoological science current in the early ages of Christianity; but the book in itself is absolutely worthless. Each chapter contains one or more sayings of the *Physiologus*, generally of a marvellous, if not fabulous, character, on the subject of an

animal, occasionally of a plant, or a stone. To these sayings are added texts of the Old or New Testament, with some moralising or allegorising commentary. This commentary (*ἐμπνεῖα*, as it is called) is of course Christian, but the sayings of the *Physiologus* read like extracts from a popular compendium of natural history, and they may well proceed from a heathen* or Jewish author of an earlier century. I say "or Jewish," because certain expressions (such as ἐν τῇ μητρὶ τῷ νέῳ Νησῶν ἢ Ἀδὰμ, τούτῳ τῷ φαρμακῶν ἢ τῷ φαρμουθί) seem to flow more naturally from the pen of an Alexandrian Jew than from that of a heathen or a Christian writer. The Christian commentary may possibly, as the decree of Gelasius says, have been composed by heretics; but the traces of heterodoxy which Pitra and Cahier fancy they have discovered are, I believe, quite imaginary. Not less imaginary, I fear, are all supposed traces of ancient Egyptian doctrines, whether esoteric or exoteric. I cannot agree with Dr. Hommel in considering the book as "in seinen Uranfängen bis ins zweite Jahrtausend vor Christus zurückreichend." The reference made in the novel of Heliodorus to the sacred books of the Egyptians, where a story is told about the curlew (already known to Pliny) very similar to what is found in the *Physiologus*, proves nothing. If even those Greek writers who gravely profess to hand down Egyptian science are always to be distrusted, what reliance can be placed on the statement made by one of the personages of a novel? The identity of the phoenix and the Egyptian *bennu* is a mere conjecture, which one scholar has repeated after another without any better reason than the resemblance of sound between the syllables *phoen* and *ben*, the syllable *ic* being, I suppose, of no account in this kind of philology. But the *bennu* was probably one of the commonest birds in ancient Egypt, whereas the *Physiologus* distinctly says ἐστὶ πετεινὸν ἐν τῇ ἰνδικῇ χώρῃ, φοινῆξ λεγόμενον. The Osiris of the Egyptian Ritual assumes, among many other forms, that of the *bennu*; but this has no visible connexion with the myth of the phoenix, nor has any evidence been discovered showing that the Egyptians knew this myth, or anything like it. The Egyptian god Set was represented in the form of a wild ass, but there is no connexion between this fact and the absurd tale told by the *Physiologus*. We might as well refer to the Egyptian god the wild ass of the Book of Job, which is actually quoted in the commentary.

The chief interest of the present publication lies in its presenting to us a new Ethiopic text belonging to the best period of the language. Its exact date cannot be fixed, but probably lies between the fourth and the seventh century. There are strong reasons for supposing it of the same, or nearly the same, date as the Ethiopic translation of the Bible. The manuscripts, however, which contain it are much more recent, and the orthography has been sadly corrupted by scribes, to whom the ancient language was a dead one, and whose untutored ear confounded gutturals and sibilants. One of these

* The panther is described as speckled "like the coat of Joseph." Pitra brackets these words as an interpolation.

manuscripts, belonging to the Magdala collection in the British Museum, is of the last century. Another MS., brought to Paris by M. Rochet d'Héricourt, bears the date of 1594. The two texts are very closely related. For the publication of the work we have in the first instance to thank Prof. Wright, who entrusted the task to Dr. Hommel, and sent him his own copy of the London manuscript, together with M. Zotenberg's collation of the Paris codex. The task appears to have been admirably performed. A very excellent Introduction precedes the Ethiopic text, at the foot of which are given the various readings, together with the Scripture references and some other notes. It is perhaps to be regretted that Dr. Hommel has not also given us the faulty orthography, which he has so often been compelled to correct. The text is followed by the German translation, with notes pointing out the variations from the Greek original. A supplement contains the German translation, by Prof. Möbius of Kiel, of the Icelandic *Physiologus*, and, secondly, the various readings of a Viennese MS. which only came into Dr. Hommel's hands after his text, translation, and Introduction were in print. This accession to Dr. Hommel's apparatus does not appear to interfere with his restoration of the text in any essential point, but rather to confirm his emendations.

The additions which this newly-discovered work contributes to the Ethiopic lexicon are divided by Dr. Hommel into four classes: 1. those words which appear in Dillman's lexicon with only one or two references or with the note "Lud. sine auct.;" 2. those which appear in the *Physiologus* with somewhat different significations from those given in Dillman; 3. denominatives, verbal and nominal forms, which are not to be found in Dillman; 4. ἀπαξ λεγόμενα. Some of this latter class are genuine Semitic words, some are corrupt forms of foreign names, and others are of doubtful origin. One of these (Henkákjà), which he is not able to explain, Dr. Hommel is disposed, I cannot see why, to treat as Egyptian. The word is as yet unknown to the Egyptian vocabulary, and as it seems to be the name of a tree growing in "the land of the Sirens," why not suppose it to have been one of those "Sirenum voces" of which Horace speaks in his epistle to Lollius? In researches of this kind the true guide to the philologist is sometimes a Sindbad or a Gulliver.

P. LE PAGE RENOUF.

THE REV. JAMES BOOTH, LL.D., F.R.S., F.R.A.S.

THIS distinguished mathematician was born in the year 1814 (according to all the authorities we have been able to consult, though his age at his death on the 15th inst. is stated to be 71). He was educated at Trinity College, Dublin, where he graduated in honours, winning the classical gold medal, a scholarship, and numerous other prizes. Subsequently he was Professor of Mathematics in the Collegiate Institution, Liverpool; then Principal of Bristol College; holding with each of these appointments the office of Chaplain to the Marquis of Lansdowne. In the year 1846 he published his pamphlet, *Examination of the Province of the State; or, the Outlines of a Practical System for the Extension of National Education*. In this publication he advocated principles which

have been adopted by the Government and the Universities in the Civil Service and other examinations. In the same year he was elected a Fellow of the Royal Society, of which learned body he was subsequently a member of the council. In 1856, when chairman of the Society of Arts, he was able to give a practical form to the views he had advocated in his above-named pamphlet by establishing examinations for candidates which were held in London, Huddersfield, and elsewhere. In this same year he brought out, at the instance of the same society, his lectures on "How to Learn" and "What to Learn," two small works which have run through many editions. Beside the works we have already specified, he published a few other pamphlets and sermons. In 1857 he annotated and edited, by special request, a volume of the "Speeches and Addresses of the late Prince Consort." The latest printed letter of his which we have seen combated the views of the Spelling Reformers, on, we are disposed to think, too slender a knowledge of the subject.

Having held one or two ministerial appointments he was, in 1857, though not at the time a Fellow of the Society, presented by the Royal Astronomical Society to the vicarage of Stone, Aylesbury, Bucks, an appointment he held till the time of his death.

Dr. Booth's first contribution to mathematical science was made in 1840, when he brought out his *Tangential Co-ordinates; or, the Application of a new Analytical Method to the Theory of Curves and Curved Surfaces*. This, originally a tract of 32 pages, he has amplified in his later work, to which we shall refer more at length presently, to some 200 pages. This is the work by which for many years he was best known, and the method is always connected with his name. Besides this tract he has credited to his name in the Royal Society's *Catalogue* no less than twenty-eight papers. It is not necessary to particularise these, as the "old man eloquent" in 1874-77 was able to realise a cherished idea, and to publish in two volumes his chief papers with considerable amplification and wealth of illustration. To this he gave the title of a "Treatise on some new Geometrical Methods, containing Essays on Tangential Co-ordinates, Pedal Co-ordinates, Reciprocal Polars, the Trigonometry of the Parabola, the Geometrical Origin of Logarithms, the Geometrical Properties of Elliptic Integrals, Rotatory Motion, the Higher Geometry, and Conics derived from the Cone." To each volume he has prefixed an exceedingly interesting Introduction. Of late years he seems to have been content to live a quiet and retired life, working hard at his favourite subjects, and not often taking part in scientific gatherings. He writes:—

"It has been to me a heavy drawback and deep discouragement that I have had no fellow-workers to share in these researches, neither have I entered into the labours of any. Without sympathy and without help I have worked upon these monographs now presented to the public."

This isolation has on one side resulted in the production of a work of great originality and freshness, while on the other hand, had he been acquainted with the doings of mathematicians of the last thirty years (he was exceedingly well read in the old geometers, and knew well Chasles and others who were making a name *Planco consule*), he might have made greater advances than he did. However, Prof. Clifford, who in a genial review styles him a "Rip Van Winkle" (supposing "the same to have been a most original and accomplished geometer, instead of an idle scape-grace"), and imagines his delight on hearing of the discoveries of Jacobi, Göpel, Rosenhain, Weierstrass, Hermite, Königsberger, and Reye, remarks:—

"Instead of thinking of all the beautiful things that we can teach *him*, it would be more profitable to pay attention to many beautiful things which he can teach *us*. . . . The freshness and originality of treatment which are here to be found will prove an effective

stimulus to those who have endeavoured to keep up with the rapid progress of science."

We retain very pleasant memories of hours spent in his society, when he would pour forth stores of information on the subjects he loved so well. Dr. Booth experienced the great sorrow of losing his wife soon after the publication of his first volume; he refers to this loss in his second volume: "after the lapse of nearly four years, in the face of many hindrances, untoward events, and difficulties, I have succeeded in bringing through the press this second and concluding volume of my mathematical and physical researches." We saw him last at the Royal Society's 1877 conversation. There is an admirably characteristic photograph prefixed to the first volume of his great work.

R. TUCKER.

SCIENCE NOTES.

PHYSICS.

Influence of Electricity on Evaporation.—Physicists are not agreed as to the relation between atmospheric electricity and the evaporation of water which goes on at the surface of the earth. The earlier writers on electricity maintained the view that the latter was the cause of the former; more recent investigations, however, have cast doubt on this conclusion. M. Mascart (*Comptes Rendus*, lxxxvi. 575) has regarded the matter from another point of view, and has endeavoured to ascertain whether the slow formation of vapours is modified under the influence of electrified bodies. A series of small evaporating basins communicating with the ground and containing water or moistened earth, were placed beneath conductors maintained in a constant electrical condition. These conductors were charged by a Holtz machine maintained in continuous action by a water motor. One pole was connected with the ground, the other was insulated and kept at a constant potential by means of a sort of safety valve, formed of a metallic point, which allowed the electricity to escape as soon as the potential of the insulated pole exceeded a certain value. It was found that the evaporation was invariably increased under the electrified conductors, whether the latter were charged positively or negatively, and the effect was so marked that the evaporation was sometimes doubled in the basins under the conductors. M. Mascart considers that whether the influence of electricity be due to a specific electrical intervention, or to a secondary mechanical action, the excess of evaporation is not limited to the case where the electrical forces in play are relatively considerable, as in his experiments. He considers it to be a general phenomenon, which must be taken into account in appreciating the part played by electricity in nature on the production of vapours.

The Earth's Mean Density.—A carefully-executed series of experiments has been carried out by MM. Cornu and Baille (*Comptes Rendus*, lxxxvi. 571-599), with the object of determining with the greatest possible accuracy the mean density of the earth. They adopted a modified form of the torsion-balance originally employed by Cavendish, but were careful to take account of certain disturbing causes which were ignored by the earlier experimenters. For instance, Cavendish took no account of the influence of the ambient air on the oscillations of the lever. MM. Cornu and Baille have shown, that in consequence of the extreme smallness of the attraction to be measured in such experiments, the resistance of the air produces a considerable effect. In a preliminary investigation they arrived at the two following laws:—(1) The amplitudes or the distances of the successive elongations decrease in geometrical progression; (2) The epochs of the elongations are in arithmetical progression. The forces in play are extremely small. In the actual experiments with the torsion-balance, in which the lever was moving with a maximum velocity of one-tenth of a millimetre per second, and the

moving masses had a diameter of 2.46 centimètres, the total force which produced the regular decrease of the oscillations was less than the ten-thousandth of a milligramme. The authors point out certain errors with which the determinations of the mean density of the earth by the English astronomer Baily were necessarily affected. These errors they have been able entirely to avoid with their improved apparatus. The value they find is 5.56. That determined by Baily was 5.67, which reduces to 5.55, if a certain correction be applied to it, which MM. Cornu and Baille show to be necessary on account of the peculiarity of the method used by Baily.

Reversal of the Spectrum Lines of Metallic Vapours.—Profs. Liveing and Dewar (*Proc. Roy. Soc.*, vol. xxvii., p. 132) have examined the absorption spectra of certain metals which volatilise at a moderately low temperature. They employed for this purpose a long iron tube, which was placed nearly vertical in a coal furnace, and contained the substances experimented upon. The upper part of the tube, being raised to a welding temperature, emitted a continuous spectrum, and thus an independent source of light was rendered unnecessary. To exclude oxygen, and to avoid as much as possible variations of temperature, hydrogen was introduced in a gentle stream by a narrow tube into the upper part of the iron tube, so that the hydrogen floated on the surface of the metallic vapour without producing convection currents in it. The metals operated on were thallium, indium, magnesium, lithium, sodium, and potassium, and in the case of each of these the characteristic bright emission lines were seen to be reversed. The method employed by Profs. Dewar and Liveing was, of course, inapplicable to the more refractory metals.

Theory of the Telephone.—From the fact that the thin plate of a receiving telephone may be replaced by a very thick and massive armature, that the vibrating plate may be made of non-magnetic material, that, according to a recent statement by Mr. Spottiswoode (*Telegr. Journ.* March 1, 1878), the vibrating lamina may be suppressed altogether without preventing telephonic transmission, provided the polar extremity of the magnet is placed very close to the par—from these facts M. du Moncel (*Comptes Rendus*, lxxxvi. 557) has arrived at the conviction that the vibrations which reproduce speech in the receiving telephone are principally produced by the metallic core enveloped by the bobbin; and consequently are of the same nature as those which have been studied in the electro-magnetic resonant rods of Page, Henry, Wertheim, &c. These vibrations were utilised in the year 1861 in Reiss's telephone, and later in those of Wray, Van der Weyde, and Elisha Gray. According to this hypothesis the vibrating lamina has no other rôle to fill than to react by the production of induced currents, and to reinforce, by its reaction on the polar extremity of the magnetised bar, the magnetic effects determined in the body of the latter. In the telephones of Reiss, Wray, and Gray the magnetic cores had no armatures, and resonant boxes were employed to amplify the sounds. In Bell's telephones the vibrating plates determine this effect, and Bell only employs permanent magnets in the latter in order to render the apparatus at the same time transmitter and receiver. In his model exhibited at Philadelphia the receiver contained an iron electro-magnetic core, not a permanent magnet. Against this view it is to be remarked that in the telephone the best effects appear to be obtained when the coil of wire is formed on a very thin bobbin placed at one extremity of the magnetic core; and, secondly, that the performance of the receiving telephone is, if anything, improved by making the magnetised steel core as hard as possible, and by magnetising it to saturation.

New Mercury Telephone.—In the volume of the *Comptes Rendus* cited above (p. 711), is an account

of an entirely new species of telephone devised by M. Bréquet of Paris, and founded on electro-capillary phenomena. The sending and receiving instruments are exactly alike, each being in fact a Lippmann's capillary electrometer; no battery is required, and the transmission of signals is practically independent of the resistance of the circuit. A few lines will suffice to give an idea of this simple apparatus. A glass tube, open at one end and drawn out to a capillary termination at the other, stands upright and is three-fourths filled with mercury. The upper end is closed by the vibrating plate; the lower dips into a vessel containing acidulated water, with a layer of mercury at the bottom. This mercury and that in the tube are connected by means of platinum wires fused into the glass with the two wires of the telephonic circuit. This constitutes the whole apparatus, which serves indifferently as transmitter or receiver. The mode of action appears to be as follows: The plate when set in vibration by the voice or otherwise, causes changes of volume of the air enclosed between it and the surface of the mercury in the tube. In consequence, the mercury in the capillary tube advances and recedes, and every change in its position gives rise to a change in electrical potential, which is transmitted through the circuit, causing corresponding changes of position of the capillary column in the tube of the receiving instrument. Hence ensue, as a matter of course, rapid changes of volume of the air-space in this tube, which set the plate in vibration, the vibrations corresponding exactly to those of the plate which caused the electrical disturbances in the sending instrument. The successive phenomena are precisely analogous to those which occur in Bell's telephone. At present M. Bréquet's apparatus, though simple in construction, is scarcely convenient or handy, and the inventor is engaged in experiments in conjunction with M. Lippmann, with a view to render the instrument more portable. He anticipates that the mercury telephone will become largely used, not only as a telephone, but also for ordinary telegraphic purposes.

Thermal Conductivity.—At a recent meeting of the Royal Society of Edinburgh (March 8), Prof. Tait gave a résumé of his experiments on thermal conductivity carried out during the last ten years. In the case of iron his results agree with those arrived at by the late Principal Forbes. The following are among the other results he obtained:—(1) With the exception of iron, in no case as yet tried does a pure metal diminish in thermal conductivity as the temperature rises. (2) Different specimens of the same metal, as, for instance, two kinds of copper, differ much the same relatively in thermal and electrical conductivity. (3) A substance which is pretty constant as a conductor of electricity is also pretty constant in thermal conductivity. Among the difficulties encountered was the alteration of the zero point of the thermometers used—Kew standards—after being heated to a high temperature. This affects only the absolute values slightly, but not the general character of the results. Another difficulty was the oxidation during heating of the short bars employed to measure the heat lost by radiation and convection at different temperatures. This was almost completely overcome.

Absorption of the Ultra-Violet Rays.—M. Soret of Geneva, in the *Comptes Rendus*, lxxxvi. 708, gives a brief notice of his researches on the absorption of the ultra-violet rays by various colourless substances. He employed a spectroscope with quartz lenses and prisms, the telescope being provided with a fluorescent eye-piece, such as was described by the author at one of the Conferences held in connexion with the Loan Exhibition in 1876. The source of light consisted of an induction spark passing between terminals of various metals, such as cadmium, zinc, and aluminium. The results obtained by Dr. Miller and Prof. Stokes in this field of enquiry have been confirmed by M. Soret. It appears

that distilled water in a layer about 1 centim. in thickness is notably less transparent to the ultra-violet rays than quartz, but for greater thicknesses it occupies the first place. A layer of water 10 centim. thick transmits rays which are stopped by a quartz plate 6 centim. thick. Even in greater thicknesses (up to 116 centim.) water was found to be remarkably transparent.

PHILOLOGY.

THE *Romania* for January opens with a neat little Old French poem, the *Las de l'Epervier*, published by G. Paris with a full literary commentary, tracing the history of the tale in Europe and its native East. P. Rajna makes known a rhymed fifteenth-century Italian version of the *Seven Sages*, which from a careful examination of the language he infers to be Venetian; V. Smith gives some popular traditional songs of rural France; and A. Lambrior contributes an important article on Latin short *e* in Roumanian, distinguishing its fate from that of *é* and *i*, and showing that (though the fact is partly concealed by subsequent special changes) it was, as in some other Romanic languages, everywhere diphthongised to *te*. Nearly a fifth of the number is occupied by a valuable review by G. Paris of Lücking's important work, *Die Ältesten Französischen Mundarten*, in which the main questions of Early Old French phonology and dialectology are discussed. Of special interest for English philologists is, among others, M. Paris's observation that the retention in Norman of Latin *c* before *a*, discovered by M. Joret, is confined to the north of Normandy—a fact which invalidates M. Joret's and Mr. Nicol's inference that the *ch* in this position of many English words borrowed from French (as *channel*, contrasting with *kennel*, both Latin *canālem*) must be of Angevin or Parisian origin. The numerous minor articles and notices are as interesting and useful as usual.

THE number of the *Revue de Linguistique* for November and December, 1877, which has only just appeared, completes the tenth year of this useful publication, which has given so great an impulse to higher philological studies in France. Subjoined to it is a fourfold index, which enables the reader readily to consult the contents of the whole ten volumes. Beside numerous articles by the editors, MM. Hovelacque, Girard de Rialle, Picot, and Vinson, the review contains contributions by Adam, Charency, Charvée, Prince L. L. Bonaparte, General Faidherbe, Ascoli, Maspero, and many other eminent philologists. Not the least useful part of the publication is the tabulated list of works in all languages on philology and the allied sciences in the *Bulletin Bibliographique* at the end of each volume.

Pañca Danda Chattra Prabandha, by Prof. Weber (Berlin: Dümmler), is an edition of the Sanskrit text, with Introduction and German translation, of a mediaeval Jain fairy tale. As in the *Arabian Nights*, and as in other Sanskrit story-books, a number of shorter tales are inserted in the course of the story about King Vikramāditya's magic umbrella, from which the collection derives its name. Since the publication of the masterly Introduction to Benfey's *Pañca Tantra* increasing attention has been paid to the curious similarity of many of such stories in all parts of the world—a similarity which Prof. Benfey in great part explained by showing how very often they were ultimately derived from Buddhist sources. The present work shows further that the Jains, the successors of the Buddhists in India, were also cultivators of this kind of literature. It contains several stories of wicked fairies, which have hitherto not been found in the Buddhist collection; and also a full version of the "Sleeping Beauty." It is a noteworthy sign of the progress of opinion in such matters that both Sanskrit and German are printed in Roman letters of so fine and bold a character that the work is a model of the typographical art.

M. MICHEL BRÉAL'S *Mélanges de Mythologie et de Linguistique* (Paris: Hachette) include a reprint of his essay *Hercule et Cacus*, and a collection of some of his review-articles and lectures at the Collège de France. The latter deal mainly with the methods of comparative philology and their application to the study of Latin, Greek and modern languages. From the scientific point of view, the most important of M. Bréal's lectures are that on the progress of comparative grammar, in which he points out clearly the advance shown by the works of Curtius and Corssen as compared with those of Pott and Benfey, not, however, without some just criticisms of Corssen's method and results; and that on the Indo-European roots, in which he criticises very acutely the excesses into which some scholars, and conspicuously Vaníček, have fallen from giving too blind an allegiance to Schleicher's manner of reproducing the primitive Aryan tongue. M. Bréal, however, appears to have somewhat underrated, although he does not ignore, the effect produced upon language by the struggle for survival among a number of synonymous words, a fact which seems to obviate many of his objections to derivations proposed by Curtius. We may also call attention to an extremely interesting lecture on the ideas latent in language, where M. Bréal points out and illustrates the danger of denying the existence in a language of all that is not formally represented in it. It can only be by an oversight, by the way, that the author writes of *torrens* "qui désigne un cours d'eau qui reste à sec pendant l'été;" the usage of the word and the analogy of *æstus* both point to a very different explanation. For the teacher M. Bréal has an excellent address on the method of teaching French, and a very judicious warning against the premature introduction of comparative philology in the study of Latin. His remarks on the latter head are certainly strongly confirmed by experience. The danger of *ignotum per ignotius* is one which constantly besets young teachers; and M. Bréal's own attainments place him in a position from which he can speak without the fear of being misunderstood. The volume as a whole will well repay the attention which its author's reputation is sure to secure for it.

MEETINGS OF SOCIETIES.

PHYSICAL SOCIETY.—(Saturday, April 2.)

PROF. R. B. CLIFTON, V.-P., in the Chair. The Secretary read a paper by Messrs. J. Nixon and A. W. Heaviside, describing experiments on the mechanical transmission of speech through wires or other substances. The first actual transmission of speech was effected by placing the belly of a violin against the receiving end of the wire, when every syllable spoken was distinctly audible. Very good results were obtained by employing mouth- and ear-pieces formed as in a telephone, the disc being replaced by thin wooden discs, six inches in diameter; and a No. 4 wire was found to be most satisfactory. On suspending a length of this wire in such a manner that it had no rigid attachments, it was ascertained that 120 yards is the limit through which a conversation can be carried on.—Capt. Abney described the method which he adopted for photographing the least refrangible end of the spectrum. He pointed out that it is impossible with the ordinary sensitive salts employed in the usual way to photograph further than the Fraunhofer line E, though by a preliminary exposure to light of a daguerreotype plate, Draper was able to photograph beyond the extreme limit of visibility in the red end of the spectrum. This method enabled Becquerel to photograph the spectrum in its natural colours, and later St. Victor obtained coloured images of coloured cloths. The object of Capt. Abney had been to obtain unreversed pictures of this portion of the spectrum, in other words to obtain a compound that would be similarly sensitive to the red and the blue components of white light. Such a compound he had at last obtained by what he termed *weighting* silver bromide with resin. He showed an ordinary bromide of silver plate, and the colour of the transmitted light was of a ruddy tint, showing

absorption of the blue rays; another film was shown containing weighted bromide of silver which transmitted blue light and absorbed the red. Photographic plates, prepared with the latter compound, he showed were sensitive to the red and ultra-red waves of light, and he threw on the screen photographs of the spectrum from the line C to a wave-length of 10,000, the ultra-red showing remarkable groupings of lines. He further showed that by friction the blue film was changed to the red, and in that state was not sensitive to the lower part of the spectrum. These photographs were taken by means of a diffraction grating. He then explained that recently he had elucidated the reason of the reversal of Draper's pictures by the least refrangible end of the spectrum. He finds that it is accelerated by exposing the plates in weak oxidising solutions such as those of hydroxyl, bichromate of potash, &c., or exposure to ozone. The red rays, in other words, seemed to oxidise the photographic image, and to render it incapable of development.—Mr. H. Baerman then exhibited some paper models illustrative of the disposition of the planes of symmetry in crystals. These included octants of the sphere with enclosed cube and octahedron faces pointed into their corresponding hexakis-octohedral faces; a cubic skeleton built up from nine planes of symmetry with removable outer shell, and a system of axial planes of an unsymmetrical mineral, enclosing a solid nucleus contained between three parallel pairs of planes.—Dr. Guthrie exhibited the arrangement of an apparatus he had employed, in conjunction with his brother, to ascertain the effect of heat on the transpiration of gases. Among other results it was found that the resistance of a tube is the same as that of its several portions, and if t be the time occupied, T the absolute temperature, P_1 , P_2 the pressures, and α and β constants, they find that:—

$$t = \alpha T \left(T + \frac{\beta}{P_1 - P_2} \right)$$

ENTOMOLOGICAL SOCIETY.—(Wednesday, April 3.)

H. W. BATES, Esq., F.L.S., F.Z.S., President, in the Chair. Mr. McLachlan remarked that the opinion expressed by Mr. J. P. M. Weale at the last meeting as to the functional purpose of the cephalic process in *Termes trinervius* was corroborative of an observation already recorded in Hagen's *Monographie der Termiten*.—Mr. F. Grut exhibited, on behalf of the Rev. T. A. Marshall, a collection of insects which that gentleman had made in the Windward Islands.—Mr. F. Smith exhibited a series of specimens of a species of "Harvesting Ant" sent to Mr. Darwin from Florida by Mrs. M. Treat. Three series showed a gradation from large soldiers and small workers, all having acutely dentate mandibles, to other ants of all sizes with mandibles having rounded teeth, and other specimens in which the teeth were obsolete. It was not, however, made clear whether intermediate forms of teeth were found in nests, or whether three distinct races existed. The species appeared to be identical with *Myrmica barbata* from Texas.—Mr. A. A. Berens exhibited two examples of *Thestor mauritanicus* taken on the Atlas Mountains.—Mr. McLachlan exhibited a coleopterous larva sent from Zanzibar by Dr. Kirk. He also exhibited a portion of the stem of a coffee-tree which had been bored into by this larva, and which was especially remarkable on account of the presence of a series of conical holes which opened a communication between the inner gallery and the atmosphere.—Mr. C. W. Boyd exhibited and made some remarks on a specimen of *Pterophorus laetus* taken at Deal.—The Secretary read a paper communicated by the Rev. T. A. Marshall, entitled "Notes on the Entomology of the Windward Islands."—The Rev. H. S. Gorham communicated "Descriptions of New Species of Cleridae, with Note on the Genera and Corrections of Synonymy."—Dr. D. Sharp communicated a paper "On some Nilidulidae from the Hawaiian Islands."—The Secretary read a paper by Mr. J. P. M. Weale, entitled "Notes on South African Insects," and exhibited drawings made by the author in illustration.—Mr. Wood Mason exhibited and made remarks on the insects referred to in the foregoing paper, and was followed by Mr. Meldola on the same subject.—The following papers were also communicated:—"On Display and Dances by Insects," by Mr. A. H. Swinton; and "On the Secondary Sexual Characters of Insects," by Mr. J. W. Slater.—Part V. of the *Transactions* for 1877 was on the table.

ROYAL SOCIETY.—(Thursday, April 11.)

Dr. W. FARR, V.-P., in the Chair. The following papers were read:—"The Acceleration of Oxidation caused by the least Refrangible end of the Spectrum," by Captain Abney; "Summary of an Experimental Enquiry into the Function of Respiration at Various Altitudes," by Dr. Marcet; "On Stresses in Rarefied Gases arising from Inequalities of Temperature," by Prof. J. Clerk Maxwell; "Note on the Existence of Carbon in the Coronal Atmosphere of the Sun," by J. N. Lockyer; "On the Physiological Action of the Poisonous Principle in *Urechites suberecta*," by J. J. Bowrey.

ROYAL ASTRONOMICAL SOCIETY.—(Friday, April 12.)

LORD LINDSAY, M.P., President, in the Chair. Captain Abney read a paper, "Photography at the least refrangible end of the Solar Spectrum," and illustrated it by photographs thrown upon the screen by means of the electric light. He said that in a preliminary note, read about two years ago, he had stated that he had succeeded in obtaining photographs of parts of the red end of the spectrum as far below the line A as A is below D. He thought it right now to redeem a promise then made by giving some further information, and by showing some of his photographs. He had, by the use of a special method of his own, succeeded in getting emulsions which were sensitive to the red end of the spectrum. The plates thus prepared, though sensitive to the red and ultra-red rays, were not sensitive to the yellow rays; there was consequently a gap not photographed extending from C to a little below E. In the photographs of the diffraction spectrum produced by one of Rutherford's gratings having about 8,600 lines to the inch, the lines in the spectrum appeared surprisingly sharp. Mr. De la Rue complimented Captain Abney on his success, and asked whether he had made any progress in the direction of producing coloured photographs similar to those taken some years ago by M. Becquerel. Captain Abney referred to a paper which he had just read before the Royal Society, in which he had given what he believed to be the explanation of these coloured photographs, the colouring depending upon the different oxidising powers of the different rays in the spectrum. In reply to a question put by Lord Lindsay referring to the manner of focussing for the ultra-red parts of the spectrum, Captain Abney declined to say more than that he had obtained the focus by a tentative process. It would be seen that there were lines upon the photographs which could not be seen at all when the spectrum was observed directly with the eye, and there were groups of distinctly defined lines upon the photographs which could only be discerned with the greatest difficulty in observing the spectrum directly.—Mr. Jenkins read a paper, "The Luminous Spot on Mercury in Transit," in which he had collected the notes and remarks referring to the appearance of the disk of Mercury when seen before the sun, which are scattered through the accounts of the observations of the transits made during the last 170 years. A wish was expressed that the paper might be promptly printed, so that it should be in the hands of the Fellows before the day of the next transit, May 6.—Mr. Green showed some drawings of the planet Mars made by Prof. Schiaparelli at Milan during the first months of the present year, when Mars was already at a great distance from the earth. If they could be relied on, they would indicate that great changes must have been going on upon the surface of the planet since the time of its opposition last autumn; but it was generally allowed that, under the circumstances, the evidence of such changes must be received with very great caution.—Lord Lindsay drew attention to a large oil-painting, representing the probable aspect of a lunar landscape at sunset. It was exhibited to the meeting, and elicited some criticisms from an astronomical point of view.

ROYAL ASIATIC SOCIETY.—(Monday, April 15.)

SIR E. COLEBROOKE, Bart., M.P., President, in the Chair. A paper was read, contributed by Major Mockler, "On the Identification of Places on the Makran Coast with the notices in Arrian, Ptolemy, and Marcian," in which the writer showed, by his own personal surveys and experience, in how remarkable a degree the brief notices of antiquity coincide with the more careful and scientific surveys of modern investigators. A very large number of Major Mockler's

identifications agree with what we learn from classical sources; and, where they differ from those of Dr. Vincent, it is fair to believe that the occasional errors of that great scholar are mainly due to the imperfection of the few modern charts to which alone he was then able to have access.—A second paper, by Mr. R. B. Shaw, "On the Canton of Salar," was interesting as showing the existence at the present time of a Muhammadan Turki tribe, shut in, in the extreme East, between the Mongolians and the Chinese, and subject to the latter as the suzerains of the adjacent countries.

ZOOLOGICAL SOCIETY.—(Tuesday, April 16.)

E. W. H. HOLDSWORTH, Esq., F.Z.S., in the Chair. Mr. Slater exhibited and made remarks on a typical specimen of the new fox lately described by Mr. Blanford as *Vulpes canus*, from Baluchistan; and exhibited on behalf of Mr. A. Anderson a bamboo stick with leather thong attached to it, such as is used in India for driving plough-cattle, which had been taken out of a nest of the common fish eagle (*Haliaeetus leucorhynchus*), in December, 1876.—Prof. Westwood communicated a memoir on the *Uraniidae*, a family of Lepidopterous insects, with a synopsis of the family and a monograph of one of the genera, *Coronidia*.—Mr. Gwyn Jeffreys read the first part of his work on the Mollusca procured in the expeditions of H.M. ships *Lightning* and *Porcupine*. These expeditions immediately preceded that of H.M.S. *Challenger*, but were restricted to portions of the North Atlantic, including the Mediterranean. The Brachiopods formed the subject of the present paper. A table of all the Brachiopods known to inhabit the European seas was given, comprising ten genera and twenty-two species, of which latter four were for the first time described and six figured. The table also particularised the geological and bathymetrical range of all the species.—Mr. G. E. Loder exhibited and made remarks on a mounted head of the Rocky Mountain bison, remarkable for its soft, dark, and long hair on the forehead. This specimen had been obtained near Denver, Colorado.—A communication was read from the Marquis of Tweeddale, containing the eighth of his contributions to the ornithology of the Philippines. The present paper gave an account of some Luzon birds in the museum at Darmstadt, which had been sent to him for examination by Prof. Koch of that place.—A communication was read from Dr. O. Finsch, containing description of a new species of Finch from the Feejee Islands, which he proposed to name *Amblynum Kleinschmidti* after M. Kleinschmidt, by whom it had been found in the interior of Viti-Levu.—Dr. M. Watson read a paper containing a description of the generative organs of the male spotted Hyena (*Hyena crocuta*), and a detailed comparison of them with those of the female of the same animal.—Messrs. Slater and Salvin read a report on the collection of birds made during the voyage of H.M.S. *Challenger* at the island of Juan Fernandez, at various points along the coast of Patagonia and at the Falkland Islands.—A second paper by Messrs. Slater and Salvin gave descriptions of three new species of birds from Ecuador, which it was proposed to call *Buarremon leucopsis*, *Neomorphus radiolous* and *Aramides calopterus*.

NUMISMATIC SOCIETY.—(Thursday, April 18.)

MR. R. HOBLYN exhibited a series of coins struck from dies prepared for James II. and the Elder Pretender. These dies came into possession of the late Matthew Young, who, having struck, it is said, sixty impressions from each, deposited the dies in the Mint.—Mr. O. F. Keary continued his review of the barbarian coinages which followed the Teutonic invasions of Roman territory from the end of the fourth century and onwards. The series of coins treated of in this paper was that of the Vandals in Africa, which, as the writer contended, shows a closer approximation to the Eastern standards of value, and possesses a lower medium of exchange with the money of Constantinople, than are to be found among any of the coinages of Western Europe. The writer criticised some of the attributions in Dr. Friedländer's *Münzen der Vandalen*, especially that of certain coins to Hunneric, and of the coins with the name of Justin to Hildaric, striking in the name of Justin I., instead of to Justin II., after the recovery of Africa. He also entered at some length into the difficult question touching the meaning of the numerals found upon the Vandal silver coins.

CHEMICAL SOCIETY.—(Thursday, April 18.)

W. CROOKES, Esq., F.R.S., in the Chair.—The following papers were read:—"On Terpin and Terpinol," by Dr. Tilden. The author prepared crystallised terpin, $C_{10}H_{20}O_2 \cdot OH_2$, by Wigger's process, and obtained the same compound from American and French turpentine, but did not procure any crystalline substance from the terpenes of the orange group. By the action of dilute hydrochloric acid on terpin an oily body, terpinol, boiling at $205-215^\circ$, was obtained having the formula $C_{10}H_{18}O$. By the action of dry hydrochloric acid on terpinol a dihydrochlorate was prepared. The author believes that in the preparation of terpin by the ordinary process, terpinol is formed at a certain stage of the reaction. By acting on terpin with dilute sulphuric acid, a hydrocarbon, $C_{10}H_{16}$, boiling at $176-178^\circ$, sp. gr. .8526 was obtained. It is optically inactive, and gives no crystalline deposit with hydrochloric acid, and no crystalline nitroso compound. The author proposes to call it terpinylene.—"The Poisonous Principle of *Urechites suberecta*," by J. J. Bowrey. This plant grows wild in Jamaica. It has dark-green leaves, and large, bright-yellow flowers; it is locally called "Nightshade." It is known to be very poisonous. The author has extracted from the fresh leaves of the plant, by the use of alcohol and water, and a temperature not exceeding $38^\circ C$, a white crystalline body, urechitin $C_{22}H_{22}O_8$, to the presence of which the plant owes its poisonous properties. It is very soluble in hot alcohol, chloroform, and glacial acetic acid; almost insoluble in water and dilute spirit. It is intensely bitter and very poisonous. It gives, with strong sulphuric acid, a characteristic colour reaction, the liquid passing from yellow through red to purple: a trace of nitric acid increases the rapidity of the colour changes. If the leaves are dried at 100° urechitoxin is obtained, either crystalline or amorphous. This substance resembles urechitin in its chemical and toxic properties. Both substances are glucosides. The temperature at which some of the alkaloids, &c., sublime was determined by an improved method by A. W. Blyth. The author has determined the melting and subliming points of many active vegetable principles, and classed them in regard to their behaviour to heat for practical purposes. He has also devised a new method for determining subliming points; it consists essentially in placing the substance on a thin cover-glass floating on a bath of mercury, and examining a second cover-glass placed over the substance, from time to time, with a quarter-inch objective, the mercury being gradually heated.

FINE ART.

The Temples of the Jews and the other Buildings in the Haram Area at Jerusalem. By James Fergusson, Esq., D.C.L., &c. (London: John Murray, 1878.)

In the Introduction to this work Mr. Fergusson tells us that during the Middle Ages it was usual to restore the Temple at Jerusalem as a richly decorated Gothic church in the style of the day. This was natural to the mode of thought in the past. Anyone opening Mr. Fergusson's volume, and seeing the frontispiece, would suppose that he had been acting on a similar principle, and had presented us with a Railway Station and a Grand Hotel, combined into one structure, as the outcome of our own period for the design of the Jewish Temple. That this restoration of the Jewish Temple has not been made without authority will be evident from the illustration of the church at Tourmanim, at p. 139. Even the minute details of the doorways will be found in the woodcut of the Tomb of the Judges at Jerusalem, p. 164, which must be accepted as fairly representing the style of architecture about the period of Herod. The Tomb of Zacharias in the Kidron Valley no doubt suggested the pyramidal termination of the two towers of the façade; but whether he is

justified in transferring the feature of a tomb to a roof tower may give rise to debate. The steep roof which Mr. Fergusson has given to the body of the Temple, suggesting the design of a modern French *château*, is explained as necessary from one of the conditions of the problem, that condition being that no winged creature could alight upon it. The Arabs believe that birds never defile the roof of the Kaaba, and that they never even rest upon it. Yet the roof at Mecca had no preventive arrangement, and the story from Josephus about the object of the spikes on the Temple may perhaps be as doubtful as the tradition regarding the birds at the Kaaba. The existence of an Alijah, or Upper Room, extending over both the Holy place and the Holy of Holies, will be something new to most readers, and perhaps not readily accepted; still, the evidence seems strong, for it is alluded to in 2 Chron. iii., 9, in Josephus, and in the Middoth. The main difficulty about such an apartment is the purpose it served. For the intention referred to in the Middoth it could not have required a chamber 60 cubits by 20 cubits, and it would not have been overlaid with gold if its only use had been to let workmen down to the Holy of Holies when repairs were needed. Mr. Fergusson's suggestion that it may have been the *coenaculum* finds confirmation from the fact that, according to St. Mark (xiv., 15), it was in a "large upper room" that the last supper was celebrated—some practice in the Temple most probably determining the custom of the disciples. There are other references to Upper Rooms not only in the New Testament, but also in Rabbinical authorities, which might be quoted in support of this.

It may be as well to mention some modifications which have taken place in Mr. Fergusson's ideas since his earlier works on the subject appeared. In his former writings he limited the enclosing wall of the Haram at the south-east corner to the space of the 600 feet which he derived from the dimensions of Herod's Temple; in the present work he accepts the south-east corner, explored to its foundations by Capt. Warren, as being of the time of Solomon. In this extra space he supposes the palace of Solomon stood, and a restoration of it is given in plan. This still leaves all the space to the north, so far at least as the Birket Israel, as being without the wall; and this he supposes to have been a cemetery, and that here the kings of Israel were buried. He has also come to the conclusion, not only that the Sacred Cave under the Sakhra was the Holy Sepulchre, but that if the cave could be explored the tombs of David and Solomon would be found in its recesses. In support of this he points out that the traditional site of Solomon's tomb is placed at the north of the rock, towards the doorway on that side. It may also be noticed here that, in his former works the architecture of the Kubbet es Sakhra being determined as that of Constantine, the cave under it was assumed to be necessarily the Holy Sepulchre; but in the present volume, in a note at page 56, it is stated that the cave was what Constantine "believed to be the sepulchre of Christ." This is very im-

portant as opening up a question which is entirely independent of the "architectural argument." Accepting the building as the one erected by Constantine, we have now the problem added as to whether or not it was the real Holy Sepulchre over which it was built. This is not altogether a new point, but it is expressed more distinctly in the present work than in the former ones.

Another novelty is an entirely new theory about Jachin and Boaz, which may be expected to excite considerable comment. It was a passage in the Talmud which led Mr. Fergusson into this peculiar development. The quotation is as follows:—

"The gates of the propylon were 40 cubits in height and 20 cubits broad, and above these were fine richly-carved beams of ash or oak. The lowest of these extended 1 cubit either way beyond the pillars of the doorway, while the one next above this was 1 cubit longer either way than that below it. So that the upper beam of all extended to 30 cubits. Between each beam there was a row or course of stones."

Mr. Fergusson has reproduced these words into a drawing, and it is difficult to see how the forms described could be otherwise rendered. Yet the design which is thus produced will most likely shake the nerves of many a timid archaeologist. The propylon or doorway, as drawn by Mr. Fergusson from the description in the Talmud, is identical in style with the doorway of the Sanchi Tope, in Central India, with the Pailows of China, and the Toriis of Japan. It may be noticed that "Toran" is not the usual Japanese word for these gateways, but Torii, meaning "bird-rest." They are common to both Buddhist and Shinto temples, and although at times constructed of granite, they are usually of wood, the distinction between those at Buddhist and Shinto shrines being that the former are painted and the latter not. The ideas connected with them are in perfect harmony with those held by the worshippers at the Jewish Temple, for it is supposed that the person passing through one of these gates to worship is purified, and should perform the process of washing the hands before doing so. There are often a number of these gateways on the approach to temples. The Pailows of China, referred to by Mr. Fergusson, are placed on the approach to tombs, and there are numbers erected in the streets of Peking which seem to be triumphal arches, but most of these monuments in China are erected in honour of virtuous widows. It is this peculiar doorway of Herod's Temple, evolved from the description in the Talmud, which suggested to Mr. Fergusson the idea that the chapiters on Jachin and Boaz in the Temple of Solomon were not capitals in the usual architectural sense of the word, but were ornamental screens, one above the other, and extending across the space between the two pillars, the Herodian porch being thus only a development of the earlier type. The principal difficulty to be surmounted in this case is in the Hebrew word for chapter, which is derived from a root meaning to surround, and is thus applied to a *diadem* or *crown*, which renders it difficult to reconcile its meaning with anything in the form of a screen. It is supposed that the two columns formerly marking the end of the Appian Way in Brindisi sup-

ported a large bronze crown, equal in diameter to the space between the columns, as seen on the modern arms of that city. If Mr. Fergusson's theory is correct that the two chapters extended across from Jachin to Boaz, the example at Brindisi suggests the only arrangement which would be consistent with the original meaning of the Hebrew term. The Greek word *epithema* would be quite as fully realised by what is here suggested as by a construction which is described by the word "screen."

It has always been one of Mr. Fergusson's strong points that the spot where the Jews wail at the present day on Friday afternoon, on the west side of the Haram Wall, is at the nearest point to where his theory places the Holy of Holies. To this he now adds another curious coincidence. By extending a line to the east from the axis of the Temple—i.e., the Temple according to Mr. Fergusson's theory—across the Kidron, it will be found to pass exactly in the centre between the rock-cut tombs of Absalom and Zachariah. These coincidences Mr. Fergusson thinks cannot be accidental, but he does not insist strongly upon them, leaving it rather as a line of investigation to be further worked out. He thinks that this arrangement had some reference to the Red Heifer Bridge, the supposed direction of which he draws from the south-east corner of the Haram Wall diagonally to the north-east across the valley to the above-mentioned tombs. This bridge is one of the many puzzles connected with the topography of Jerusalem. Some stones exist on the east face of the Haram Wall, not far from the south corner, which are about as palpably the spring of an arch as the courses at the south-west corner, known as Robinson's Arch, which Captain Warren explored and found the piers of. He also, while exploring, ran out a gallery from his mine at the south-east corner in hopes of finding the piers of this supposed arch, but no trace of it was visible. Captain Warren, in his own theory of the restoration of the Temple, places the Red Heifer Bridge as issuing from the Golden Gateway. If the foundations of this bridge could be found, and its position determined, it would become a very important factor in all questions of the Haram topography.

As this work deals more particularly with the Temples of the Jews, the questions connected with the Holy Sepulchre come in only for secondary consideration. Still, according to Mr. Fergusson's views, the site of the Temple and that of the Holy Sepulchre are too closely linked to allow him to treat of the one without the other. One may also guess that he looks upon this work as his last contribution to the subject, and that he has rather courted the chance of declaring his adherence to all the main points of his former theories. This he has done with his usual ardour. He has fought a long battle for the theories which he originated; the extensive knowledge of the Mohammedan architecture which he acquired at Delhi and Agra, and the study of a lifetime which he has given to architecture in all parts of the world, have made him a doughty soldier in controversial war of this nature. His first work on the subject was published in 1847,

and although since that time—a period of thirty years—the fight has continued, there is no appearance as yet of anything like a general agreement between the contending parties. A thorough exploration of the Haram area might throw new light on the subject, but as no firman has yet been obtained which permitted the use of the spade within the enclosure, very little has been done.

Mr. Fergusson is able to give in this last volume a section of the Cathedral of Bosrah from the Count de Vogüé's *Syrie Centrale*, the date of which is known, at least that of its completion, which is given as 512 A.D. Its resemblance to the Dome of the Rock is very remarkable. It might be thought that no one would be likely now to ascribe this last-named building in the Haram to the time of Omar. The Mihrab, which, from its position, is clearly an insertion, and does not belong to the original design, is also a very strong evidence, which few seem to have noticed, that the place was not at first erected with any intention of its serving the purpose of a mosque.

The supposed transference of the Holy Sepulchre to its present site opens up some very curious questions. It may be pointed out that the building over the Sepulchre as it at present stands is only a rude copy, in a different style of architecture, of the Dome of the Rock. The tomb itself is an old *Kokim* place of sepulchre—now declared to be an older type than that of the *loculi*, such as those at the tombs of the Kings—and being cut into the rock; hence if the marble structure which now covers it were removed, and the rock exposed, it would stand up under the dome, with the *Kokim* tomb as the counterpart of the sacred cave, thus repeating with a striking exactness the conditions as they still exist in the Dome of the Rock. There is more than this to be found to establish the identity. In removing this sacred building, they removed with it a number of traditions which are supposed to belong exclusively to the Jewish Temple. The most important of these, in fact the most important of all Jewish traditions, is that connected with the tomb of Adam, which is now shown at the Holy Sepulchre, and not in the Temple enclosure. He was, according to the story, buried in the "centre of the earth." This spot is also pointed out at the present moment in the Greek church of the Holy Sepulchre, and not as connected with the old Temple. Again, in the place known as the Abyssinian Convent attached to the Holy Sepulchre will be found all the spots connected with the sacrifice of Isaac, even to a bush which represents the thicket where the ram was found for the sacrifice. These are all evidence that, when the Dome of the Rock was repeated on a new site, the traditions of the Temple Mount were transplanted with it. This association of Temple traditions with the Holy Sepulchre might be pointed out as suggesting that some connexion should exist between the site of both. When the symbolism implied by these traditions comes to be considered with reference to the identity of site, it may be feared that it will only add another divergence of opinion to those now in existence. These divergences are already so plentiful that few will be able to

hope with Mr. Fergusson that he has got the "ball" made so complete and perfect that it may now roll pleasantly along the path of truth, and need not be stopped by any inequalities or unnecessary friction.

WILLIAM SIMPSON.

Illustrazione del progetto e disegni sul trasferimento meccanico e totale conservazione dell' absida Lateranense. (Roma: Tipografia Tiberina, 1877.)

OLD-FASHIONED Englishmen who look upon Rome as the source of every ecclesiastical novelty may be surprised to learn that the cathedral church of Rome is only now receiving an alteration which had been made in every English cathedral before the end of the thirteenth century. Many former alterations, and successive rebuildings of parts, have left but little that is older than the Renaissance in the Lateran Basilica. But through them all the characteristic plan has been preserved, and the one important relic of the ancient church is the apse with its mosaics. Now at last the basilican plan is to be altered, and a long choir built, after the fashion which has for centuries been almost universal on this side the Alps. To effect this the apse must be removed. In England, we believe, the preservation of the apse would be considered more important than the enlargement of the church. We might restore it, but should scarcely tolerate its deliberate demolition. In Rome, however, it is not so; and it appears that the apse would certainly have been destroyed but for the efforts of Signor Andrea Busiri, the architect in charge of the building, who proposed that it should be bodily moved from its present site to the end of the new choir, where it should again be made the termination of the church. He describes his scheme, and the means which he intends to use to effect it, in the pamphlet the title of which is given above. The apse has to be moved forward about sixty-five feet and lifted up nearly eleven feet. It is to be filled with centring, the mosaics being protected by having canvas glued over them; the outside is to be covered with a timber jacketing; and a car moving on five pairs of rails is to be built underneath. The whole is to be hauled up an inclined plane by ten cables worked by six stationary engines, Signor Busiri thinking that method less liable to accident than the use of hydraulic power, which he at first contemplated. The diagrams given are not sufficient to enable us to criticise the machinery in detail, nor do we wish to do so; but if we understand them aright, there is a want of break-power in the car which, as the incline is nearly one in six, might be fatal to the whole work. The drums on which the cables are wound seem much too large, and we fail to understand the function of five locomotive engines which are shown behind the car.

We should much prefer that the old apse be left in its old place; but as the choice is between its destruction and its removal we wish Signor Busiri success in his attempt. His failure can be no worse than the other alternative.

J. T. MICKLETHWAITE.

NOTES ON ART AND ARCHAEOLOGY.

MESSRS. COLNAGHI, of Pall Mall, open to-day (Saturday) an exhibition of sketches from Troy, Ephesus and Mycenae by Mr. William Simpson, whose interesting sketches from many parts of the world are now so well known.

A LOAN Exhibition of modern paintings is to be opened at Glasgow on May 14. The pictures will be drawn solely from the collections of gentlemen residing in Glasgow, and the exhibition promises to be one of more than local interest and importance.

A PICTURE by Prof. Ottoni, of Rome, *Christ Dying on the Cross*, has been on view at 48 Pall Mall. It belongs to the Realist section of Sacred Art, but not the ultra-Realist, and is a work of at least fair average deservings. The most peculiar point about the figure is that at first sight it is difficult to say whether the eyes are open or closed: on inspection they prove to be closed. Were this ambiguity intentional on the artist's part, it would be a stupid trick worthy of all reprobation: we incline, however, to suppose that it is more casual than prepenes.

At the last sitting of the German Archaeological Institute (April 12), Signor Mochi, of Cagli in the province of Pesaro, exhibited a fine series of antique bronzes discovered at Cagli in the beginning of April. Among these bronzes the finest is a woman's head, a little less than life-size, representing possibly a goddess. The other fragments belong to statuettes of various styles. One statuette, perhaps a Hercules, which is intact, shows on the feet traces of the process of founding, from which it may be supposed that it was never manufactured for use. This fact has induced some to believe that the bronzes here discovered indicated the site of an ancient Umbrian foundry; and what tends to confirm this view is that with the bronzes were found fragments of terra-cotta vessels, such as are used by foundries. These antiquities were presented to the municipality of Cagli.

In the neighbourhood of Acerra, in the Campagna, on a piece of ground belonging to the Spinelli family, a number of tombs were discovered a few months since, which enabled scholars to recognise in that site the ancient necropolis of Suessola. On the resumption of the excavations at the beginning of April, a large number of very important bronzes were brought to light. The tombs appear to belong to three different epochs. Archaeologists are looking forward to a paper on this subject by Senator Fiorelli at the Accademia dei Lincei, with explanations by Commendatore Minervini, who has carefully studied the discoveries in question, being present at the excavations with other Italian and foreign scholars.

A VERY important archaeological discovery was made in Rome on April 13. In one of the streets opening on S. Angelo di Pescheria, while the road was being dug up for the purpose of making a sewer, a large marble pedestal was discovered, of an oblong form, intended to support a seated female figure. This is the pedestal of the statue of Cornelia, daughter of Scipio Africanus and mother of the Gracchi, as is shown by the inscription:—*CORNELIA · AFRICANI · F · || GRACCHORVM*. . . Since the spot where the discovery was made is within the area of the Porticus Octaviae, the statue of Cornelia which stood on the pedestal must have been that described by Pliny as follows:—

"Exstant Catonis in censura vociferationes mulieribus status Romanis in provinciis poni: nec tamen potuit inhibere quominus Romae quoque ponerentur, sicuti Corneliae Gracchorum matri, quae fuit Africani prioris filia. Sedens huic posita, solisque sine amento insignis, in Metelli publica porticu, quae statua nunc est in Octaviae operibus" (*Hist. Nat.* xxxiv., 14).

Since Pliny died A.D. 79, it is obvious that the statue was in position at that time. It is also clear from the words of Pliny that the monument

to Cornelia was not erected in the time of Augustus, when the portico named after the Emperor's sister was built, but at an earlier date, while the site still retained the name of Q. Metellus Macedonicus, who built the famous temple of Jupiter Stator a little after the year 800 A.T.C., and placed in it the celebrated bronze group by Lysippus which he had carried off to Rome, representing Alexander the Great after the battle at the Granicus, attended by 25 horsemen who had survived the battle. It is also to be observed that the statue was not destroyed in the fire of the year 80 A.D., which ruined the Porticus Octaviae; and that it remained till the Lower Empire in the days of the *praefecti Urbis*. There is still to be seen attached to the pedestal the mark usually affixed at that time to the masterpieces of sculpture which adorned the city. The Archaeological Commission of the Municipality of Rome will shortly publish a representation of this relic of antiquity, with copious illustrations. Meanwhile, it would be very opportune if the Municipality and the Government were to institute regular excavations in the Porticus Octaviae, and to remove the fish-market which now occupies the site.

THE discovery of large numbers of fragments of bronze objects in the excavations at Olympia reminds us of the excavation which Pausanias saw going on when he was there (v., 20, 3). A Roman athlete was to have a statue set up in his honour, and in digging a foundation for it, the workmen came upon a quantity of fragments of armour and trappings.

THE Quarterly Report of the Palestine Exploration Fund republishes M. Clermont-Ganneau's conjecture that the curtain which Antiochus presented to the temple of Zeus at Olympia (Pausanias, v., 12, 2) may, in fact, have been previously the curtain or veil of the Temple of Jerusalem, whence he supposes that Antiochus had carried it off. There is, perhaps, nothing improbable in this conjecture; yet it would be singular that the fact should have escaped Pausanias. M. Ganneau also would require to produce other instances in which spoils taken from one temple had been dedicated in another.

THE discovery of a bull's head with moveable horns at Mycenae has lately found a parallel in Ireland. In the head of the Irish bull, however, the horns are now wanting. They may have been of a different material from the head, which is of bronze, and is supposed to be Celtic. It is said to have been found in a bog many years ago, but did not till lately come into hands likely to appreciate it.

MR. A. W. HUNT writes to us requesting that we would contradict the statement in a paragraph in our last Art Notes, regarding the purchasers of the Turner drawing of *The Baths of Pfyffers*. Mr. Hunt says that he "was the purchaser on behalf of himself and friends." He also wishes to correct the statement as to the way in which the purchase was made; no intention to enhance the value of the work having prompted the proceedings.

IN Mr. Heath Wilson's article on the Michelangelo MSS. in our last number, in the reference to the tomb with the statues of Day and Night, for *Julius* read *Julian*.

THE *Freie Rhätien* of Chur reports the sudden fall, at midday on April 11, of the old hexagonal tower of Ruch-Aspermont, which frowned down upon the valley from a rocky promontory over the beautiful episcopal *Semmeret* Molinaera. The league of the "Four Villages"—Zizers, Igis, Trimmis, and Untervatz—one of the many republics of the old Graubünden, was subject for a long period to the dominion of the lords of Ruch-Aspermont. The villages purchased their liberty from the Bishop of Chur, and formed themselves into an independent state. The picturesquely situated ruin, which was visible for a great distance

in the majestic valley, had withstood the storms of fifteen centuries, if the belief of the local archaeologists be well founded, who attribute it to the Emperor Valentinian I. It was the "Stammsschloss" of the old Rhaetian house of von Flugi, and for some time the residence of the powerful bailiffs of the Bishops of Chur.

AN exhibition of ancient and modern products of the art of the goldsmith was opened in Gmünd, the capital of the Swabian gold-industry, on April 15. It is enriched with some of the fine works from the collections of the King of Württemberg and of Prince Karl of Prussia; the Gewerbe-Museums of Berlin, Stuttgart, and Karlsruhe have lent from their stores; while the churches, and the antiquarian collections of many towns, have also been large contributors.

THERE is much talk in the Paris art world about Régamey's Japanese studies for the Universal Exhibition.

HENRI BONNEFOY has sent to the Salon two unusually large water-colour studies, of great vigour and power—a stream, and a corner of a flower-garden, painted direct from nature, in one of those nooks of the Pas de Calais which he has made his own.

A PICTURE by the Belgian artist, M. David Col, representing a *Canary Competition*, is at present being exhibited at the Cercle Artistique at Antwerp, where it is attracting considerable attention. The scene takes place in a small tavern, where the jury are sitting with imperturbable gravity, while the various birds ranged on the table and in cages round the room are brought before their notice. The varieties of expression on the countenances of the different jurors who have to decide in this important matter are said to be irresistibly comic.

M. CHARLES VERLAT, professor at the Antwerp Academy, sends a large painting to the Paris Exhibition entitled *The Defender of the Flock*, in which a bull and a lion are represented in combat. In his studies for this work, made at the Zoological Gardens of Antwerp, M. Verlat, it is said, always had before him six studies of the animal he was painting taken in six different positions, which, according as the creature moved and changed its position, he worked at in turn, so that he might be able to express its various attitudes and thus give a true effect of movement. Whether this ingenious method of studying a restless subject has been successful remains to be seen.

A COLOSSAL statue of Jan van Eyck, modelled by the Belgian sculptor M. Pickery, was recently cast in bronze with great success at the foundry of MM. Aker-Chatteau, at Haaren, near Vilvorde. The casting was effected by the galvanoplastic process, which seems to have been only recently introduced into Belgium, although it was used in Holland five years ago; and great excitement prevailed when the placid face of the great Jan emerged from the gigantic bath and the process was found to have preserved every mark of the chisel with the greatest delicacy.

Two elegant series of prettily illustrated works, the one entitled "*La petite Bibliothèque de Luxe*," and the other "*Collection de petits Romans Anciens*," are being brought out by MM. Quantin, of the Rue Saint-Benoit, Paris. Of the first series three volumes have already appeared—Bernardin de St. Pierre's *Paul et Virginie*, and Benjamin Constant's *Adolphe*. Both these are illustrated with delicate little etchings by F. Régamey; and the third, M^{me}. de Lafayette's celebrated story, *La Princesse de Clèves*, to which M. Taine has written a preface, is adorned with the same kind of small illustrations by G. Masson. These notable works of French legitimate fiction are issued with the careful finish and taste for which French artistic publishers are renowned. The "*Collection de Petits Romans Anciens*" is as yet represented only by *L'Amour et Psyché*, from Apuleius, but

his little volume is a marvel of beautiful typography and paper, and the eight headpieces to the chapters copied from Natoire are perfect little gems of their kind.

A new picture by Hans Makart, *The Entry of Charles V. into Antwerp*, is creating a sensation in the Vienna exhibition of pictures.

THE publication of the *Gazette des Beaux-Arts* has been somewhat delayed this month, like that of several other French journals, in consequence of the strike among the French typographers. It opens with an article, the first of a series, by M. Anatole de Montaiglon, on "Diane de Poitiers and her taste in Art." A sumptuous illustrated work was published not long ago by M. Roussel, on the Château d'Anet, giving a detailed account of the famous Diana's residence here and the works executed in her time, so that it would not seem that much could be left to be said on this point. Possibly, however, M. de Montaiglon may have something to tell of other works of art commissioned by Diana beside those in her castle. In the ninth article on the National Gallery, M. Reiset, after commenting at some length on Hobbema and Ruydael, enters upon the subject of the French School and Nicolas Poussin, but does not yet arrive at Claude Lorrain. M. Ephrussi's article on Dürer's drawings has even more than usual interest this month from six of the pages being set round with reproductions of the richly inventive borders of that delightful work of Dürer's art known as *Marimilian's Prayer-Book*. Unfortunately the reproductions give but a very slight idea of the exquisite delicacy of touch of the original designs. The writers of the other articles of the number are M. Lemonnier, who finishes his study of Alfred Stevens; M. de Lestolat, who writes on the *Peintres-Graveurs en 1878*, dealing specially with the Cadart Albums; M. Lalanne, who still goes on with the interminable "Journal de Voyage de Bernini;" and M. H. Havard, who gives some documentary particulars respecting the history of those dreary Dutch painters the Palamedes. The etchings are so poor this month that he less said of them the better.

THE STAGE.

"LES FOURCHAMBAULT."

THE Théâtre Français has just produced an important novelty, a comedy in five acts, by Emile Augier, called *Les Fourchambault*. M. Augier had not written for the stage since *Jean de l'Homme* was given here in 1873, and it was thought that the reception of that unfortunate drama had caused him to renounce dramatic literature altogether. The enthusiasm, however, with which his latest effort has been welcomed by press and public must make him rejoice that he has returned to that stage on which he once triumphed with *Le Fils de Giboyer*, the finest social satire of modern times.

Fourchambault (M. Barré) is a banker at Havre, of all appearance rich and prosperous. He has married a wife with a dowry of 800,000 francs, on the strength of which, not content with reminding him continually of the fact that she was a great heiress, she spends annually nearly three times its legitimate interest, and he is about to marry his daughter Blanche (Mlle. Reichemberg) to the young Baron Rastiboulois, only son of the vulgar and fussy Préfet (M. Thiron). She is known to be in love with Victor Chauvet, a fine young fellow without fortune; but her mother will not hear of her daughter bearing a name so common and so ridiculous. She accepts, therefore, as a dutiful daughter should do, the position selected for her, and sacrifices her heart to the ambition of her family. The banker's chief trouble, when the piece begins, is his son Leopold (M. Coquelin). So long as this promising young person confined himself to sitting up all night at cards, or gaining an evil reputation for facile gallantries with the

demimonde of Havre, the father did not interfere; but he is seriously alarmed at the change in his conduct since the appearance in his house of Marie Letellier (Mlle. Oroizette), a charming young lady who has come over from Bourbon to be a governess, and has resided with them for some three months as companion to Blanche. An innocent flirtation between her and Leopold, more serious on his part than on hers, is the natural result. She tries to improve his education, hitherto much neglected, and an amusing dialogue ensues. He is helping her to wind worsted, and Penelope is mentioned. "Who was Penelope?" "Pénélope," he reflects, "Pénélope: c'est un sujet de pendule!" His French history is as weak as his Greek scholarship. "Tu as dit l'autre jour, qu'Henri IV. était le fils d'Henri III.?" "Ça... c'est mon opinion," he answers. M. de Fourchambault does not much object to all this. She is delighted at the improvement in her son's morality, and, with the heartlessness of a worldly woman, cares nothing for the peace of mind or the reputation of Marie, both of which are in danger of being seriously compromised. The father, however, takes a different view. He points out to his son the dangerous position he will soon be in, and tells him, by way of warning, a long story about a friend of his own, who got into a terrible scrape with a governess, from which he was rescued only by his father's knowledge of the world. "When a man tells a story about a friend he is generally telling his own," thinks the son, and calmly continues his flirtation.

The second act takes us to the house of Bernard (M. Got), a wealthy shipowner, who had brought Marie Letellier over from Bourbon, and has fallen desperately in love with her. Not a word, however, has he spoken; hardly has he dared to realise to himself the depth of his devotion. He is a natural son, and devotes himself to a mother whom he adores, and who has made him what he is: more rich, more prosperous than Fourchambault, and the very soul of principle and honour. As the curtain rises, his mother (Mlle. Agar), a dignified figure, dressed in black, with grey hair, and a pale grave face, is casting up his ledger. In a touching scene she tells him the story of her life; how she had been seduced under a promise of marriage; how she had been unjustly calumniated by her lover's father, cast off and deserted; after which, reproaching no one, she had devoted herself to the education of her son. The most absolute confidence exists between them except on one subject—the name of his father—which she persists in refusing to tell him. Bernard goes to business, and an amusing scene ensues with M. de Fourchambault and Blanche, who call upon M. de Bernard under pretence of asking for a subscription to a charity, but really out of curiosity to see this mysterious lady of whom Marie Letellier had spoken so enthusiastically, but who cannot be induced to leave her retirement. They take their leave, and Bernard presently returns. Among other pieces of news he carelessly mentions the failure of a commercial house which had involved M. Fourchambault to the extent of 240,000 francs. He can hardly believe his ears when his mother, whose advice he had always followed implicitly, recommends him to offer himself as partner to the banker, of whom he had sarcastically remarked, "Il paraît que la maison était toute en façade." Then comes a very fine scene.

"Eh bien! mon fils, il faut t'associer avec M. Fourchambault."

"Moi! m'associer avec ce ganache!"

"Oui. Il le faut, tu le dois, je le veux."

Then the truth flashes upon him: he divines that an accident had revealed the long-concealed secret; and exclaiming, "C'est mon père!" he hurries out to do as she had ordered.

We may pass rapidly over the next two acts. The banker, who has failed to raise money, and failed even more signally in an appeal to his wife to lend him her dowry, accepts with eagerness

Bernard's offer. Leopold is less frankly glad; but Bernard overrules his objection by coldly saying:

"C'est une association que je viens proposer à la maison Fourchambault. Elle n'a point d'obligation à moi; c'est une affaire que je traite, qui sera, je l'espère, avantageuse et pour elle et pour moi."

The domestic affairs of Fourchambault, however, need to be set in order as much as his business does, and his wife is told that she must put an end to her extravagance. Indignant at first, she sulkily acquiesces in the inevitable, not without some admiration for the strong will of the new partner. "Le brutal!" she exclaims. "C'est pourtant un mari comme celui-là qu'il m'aurait fallu." Like all weak people, from one extreme she flies to another. She proclaims that "Les privations seront désormais mon luxe;" she will emulate Penelope, who "restait chez elle, et portait de la laine," and she is not even angry with the Préfet, whose advice is as sound as it is gallant, "Vous étiez la mère des Grâces, devenez celle des Gracques."

The fourth act is chiefly devoted to the affairs of Blanche, who, thanks to Bernard's influence with her father and the excellent ideas instilled into her own silly little head by him and Marie, is induced to reject the young Baron, and recall Victor Chauvet. Meanwhile the flirtation between Marie and Leopold has progressed, and when he hears that she has obtained a situation as governess in England, and is about to leave them, he suggests to her in terms that cannot be mistaken, that she should remain as his mistress. Her refusal is full of noble indignation, but so far mingled with pity that, as she hurries out of his presence, she lets fall the riding-whip she had raised to strike him.

The fifth act is a very fine piece of dramatic writing. The reputation of Marie had been compromised by the silly chatter of M. de Fourchambault, repeated from mouth to mouth, and her English employers decline her services. Thus the situation of Bernard's mother is in part repeated. He seeks an interview with Leopold, which furnishes the principal scene of the whole piece. The author has made the ill-feeling of Bernard and Leopold for each other evident from the beginning. Bernard loves Marie; Leopold does not, but still is jealous of the interest that Bernard feels for her. Consequently he resents every word that the latter utters in her defence; while Bernard in his turn is not slow to see that Leopold's conduct might have led to such a disaster as that which ruined his mother's life. The discussion becomes more and more excited; and when Leopold suggests that the position of a governess is essentially a false one, and that every young lady so placed must accept the responsibility of it, Bernard indignantly exclaims:—

"Ah! je reconnais bien dans ce raisonnement le petit-fils de l'homme qui a calomnié une honnête femme pour empêcher son fils d'épouser celle qu'il avait déshonorée. Cela est dans le sang dont vous sortez! Votre grand-père aussi était un calomniateur."

"Ne répétez pas cela!"

"Si. Je le répète. Votre grand-père était un calomniateur!"

Leopold's answer is to strike Bernard across the face with his glove. The latter makes a forward movement of anger, then draws himself up, and says, "Ah! comme il est heureux que tu sois mon frère." Even this revelation is not enough to calm the fury of Leopold; but at last, on learning the long devotion of Bernard's mother to his father; how she had kept the secret, watched over his fortunes, and finally saved him, he begs his brother's forgiveness; who, pointing to the place on his cheek where the glove had struck, exclaims, "Eh! ça!" and takes his brother to his heart in a long embrace. The rest may be told in a sentence; Leopold proposes honourable marriage to Marie, who refuses him; and he, not to be outdone in nobility of sentiment, tells her of his brother's love, and smooths the way for their marriage.

Such is the story of this agreeable piece. It is charming to see, and will no doubt be equally so to read. It may, however, be doubted whether it will add to the literary reputation of its author. The types of character are neither new nor particularly interesting; a hundred different pieces have presented to us the good-natured banker ruined by a silly wife; the foppish son; the daughter who feebly reflects her mother. Bernard again, bluff and honest, with a fresh sea-smell pervading the atmosphere in which he moves, is as familiar, and it may be added, as unnatural a type as is his mother, the resigned and dignified victim of a scoundrel.

To say that it is admirably acted is only to repeat that it has been produced at the Comédie Française. From this general level of praise, however, I must except M. Got, who as Bernard has risen to a higher level than even he had before reached. So complete is his identification with the character that he has not merely divested himself of various little eccentricities of gesture, but his voice even is scarcely the same; while a reddish beard, slightly grizzled, completely changes his face. He plays the part with studied self-restraint; the quiet steadiness of a nature not given to outward manifestations, but of which the latent power is felt in every word that is uttered; a nature, moreover, which can flame into terrible anger against wickedness or wrong. The whole piece depends upon him; and if the present enthusiasm, which is partly due to a reaction against other pieces of a less wholesome character, should settle down into a durable success, it will be due as much to the interpretation of the artist as the creation of the author. A word of special praise must also be given to Mlle. Agar, whose dignified presence gives reality to the author's conception of the haughty, self-reliant woman who had borne her trouble so nobly; and furnishes an admirable contrast to the weak flightiness of the banker's wife. She has been specially recalled to the Théâtre Français, where she used to act occasionally some years ago, in order to play this part; and if she remains will greatly strengthen the company, as was seen the other night when she appeared as Athalie in Racine's frigid tragedy, and impersonated that wicked queen with great power and dignity.

JOHN WILLIS CLARK.

RECENT PLAYS.

WHEN the drama entitled *Une Cause Célèbre*, by MM. D'Ennery and Cormon, was produced at the Ambigu-Comique in December last, it was observed by the French critics that its reception afforded an evidence of the fallacy of the common notion that the taste for melodrama is in a declining way. It is quite true that since these dramatists first thrilled the breasts of Parisian playgoers—somewhere in the early days of the reign of Louis Philippe—some dramatic fashions have disappeared, and some new ones have gained a firm footing. Neat in construction, well defined in purpose, and sprightly in dialogue as are the vaudevilles and comedies of the prolific Scribe, not even the shoulder-of-mutton sleeves and gigantic reticules of 1836 could be more out of date in these days than are most of those once popular productions. But that the public have in any degree lost the faculty of enjoying a good melodrama is so far from being true that it is the very reverse of the truth. There is no doubt a class of melodramas that were at one time received with a certain amount of favour which they are destined probably never more to enjoy. These were of the type which sought to excite the imagination chiefly with vulgar terrors, and to overawe the ignorant with pompous speeches. Specimens of these pieces, some of English growth, others of French and German origin, may still be found in old collections of the acting drama, where the curious may read them, and easily satisfy themselves that the simple-

minded folk whom they moved to terror and to pity have passed away and left no representatives of themselves in our time. Mr. Chatterton, a few years ago, endeavoured to revive one of these productions, famous in its day as *The Cataract of the Ganges*, but its torrent of real water which so delighted our grandmothers was found to have lost its charm, and the pompous declamation of its leading personages excited only irreverent laughter. Matthew Lewis's *Castle Spectre* and *Wood Demon* were once scarcely less popular pieces, yet the manager who should think of reviving them would certainly not be well advised. A still more famous example is Kotzebue's *Pizarro*, which received the honour of being adapted by Sheridan. All these pieces belong to the class referred to; and, so far, it is perfectly correct to say that melodrama is no longer in demand. But the taste for dramatic works of this sort has too long been extinct to give any point to the remark that melodrama is declining.

Melodramas of the type with which the names of MM. D'Ennery and Cormon are chiefly associated—the only kind in fact which have been popular in France in recent times—are really works of a very different stamp. They belong, no doubt, to the same class, because their aim is to move the feelings and excite the imagination by a prevailing exaggeration both of incident and of sentiment, and because they invite the spectator to contemplate a state of existence which is of an ideal kind, and yet is not strictly poetical; but their distinguishing characteristic is that they unfold a story which is generally of a pathetic nature. Such pieces, if they lack more or less the truth and moderation that are essential to true art, have nevertheless a power to interest which is by no means limited to the uneducated among audiences. There is, indeed, no better test of a robust appetite for dramatic performances, as distinguished from that fastidiousness of taste which is often only another name for comparative indifference towards entertainments of the stage, than the capacity for enjoying a good specimen of works of this description. Such a piece is *Une Cause Célèbre*, which has been adapted without any essential modification by Mr. Burnand, and produced at the Adelphi Theatre under the not very attractive title of *Proof, or a Celebrated Case*. The germ of the story of this play is understood to have been the incident of a little child being admitted to give evidence at a criminal trial, and thus, unconscious of the nature of its act, causing the conviction of her father on a charge of murder. It will be felt at once, that pathetic in its nature as this incident is, it would be apt on the stage to shock the feelings of an audience. Hence the authors have been careful to subdue the painful nature of the trial scene, and invest the whole with a degree of moral beauty which renders it, not revolting, but touching in a high degree. The accused is a brave and honest soldier in the French army; he has just been rewarded by his commanding officer for his gallantry in a skirmish on the eve of the battle of Fontenoy, when he is overwhelmed by the news that his wife, from whom he had affectionately parted only a few hours before, has been murdered, and that he himself is accused of the act on the testimony of his little daughter. Pierre Lorange—such is the name of the hero in the English play—has been absent without leave; and, unfortunately, when questioned on the point, he has prevaricated and has hesitated to confess the fact. The child knows that he has been at his cottage; more than that, she had been alarmed by the noise of the scuffle between her mother and the assassin in an adjacent room; and she states that at this time she heard her mother's voice bidding her not to be alarmed, as her father was there. The charge made by the senechal is heard only in a sort of preliminary enquiry before the Count d'Aubeterre, Lorange's commanding officer; but when it is complete it is felt that, though the soldier is perfectly innocent, his condemnation is

inevitable. Beatrice Cenci's beautiful exhortation—

"For thine own sake be constant to the love
Thou bearest us; and to the faith that I,
Though wrapt in a strange cloud of crime and
shame,
Lived ever holy and unstained,"

is hardly more affecting than the rough, honest soldier's tender farewell of the little child, bidding her, if these things should still linger in her memory, to believe in his innocence and his entire forgiveness. Few incidents indeed on the stage in recent times have so powerfully moved an audience; and when, after a supposed interval of twelve years, the daughter, reared in affluence by wealthy benefactors, detects the speaker of these words among a gang of convicts, heavily chained, who are permitted to rest on their long march within the grounds of the *château* in which she lives, the scene is hardly less affecting. With this simple notion, MM. D'Ennery and Cormon have associated a complex and ingenious story, of which no outline even could be given within reasonable limits. They have not wholly escaped the tediousness which generally attaches to investigations of any kind upon the stage; and there are some clumsy repetitions which, as they are not likely to have been gratuitously inserted by the adaptor, are probably due to too conscientious a regard for the original text. And unfortunately, where the acting at the Adelphi is weak, it is just where the actor's art is required to redeem defects of this kind. Mr. Bandmann's performance of the part of the hero is characterised by a great deal of true tenderness, and by a degree of dignity and self-restraint which is equally valuable; and Miss Pateman's florid method does not wholly prevent her from touching the feelings of the audience. On the whole, the Adelphi company is remarkably efficient, though it is unfortunately without a satisfactory representative of villainy of the thorough-paced and plausible kind. The performance introduces us to at least one really fine piece of acting in the case of a minor but not unimportant part, which is played by Mrs. Arthur Stirling with an appropriately noble and graceful bearing, as rare as her delicately varied delivery of words and perfect sincerity of utterance.

Mr. Wills's beautiful play, *Olivia*, at the Court Theatre, is a work of a far different kind. This is neither a drama nor a comedy, but a happy blending of both these forms. Poetical in conception, and singularly delicate in its treatment of the story, this piece will live—or will at least deserve to live—when probably few plays of our time will have escaped oblivion. It is remarkable that though Goldsmith's immortal story furnishes the theme of this work, its originality is scarcely affected by that circumstance. This is not merely because the dialogue is almost entirely of Mr. Wills's invention, but also because he has cast the whole in a powerful dramatic form, rejecting what was unsuited to his purpose, adding, though in no irreverent spirit, where effect upon the stage required it, both characters and incidents, and excluding all incongruous elements with a poetical and dramatic instinct akin to the highest creative power. Those who are willing to interrupt for that purpose the pleasure which is to be gained by lending the imagination to the unfolding of the story would find it interesting to study the skill with which the dramatist has softened what might strike an audience as harsh or repulsive. It must be remembered that the descriptive means of the story-writer are denied to the writer for the stage, who, apart from such aid as the scenic artist and the actor's interpretative arts can lend, is limited in the development of his plan to the mere dialogue of his personages. Yet many of the new passages in the play may well take their stand upon the ground of their own intrinsic beauty and dramatic strength. There is, for example, the touching and beautiful incident of Olivia's distribution of little *souvenirs* among her brothers and

sisters before her flight: and the intensely dramatic and affecting interview between Olivia and her father at the old inn.

The heartlessness of Olivia's disappearance is also mitigated by many skilful touches. The interview in the vicarage between her and young Thornhill goes far in this direction, from the subtlety of the arts by which he is seen to play in turns upon her pride, her love, and even on her affection for the home-circle, in order to induce her to elope; and meanwhile the pure simple courtship of Sophia and Burchell stands in admirable contrast. At the end of the play Mr. Wills contrives, with excellent judgment, to represent Thornhill as rudely rejecting his uncle's patronage and promised favour, while yet eager to humble himself before the woman he has so cruelly betrayed. Thus the suspicion of a false repentance for the sake only of propitiating his powerful relative is removed, and the audience is enabled to sympathise with the final prospect of a forgiveness which on Olivia's part is still withheld. It would be difficult to overpraise the homely strength of the dialogue where passionate feeling is involved, which, no less than the somewhat courtly and sententious style where ceremony is to be observed, is thoroughly in the spirit of the time. There are few utterances assigned to Olivia which do not convey some indication of character. Beautiful is her intense anxiety for news from home; her haunting dread of being forgotten or, what is worse, harshly judged by the little circle; her innocent joy over the least significant details of the daily life of those who are still so dear to her. And by that faculty of turning all to account which is one of the dramatist's most precious gifts, the spectator is meanwhile made to feel how alien is all this from the sympathies of the town-bred rake, how certain to increase the feeling of satiety which has already set in. It is impossible to do more than touch on some of the manifold beauties of this play; which runs, perhaps, some risk of being undervalued, because the attention is naturally attracted both to the high merits of the acting, and the beauty and appropriateness of the scenery and accessories which the unrivalled taste of Mr. Hare has provided. Fortunate indeed is the author in a representative of Olivia so tender and graceful, so skilful to suggest both lightness of heart and depth of feeling and passion, so habitually sweet in manner yet so terrible in just resentment, as Miss Ellen Terry. Nothing so fine has been seen on our stage in recent times as her sudden change from innocent unsuspecting joy and love to horror and loathing, as the deception of which she has been the victim is cynically, but not without some approach to shame and reluctance, revealed by her profligate lover. Of other merits in this memorable performance I have already spoken. That the play has attained a popularity which promises to be of an enduring kind is a satisfactory token of the readiness of the public to recognise sterling merit on the stage. It ought to be an answer to those who believe that nothing short of a State subvention can release our managers from the debasing influences of an alleged necessity for pandering to low tastes.

The production of *Madelaine Morel* at the Queen's Theatre, and of the drama entitled *Jealousy* at the Olympic, are events of little significance from the point of view of dramatic art. *Madelaine Morel* is an adaptation from the German of Mosenthal, and the adaptor is Herr Bandmann, whose alleged violent conduct towards Mrs. Rousby is nightly proclaimed by that lady, not merely by carrying her arm in a sling—which may, for aught that is publicly known, be a necessary condition of the healing process—but by exposing the bruised and discoloured skin to the eyes of the audience in a way which seems not to serve any purpose save that of associating prosaic proceedings in the adjacent Police Court with the romantic threads of Herr Mosenthal's story. As it is, Mrs. Rousby's grievously disfigured arm necessarily assumes an almost overwhelming pro-

minence in a piece in which it is still an irrelevant feature. Further grounds of regret may be suggested to some minds arising from the reflection that, after all the mischief done or alleged to be done, to a charming and accomplished lady, Herr Bandmann so signally failed in his efforts to withdraw his play from public cognisance. The subject of *Madelaine Morel* is the old theme of the difficulty in the way of a woman's regaining in society a position which she has once forfeited by profligate courses. The author has endeavoured to secure sympathy for his heroine not only by her genuine repentance and sincere attachment to a worthy lover, but by the circumstance that she has been exposed to peculiar temptation through being left an orphan at an early age; and, further to satisfy poetical justice, it is at the hands of the family of the worthy lover that her father had suffered, though innocently on their part, the injustice which had finally broken his heart and caused his death. Though the story bears a considerable resemblance to that of M. Dumas' *Dame aux Camélias*, there is some novelty and some dramatic force in the situation of affairs when the hero, who has long been seeking for the persecuted steward and his daughter in order to make them tardy amends, suddenly discovers the latter in the person of a lady for whom he has conceived an ardent attachment, and at the same moment learns the fact that Madelaine's associates are women of loose morals, and Madelaine herself not free from stain. But the treatment of the subject is of a feeble and hesitating kind. From certain speeches of a lofty and sententious nature, introduced here and there, it would seem that Herr Mosenthal's intention was to teach a wholesome lesson to a pharisaical world. But Madelaine, when introduced by her aristocratic lover to his own home circle, is really treated with much kindness. In the end she abandons her engagement, returns to Paris, and there dies; but this change of mind is not on account of any persecution she has suffered on the ground of her antecedents, but merely because she has learnt that under the terms of a will—if I have rightly understood the dialogue—her intended husband's worldly interests would be injured by a *mésalliance*. The play has, on the whole, no great merits. The treatment of the subject wants delicacy of touch; above all, in the earlier scenes, in which the vulgarities of Madelaine's Parisian associates are more than sufficient for illustrative purposes, and are not in themselves pleasing to contemplate. There is really no art worth mentioning in the acting of this play; though Mrs. Rousby speaks her words very prettily, and where needful very plaintively, and also moves as gracefully as is perhaps practicable under the distressing circumstances of the case.

Jealousy is an adaptation by Mr. Charles Reade of a comedy entitled *Andrea*, by M. Sardou, which was originally produced in Paris about seven years ago, and is now almost forgotten. It tells the story of a weak-minded Austrian nobleman who, neglecting a charming and devoted wife with no perceptible excuse, makes passionate love to a popular dancer who is ostentatiously heartless and indifferent, but nevertheless promises to elope with him to St. Petersburg if he will only desert his lawful spouse. Having promised to do all this, the Count de Beudoz adds an additional touch of meanness to his character by privately resolving to desert the popular dancer after a brief spell of her society in the Russian capital. Then, unconscious that his wife has, by gaining admission on a plausible pretext to the dancer's dressing-room, heard the whole of this compact from behind a screen, the Count increases the total of his enormities by falsely assuring her that he is merely going away on urgent business. Finally, as if to forfeit all possibility of gaining the respect of the audience, he is rendered by certain circumstances intensely jealous of the wife whom he has neglected, and much excited on the subject of his honour as a

husband, and this on grounds which turn out to be entirely fallacious. The part of this contemptible personage is played by Mr. Henry Neville, with head erect, and with the proudly gallant bearing and emotional style of utterance of a hero of romantic drama. In point of fact, there is no other hero, and when the curtain falls upon the spectacle of husband and wife reunited, there seems to be a mute appeal to the audience to rejoice over the happy termination of long and unmerited persecution and distress. If it is permissible at any time to interpolate nearly a whole act of a boisterously farcical kind in the midst of a serious play, it would perhaps be in the case of a serious play which excites so little serious interest as this. Any way, M. Sardou has thought proper to have his hero conveyed by the connivance of his offended wife to a private lunatic asylum, where he amuses himself by dexterously avoiding jets of cold water from a syringe, by lying half undressed in bed, and bobbing from time to time under the bedclothes, and does other strange and ludicrous things. Somehow, the comedy element of the original appears to have evaporated in the English play, while the incongruities in which M. Sardou takes a curious delight flourish in increased luxuriance.

MOY THOMAS.

MUSIC.

THE interest of last Saturday's concert at the Crystal Palace centred in the performance of Beethoven's Violin Concerto by Señor Sarasate. The Spanish violinist's reading of this great work, which may be said to form the highest test of a player's ability, had several points of individuality. Señor Sarasate has not the immense vigour nor the impassioned mode of utterance that characterise Herr Joachim, but his style is eminently refined, and any lack of power is compensated by a marvellous beauty of tone, especially in the higher register, and by singularly truthful intonation. These qualities were fully manifested in the first movement, but less so in the Rondo, which suffered to some extent by the want of animation in the executant. A short orchestral piece entitled *In Memoriam*, by Herr Reinecke, and a romance for violin by Herr Max Bruch, were the novelties of the day, but neither proved of any great importance. The former consists of an Introduction and Fugue in D minor, in the course of which the familiar chorale, "O Haupt voll Blut und Wunden" is utilised. The occasion for which the piece was written was not mentioned in the programme, and notwithstanding its effective scoring it will scarcely advance the reputation of the Leipzig Kapellmeister as a composer. The vocalists were Mdles. Redeker and Friedländer, the lady first named introducing an interesting cycle of songs entitled "Thüringer Waldblumen," by Herr Henschel.

THE second concert of the Bach Choir will take place at St. James's Hall on Monday evening, when Bach's *Magnificat*, with Franz's additional accompaniments, Mendelssohn's *Walpurgis Night*, an anthem by Purcell, and a selection from Palestrina's *Missa Papae Marcelli* will be given. The programme will also include Schumann's *New Year's Song*, which, in consequence of its success at the last concert, will be repeated.

THE official concerts at the Paris Exhibition are to commence on June 1. The ten symphonic concerts, under the direction of M. Colonne, will take place at irregular intervals; but the sixteen quartett concerts are fixed for every Wednesday from June 5. The concerts will commence at three, and finish at five. It is now stated that several foreign musical societies, both choral and orchestral, which had announced their intention of coming to Paris, have abandoned the idea in view of the probable heavy expenses. Among these we note with regret Hans Richter's celebrated band from Vienna.

THE important library of the late Julius Rietz will be sold by auction next week at Dresden. The catalogue contains over 3,000 lots, including more than a thousand lots of music alone—certainly one of the most valuable musical collections offered for sale for many years past.

ARRANGEMENTS have been made for the production of the whole of Wagner's *Ring des Nibelungen* at Cologne. The *Walküre* is to be the first portion produced, and is to be given in May, 1879, at the close of the regular operatic season.

WILHELM SPEYER, well known in Germany as a composer of part-songs for male voices, died on the 5th inst., at Frankfort-on-Main, in the eighty-eighth year of his age.

A FORMERLY distinguished German violinist, bearing the illustrious name of Franz Schubert, has lately died in Dresden, in which city he was for thirty years a member of the Royal orchestra.

AUTOTYPE PERMANENT PHOTOGRAPHIC BOOK ILLUSTRATIONS. THE AUTOTYPE COMPANY are producers of Book Illustrations by the Autotype and Sawyer's Collo-type Processes. Employed by the Trustees of the British Museum, Palaeographical, Numismatical, Royal Geographical, and other learned Societies. Facsimiles of Medals and Coins, Ancient MSS., Paintings, Drawings and Sketches, Views and Portraits from Nature, &c., &c. For Terms and Specimens apply to the MANAGER.

AUTOTYPE supercedes the old methods of photographic printing by processes which, preserving all the beauty of silver prints, are free from the fatal defect of fading.

THE AUTOTYPE FINE ART GALLERY.

36 RATHBONE PLACE. Displays a Splendid Collection of Copies of the Great Masters from the Art Galleries of Europe, Reproductions of Turner's Liber Studiorum, the Works of Sir Joshua Reynolds, and Examples of the art of Poynter, Ward, Cove Thomas, Shields, Ford Madox Brown, Hardy, Rowbotham, D. G. Rossetti, Beavis, Lehmann, &c., &c., &c. Catalogues on application.

The AUTOTYPE FINE ART GALLERY, 36 Rathbone Place.

The Works, Ealing, Essex, Middlesex.

General Manager, W. S. BIRD. Director of Works, J. R. SAWYER.

FURNISH your HOUSES or APARTMENTS

THROUGHOUT on MOEDER'S HIRE SYSTEM. The original, best, and most liberal.

No extra cash price for time given. Illustrated Price Catalogue, with full particulars of terms, post free. F. MOEDER, 248, 249, 250 Tottenham Court Road; and 15, 20, and 21 Cross Street, W.C. Established 1852.

F. MOEDER begs to announce that the whole of the above premises have just been rebuilt, specially adapted for the furniture trade, and now form one of the most commodious warehouses in the metropolis.

Bed-room suites, from 6l. 6s. to 50 guineas.

Drawing-room suites, from 9l. 9s. to 45 guineas.

Dining-room suites, from 7l. 7s. to 40 guineas.

And all other goods in great variety.

F. MOEDER, 248, 249, 250 Tottenham Court Road; and 15, 20, and 21 Cross Street, W.C. Established 1852.

PERMANENT PHOTOGRAPHIC BOOK-ILLUSTRATIONS.

MESSRS. H. M. WRIGHT & CO.'S IMPROVED PROCESSES

Combine the fidelity and delicacy of Photographs with the permanence of Engravings. They are unrivalled for cheapness and rapidity of production; require no mounting; and are available for all kinds of illustrations. Specimens and Terms on application.

Offices, 61 Fleet Street, E.C.—Works, Lansdowne Road, Tottenham.

Sole Proprietors of the PHOTOTYPE and Heliotype Processes.

BIRKBECK BANK. Established 1851.

20 & 20 Southampton Buildings, Chancery Lane. DEPOSITS received at INTEREST for stated periods or repayable on demand. Current Accounts opened with persons properly introduced, and interest allowed on the minimum monthly balances. No charge made for keeping accounts. Letters of Credit and Circular Notes issued. The Bank undertakes the custody of Securities of Customers, and the Collection of Bills of Exchange, Dividends, and Coupons. Stocks and Shares purchased and sold, and Advances made thereon. Office hours from 10 till 4, excepting Saturdays; then from 10 to 2. On Mondays the Bank is open until 9 P.M.

A Pamphlet, with full particulars, on application.

FRANCIS RAVENSCROFT, Manager.

RUPTURES.—BY ROYAL LETTERS PATENT.

WHITE'S MOC-MAIN LEVER TRUSS

COMPANY (Limited).

WHITE'S MOC-MAIN LEVER TRUSS is allowed by upwards of 500 Medical gentlemen to be the most effective invention in the curative treatment of HERNIA. The use of the steel spring, so often hurtful in its effects, is here avoided, a soft bandage being worn around the body, while the requisite resisting power is supplied by the MOC-MAIN PAD and PATENT LEVER, fitting with so much ease and closeness that it cannot be detected, and may be worn during sleep. A descriptive circular may be had, and the Truss (which cannot fail to fit) forwarded by post, on the circumference of the body two inches below the hips being sent to the Manufacturer.

Mr. WHITE, 230 Piccadilly, London.

Single Truss, 16s., 21s., 26s. 6d., and 31s. 6d.; postage free. Double ditto, 31s. 6d., 42s., 47s., and 52s. 6d.; postage free. Umbilical ditto, 42s. and 52s. 6d.; postage free.

Post-office Orders to be made payable to John White, Post Office, Piccadilly.

NEW PATENT.

ELASTIC STOCKINGS, KNEE-CAPS, &c., for VARIOUS VEINS, and all cases of WEAKNESS and SWELLING of the LEGS, SPRAINS, &c. They are porous, light in texture, and inexpensive, and are drawn on like an ordinary Socking. Price 4s. 6d., 7s. 6d., 10s., and 12s. each; postage free. JOHN WHITE, Manufacturer, 230 Piccadilly, London.

SATURDAY, MAY 4, 1878.

No. 313, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Russians of To-day. By the Author of "The Member for Paris." (London: Smith, Elder & Co., 1878.)

THIS is an amusing book, and some parts of it testify to a close acquaintance, on the part of the author or of the persons from whom he derives his information, with the political and social life of those contemporary Russians whom it describes. Of course it must not be gravely quoted as an authority, its caricatures must not be accepted as faithful portraits. And in those parts of the book which neither are, nor make any pretence to be, amusing, its statements, as will be seen presently, do not always inspire confidence.

By far the best portions of the book are those which are meant to be amusing, and decidedly are so. The Prince Wiskoff, the "Squire among many," who has spent all his money, and has nothing to do, is very well described. And in the accounts of "An Emancipated Village" and "A Co-operative Village," there is much that must be admitted to be sufficiently true in many instances, though it would be absurd to suppose that all villages are in the unfortunate position occupied by those of which the misfortunes are here made patent. The chapter on "The Temperance Question" deals with one of Russia's greatest evils—one, however, with which we are unfortunately too well acquainted at home. To the eye of the stranger who comes from any of the sober countries of Europe, Russian intemperance must needs seem something not only terrible, but almost incredible; but to the Briton, who is aware of what is going on in his native land, and knows to what fearful crimes of violence his countrymen are driven under the instigation of drink, there will be nothing new in the drunkenness which he may witness in Russia, except the good humour which generally accompanies it. The chapter headed "Through the Streets" is smartly written, but far too much stress is laid on the power and inclination of the police to annoy. The account of their behaviour may be correct as regards the police of Odessa a score of years ago, but is absurdly exaggerated as regards the police in an ordinary Russian town at the present day. And the same may be said of the author's remarks about how absolutely necessary it is for a stranger always to have his passport about him. They apply to a time which is past and gone. At present, unless a change has taken place recently, the tourist in the interior of Russia is very little troubled with en-

quiries after that document. The account of Simon Iscariotovich, the "prosperous merchant" of Odessa, is very good, but it is only in South and West Russia that Jews of his class thrive and grow fat. Elsewhere they are unknown. The chapter on "Judicial Business" describes the state of things which prevailed in the reign of Nicholas; as when we are told that "a judge of first instance, commonly a tschinovnik, is paid 40*l.* a year, and has bought his office secretly for about 4,000*l.*" We might suppose that the writer had never heard of the immense reforms which have been effected in judicial business were it not for his remarks about juries, which are confined to the repetition of a few old jokes about their behaviour. We need not travel beyond the limits of our own island to meet with many a merry jest at the expense of jurors' intelligence. Many an Englishman who has suffered from long sitting in a jury box, stifled by the horrible atmosphere peculiar to our courts of law, will be inclined to sympathise with the fugitives of whom the following story is told. "Once when a jury had been locked up three hours, an impatient judge sent an usher to see what they were doing, and it was found that they had all escaped through a window, to avoid giving a verdict." Nearer to the truth than this account of the legal proceedings which have been so greatly altered during the last few years, are the military sketches entitled "The Briskatstartine Hussars," and "A Victorious General," for in military matters there is much room left for improvement, and a foreigner can scarcely speak more severely than natives are accustomed to do of the sufferings of the private soldier, the incapacity of generals who owe their rank to female influence or Court favour. The chapter on "Orders of Knighthood," also, is sufficiently correct as well as amusing. The skit entitled "A Bookseller and Publisher" is really humorous, and it may possibly be not an unfair representation of an Ekaterinoslaf bibliopole. But it would be absurd to look upon it as in any way doing justice to the publishers in the large Russian cities. In fact almost all the chapters which are written in a lively vein, whether the author amuses himself with "Marriage Customs," or sketches imaginary political lady-helps, or dwells on the horrors of travelling in the interior, are at least readable if not always entirely to be depended upon. In those in which he gravely descants on the Turkestan and the Siberia of which he evidently has no personal knowledge, merely repeating what has been said so often before, he does not appear to the same advantage. They will, of course, please those readers who are already of his opinion, but to an impartial investigator they will not appear worthy of attention.

One thing, at all events, is certain. Whatever the writer may know of *The Russians of To-Day*, he is singularly ignorant of all that concerns the Russians of olden days. Reasons best known to himself have induced him to prefix to his very lively and amusing sketches, which show, as has been said, considerable acquaintance with Russian life and thought, a very dull "Intro-

duction," full of the most extraordinary mistakes.

First of all he must needs talk about "the Slavs, who were the primitive inhabitants of Northern Russia," and who, it seems, "invaded Sarmatia and Scythia, and conquered all its tribes one by one." These Slavs, he goes on to inform us, "had Indian blood in their veins, and were settled on the western shores of the Volga fifteen centuries before the Christian era." Not only were their manners Oriental, but "their religion was a mixture of Brahmanism and of the forest worship of the Germans." All this is remarkable enough. But there is more to come. After informing us that the name of Russia is "derived from Rurik," decidedly a piece of information, he goes on to tell how the Russians threatened Constantinople "under Jaroslav, in 1020," but that "Jaroslav was unable to conquer the Turks." As we have just been told that "then as now religious zeal was pleaded as the excuse for coveting the Byzantine city," we must suppose that the author imagined that the Turks were in possession of Constantinople in the eleventh century. After that we need not be surprised at hearing that "Christianity having organised Russia on the feudal system of Western Europe," as soon as "Jaroslav was dead" feudal wars commenced and raged intermittently during the next four centuries. The truth being, as "every schoolboy" knows, that nothing at all resembling the feudal system ever got a footing in Russia. Almost equally astounding is the statement that "Novgorod freed itself from the Moscovite connexion, and set up an independent republic under the protection of the Mongols." The fact being that Novgorod had been to a certain degree republican long before what the author pleases to call "the Moscovite connexion" was dreamt of, and that it was Moscow which made use of the "protection of the Mongols" in order to subjugate the rest of Russia, Novgorod included. After this we are not surprised to find that the author accepts as a genuine document Peter the Great's "famous will, which has become, so to say, the charter of Russian Imperialism."

W. R. S. RALSTON.

A Chronicle of England during the Reigns of the Tudors. From A.D. 1485 to 1559. By Charles Wriothesley, Windsor Herald. Edited by William Douglas Hamilton, F.S.A. Volume II. (Camden Society, 1877.)

SOME time has elapsed since the publication of the first volume of the *Chronicle of England during the Reigns of the Tudors*. We may refer our readers to the notice of it which appeared in the ACADEMY, July 10, 1875. We are a little disappointed in the size of this second and concluding instalment, which scarcely extends to 150 pages. The two parts might well have been issued in a single volume, or, if it is thought necessary to publish a certain number of volumes in return for the subscription to the Camden Society, it would be convenient to continue the paging, which does not extend to 400 pages, through the second volume. This would enable the historical enquirer to refer

to a single volume, and likewise save him some trouble in consulting the index, in which it is not always easy to distinguish vol. i. from vol. ii.

We are also a little disappointed in the amount of new information contained in the *Chronicle*, which is in parts very meagre, and this especially applies to the first two years of the reign of Edward VI., the notices of which extend only to six pages. There is scarcely anything narrated which has not appeared before in some of the chronicles of the period. The notice of the ceremonial practised at the keeping of the anniversary of Henry VIII. at Westminster is, we believe, altogether new, and it is of some importance as indicating the intention of the Government to proceed systematically but gradually with the changes of worship and ritual. According to the new Communion Book which had been issued by the king's authority two months before, the Canon of the Mass was to be said in Latin as formerly, but this particular Mass was "sung all in English with the consecration of the sacrament said also in English, the priest leaving out all the Canon after the Creed save the Pater Noster." It is a curious fact, because, as there was no English translation authorised, the words used in the Canon must have been according to the fancy of the individual priest who was celebrating. It seems, however, from another memorandum that the same unauthorised practice had been introduced as early as May 1548 into the cathedral church of St. Paul's, London. Who was the Mr. Tong or Doctor Tonge, the King's chaplain, who preached twice about this time, once on May 12 and once on Whit Monday, we do not know. No such name occurs in any list of the King's chaplains that we have seen. Perhaps he is the same as the Roger Tongue whose name appears among the King's Visitors in the north. There is a similar instance of anticipating the law in the following year, in which the author records that in St. Paul's and divers other churches in London and elsewhere the new Prayer Book of 1549, which was ordered to be used on and after Whit Sunday, June 9, was voluntarily adopted at the beginning of Lent, just three months earlier.

From this time till the end of the reign the *Chronicle* is much more full of details, and adds something to our knowledge of what was going on in London, more than can be gathered from the histories and other chronicles of the period. Thus we have two or three instances of prosecutions of Anabaptists which ought to have been, but have not been, recorded in Cranmer's register at Lambeth. It is a striking fact that whereas Bonner's register for London is most accurately kept, Cranmer's at Lambeth should have been so neglected through his carelessness in not entering processes which came before him.

There is an illustration of the practice of the day as regards the celebration of Holy Communion, Cranmer officiating in a cope and not using the chasuble, according to the rubric of the first Prayer Book, which allows the choice of a cope or a chasuble. The intention was to make the use of the chasuble optional, with a view to getting rid

of it altogether, as was done in the second Prayer Book of Edward VI.'s reign. It is to be regretted that the editor of this volume does not seem to be adequately acquainted with the nature of the important ecclesiastical changes which the Protector, with the assistance of Cranmer and Goodrich, was persistently carrying through. He more than once seems to confuse the first Prayer Book of the reign with the second, though the tone of the two books is as distinct from each other as that of both of them is from that of the Book of Common Prayer at present in use, which is certainly not "the same, excepting a few alterations, with that of 1549." We should have thought also that the last-published edition of the *History of the Reformation* would have effectually prevented anyone from appealing to Burnet as an authority, especially as regards the conduct of a bishop of the Old Learning. There is really something ludicrous in being told on Burnet's authority that Bonner, at his illegal deprivation by Cranmer, "behaved before the judges more like a madman than a bishop."

There is a change observable in this volume in the tone of the chronicler, who seems to acquiesce more readily in the new state of things introduced by the Reformers. The diary seems to have been written almost from day to day, and so after the death of Edward VI. we have a new heading, "Johannae Reginae Anno 1^o," under which is duly entered the proclamation on July 10, 1553, of "Jane, Quene of England, Fraunce, and Ireland, Defender of the Fayth, and of the Church of England and Ireland the supreme head." But nine days afterwards he speaks as if he entirely sympathised in the general delight felt in London at the proclamation of Mary, and mentions that on the very next day Cranmer and Goodrich, who had consented to the exclusion of the Princess Mary from the succession, were present at the Lord Mayor's dinner given in commemoration of the event. How Goodrich managed to escape a traitor's or heretic's death does not appear. The *Chronicle* gives no additional information as to the few remaining months of his life. He died a natural death in May, 1554.

The entries in the *Chronicle* extend to September 8, 1559—that is to say, not quite to the end of the first year of Elizabeth. On that day the obsequy was kept for Henry II. of France. Before that time the change of religion in the Protestant direction had been adopted, the entry of May 14, 1559, being "Whit Sunday, the service began in English in divers parishes in London after the last book of service of Common Prayer used in the time of King Edward the VI." This is important because it falls in with the report that Elizabeth caused the book to be used in her own chapel on May 12, which latter date is probably a mistake for May 14, the book being authorised for use on and after June 24, 1559. Wriothesley has noticed the first public indication of the coming change as happening on Sunday, January 1, 1559, on which day, he says, the Mayor's commandment to read the epistle and gospel in the English tongue, according to her Majesty's proclamation, was observed in most parishes in the city.

We cannot say much in praise of the editorial work. So far as we can judge without having seen the transcript from which it has been produced, we should suppose it was fairly well executed, and the Index is all that could be desired. But as regards the notes, they are neither as numerous nor as copious as those added to the first part of the *Chronicle*, while some of them contain mistakes similar to those noticed in our previous review of the earlier part. Neither has the editor taken the trouble in all instances to point out the mistakes of the writer or the transcriber of the MS., whichever of the two may be fairly credited with them. We observe, for instance, at page 134, the entry, apparently under the head of Monday, April 27, 1556, after the notice that six Essex men were sent out of Newgate to be burnt in divers places in Essex, "also three women burnt in Smithfield." It ought to have been noticed that the six men were all burnt at Colchester, and that the other part of the notice was a subsequent addition to the diary, the three women alluded to having suffered death on May 16, 1556. Again, in the entry of Sunday, March 24 (p. 127), that Thomas Hikbye, with others, was delivered to the sheriffs of Essex to be burned, the explanation in the note is altogether wrong. The person alluded to is not, as the editor suggests, Thomas Hawkes, who was burned three months afterwards at Coggeshall, but Thomas Higbed, who suffered at Hornden-on-the-hill two days afterwards, on March 26. In the very next line we have "the 4th of April, being Easter Day." But Easter Day fell in that year on April 14. The mistake is the more palpable because a few lines lower down we have correctly "the 17th of April, being Wednesday in Easter week." The *Chronicle*, we may observe, affords some corrections of dates with regard to the days on which other heretics were burnt. While we are on the subject of variations of dates between this chronicle and other histories, we may notice that the proclamation of Queen Elizabeth about reading the epistle and gospel in English was issued, not as Wriothesley narrates, on December 30, but on December 27. We have noticed a few errors, but we should scarcely be doing justice to the editor if we did not add that it is very difficult in such a work entirely to avoid mistakes. But we have not the same excuse to make for the extremely Protestant prejudice exhibited by the editor in many of his notes. Though the Camden Society are not answerable for the opinions or observations of their editors, we think it would be wise to let the volumes as nearly as possible tell their own story, the notes to be added being simply explanatory of matters of fact. NICHOLAS POOCK.

The Litany of the English Church, considered in its History, its Plan, and the Manner in which it is Intended to be Used. By the Rev. W. H. Karlslake, M.A. (London: Pickering.)

THERE is no manual of devotion in the world which has had such a number of glosses, comments, dissertations, and illustrative matter devoted to it as the English Book of Common Prayer. Works on the Greek offices may almost be counted on the fingers of one

hand, for when Symeon of Thessalonica, Gabriel of Philadelphia, Habert, Goar, King, and Neale have been named, there is little else of importance to add; nor are there more than a few really valuable treatises on the Breviaries of the Latin Church. The Missal has been, doubtless, far more copiously illustrated; but even beginning with Durand, Sicard, and Micrologus in the thirteenth century, and coming down to the very latest text-books, such as those of Guéranger, Lüft, and Probst, it has not had a third of the pains bestowed on it which has gone to the discussion of the Anglican rite; so that anyone with a merely external or book-seller's knowledge of the bibliography of the latter subject might very reasonably suppose it exhausted, and that all future books can be little save old materials rearranged.

The reason of this copiousness of illustration is due to the unequalled position held by the English Prayer-Book as a lay volume. The Oriental and Roman offices are in dead languages, or, at best, in archaic and unfamiliar dialects of still living tongues, and are practically not in lay hands at all. They are the heritage of a professional body, and not that of the people at large, and are not customarily used by any save the clergy, either in public or private. Consequently, the area of literary interest in their contents, viewed from the historical, or even from the doctrinal, point of view, is necessarily restricted to a narrow area of readers, the tiny minority of learned ecclesiastics, and no demand exists to induce a continuous supply of fresh comment, such as our ecclesiastical literature can boast; whereas the fact that both the Latin and English rites have a common origin makes some of the more recent books produced here, such as Mr. Scudamore's *Notitia Eucharistica*, wellnigh as valuable to Roman as to Anglican students. As to the question of freshness, of course in a field which has been worked so sedulously (not having been neglected here since the revival of theological study under the influence of Andrewes and Laud, even in the slacker times of the eighteenth century, till it was laid aside for a time while the unlettered and emotional revival of Venn, Newton, and Romaine, but little interested in liturgical or, indeed, strictly theological learning, continued to dominate) it is impracticable to be very original. But the far minuter study of Biblical and early Christian archaeology and the adoption of the comparative method which mark modern scholarship have not been sufficiently long introduced among us to have finally done their work in this direction, and there is abundant room still for erudite monographs on detached portions of the Anglican formularies. Such is the treatise before us, in which Mr. Karslake has done a great deal more than merely reproduce the matter already made *publici juris* by Sir William Palmer and Professor Bright. He has distributed the subject into thirteen chapters, of which seven deal with the English Litany as it stands, inclusive of a survey of the origin and use of similar forms in the ancient Church; while the last six are devoted to an enquiry into the sources whence our rite has been compiled, and to a tabulation of the most striking examples found

in Eastern and Western Christendom, from the quasi-Apostolic forms embedded in the earliest Oriental Liturgies down to the latest of those newer modes of supplicatory prayer to which Mamertus of Vienne appears to have given the first impetus. This latter portion of the volume, as dealing more directly with questions of pure scholarship, is that which has the chief interest for the readers of the ACADEMY, and to it, therefore, the subjoined remarks will be confined; though matter of a similar kind—such as the relation of the curious survival among us of beating parish bounds at Ascension-tide to the ancient Rogation “gang-days”—will be found abundantly sprinkled through the earlier part likewise.

At the outset, there is one curious omission to be pointed out. Mr. Karslake, like Archdeacon Freeman before him, had given attention to the Eucharistic relation of the Litany—that is to say, not only its earliest traceable Christian use as the “Great Intercession” of the primitive Missals, but its subsequent employment, as in the Milanese rite and our own, for saying in connexion with the Communion office, there as an integral part of it, here as a preparation. But he has not attempted to trace it any higher. The Clementine Liturgy, embedded in the Apostolical Constitutions, is most probably, as it now stands, the most ancient Christian rite extant; since the fact, which may almost be taken as proved, that it never was in actual use anywhere, but merely stood as a literary norm for local adaptation, has preserved it from the mutilations and interpolations which have affected those other extremely early forms which bear the names of St. Mark, St. James, and SS. Adaeus and Maris. Nothing is easier than to show how the Clementine *Synapte* or *Ectene* could be broken up into portions by intercalated responses; nay, how it actually has been done in the Milanese Lenten litanies of the Ambrosian Missal, and its subsequent adaptation in Anglican Portiforia and Primers. But a deeper enquiry is not even touched on. Whence did the Clementine Liturgy get it? or, for that matter, the Palestinian and Egyptian liturgies either? Such elaborate forms as they unquestionably are do not spring to existence at once in full completeness under the conditions of an infant and comparatively obscure religious society, whatever may be its fervour. There is a minuteness of detail and a finish of form about these very ancient Missal Litanies which, if we did not know for certain that they are, in part at least, ante-Nicene, would lead us naturally to ascribe them to a late and settled period of ecclesiastical history, as the ultimate outcome of long use and adaptation. The answer is extremely simple, and indicates a great field of enquiry, which has not yet been so much as surveyed, not to say worked—namely, that the devotions of the primitive Church, like much of its theology and polity, come straight from the synagogues of the Pharisees and Essenes. Archdeacon Freeman did see this truth, and lightly touched on it in his *Principles of Divine Service*, but he stopped short at the liturgical provisions of the Pentateuch, and did not carry his investigations suffi-

ciently far down. In fact the only treatise with which I am personally acquainted which goes into the question of the later Hebrew ritual is Professor Gustav Bickell's *Messe und Pascha* (Mainz, 1872), in which the liturgical relations between the Missal and the Jewish Passover rite are traced with considerable ingenuity, though perhaps not with entire dispassionateness. It is the more curious that Mr. Karslake should have omitted this investigation, because in a scholarly volume on the Lord's Prayer which he published about sixteen years ago he went freely into the Jewish origin of its petitions. Now, the *Te rogamus, audi nos*, of the Western Litanies is found almost textually in the modern Order of the Hallel as recited by the German and Polish Jews, for they twice repeat near its close the forms אָנָּה וְהַלְלָתָהּ אָנָּה וְהַלְלָתָהּ אָנָּה וְהַלְלָתָהּ, and a still more remarkable, because true, Litany of considerable length occurs in the office of Sanctification for New Year's Day, extending to forty-four suffrages, which, I apprehend, had more anciently an intercalated response, and shows by its form what I take to have been the earliest mode of publicly reciting the Clementine *Synapte*, though its actual literary shape is that of an unbroken supplication of considerable length. There is a third Litany of Deprecation, which also seems to have lost most of its responses—albeit there are three to its fifty-two suffrages—recited on the Great Day of Atonement; while the germ of a fourth, probably the most ancient of all, may be found in the Passover Service. Here, then, is a whole mine of almost unworked material, to which Mr. Karslake would do well to have recourse whenever his book reaches a new edition, and which, indeed, deserves the attention of all liturgical students.

In the ninth chapter of the book before us, the author takes each clause of the Litany in turn, printing just enough of it to guide the eye and memory, and appends a few words as to its certain or probable source, an arrangement which is incomparably more convenient than a separate dissertation would be, as it emphasises the facts bearing on every paragraph. And there is a very interesting collection of Litanies and quasi-Litanies, forming an appendix to the book. There are, however, four very serious omissions under this head—to wit, the Armenian Missal Litany, the very curious Mozarabic *Preces* after the *Psallendo*, the farced *Kyries* of the Sarum and unreformed Roman Missal, and the metrical Litanies of Salzburg and Münster, printed by Martene. These should also find a place in any revised issue of Mr. Karslake's useful and interesting treatise.

RICHARD F. LITLEDAL.

The Monuments of Upper Egypt; a Translation of the “Itinéraire de la Haute Egypte” of Auguste Mariette-Bey. By Alphonse Mariette. (Alexandria and Cairo: A. Mourès; London: Trübner & Co., 1877.)

For the benefit of such as do not read French easily, M. Alphonse Mariette (himself a Frenchman) has, under the above

title, translated into choice and fluent English his brother's *Itinéraire de la Haute Egypte*; a little book which for the last few years has been the delight and instruction of travellers on the Nile. Setting aside the way in which the translation is done—and it could scarcely be better done—M. Alphonse Mariette has performed a good work in throwing open these sources of delight and instruction to a wider circle of readers. For the *Itinéraire* stands alone in its way. It is neither a guide-book, nor an archaeological treatise, nor a popular essay for library circulation. It is simply what under its new and better title it professes to be—namely, a descriptive account of the Monuments of Upper Egypt, written by the one man who for more than eight-and-twenty years has made that district the principal field of his labours, and who knows more about its antiquities than any other Egyptologist in or out of Europe.

Of Mariette-Bey's magnificent and costly works on Abydos, Denderah, Karnak, &c., &c., the majority of even highly-cultivated readers know little or nothing. Such books are for the scientific few, and, although they constitute the corner-stone of his fame, do little to popularise the name of their author. But even the unarchaeological world, which cares little for Egyptology and not at all for hieroglyphic literature, is by this time alive to the extent of Mariette-Bey's renown as creator of the famous museum at Boolak, and discoverer of the long-lost Serapeum, or burial-place of Apis, described in the seventeenth book of Strabo. The splendid folio in which he has recorded the history of this last achievement is not to be found in many private libraries; but in that division of the *Itinéraire* which treats of excursions near Cairo, enough is told, and delightfully told, of the way in which the discovery was made, to satisfy the curiosity of most readers. As with the Serapeum, so with the scenes of Mariette-Bey's other labours. Lightly but firmly, with such subdued enthusiasm and in such modest language as befits a great explorer reciting the story of his own successes, he sketches each in turn, holding us no less by the charm of his literary style than by the interest of the facts with which he deals. Take, for instance, his descriptions of Denderah and Edfoo. He found these two temples half buried in the compact *débris* of countless crude brick towns, Arab, Copt, and Egyptian; each superimposed, like geological strata, on the crumbled ruins of its predecessor. The inner chambers of both were choked to within a few feet of their ceilings. There were the ruins of a deserted village on the roof of Denderah; and there was an inhabited village swarming with human and animal life on the roof of Edfoo. All these foul incumbrances Mariette-Bey swept away. All those pillared halls, all those side-chambers and corridors covered with sculptures which are the marvel of the traveller and the inexhaustible storehouse of the student, he caused to be cleared out from basement to cornice. Of the inscriptions with which they are covered—crabbed and corrupt because dating from Ptolemaic times—he can read every line. He has copied thousands of them with his own hand. He knows the history of every

part of the building; the additions made to it by each successive monarch; the uses of every chamber in it. He has the lists of endowments, the Kalendar of fast-days and feast-days, the very order of religious ceremonial, at his fingers' ends. Yet he never bores you with too much learning. In words few but picturesque, he tells you precisely what you would best like to know; but contrives to give you at the same time a passing glimpse of the most philosophic religion and the most elaborate ritual of antiquity. By this door, he tells you, the king was wont to enter the sacred precincts; in yonder oratory he underwent the ceremony of purification; in these chambers he consecrated certain offerings. Here, crossing the threshold of the holy of holies, he opened the shrine of the god, and, according to immemorial tradition, unveiled and perfumed the sacred emblem. Finally, placing himself at the head of a long and splendid procession, he made the circuit of the building, the roof, and the consecrated grove by which the temple was originally surrounded. In the prayers which were recited on these occasions by the king and the priests, and in the nature of the offerings placed on the altars of each divinity, Mariette-Bey traces a hidden symbolism derived from the Platonic schools then flourishing at Alexandria; and shows how the entire decoration of a Ptolemaic temple was composed "with a view to summing up synthetically, under the imagery of local divinities and their attributes, the three fundamental parts of that philosophy—the Beautiful, the True, and the Good." Told in this way, archaeology reads like romance.

Of the new matter incorporated with this present issue, the most valuable and important part is that which treats of the latest excavations at Karnak. Setting aside Mariette-Bey's own great folio on this subject, and the late Vicomte E. de Rougé's elaborate "Étude des Monuments du Massif de Karnak" (*Mélanges d'Archéologie Égyptienne et Assyrienne*, Paris, 1875-6-7), both of which are obviously too recondite for the use of ordinary readers; setting aside also the five or six unsatisfactory pages given to the subject in Murray's *Handbook*, this is really the first and only intelligible clue to the great Karnak group which has yet been placed in the hands of English travellers in Egypt. It is illustrated, moreover, with a ground-plan of the great temple, for which it is impossible to be too grateful. For it is not simply the best, but it is the only good plan of portable size yet given to the public. The scale is about forty-five mètres to the inch, and it takes in both the sacred lake of Thothmes III. and the pylons leading to the temple of Maut. Beginning this section with a sketch of the history of Thebes, Mariette-Bey takes his reader from Luxor to Karnak; tells him in what order to see the ruins; and in thirty pages of lucid explanation points out the principal objects of interest by the way. Here, for the first time in popular form, we find some account of the two hundred and thirty hieroglyphed scutcheons (each scutcheon suspended to the neck of a captive), sculptured on the western front of the fifth and last pylon of the great temple; a series at

least as interesting to the Biblical student as that of Shishak, in which Champollion believed that he had found the portrait of King Jeroboam. These scutcheons, containing the names of conquered cities, record the victories of Thothmes III. in Ethiopia, Libya, Arabia Felix, and the land of Canaan. Among the last appear Kadesh, Megiddo, Damascus, Beyrout, Nain, Jaffa, &c., &c. "In fact," says Mariette-Bey, "this list is nothing less than a synoptical table of the Promised Land, made 270 years before the Exodus" (p. 176).

It is to be observed, while on the subject of Karnak, that our author corrects the generally received proportions of the great obelisk of Queen Hatasu, which according to Murray measures 92 feet in height, but which is now shown to stand 108 feet 10 inches in the shaft, so exceeding the obelisk of St. John Lateran in Rome by three feet and four inches. Of the granite sanctuary, or what has hitherto been universally accepted as the sanctuary, of the great temple, constructed by Thothmes III. and restored by Philip Aridaeus, Mariette-Bey enunciates a new and startling opinion.

"It is a mistake," he says, "to consider the granite chamber as the actual sanctuary of the great temple of Karnak. The sanctuary of the great temple was anterior to Philip, anterior even to Thothmes; it ranked among the oldest edifices in Egypt, since it dated from the second king of the twelfth dynasty. It was built of sandstone, and stood in the centre of the large court to the east. Its renown, its antiquity, and probably also its riches, had the effect of attracting, more than any other part of the temple, the attention of every conqueror who invaded Thebes, and it has disappeared to its very foundations" (pp. 177-8).

That the most ancient part of the great temple was begun by Usertasen I. was pointed out long since by Sir Gardner Wilkinson; but Egyptologists, I believe, have hitherto taken it for granted that the structure of Thothmes III. was not only a later sanctuary, but that it covered the original site of whatever may have been the earliest sanctuary. De Rougé, at all events, seems never to have doubted its identity.

In the section on "Language and Writing" more space is now given to the subject of hieroglyphic signs, and some examples of syllabic, alphabetic, and ideographic characters are added. A short description of the temple of Khons is also given for the first time; and many new and interesting remarks are scattered up and down the book. Among these we find that the ancient necropolis of Drah-Aboo'l-Neggah, at Thebes, has yielded evidence of the very curious fact that a large proportion of the inhabitants of that part of the Nile valley at the time of the eleventh dynasty were negroes.

It is a pity that this charming little book has not been brought up in all points to the latest level of information. Since the discovery of the remains of a palace of Rameses III. at Tel-el-Yahoodah in 1870, for instance, it can no longer be said that the so-called pavilion at Medinet Haboo is "the only example of civil architecture which we possess." Neither, in view of Dr. Birch's learned paper on "Le Roi Rhampsinite et le Jeu des Dames," contributed to the *Revue Archéologique* (vol. xii., Nouvelle

Série, 1865), is it any longer possible to accept the symbolical sculptures on the upper storeys of these pavilion towers as representations of Rameses III. "surrounded by his family." Those flower-crowned maidens, with one of whom the king plays at draughts, are not his daughters. They are the goddesses of the upper and lower world; and that mystic game (one of the recreations promised in the Ritual to the justified dead) is played in Hades.

With regard to M. Alphonse Mariette's share in *The Monuments of Upper Egypt*, his translation is so easy and idiomatic that one never even recognises the hand of a foreigner. If in dealing with the proper names of kings and gods he had always adopted the Egyptian spelling instead of the Greek, he would have left nothing to be desired. It is time that we had done with the Amenophis and Imouthes of the old school.

AMELIA B. EDWARDS.

The Cottage Hospital: its Origin, Progress, Management, and Work. By H. C. Burdett. (London: J. & A. Churchill, 1877.)

WITHIN the last seven years the increase of Cottage Hospitals, until then a novelty in Great Britain, has been considerable, if not uniform; and it appears that the impetus given to the movement by Dr. Horace Swete's book in 1870 accounts for not a few of the more recent undertakings of the kind. As, however, Dr. Swete, now widely known as a public analyst, has no leisure to prepare for the press a second edition of a work which was soon out of print, a gentleman of long experience in hospital administration, Mr. Burdett, has gathered into the handy volume before us a history of the Cottage Hospital Movement, its progress and results, designed to show that there is room for it alongside and in supplement of the public hospitals and infirmaries. Without possessing the attractive pen of Dr. Swete, he deserves the credit of having brought a shrewd judgment to his task; and in most of the debateable questions connected with his subject-matter we suspect that his views will command the suffrages of the intelligent reader.

Only five English counties are now without one or more of these excellent institutions, which in their primitive and best type—i.e. the Cranleigh pattern—aim at bringing home to the small town or rural district, amid fresh air and out of the dust and turmoil of crowded thoroughfares, those advantages of medical advice and trained nursing which till recently were limited to the general, and comparatively monster, hospitals. It is found, where they have taken root—i.e. in above one hundred probably of the 160 Cottage Hospitals of which returns have been obtained—that the cheaper and simpler institutions are more economical than the best managed of the public and general. For example, while at the General Hospital, Birmingham, each bed occupied in 1875 cost 53*l.*, and at the Royal Hospital, Bedford, 56*l.*, the average cost per bed in the Cottage Hospitals is calculated to be 12*l.* and 9*l.* per bed less than in these—and this, too, though a small rural institution cannot get large discounts, and has to pay retail prices.

Indeed, it would seem that the sense of a narrow margin sharpens vigilance in the careful balancing of accounts, for clearly the income question is equally satisfactory, in 100 cottage hospitals reaching to 350*l.* in round numbers, or 10*l.* per annum above average expenditure. One great recommendation of the movement is its good in a provident sense, which is greater far than the general hospitals have ever aimed at, a large portion of income coming from annual subscriptions—indeed, nearly half of the whole income of this class of charity. Mr. Burdett is no advocate, by the way, for funding reserve capital, but would have the promoters of a Cottage Hospital, if in a condition to do so, first purchase their freehold, then provide all appliances and comforts, and then, after keeping in hand a very moderate reserve, consider the remuneration of the medical staff, whose work is too much suffered to be gratuitous, even where the Cottage Hospital has a surplus of invested savings. Large investments are a drawback, as encouraging reckless expenditure, and there is no point which Mr. Burdett makes more clear than that part-payment of medical assistance should be a normal mode of keeping such investments within a moderate and wholesome margin. The principle of patients' contributions according to their means, which in a rural area there is no difficulty in ascertaining, has the double advantage of teaching independence and self-help, and of enabling a portion at least of the medical aid rendered to be in some degree remunerative. The system of payment by the guardians for paupers admitted to a Cottage Hospital is worthy of all imitation, and should be adopted by our great general hospitals; and, in truth, the "Cottage Hospital system" may fairly claim as its *raison d'être* a mission to introduce *provident* medical relief in lieu of *elemosynary*.

It is needless to reiterate the arguments devoted by Mr. Burdett to the removal of a prejudice against a movement really ancillary to the county and general hospitals, or to enhance the advantage likely to accrue to the medical men of a district in economy of time and labour, in means of conference, mutual intercourse, and experience. A Cottage Hospital feeds the county hospital, besides furnishing a previous history of each patient, and hints as to habits and treatment. The briefest rules for internal management are found to be most satisfactory, and it would seem that a small ladies'-committee, or even, where it can be arranged, a really working lady-superintendent, answers best. Our author naturally attaches great weight to exact tabular statements of cases under treatment at each Cottage Hospital, particularly as to severe accidents (which are above the average at general hospitals), and thinks that every establishment should have its fixed scale of diet. These dietaries are given on page 60. For the avoidance of all possible jealousy between the hospital staff and (say) the poor-law medical officers, committees should guard against such a case as is quoted at Boston, on page 68, where the Cottage Hospital "did" the Union doctor out of the fee, when a broken limb was taken to it from the Union.

It is in vain, also, to do more than note

two or three of the chief hints to be gleaned from Mr. Burdett's pages. His experience leads him to advocate the widening the scope of these institutions from eight to as many as twenty, or, in mining districts, twenty-five beds—a very convenient number, as is shown by certain clear statistics. Where the maximum number allows of wards of ten beds in each, there is an economy of day and night nursing, though of course in small rural districts a less extensive ward is required. The vital questions of ventilation and warming are carefully discussed in chapter iii., and the not less vital one of the disposal of *excreta*—touching which the author commends water-closets, if the supply of water is good, and there is a system of sewerage; although he regards earth-closets as generally the best, cheapest, and most easily managed plan. It should be borne in mind, however, that this involves the presence of an *odd-man* on the premises, to look, among other out-door duties, to the drying and removing of the earth, which it will not do to leave, as in a case cited in the *Lancet* (October, 1867), unshifted for three months!

As regards attendants—whom the author thinks the Cottage Hospitals must train for themselves—the absolute requirement is, as nearly as possible, a trained nurse for matron, with an assistant-nurse in training under her, and it is pointed out that as these institutions increase, much may be done in this way to supply vacant situations by duly trained young persons of the tradesman and farmer class. In some Cottage Hospitals—e.g., at Cranleigh—one feature of the hospital is a second nurse for use in home cases, at need. The "Fowey" scheme, which allows the patients either to board themselves or to be boarded by the nurse, seems alike impracticable and unpractical. There is much to be admired in the late Baron Hambro's noble institution at Milton Abbas, but here also the plan of allowing the nurse to board the patient must be regarded as wrong. It simply ends in a lax rule of self-pleasing as to food, time of food, and payment for food. The Scarborough Cottage Hospital is an example of success arising from the principle of one sole manager. The founder, Mrs. Wright, has no committee, no chaplain, no house-surgeon: but she is a strong-minded woman, and has studied medicine and hospitals at home and abroad. The Boston Cottage Hospital promises to be one of the best in the kingdom. Mr. Burdett is in favour, we are glad to see, of abolishing all restrictions on admission of friends to see the patients from two to five o'clock daily, and would also do away the system of tickets of admission to patients. He recommends, too, the admission of cases of enteric or typhoid fever, and placing these in the same wards with other cases; but midwifery cases he thinks could not possibly be taken, unless a special and distinct ward (and perhaps staff) were provided for the reception of such. Many very interesting questions are treated of in this volume, which would assist intending promoters of Cottage Hospitals, but which space fails us to discuss. We cordially recommend *The Cottage Hospital* to all such.

JAMES DAVIES.

Thukydides und sein Geschichtswerk. Ein Beitrag zur Geschichte der Historiographie. Von Heinrich Welzhofer. (Munich, 1878.)

THE author of this treatise has gone laboriously and exhaustively over the well-trodden ground which is covered by K. O. Müller's admirable chapter on the political historiography of Thucydides. His conclusions are mostly identical with the views of that illustrious scholar, whom, strange to say, he never once mentions. One of his suggestions indeed is new, but is hardly true. Herr Welzhofer has persuaded himself that the Thucydidean speeches are literal reproductions, and just as genuine as the orations of Demosthenes. The first obstacle to such a theory is, of course, the statement of Thucydides himself (i., 22). Our author wholly ignores the admission of the historian, that he worked up each address in the mode which seemed best adapted for the occasion. (So the words are fairly paraphrased by Mure.) He is equally oblivious of other difficulties, such as the plurality of the speakers (several of the speeches are put into the mouths of deputations), the prophetic allusions (e.g. where Archidamus at the outset of the war anticipates the alliance between Sparta and Persia), and the fact that some speeches, such as those of the Corinthian envoys in the first book, are designed to answer others which the speakers could not have heard. The most fatal objection, however, is that arising from the similarity of style throughout the work. The narrative, it is true, is nearly free from the rhetorical mannerism which disfigures the speeches. Still in rhetorical passages, such as that relating to the Corcyrean massacre, the likeness is glaringly manifested; and it is not less striking throughout the speeches themselves, in spite of the difference of tone and spirit which is so well preserved. The characteristics of the speakers are certainly brought out with a force wholly beyond the reach of rhetorical art; and there is no trace of any formal method in the composition of the speeches—a conclusion which Niebuhr supported. But it is idle to maintain that the prose of Thucydides represents the oratorical style of the period; which, according to our author, was still too new to admit of much variety. Was every orator afflicted with that absurd antithesis of "words" and "deeds," which is said to recur not less than eighty times?

But the basis of this singular theory is an assumption (for which no evidence is offered) that at Athens and elsewhere political speeches were officially reported and preserved. Assuredly the Athenian "Hansard" would deserve a prominent place in the army of martyrs, if he ever existed elsewhere than in the consciousness of our author! The Greeks were not a reading people, notwithstanding that nearly all possessed the necessary instruction. There were, doubtless, reports of celebrated speeches made from memory; and Herr Welzhofer's evidence serves at least to prove that Thucydides made the utmost use of all available materials. He rightly observes that the historian often refers back to the speeches

as part and parcel of the history which he is writing. He also points out various undesigned coincidences, e.g., i., 144—where Pericles undertakes to prove a point in a subsequent speech (cf. ii., 61). With regard to the omission of speeches in the eighth book, from which Cratippus gratuitously inferred that Thucydides altered his plan in deference to his critics, we are justly reminded that the history was originally divided by years, and there is only one completed year (viz. the twentieth) which has no directly reported speeches, while it contains several indirectly quoted.

Several chapters, in which Herr Welzhofer lauds the originality of Thucydides, his accuracy and impartiality, his practical genius, the realism of his political philosophy, &c., are interesting and generally judicious. He is carried too far, however, by his unbounded admiration of the historian. It is surprising that he should so implicitly accept the contemptuous estimate of Herodotus which Thucydides implies by tacitly classing him with the *logographi*. Thucydides was wedded to his own political topic, and the gulf was wide indeed between his rational analysis of the quarrel raging around him and Herodotus's simple sympathetic description of men and manners. What is still more surprising, he goes beyond Thucydides himself in magnifying the importance of the Peloponnesian war, and applies the strong but somewhat vague epithet "Hellenomanen" to all who venture to attach superior significance to the great victory over Persia. The latter saved the intellectual work of Greece from destruction; but, according to our author, that destruction would have been less disastrous than was the political eclipse of Athens which dispelled the dream of an empire of culture. Such a vision seems to have dawned anew on the professorial zealots of the "Culturkampf." The history of Greece might teach them that there is one form of government which will never be successful—Pedantocracy. GEORGE C. WARR.

NEW NOVELS.

Love Strong as Death. By Rose Burrowes. (London: Remington, 1878.)

Angus Gray. By E. S. Maine. (London: Smith & Elder, 1878.)

Love Lost but Honour Won. By Theodore R. Monro. (London: Samuel Tinsley & Co., 1878.)

A Maddening Blow. By Mrs. Alexander Fraser. (London: Hurst & Blackett, 1878.)

My Heart's in the Highlands. By the Author of "The Sunmaid." (London: R. Bentley & Son, 1878.)

It is a pity that Miss Burrowes has jeopardised the success of a novel which shows considerable narrative power and some skill in description, first by adopting the abominable present tense, and secondly by the wild impossibility of the *dénouement*. The heroine is engaged to one of two brothers who are very like each other. When she first sees Lawrence, the "other one," she mistakes him for Leonard, her betrothed, though she immediately finds out the mis-

take. Lawrence conceives an unholy passion for her; and, as Leonard falls violently ill in Demerara, whither the two brothers are obliged to go before the marriage, he forms the ingenious idea of returning to Europe and personating him. This we are asked to believe he succeeds in doing, and the girl never finds out in three weeks' love-making the mistake she had formerly discovered in three minutes. Lawrence, being a scrupulous gentleman, signs the register merely with an L. We are not told how he had got over the previous difficulty of "I, Leonard, take thee Hesba," and when the ceremony is over the real Leonard appears. Hesba charitably regards herself as Lawrence's wife, and though at first she will have nothing to do with him, she at length, after nursing her luckless lover to his death, forgives the other "for his sake." Certainly English notions of matrimony and morality lead to eccentric entanglements sometimes.

There are no eccentricities of this sort in *Angus Gray*. It is a very steady-going book in the main, though it indirectly raises an interesting question for casuists in manners and morals. When a perfect gentleman can only conceal something not unlike a crime of his own by raising disagreeable suspicions about a lady, which should he do—confess and raise the suspicions, or not confess and hide them? Perhaps it ought to be added that the lady is his daughter, though this adds rather to the temptation than to the excuse for concealment. The story of *Angus Gray* is one of those which recount the good fortunes of a squire of low degree. Its drawback is that though the squire in question, Angus Gray himself, is a very honest and manly fellow, it does not appear that he was at all a suitable husband for the heroine, Nell Eveleigh, nor is any cause shown why she should have fallen in love with him except his mere physical beauty. Now, doubtless for contemptible reasons, the idea of a young lady marrying a man out of her own class for his good looks is rather a repulsive one, though it may be suspected that "the lady of the Strachey" was not instigated by any very different motive. Ralph Curgenwen, too, the gentleman suitor, is, as Mr. Eveleigh justly calls him, a "cad," without any cause being shown that he should be so. His keeping his sister out of her rights by working on her feelings is quite consistent with his alleged gentleness of birth and breeding and society; his "caddishness" of language and manners is not. Harold Eveleigh himself is well-enough drawn, with his *dilettante* selfishness and laziness, which, however, do not prevent his being honourable enough as honour goes. But the rest of the characters are too much talked about and not enough set going.

Mr. Monro—though *Love Lost but Honour Won* is not his first novel—has fallen into an error more common in first books than in any others, the error of having too many personages and distributing the interest too much. At the close of this book we are treated to no less than seven weddings, and there has been an eighth just before. This gives us sixteen persons in whose fortunes we are expected to take an interest, and there are four others who are also personages

of the first rank, though they do not succeed in pairing appropriately. Now there are very few novelists indeed who can keep so many balls going satisfactorily. Moreover, the author is too fond of large people. Four at least of his heroes and two of his heroines are magnificent animals, planned on the most extensive scale, and their physical dimensions are impressed upon the reader so frequently that he feels very much like Gulliver on the table in Brobdingnag. These faults are the more to be regretted because there is really some interest in *Love Lost but Honour Won*, if only it were more concentrated. The book contains an excellent and novel receipt for the reclaiming of drunkards, and there is a description of a fancy ball which has a good deal of life and movement.

In *A Maddening Blow* Mrs. Alexander Fraser has entered on a new class of subjects. She has hitherto, in such novels of hers as we have come across, given rather a sunshiny set of pictures. In this book the sun cannot be said to shine at all. The heroine, Ursula Pierce, is a girl whose ruling passion is a love of luxury and excitement, and whose unscrupulousness in gratifying her tastes brings at last a terrible retribution upon her. The less guilty characters of the book are also treated rather roughly on the whole, and the general effect is decidedly gloomy. There is, however, more power in it than there was in *A Thing of Beauty*, and with a little more pains spent upon Ursula Pierce, she might have been made very good indeed. But, considering that it is not more than six months since we reviewed Mrs. Fraser's last novel, we do not think it is unfair to presume that no very great amount of time has been spent over this one. Mrs. Fraser would probably tell us that as it is her readers read her once, and that if she took twice as much time and trouble they would not read her twice. Certain it is that the reader is not guiltless in this matter, but we do not know that his guilt involves the novelist's innocence. We should notice, before quitting *A Maddening Blow*, that it contains a capital child-character—the little damsel Nell Weston, who keeps her father and brother and other people too going by dint of her shrewdness and good offices. We must notice also that Mrs. Fraser, in common with a good many other novelists of both sexes, appears to have very odd notions about special licenses. These conveniences are not obtainable by everybody at a moment's notice all over the United Kingdom.

My Heart's in the Highlands is a pleasant book enough, especially in February and March, when the August delights it celebrates have the additional attractions of distance and contrast. Its affectation of a rollicking and sportsmanlike tone, which may be described as by Captain Hawley Smart out of Major Whyte Melville, with a Guy Livingstone strain, is gently ludicrous, and its astounding misprints of the foreign words which are occasionally indulged in somewhat provoke the carping critic. But it tells its story well and spiritedly, the good people are rewarded and the machinations of the wicked defeated in a thoroughly satisfactory manner, and the decisive scenes

between the heroine and her unworthy lover are really good. The Highland part is good too, though since the publication of *Fair to See* novelists have had a dangerous and arduous task in drawing the humours of Scotch shooting. The writer's love for her scene is evidently as little affected as that of her heroine, and this gives a genuine air which seldom fails to add to the attractiveness of a book.

GEORGE SAINTSBURY.

CURRENT LITERATURE.

Two books on Turkey have just been added to the extensive crop produced by the Eastern Question. The first of these, *Constantinople: how we got there*, by an Engineer (Remington and Co.), is a short narrative of a journey in October 1874, by land from Odessa, where the writer was residing, to Bucharest, Rustchuk and Varna, and from thence by sea to Constantinople, a few of the sights of which city are superficially described. It is devoid of interest, and its sole merit consists in its being grammatically written, and colourless as regards politics. If it had taken the form of a letter to friends, it might perhaps have pleased them, hotel-bills, familiarities and all, but it is wholly unsuited for publication. When the author gets beyond commonplaces, he is especially unfortunate; witness the following:—"A little quotation will, perchance, be excused here, if I inform the forbearing reader that the word Bosphorus is really the same as our most ancient university, signifying the ford for oxen—though where oxen were forded over remains a mystery to me—ferried, I should think, they must have been." We have failed to discover which part of this passage is the "quotation."

THE second of the two books, *The Cross above the Crescent: a Romance of Constantinople*, by the Right Rev. Horatio Southgate (Philadelphia and London: Lippincott), is a strange, and certainly a clever, novel, which, the writer impresses on us, is as much a reality as a romance, for "many of its characters are real persons," and "the greater part of its events really occurred." The scene is laid on the shores of the Bosphorus, and the period it embraces is the twenty years preceding the Crimean War. It is the story of the abduction of a Greek Christian child of low parentage, to be adopted and educated by a wealthy, but childless, Turkish pair; afterwards, when a hue-and-cry is raised, and ambassadors are expected to interfere, the boy is transferred to the house of a Turkish official of high position, where he grows up, and is destined to be the husband of his patron's daughter, a beautiful girl, who is also of Greek descent by the mother's side. In course of time he forgets what he once knew of Christianity, and makes profession of Mohammedanism, after which the marriage is celebrated. Ultimately he is reconverted, and makes his escape to Greece, together with his wife, who also embraces the religion of her forefathers. The principal agent, both in the conversion and the escape, is a travelling Englishman, whose acquaintance we make for a moment early in the story, when his views of life are changed by an interview with a hermit on the Bithynian Olympus, who had formerly been a corsair—a situation not unworthy of *Tancred*. He is the good genius of the story; and not the least startling phenomenon is that, though there is but little sacerdotalism in the book generally, in the last chapters this personage and the hero reappear at Constantinople in the character of priests—the one of the Anglican, the other of the Greek Church. The outline of the tale is sensational enough; but the greater part of the narrative, describing the life of the boy and girl on the shores of the Bosphorus, is imbued with the repose, one might almost say the monotony, of Eastern life. The tone of the book is strongly anti-Mohammedan, while at the same time it gives

proof of a lively appreciation of the good side of the Mussulman character. The writer, who is an American, and describes himself as "formerly bishop at Constantinople," is evidently familiar with the East from the minuteness and accuracy of his descriptions of Oriental customs and ceremonies, which form a marked feature in the work. The scenery, also, both of the neighbourhood of Constantinople and of the old Ottoman capital of Brousa, is sketched with much graphic truth. Here and there, especially in the earlier part, the reader is prejudiced against the book by sallies of bad taste. This passage, for instance, can hardly be described otherwise than as "rubbish":—

"The sorrows of time march along the same pathway with ourselves; but in the reverse direction. They meet us. As soon as they have gone by they vanish into empty air; but each as it passes lays its load upon us; then it disappears—its mission and its life ended for ever."

And "vulgar" is not too strong an epithet for the following:—

"her real name being *Fatma*, which corresponded better, in English, with her physical condition; for her proportions were of rather uncomfortable magnitude, and she waddled as she walked."

On the other hand, what can be better than this description of the stillness of Eastern towns and villages? We wish we had room for the whole passage:—

"It is this death-like repose, hovering like a spell over the charmed land, which everywhere in Turkey offers to the Western traveller the most striking contrast with the homes which he has left. It is in its outward aspect the token of gentle and peaceful decay. But within and at closer view it is disease at the heart, consuming the vital functions and crippling all the active issues of life."

This inequality of treatment is the peculiarity of the book, but much of it is very gracefully written, and, in particular, the story of the hero's visit to his family as a Mohammedan of rank, when he had not seen them since his childhood, is told with a simplicity and tenderness which are a proof of great skill.

The Life of Alexander Lycurgus, Archbishop of the Cyclades, by F. M. F. Skene, is an interesting account of a man whose single-mindedness and elevation of character would be remarkable in any age and country, but are so especially in Eastern Europe at the present day. The lives of such men are of value, among other reasons, because they enable us to see below the surface of their times, and to form a juster estimate of the society in which they lived—as Neander, with his profoundly sympathetic historical insight, has amply shown in his *History of the Church*. No one who is acquainted with the Eastern Church will deny that there is a large element of formalism and superstition in that communion; but on the other hand, if evidence is wanted that vital religion is to be found there, it may be seen in the existence of characters like Archbishop Lycurgus. Such persons, though they may tower above their contemporaries, never stand wholly alone. Where one comes prominently into view, we may be sure that there are many others, unknown or undeveloped, in whom the same qualities would be found in smaller measure; and the soil which produces these cannot be wholly barren. The father of Alexander Lycurgus, George Lycurgus Logothetes, was a Greek of important station in Samos, by profession a physician, who, before the Greek War of Independence, devoted himself to ameliorating the condition of his countrymen in that island, and afterwards fought bravely for the cause of Greece. During the latter part of his unselfish and religious life, he frequently endeavoured to inspire a spirit of patriotism into his youthful son by recounting to him the stirring passages of his life; and the feeling thus generated, acting on a mind which from early years was deeply religious, produced a passionate devotion to the cause of God and the Church, which, as his biographer remarks, was the best service he could render to his

country. In particular he conceived a strong desire to abolish the ignorance of the clergy, and this object he kept in view throughout his life. His great abilities were discovered at an early age, and after studying some time at Athens he removed to Germany, where he spent seven years at various universities, and obtained the esteem of several eminent teachers. Returning to Athens, he was appointed in 1861 Assistant Professor of Divinity in that university, and in the following year received his ordination in Palestine, whither he had gone on a sort of pilgrimage. At Athens he subsequently combined the duties of professor with those of preacher, but he avoided the office of parish priest, as marriage is indispensable in the Eastern Church for that position. In 1866 he was made Archbishop of the Cyclades, an office for which he was specially fitted, not only by his learning, zeal, and piety, but by his knowledge of the world—an element rarely found in Greek bishops, as they are usually selected from the monasteries. There is an interesting account of his discharge of these functions, of his powers as a preacher, his wisdom in dealing with superstitious practices, and above all, his tolerant spirit. This last element was an important qualification for his position, as the Greek islands, owing to their long occupation by the Venetians, contain a much larger Roman Catholic population than any other part of Greece; and it is pleasing to find him not only quelling the animosities which had previously existed between the rival Churches, but even contracting a friendship with the Roman Catholic bishop. Of course, his visit to England in 1870 is narrated in some detail, and the letters which he wrote to friends in Greece, describing his impressions of the country and the English Church, and his reception by the Queen and other eminent personages, are very interesting. His views on the much debated question of the intercommunion of the two Churches are sensible enough. He says:—"I do not believe that the union can be the work of the present day; for the present, in order to prepare for this work of union, a friendly approximation of the two Churches in the spirit of mutual love is both possible and desirable." The affection which he conceived for this country during his stay is very remarkable. He writes to his favourite sister from Paris:—"On sailing from England I raised my arms to heaven, and blessed the land, praying from my heart that it may ever be covered by the all-powerful right hand of the Lord." Perhaps, after all, the most attractive point in the man's character was his thorough domesticity and the warmth of his family affection.

St. Petersburg to Plevna. By Francis Stanley, Special War Correspondent of the "Golos of Russia," "Manchester Guardian" &c. (Bentley.) *St. Petersburg to Plevna* is light reading; Mr. Stanley gossips pleasantly of the "confidences," if such they can be called, extended to him by Russian diplomatists and soldiers, and of his personal experiences at the seat of war, but his contributions to the history of the campaign are small and his remarks have but little "direct bearing on the great questions of the hour." Mr. Stanley has no very high opinion of the Bulgarians and Roumanians; the former are a "prosperous white-livered set of curs," mean, selfish, cowardly, and treacherous, and they are credited with all the atrocities committed on Russians, Turks, and Bulgars; the character of the latter is composed as a whole "of a complete forgetfulness of all the ten commandments, added to a double dose of profligacy and covetousness." The Grand Duke and his staff are most unsparingly criticised, and the former is accused, rather unfairly, we think, of something very like want of personal courage (p. 185), in retiring to Radenica before the attack on Plevna. Mr. Stanley charges Levitski, who planned the assault on Plevna on September 11, with never having visited his proposed field of attack, and with having forgotten his own dispositions while the battle was raging. He

also states that on the day of the assault the general staff, impressed with the value of the lives of staff officers, remained at Radenica, fifteen miles to the rear. Perhaps the most amusing incident in the book is that in which Colonel Tickenmanyeff, chief of the staff of the 16th Division, and Mr. Stanley, on the evening of September 8, ride off into the darkness at the head of 2,000 men, and losing their way run against the Turks; a sharp fire is at once opened on both sides, the result being that Tickenmanyeff and the "Golos special" bolt in one direction, the men they were leading in another; the former after sundry adventures reach Skobelev in safety, the fate of the latter is not mentioned. Mr. Stanley is not always quite fair in his remarks on the action of the Russian generals, and his comments on the celebrated raid of General Ghourko across the Balkans, at the commencement of the war, will hardly meet with the approval of military men. A melancholy picture is drawn of the needless suffering entailed on the wounded, after the failure of the last assault on Plevna, by Russian carelessness and want of forethought; and Mr. Stanley writes in just indignation of the terrible scenes which followed the capitulation of Osman Pacha. For three days the sick and wounded remained unfed and untended; then the burial of the dead, and too often of the living, was carried out "with the greatest possible amount of indignity." These scenes were allowed "to go on for weeks;" and, coupled with "the miserable fate of the prisoners, who were bivouacked in a starving condition for days on the plain west of the Vid, and then marched off, without food, to perish in the snow, will for ever remain a monument of eternal disgrace to the Russian name."

Notes on Cavalry Tactics, Organisation, &c. By a Cavalry Officer. (C. Kegan Paul and Co.) The author lays down the following principles for the action of cavalry in battle: that infantry and artillery should be assailed in extended order; that the normal formation of cavalry should be in "rank entire"; and that the attack and preliminary advance should be as rapid as possible. Formation in "rank entire" has so often been advocated by high and competent military authority, and seems so necessary a sequel to the introduction of breech-loaders, that it is not easy to see why it has not been adopted, unless, indeed, cavalry officers are "of all classes of military men that most opposed to change." Speed has now become more essential than ever, and it would be well if more attention were paid to the maxim of Marshal Saxe, that "a squadron that cannot charge 2,000 paces at full speed is unfit for service." After discussing the employment of cavalry on the field of battle, the author devotes a chapter to fighting on foot and minor tactics, and concludes with some suggestions for the improvement of the arms, equipment, and organisation of our cavalry, which, if not altogether new, are by no means wanting in value. The Cavalry Officer has evidently given much time and attention to the subject on which he writes, and we hope that his book may be the means of removing some of that "dead weight of professional opposition and apathy" of which he complains.

Tactical Examples. Vol. II. By Hugo Helvig, Major of the Royal Bavarian Staff. Translated by Colonel Sir Lunley Graham. (C. Kegan Paul and Co.) The second volume of Major Helvig's *Tactical Examples* treats of the "Regiment and the Brigade," and is a fitting sequel to its predecessor, which dealt with the "Battalion." The examples are carefully worked out, and their value as a means of tactical instruction can scarcely be over-estimated. In a preface to his translation Sir Lunley Graham replies to some recent remarks by Sir Garnet Wolseley adverse to the system of four company battalions adopted in most of the continental armies, and brings forward several strong arguments in its favour. The four company battalion is in many respects superior to

the eight company battalion, and its advocates are increasing in number and influence, but the system will probably not be introduced into the British army until the rude teaching of war has shown it to be necessary.

NOTES AND NEWS.

MR. O. W. A. TAIT, of Olifton College, has prepared an *Analysis of Green's Short History of the English People*. It will be published immediately by Messrs. Macmillan and Co., with the sanction of Mr. Green, and should prove useful in schools.

DR. W. WAGNER, the compiler of the *Carmina Graeca mediæ ævi*, has just returned to Hamburg after a visit to England of some weeks' duration, mostly spent in examining the Mediaeval Greek MSS. in the British Museum. Among other discoveries he has found an "Alphabet of Love," or collection of short lyrical pieces in early Romain. Judging from the words *τὴν κόρην τὴν ἐφιλόσα* 'σ τὴν Ῥόδον τὴν ἐφῆκα, it would seem to have been written at Rhodes, and as the words ἐσύ 'σαι κίονον πορφύρον ποῦ στέκει 'στὸ παλάτιον οὐοῦ κουμπίζει ὁ Βασίλεὺς καὶ κρίνει ὁ λογοθέτης would naturally suggest, before the overthrow of the Byzantine empire. There can be little doubt that this is the earliest collection of popular Greek poetry that exists. It amounts to about 700 lines. Some of the poems are of very great beauty, and for the happy marriage of southern warmth of expression with the picturesque colour of the Byzantine element, is even poetically superior to the MSS. from the Library at Vienna lately brought to light by M. Emile Legrand. Dr. Wagner is now preparing his transcript for the press, and will accompany it with a short Glossary.

The Librarian of Congress has issued his Report for 1877, from which we learn that the Library now possesses 331,118 volumes, and about 110,000 pamphlets. The separate books deposited under the copyright laws during the year were 4,476, beside a still greater number of periodicals. The library has begun the printing of its catalogue, which has long been ready for the press, and which will be brought down to 1877, arranged in a single alphabet by author's names. Mr. Spofford says that this will include a larger collection of English and American literature than has ever been embraced by any printed catalogue in a single alphabet. As, however, two copies of every publication are deposited under the copyright law, the Library probably possesses an unusual proportion of duplicates. The Library is also completely indexing the documents, debates, and laws of Congress; and the Boston Public Library has offered it its manuscript index of documents, assumed to be approximately complete. Why should not such co-operation be widely extended?

WE have received the seventh *Library Bulletin* from Harvard University, which, beside the usual list of the more important accessions for the previous quarter, concludes the selection of authorities on American history to accompany the Syllabus to Dr. Lodge's Lectures, with brief but exceedingly useful notes. There are also similar notes on the authorities for the earlier Puritan history, for the question of Gold and Silver, and for the history of the Empire and the Papacy 1056-1122. The *Bulletin* ends with an account of the notable books in the Summer collection, and the first instalment of Prof. Norton's descriptive notes on the principal works on Michelangelo. The administration of Mr. Justin Winsor seems likely to prove an admirable commentary on his own text, "Make all the use you can of the college librarian. It is his business to advise you."

MESSRS. MACMILLAN AND Co. have just ready a new and rewritten edition of Mr. W. Robinson's *Parks and Gardens of Paris*. It forms a handsome

octavo volume, and contains more than 350 illustrations.

THE French Academy has made the following awards for four of the chief competitions of 1878:—Gobert prize (1) M. R. Chantelaure, for his work *Le Cardinal de Retz et l'affaire du chapeau*; (2) M. L. Perigaud, author of *Les Saulx-Tavannes* and *Correspondance des Saulx-Tavannes au XVI^e Siècle*. Théroutanne prize (1) M. H. Forneron for a work on *Les Ducs de Guise et leur époque*; (2) *Alain le Grand*, by M. A. Luchaire, and *La Fronde Angevine*, by M. A. Debidour. Bordin prize (1) M. Gustave Marlet, author of a *Tableau de la littérature française, 1800 à 1815*; (2) M. le Comte de Gobineau, for his work on the Renaissance. Marcelin-Guérin prize (1) M. A. Rambaud, author of an *Histoire de la Russie, depuis ses origines jusqu'à l'année 1877*; (2) M. Hippeau for his *L'Instruction publique dans les Etats du Nord*; M. H. Jouin for a Study on David d'Angers; M. Rambosson for a scientific treatise on *Les Harmonies du son et les instruments de musique*.

AN eighth edition of Eduard von Hartmann's *Philosophy of the Unconscious* has just been issued in Germany, showing how large is the demand among German readers for pessimistic literature. The author has accompanied this edition with a Preface, in which he gives (1) directions as to the proper study of his writings, (2) a list of works that have been written on his own, (3) a short characterisation of his own and his disciples' apologetical writings, and (4) a list of those of his writings which have been translated—altogether a by no means over-modest performance.

THE *Rivista Settimanale* states that on the occasion of the festival which is to take place next June at Ravenna, at the inauguration of the monument to Luigi Carlo Farini, a Life of Farini will be published from the pen of Giuseppe Badiali, and also a selection of Farini's unpublished correspondence, with a preface by Adolfo Borgognoni.

THE interesting little polyglot *Journal of Comparative Literature*, published weekly in Transylvania, brings, in its last number, a Schopenhauer relic communicated by Dr. Gwinner, Schopenhauer's friend, biographer, and executor. It is a translation of Milton's Ode "On Time," and is so admirable, exact, and powerful that we would gladly reproduce it here to show that Schopenhauer could lay claims to be a poet also. We are, however, deterred by an earnest appeal from the above-named journal against such a reprint. It is their intention to publish it themselves in *facsimile*, and the profits accruing are to be devoted to the erection of a colossal bust of Schopenhauer on the centenary of his birth, February 22, 1833. Dr. Gwinner judges from the handwriting that the poem was translated when Schopenhauer was still a clerk at Hamburg.

SINCE the close of the late war a praiseworthy literary activity has sprung up in the Spanish Basque provinces. We lately noticed the publication of the *Concionero Vasco* at St. Sebastian, and we now draw attention to the "Asociacion Euzkara de Navarra," which has its seat at Pampeluna, and the *Revista Euzkara*, a monthly publication in Basque and Spanish, for its literary organ. Dryden thought he said a good deal when he wrote "Thrice he routed all his foes, and thrice he slew the slain;" but a literary error needs a deal more slaying ere it finally disappears. We are astonished to see at pp. 28-29 of the No. for April, the "Canto de Altobiscar" still treated as authentic by Basques. Not only did M. d'Abbadie, on its publication by Fr. Michel, in *Le Pays Basque*, write to the *Gentleman's Magazine*, March 1869, p. 226, declaring that he knew when, and in what language it was first written (a statement which he has frequently repeated to the present writer), not only M. Bladé (whose opinions are here combated) in 1866, but a much more competent writer in *L'Imparcial de Bayonne*, in 1873, in

detailed criticism, has proved the essentially modern character both of this and of the so-called, but older, "Chant des Cantabres."

THE *Nuova Antologia* for April 15 has an article by Signor La Lumia on the life of the Macaronic poet Teofilo Folengo (Merlino Occcai), especially on his later days, which were spent in the monastery of San Martino, near Palermo. There he wrote a poem *La Palermimana o humilità di Cristo*, which was dramatised into a sacred play and was known as *Atto della Pinta*. Of this curious play Signor La Lumia gives a full account.

IN the *Rivista Europea* Signor Bartolotti publishes some valuable documents illustrative of the Florentine diplomacy at Rome when Cosimo I., Duke of Tuscany, was maturing his schemes for seizing the Republic of Siena. Signor Modona publishes an instalment of a work on which he is engaged on the Ario-Semitic Solar Myths. In his paper he discusses the legend of Sappho and Phaon, which he reduces to a solar myth, and concludes that this early myth gathered round it stories of profligacy, and that in later times the myth and its attendant stories were transferred to a poetess, of whom nothing was known save the name, which happened to be the same as that of the heroine of the myth. The real poetess was therefore credited with the qualities of her mythical homonym. Signor Ademollo finds a flaw in Goethe's *Italienische Reise*, where, in his description of the Carnival in 1783, he mocks at the Pretender, Charles Edward Duke of Albany, for being the only noble who insisted on using his privilege of driving along the Corso in the Carnival week, "adding to the general mummery the special mummery of his own kingly pretensions." This, Signor Ademollo points out, is unhistorical, as the Duke of Albany died on January 30, 1788, and therefore could not have been present at the Carnival in that year. Signor Ademollo attributes Goethe's mistake to an unworthy desire to have a fling at the fallen, through a courtier's sympathy with the powerful House of Hanover.

THE *Deutsche Revue* for April has a suggestive article by Brugsch-Bey on the "Mysteries of the Ancient Egyptians," founded on personal investigation of the Egyptian temples and hieroglyphics. The *Revue* also begins the publication of a series of letters of Liebig addressed to Prof. Wöhler, beginning in the year 1829; only such parts of the letters are published as are of general interest in showing the course of chemical studies, without going into the details of experiments.

THE *Cape Monthly Magazine* for April contains an interesting, but tantalisingly short, article on Malagasy Folk-lore. It consists of three tales translated by Miss Cameron from a work entitled *Specimens of Malagasy Folk-lore*, edited by the Rev. L. Dahle, of the Norwegian mission in Madagascar, and published at Antananarivo last year. Like so much of South African folk-lore, the three tales are largely concerned with animals. Thus the first explains "why the rats are devoured by the cats." The rat and the cat, it seems, once went out hunting together, the rat having previously taken the precaution of making a hole in the ground. They brought back with them a fattened ox, the bones and skin of which alone were given to the rat, while the cat seized all the flesh. What he could not eat at once was salted and hung up in a basket. While the cat was away the rat nibbled a way through the basket and devoured the flesh inside, and when chased by the cat upon its return fled into the hole it had made and so escaped. The second tale describes a certain Ravazimba, who belonged to the race of the Azimba, "small of stature and with small heads." After catching the Seven-headed Hydra, he sent the serpent called "Lord of the Water" to tell his parents: "I am gone down below the water, and I send to bid you good-bye; send, therefore, the blood of some living creature, with its feet, its fur, and its fat, and if ye do this ye shall be blessed." A small blue bird called the Vintay

was afterwards despatched with a similar message, and in return Ravazimba said to it:—

"Because you have been diligent and wise, I bestow honour upon you; I will place upon your head a crown of glory, and I will array you in blue day and night. When you have young, I will rear them; and those who seek to kill you I will slay in their youth."

Hence it is that the Vintay builds its nest close to the water's edge, and, like the serpent called "Lord of the Water," is not killed. The Vazimba are frequently promised gifts of sheep, fowls, and the like, in return for restoration to health, general prosperity, &c. The third tale narrates some stories of the Songomby, a fabulous animal, large and fleet-footed, about the size of an ox, which devours human beings. This creature is supposed to live in caves, and on the African side of the Straits to have formerly been trapped by placing a crying child, bound, near its den, and then to have been used as a horse.

WE noticed in our last number some new and old literary journals published in Germany. This week brings us a new advertisement of the *Deutsche Literaturblatt*, issued by the old-established firm of Perthes in Gotha, and edited by Prof. Herbst. Its special object is, as usual, to counteract the fatal influence of "dishonesty and dilettantism," now so prevalent in the critical papers of Germany. All reviews are to be written by well-known authorities, and will contain both "a picture and a judgment" of each book. The books to be reviewed are chiefly to be those which may be called popular, or not exclusively technical. "Popular," however, has a wide sense in German, and when applied to such works as the Greek and Roman histories by Curtius and Mommsen, or Helmholtz's *Tonempfindungen*, means really what is thoroughly natural, digested, and artistically finished, as distinguished from the raw and crude materials occasionally poured out in the ponderous volumes of learned but lazy writers. The Review is to appear at first fortnightly, and is strongly recommended to that large class of Germans who are living abroad in every part of the world.

A FRENCH translation of the English novel *Marmorne* is now appearing in the *Temps* newspaper. It will afterwards be reprinted as a volume in Messrs. Hachette's "Bibliothèque des Meilleurs Romans Etrangers."

OBITUARY.

PROF. HEINRICH LEO, the celebrated historian and philologist, whose death is announced by the German papers, presents a singular instance of the mutability of human opinions. He started in life as an advanced Liberal after the fashion of Ludwig Jahn and as a staunch disciple of Hegel's philosophy, and died one of the most fanatical upholders of Conservative and orthodox principles. The story of his life is soon told. He was born at Rudolstadt in 1799, and at the age of seventeen went to the University of Breslau to study medicine. Soon, however, the more congenial disciplines of history and philology attracted him, and after having visited Italy he wrote his first important work, on the *Constitution of the Cities of Lombardy* (1827), in continuation of a smaller book on the same subject published four years previously. After having held various positions in the Universities of Berlin, Dorpat, and Jena, he obtained in 1830 the Professorship of History at Halle. In the meantime the change in his political and religious opinions above indicated had taken place, and in his *Studies and Sketches on the Natural History of Government* (1833) he finally broke with the principles of modern progress, and preached reaction pure and simple. His numerous polemical writings do not concern us here. More important and of lasting value are his purely scientific works, his *Altäussische und angelsächsische Sprachproben* (1838), his *Beowulf* (1839), and his *Vorlesungen über die Geschichte des*

deutschen Volkes und Reiches (1854-1866). Since 1863 Prof. Leo was a member of the Upper House of the Prussian Diet.

SWITZERLAND has lost one of her most industrious and promising historical scholars in Traugott Probst, Canon of Solothurn, who has just died in that city at the age of 35. He published a number of original articles upon the history of his fatherland, principally in the successive volumes of the *Archiv der Schweizer-Geschichtsforschenden Gesellschaft*. Perhaps the most valuable of these is an exhaustive enquiry into the relations between the Swiss Confederacy and the Empire up to the year 1490, in which he brought much new light to bear upon the causes of the Swabian War. Since the year 1870, Probst has been the painstaking editor of the *Anzeiger für Schweizerische Geschichte*.

THE death is announced of M. Gustave de Wailly, at the age of 74. He was the author of several dramas, and of a translation of the first four books of the *Aeneid*.

NOTES OF TRAVEL.

WE have received a copy of the Annual Address of Chief Justice Daly, LL.D., President of the American Geographical Society of New York, which contains an excellent review of the geographical work of the world in 1877. One of its most interesting paragraphs refers to a new light which has been thrown on the probable fate of part of Sir John Franklin's expedition. It will be remembered that in 1872 Captain Potter, master of a New Bedford whaler, obtained a few spoons and other relics of the ill-fated expedition of Sir John Franklin, from two Esquimaux of the Netchelli tribe, who told him that the articles had belonged to a party of white men who came a long time before to the place, in the Gulf of Boothia, where the Netchelli were then wintering, and all of whom they said had died there during the winter. This information did not at the time attract much attention, as it appeared improbable that the survivors had gone in the north-eastern direction to which this pointed, when it was known from their own record, found by Sir Leopold McClintock at Point Victory, on the north-west coast of King William's Island, that they were compelled to abandon their ships, and were to start on April 26, 1848, from that point (105 souls, under command of Captain Crozier, Sir John Franklin being then dead), for Back's Great Fish River to the south: and that they did so was confirmed by information afterwards received by Dr. Rae from the Esquimaux. During the present year, however, Thomas F. Barry, second mate of the *A. Houghton*, a whaling vessel which was stranded last year on the north-eastern shore of Hudson's Bay, and who was with Captain Potter in 1872, brought back the intelligence that while his vessel was wintering last year at Marble I. in the upper part of Hudson's Bay, he obtained from some other Netchelli Esquimaux a silver spoon with Franklin's crest on it, and that upon conversing with these natives they told him exactly the same story respecting the party of white men that he had heard at Repulse Bay five years before. A chart had been laid open before the Netchelli at that time, and they were asked if they could point out where these white men died and were buried. The Netchellis followed up the outline of Melville peninsula very carefully till they came to Cape Englefield, the north-west point of that peninsula, when they looked for an island in the west, in the Gulf of Boothia, and were disappointed at not finding it on the chart. As Barry understood them, it was upon this island, or in its vicinity, that the white men were buried, and they gave the direction of the place by pointing to the north-west from Cape Englefield. The Esquimaux, Joe Ebberbing, told Dr. Daly that he saw this island when he was with Hall, and he fixes it upon the chart in about

70° N. and 87° W. long. in the Gulf of Boothia. Dr. Daly thinks it probable that one or other of the parties under Captain Crozier, going towards the Great Fish River, may have changed their course to make for Victory Harbour, on the south-eastern shore of Boothia Felix, where Sir John Ross abandoned his vessel, the *Victoria*, in 1832, and where it was known that a large depôt of provisions had been left.

In addition to its *Bolletino*, the Italian Geographical Society has begun the publication of a journal entitled *Memorie della Società Geografica Italiana*, the first part of which opens with a lecture on Scientific Geography by the president, Cristoforo Negri. We find here also the commencement of a valuable series of instructions for travellers in scientific work by various authors, and an account of the famous planisphere of Bartolomeo Pareto of 1455, which was believed to be irreparably lost after the death of its last known possessor, Padre Giovanni Andrea, but which has found its way to the Biblioteca Vittorio Emanuele in Rome.

INFORMATION has been received by the Italian Geographical Society through Gordon Pasha at Khartum that the members of the Matteucci-Gessi expedition had reached Fadasi, the first station in the Galla country and the limit point as yet of exploration in the direction from the Nile valley, in excellent health. According to Col. Gordon, the part on which the travellers are now entering, the thirty days' march through hostile tribes between Fadasi and the country of Kaffa south of Abyssinia, centres in itself all the dangers of the proposed route. Col. Gordon had formed a plan of establishing a chain of Egyptian military stations between Fadasi and Kaffa, but the scheme is not realisable at present on account of its cost.

CAPTAIN MARTINI, one of the members of the Marchese Antinori's expedition, has returned to Rome from East Africa, bringing with him presents for the Pope from King Menelik of Shoa.

As the result of his recent observations in New Guinea, the Rev. S. Macfarlane states that the people of Kerepunu and Hula are by far the finest-looking natives he has seen in the island, and the most industrious he has met with throughout the South Seas. Their villages are unusually neat and clean, their houses and canoes well-built, and their plantations like well-cultivated gardens in England. Mr. Macfarlane saw the work in its different stages. The land is turned over, as if it had been ploughed, by rows of men with pointed sticks, which they simultaneously plunge into the soil and use as levers. It is then broken and neatly levelled by the women, after which bananas, sugar-cane, yams, &c., are planted in lines. Mr. Macfarlane saw several square miles of these gardens, all neatly fenced in and thoroughly weeded, with bananas and vegetables planted in rows as straight as an arrow. The people observe a regular system of working two days and resting one, and they are very systematic in their work, some devoting themselves to agriculture and others to fishing.

THE Rev. W. Wyatt Gill, whose return to the South Seas we recorded the year before last, was engaged for some weeks during the past summer in making a tour among the islands of the Hervey Group in the South Pacific.

HIMALAYAN EXPLORATIONS.

IN our last issue we briefly alluded to some important geographical work which has been performed on our northern Trans-Indus frontier by one of the trained explorers attached to the Great Trigonometrical Survey of India. The Mullah, the explorer in question, has made a survey of the course of the river Indus, from the point where it enters the plains above Attok to that where it is joined by the river of Gilghit, which portion has hitherto remained unexplored.

Here the great river traverses a distance of some 220 miles, descending from a height of about 5,000 feet to 1,200 feet above the sea-level, and its course winds tortuously through great mountain ranges, whose peaks are rarely less than 15,000 feet high, and culminate in the Nanga Parbat, the well-known mountain, whose height (26,650 feet) is only exceeded by a very few of the great Himalayan peaks. No European has ever yet penetrated into this region, which is very difficult of access from all sides, and is inhabited by hill tribes, independent and suspicious of one another. Each community elects its own ruler, and has little intercourse with its neighbours, and with the outer world it only communicates through a few individuals who are privileged to travel over the country as traders. The Mullah possesses this privilege, and thus, in the double capacity of trader and explorer, was able to travel along the Indus and through some of the lateral valleys, leaving the rest for future exploration. He afterwards proceeded, as directed, to Yassin, through the Gilghit Valley, which has been already surveyed. From Yassin he surveyed the southern route to Mastuj, through the Ghizar and Sar Laspur valleys, and has furnished an important rectification of a route hitherto very erroneously laid down from conjecture. From Mastuj the explorer proceeded along the route leading towards the Baroghil Pass, as far as the junction of the Gazan with the Yarkhun river, and then along the northern road from Mastuj to Yassin. This road turns up the Gazan Valley, crosses the Tui or Moshabar Pass, which is thought to be not less than 16,000 ft. above the sea, and, after traversing a deep crevassed glacier for some eight miles, reaches the point where the Tui river issues in great volume from the glacier; the road then follows the course of the river down to its junction with the Warchagan near Yassin. Returning to Sar Laspur, the Mullah next surveyed the route to the south-west, up the valley leading to the Tal Pass, which is situated on a plateau of the range connecting the mountains on the west of the Indus Valley with those on the east of the valley of Chitral, a region generally known by the people of the country as the Kohistan. The Swat and Panjkora rivers, and most of their principal affluents, are found to take their rise here. The most commanding peaks of the range have already been fixed, but of the general lie of the valleys relatively to the peaks nothing was known before the Mullah's visit, and he has done much to elucidate the geography of this region. After crossing the Tal plateau, he descended into the valley of the Panjkora, and traversed its entire length down to Dodbah at the junction of the Dir river. He was prevented from following the Panjkora to its junction with the Swat river, and therefore travelled along the Havildar's 1868 route to Miankalai. Thence he surveyed the road to Nawagai and on to Pashat in the valley of Kunar; and, last of all, he surveyed the road from Nawagai down to the British fort of Abazai. The explorations of the Mullah have thus filled up a considerable gap in the map of the country on our northern Trans-Indus frontier, where the Survey propose to carry out further explorations as soon as possible.

STATEMENT OF THE OXFORD UNIVERSITY COMMISSIONERS.

THE work of the Oxford University Commission has advanced one stage. The Commissioners were required by their Act of Parliament, before approving any scheme submitted to them by the colleges, to publish a Statement defining the main purposes relating to the University for which in their opinion provision should be made, the sources from which funds for those purposes should be obtained, and the principles on which payments from the colleges should be contributed. This preliminary statement the Commissioners have now issued in a somewhat lengthy docu-

ment, which has been elsewhere inaccurately described as a "Report." It is important to bear in mind the origin and scope of the document, in order to appreciate it at its proper value. The Commissioners have scrupulously limited themselves to the duty imposed upon them. It may be regretted that they did not take a wider view of their instructions. A prudent lawyer will never volunteer his opinion beyond the facts on which he is expressly consulted. But we might have expected from a body of men so eminent as the Oxford Commissioners something like a general review of the subject of academical reform. It would be a matter of more than common interest to learn their considered opinions on such fundamental questions as the relation of the professoriate to the working staff of college tutors, the continued existence of the colleges as overgrown boarding houses, or the methods of encouraging study and research outside the trammels of the examination system. On these points they have preferred by their silence to disarm opposition rather than arouse enthusiasm. Their Statement deals with details and not with principles. It merely formulates suggestions that have long been the common property of most academical reformers. It is addressed to resident teachers and college bursars rather than to the general public. The parties that desire the reorganisation of the faculty of medicine, or the establishment of an Indian Institute, equally with the advocates of the endowment of research, will receive from it but scanty encouragement. It is marked throughout by an excess of cautiousness, finding a fit expression in the laboured sentences and saving clauses which seem to betray the professional hand of the chairman. Those who are familiar with the Report of the Hebdomadal Council, published in March of last year, will have no difficulty in recognising the proximate source of inspiration. In fact, the present Statement may be described as an authoritative promulgation of that Report, supplemented by an indication of the financial demands involved.

The subjects of which the Commissioners treat may be arranged under four headings: (1) the augmentation and better endowment of the teaching staff of the University; (2) the erection of University buildings and their maintenance in a state of efficiency; (3) the consideration of certain miscellaneous wants of the University, to be satisfied for the most part out of a common fund contributed by the colleges; (4) suggestions with regard to the manner and the proportion in which the colleges shall furnish such contributions. Under the first heading it is proposed to fix the stipends of twenty-five chief professorships, including three chairs to be newly founded, at a value ranging between 700*l.* and 900*l.* a year; to fix the stipends of twelve minor professorships, also including three new chairs, at a value ranging between 400*l.* and 500*l.*; and to found about a dozen readerships, each with a salary of 400*l.* The proposal to divide professorships into two classes is open to criticism; and it may be urged that the wife of every professor will consider her husband an ill-used man if he is not awarded the maximum salary of his class. It is also of doubtful expediency to abolish the Corpus chair of jurisprudence, and apportion its subject matter between constitutional and international law. The entire faculty of theology and several other chairs, such as those of Sanskrit and Fine Arts, are altogether omitted from consideration. The reason for this omission is obvious; but the result is that it is difficult to estimate the financial consequences of the changes proposed. Assuming, however, for each professor the average stipend between the two extremes, it may be calculated that the total annual sum required for the fifty University teachers in the above list will be about 30,000*l.* Owing to the existence of certain special sources of endowment, the whole of this sum will not fall upon the colleges; but the Commissioners propose that the Colleges shall henceforth take upon themselves to meet that

portion of the professors' salaries now defrayed from the University chest. According to the Report of the Duke of Cleveland's Commission of Enquiry, the professorships corresponding to those now under discussion received in 1871 about 2,500*l.* from special endowments, 4,500*l.* from the University chest, and 6,500*l.* from the colleges: total, 13,500*l.* To make up 30,000*l.*, therefore, the colleges will now have to furnish no less than 27,500*l.*, or more than fourfold their present contribution, making full allowance for some increase since 1871. We may remark that the total income of all the professors and readers in that year from all sources, including fees, amounted to only 25,000*l.*, of which the five chief theological chairs absorbed 7,500*l.*

In regard to University buildings and their maintenance, the Commissioners suggest that all capital expenditure should be provided by the University from its own corporate funds by means of borrowing. In 1871 the corporate income of the University was 32,000*l.*; and it is argued that this income will be ample for all purposes, when augmented by increased profits from the Clarendon Press, and relieved by the transfer of other charges to the colleges. On the other hand, it is proposed that the colleges should contribute an annual sum of 3,000*l.* toward the general needs of the Bodleian Library, in addition to the present endowment of 6,500*l.*; and also an annual sum of 500*l.* for the proper maintenance of the Archaeological Museum which it is intended to establish. The third class of recommendations is of a miscellaneous nature. They comprise retiring pensions for professors; additional provision for unattached students and certain examining boards (both of which departments ought certainly to be made self-supporting); and the three following objects, which we quote at length because of their intrinsic importance, and also to illustrate the pseudo-legal circumlocutions in which the Commissioners have enveloped their meaning:—

"The foundation and endowment of scholarships or exhibitions tenable after a certain fixed period of residence in the University, for students in any special branches of study (including subjects which do not fall within the ordinary University course, such for example as medicine), which may be usefully promoted by such encouragement, under conditions properly adapted to make their enjoyment dependent upon the *bonâ fide* prosecution of such studies.

"The encouragement of research, by the employment of properly qualified persons, under the direction of some University authority, in doing some definite work, or conducting some prescribed course of investigation, in any branch of literature or science; or by offering prizes or rewards for such work or investigation.

"The appointment and remuneration, from time to time, by the University authorities, of extraordinary professors or occasional lecturers in any subjects, either represented or not on the ordinary teaching staff of the University."

The concluding portion of the Statement, indicating the principles according to which contributions should be levied from the colleges, is characteristic of the spirit of permissive reform which animates the entire document. All educational and other wants of the colleges themselves are to be liberally provided for, before the most pressing necessities of the University are taken into consideration. Prize-fellowships are to be retained pretty nearly in their present form. As a first step, the contribution of every college towards the stipends of the new University readers is approximately fixed at $1\frac{1}{2}$ per cent. on the amount of the ordinary revenue. Then the charges for the professoriate, the Bodleian Library, and the Archaeological Museum, are to be apportioned among those corporations best able to bear the burden. Finally, after the lapse of some years, "such of the colleges as may from time to time have a further disposable surplus," not sunk in bricks and mortar, or divided among the teaching staff, are expected to contribute to a common University fund from which the class of miscel-

laneous wants is to be met. There is perhaps but little harm in thus postponing the endowment of research to a future epoch, when the meaning of the phrase shall be better understood.

JAS. S. COTTON.

M. RENAN'S "CALIBAN."

THE curiosity which was felt about M. Renan's *Caliban* before its publication has in one way hardly been satisfied by the result. The interest of the little piece is much more political than literary, and thus one feels that a rather unjustifiable liberty has been taken with Shakspeare. It is perhaps no wonder that the Republican party in France should have been bitterly annoyed at it, but we cannot avoid a slight feeling of surprise that M. Renan should have taken the trouble thus to annoy them. The first act shows us Prospero restored to Milan, but living very much in retirement, and still practising his magic arts. As he has not drowned his books deeper than ever plummet sounded, so also he has parted neither with Caliban nor Ariel. The latter still executes his hests, the former is kept as a kind of tame monster, but is allowed free access to the cellar. Here we find him in the condition which might be expected. The wine makes him moralise, for he has advanced considerably in civilisation. He is still, however, very angry with Prospero, by whom he considers himself *exploité*. Ariel appears and remonstrates, but, of course, with no effect. Then follows a theosophic dialogue between Prospero and Ariel of very little interest, but fortunately short. Act the second shows us a *fête* at Milan where Prospero regales his subjects with the same shows which we knew of old in the Isle. Groups of citizens wander about and converse: some signs of a popular conspiracy being visible. Prospero is warned of this but despises the warning, trusting to his art, and once more retires to his study at Pavia. In the third act something like an *émeute* begins, and Caliban is active in it. He becomes suddenly eloquent, addresses the people on their wrongs, and they salute him as *Le Grand Citoyen Caliban*. Finally they carry him to the palace and enthroned him. Short as is the time, the capable brute has gone through another metamorphosis. Being in power he preaches moderation, and bids them go home and crown their victory by respect for property. In the last scene he soliloquises—decides that *le Gouvernement doit résister*, and that he will be a patron of arts and letters, even of Prospero himself. In the fourth act Prospero receives the news, and naturally cannot believe it. He is convinced at length, and bids Ariel with his art restore order. The tricky sprite flies to execute his bidding, but returns beaten—"against the people spells are powerless." Prospero feels himself vanquished; and when a deputation arrives from Milan announcing the gracious intentions of Caliban, he gives way at once, especially when he finds that the new Government will not give him up to the Inquisition, which on his downfall is prompt to seize on the magician. Then in the fifth act we have the coronation of Caliban and the prodigality with which the Church lavishes her favours upon him. Even Prospero consents in his turn to be *exploité*, and to throw the lustre of his scientific knowledge and discoveries over the reign of the new Duke. Only Ariel does not understand this facility; he cannot change his allegiance; the complaisance of Prospero is his death-warrant; he is resolved into the elements.

The chief drawback of the piece may be apparent even from this slight sketch. The metamorphoses of Caliban are too rapid. From his stage of drunken revolt to that of conspiracy is of course no unnatural transition; but thereafter he becomes revolutionary leader, is struck with a respect for property, lays aside his sanguinary projects, and starts saviour of society in little more than a few minutes. The transition from

Danton to Napoleon III. is legitimate enough and full of points for satire; but it needs broader canvas to work it out upon. Another fault is that Prospero's aerial police seems to have lost not merely its authority but also its intelligence, and that the magician himself has become a very singular sort of dotard. But of course M. Renan's main design was to complete his sketch of Caliban himself: to show the readiness of democracy to admit any leader, and the readiness of the leader to cool down in his revolutionary ardour when he is once arrived. This object he has fulfilled happily enough, and at the same time he has gratified Voltaireans by a most stinging picture of the sycophancy of the clergy. *Caliban* will remind some people a little of *Rabagas*, and others a little of *A Soul's Tragedy*. But it will, we think, seem to most readers a pity that a grand subject which, treated as M. Renan has in parts treated it, somewhat on the plan of the second part of *Faust*, might have been made a whole satiric drama of modern society, should have been thus insufficiently handled. Shakspeare's characters are not exactly *publica materies*, to be turned to such slight uses. The following soliloquy of the Carthusian prior during Caliban's enthronisation is as good a key-note of the tone adopted as any other:—

“Réflexions du prieur des Chartreux, assis dans sa stalle et récitant son bréviaire.

“Le monde, que j'ai bien fait de quitter, est une illusion éternelle, une comédie composée d'actes sans fin. Ce qui vient d'arriver prouve ce que j'avais entrevu et ce que personne ne voulait croire, c'est que Caliban était susceptible de faire des progrès. Oui, toute civilisation est l'œuvre des aristocrates. C'est l'aristocratie qui a créé le langage grammatical (que de coups de bâton il a fallu pour rendre la grammaire obligatoire!), les lois, la morale, la raison. C'est elle qui a discipliné les races inférieures, soit en les assujettissant aux traitements les plus durs, soit en les terrorisant par des croyances superstitieuses. Les races inférieures, comme le nègre émancipé, montrent d'abord une monstrueuse ingratitude envers leurs civilisateurs. Quand elles réussissent à secouer leur joug, elles les traitent de tyrans, d'exploiteurs, d'imposteurs. Les conservateurs étroits rêvent des tentatives pour ressaisir le pouvoir qui leur a échappé. Les hommes plus éclairés acceptent le nouveau régime, sans se réserver autre chose que le droit de quelques plaisanteries sans conséquence.

Au fond, l'éternelle raison se fait jour par les moyens les plus opposés en apparence. Le budget de Caliban vaudra peut-être mieux pour des gens d'esprit que le budget de Mécène. Bien peigné, bien lavé, Caliban deviendra fort présentable. Il y aura peut-être un jour des médailles *A Caliban, protecteur des sciences, des lettres et des arts*. Prospero peut vivre, au moins quelque temps, sous un pareil régime, et il a même chance d'en ressaisir la direction. Il faut pour cela de la prudence; car la démocratie est jalouse et soupçonneuse. Mais, en étant modeste et en cachant son jeu, on fait bien des choses. Quant à l'extrême délicatesse des âmes tendres, mues par un sentiment personnel de fidélité, elle n'a plus de place dans un tel état du monde. Ces âmes-là n'ont plus qu'à mourir: ‘J'ai aimé la justice et j'ai haï l'iniquité,’ disait un grand pape. On peut toujours aimer la justice; mais haïr l'iniquité!... c'est plus facile à dire qu'à faire. Où est l'iniquité? Les meilleurs esprits s'exténuent à la trouver et, en définitive, sont fort embarrassés.”

G. SAINTSBURY.

MAGAZINES AND REVIEWS.

MAY, that “season delituous,” is the month in which literature, like Nature, is most full of bloom and voice; and the magazines of the month seem rich and copious. Mr. Goldwin Smith, the *Diva triformis* of the periodical press, shows his austere countenance in each of the three chief Reviews, attacking the Crisis in one and the Jews in another, while in the third he deals with the greatness of the Romans. This is a considerable feat; but one cannot help regarding such multifarious writings as one regards the speeches of

statesmen that are heard every week, as ruinous to their own efficiency. The *Fortnightly* contains many other articles than Mr. Goldwin Smith's on which it would be pleasant to dwell, such as Mr. Saintsbury's “Anniversary,” a temperate and fully-informed article on the commemoration of Rousseau and Voltaire; or Mr. Myers's second paper on Mazzini, as fervid as might be thought likely *a priori* by those who have felt the Mazzinian inspiration and know the other writings of Mr. Myers. The Editor prints another chapter from his forthcoming “Diderot,” dwelling this time upon the experiences of that strange being (“that unique man,” as Voltaire called him) at St. Petersburg, on his relations with Catherine II. and her court, “a hotbed of corruption, intrigue, jealousy, violence, hatred,” and his return to the Hague and to France. Not the least interesting parts of these lively pages are the lines in which Mr. Morley describes the Galitzins and their house in the little city which was even then, as it had been for two centuries, the capital of western freedom. Mr. H. Nettleship's ten pages on Catullus do not pretend to be more than a slight, though very graceful, study of the great poet, to whom the labours of Munro, Ellis, and Baehrens have lately redirected attention. Readers who have not followed the writings of these scholars will note with great interest what Mr. Nettleship borrows from Mr. Munro and Mr. Ellis; i.e. the extremely acute *rationale* of Roman indecency given by the one, and the translations of the other, as great a *tour de force* as Mr. Tennyson's own hendecasyllables, and adding to the “dainty metre” complete literalness of rendering. The most interesting of Mr. Nettleship's own remarks are those in which “on a reconsideration of the evidence” he asserts his agreement with those who identify Lesbia with Clodia, the sister of P. Clodius, the enemy of Cicero; and those where he supports this assumption by chronological arguments drawn from the shifting relations of Cicero with the democratic party. It need not be added that the background of the essay, so to speak, is filled in as firmly and truly as might be expected from a scholar of Mr. Nettleship's eminence.

THE *Nineteenth Century* for this month is certainly a strong number, and ought to appeal with effect to very various interests. Dr. Stanley's paper on the “Eucharist” is a characteristic piece of work, and will probably draw more readers than anything else in the number. We are not, however, concerned with it, nor with Prof. Goldwin Smith's answer to Dr. Adler on the subject of “Can Jews be patriots?”—an answer conceived, we venture to think, in a tone and spirit not altogether worthy of Prof. Smith. The only articles, indeed, which seem to fall within the scope of these notices are “Méryon and Méryon's Paris,” by Mr. Wedmore, and the fresh instalment of “A Modern Symposium,” which heads the number. This last is an extremely readable discussion of the relative justice of “the popular judgment and of the judgment of the higher orders” in political matters. Which show most political capacity and insight in the long run, the masses, or the cultivated classes? Is Mr. Gladstone right in thinking that the whole history of the country since 1815 is made up of a series of instances of the general superiority of the popular judgment to that of rich and cultivated people in matters of practical politics? Lord Arthur Russell opens the discussion, and it need scarcely be said that in a literary conversation of this kind, where for the most part only one utterance is allowed, the first speaker is at a disadvantage. Mr. Hutton has no difficulty in pointing out his predecessor's omissions, and then goes on to develop Mr. Gladstone's assertion as to the history of the country since 1815. The history of the reform of the criminal law, of the abolition of slavery and the slave trade, of Catholic emancipation, is dwelt upon in turn as evidence of the general soundness of the popular judgment,

and of the slow apprehension of the privileged or cultured classes. Lord Arthur Russell's conclusion is that “the uneducated masses are only in the right when led by right-minded leaders,” which leaders, apparently, must always come, however, from the upper classes. Mr. Hutton agrees that the leadership must come first—the “minority of the minority” must pronounce—but he then proceeds to dwell on the *teachableness* of the masses, as compared with the slow reception by the cultivated classes of ideas that touch interests or long-established prejudices. Mr. Grant Duff follows in the same strain, endeavouring at the same time to convince the two previous speakers that substantially there is no difference between them. “The whole art of politics,” he says, “worthy of the name, in our day appears to be to try to get the ideas of the ‘minority of the minority’ stamped as deep as possible on, and spread as wide as possible among, the masses.” How, indeed, should “society” be right in politics? Our boys are badly educated, our girls rather better, but still insufficiently; out of such conditions the true culture cannot grow, while a hundred warping influences of tradition and self-interest hinder the free ingress of ideas. “We are in the midst of a bad decade of the century—a decade marked by the triumph of falsehood and charlatanism in politics.” The cultivated intelligence of the country must try to make the next decade better by appealing to those classes which being brought more in contact with the sterner realities of life are more inclined to seriousness than “the roses and nightingales” of society. Mr. Frederic Harrison winds up the discussion with his usual ability and directness, and as might be expected puts in—beyond and above the plea for the general soundness and teachableness of the masses when properly led—a plea for the individual working man. An illiterate collier could not, of course, administer the Foreign Office by the light of nature, but there are born leaders in the working classes as well as in what we call the cultivated classes. A course of Eton and of general literature does not secure political training. “Working-men may talk ungrammatically, and may never have heard of Mr. Ruskin, and yet may be trained politicians. True political leaders are formed in all kinds of ways and out of all sorts of grades.” Mr. Wedmore's paper on “Méryon and Méryon's Paris” is a clever, appreciative, but rather over-emphasised study of the great French etcher. It certainly brings Méryon and Méryon's art clearly before those who know not Méryon, and in point of judgment and interpretation will probably win the assent of those who do. But the writer's touch wants breadth, wants ease. And this ought to be amended, for Mr. Wedmore has a great deal to say, and in the main says it with crispness and individuality. A little more repose in narrative—the courage to be quite simple when the facts are simple—something more in these directions would, we think, bring out the elaborate passages of criticism and description into the relief which imaginative writing of any kind, whether prose or poetry, must somehow get for itself. Mr. Wedmore might borrow something in these respects from Mr. Hamerton. His general picture of Méryon is, however, a more delicate piece of work than that given in *Etching and Etchers*, and wants only what an etcher would call some “quiet spaces” to rank as a really good bit of critical writing.

VICTOR HUGO'S NEW POEM.

Paris: April 30, 1878.

Victor Hugo's new volume of verse, *Le Pape* (Calmann Lévy), will prove to the majority of readers a surprise approaching to disappointment. When it was known that the poet of *Les Châtiments* was about to publish a book entitled *Le Pape*, it was generally supposed that we should be treated to a series of virulent satires against the Papacy and against the Church, in the style of the verses which appeared a few years ago, when the

chassepots of Mentana had just "done wonders," and in which Victor Hugo said to Pius IX. :—

"Ce qui plaît à ton cœur et ce que tu bénis
C'est un fusil tuant douze hommes par minute."

Far from it. *Le Pape* is a book, noble, pleasing, calm, and religious in style, and in tone genuinely pastoral and pontifical. It certainly is a satire, but a satire of a very peculiar kind, in which the poet only criticises the Papacy by tracing a noble picture of what it should have been, while leaving to the reader the task of comparing its actual state with its ideal.

The first scene (for the poem assumes a semi-dramatic form) shows us the Pope asleep. The poet sets forth his dream. He begins by repulsing scornfully the Kings who boast before him of their power; he leaves the Vatican and all his wealth to resume the sackcloth and sandals of the monks, and to go out into the world preaching love and peace. At the Synod of the Eastern Bishops, he preaches poverty and liberty; he anathematises, to the great scandal of all present, the social injustices and the unnumbered evils engendered by theocracy and monarchy; he makes the poor man who denies God believe in His existence by acts of charity; he protests in the name of God, who alone is infallible, against those who are fain to attribute infallibility to a man; he weeps over the sorrows of the poor, sheep shorn by the rich; he reminds the Archbishop who combines in his church all the splendours of wealth and of art, that it must, before all else, offer an asylum to the unfortunate; he proclaims the sanctity of life, fulminates his anathemas against war between peoples, against civil war, against the penalty of death; he blesses little children. Finally, his task accomplished, he makes his triumphal entry into Jerusalem, which he chooses for his dwelling place instead of Rome, after establishing upon earth the reign of justice and fraternity :—

"Peuples, aimez-vous. Paix à tous.

LES HOMMES. Sois béni, père.
DIEU. Fils, sois béni."

At this moment the Pope awakes, crying :—

"Quel rêve affreux je viens de faire !"

It is impossible to deny the grand and original character of this conception, the nobility of this new form of satire. Victor Hugo has recognised, with his profound poetical sense, that whatever may have been the defects, the weaknesses, even the crimes of the Papacy, it is yet too deeply rooted in the conscience and the heart of men—it is bound up with a past too glorious, it represents in the eyes of vast numbers too ideal things, for it to be possible to employ against it irony and invective of an ordinary type. He would have run the risk of offending many sentiments worthy of all respect, and even the taste of unbelievers might have been shocked. But the stumbling-block of the form of satire adopted by Victor Hugo is a peculiar monotony; he has avoided all allusion to real, modern facts; he has confined himself to generalities, always noble, always lofty, which yet lack variety, and which have a tendency to glide off into subjects already treated by the poet. He runs the risk likewise of scoffers saying that this book should really have been entitled "What I should do and say if I were Pope;" that Victor Hugo in his pride has dreamed this strange and sublime dream; that the Pope's dream really consists in his believing himself transformed into Victor Hugo, which appears to him, as may be well imagined, "un rêve affreux."

Despite these criticisms, and despite what may, as in all Victor Hugo's works, cause a smile, there will remain of this book a fine conception, and some passages which reach the sublime. One of the finest is the episode of the woman who is

condemned to death, but whose execution is stayed because she is with child :—

"L'enfant, si le ciel l'eût fait parler, eût dit,
Tu commences, ô loi, par me tuer ma mère.
O triste loi sans yeux, dans cette angoisse amère,
La malheureuse a beau trembler, frémir, prier,
Tu charges son enfant d'être son meurtrier;
Son sang teint mon berceau, déjà sombre, encor vide,
Et de moi, l'innocent, tu fais un parricide.
Tu me fais faire un crime, à moi qui ne suis pas.
Je nais, je tue."

The dialogue on the scaffold is also strikingly beautiful :—

"LE PAPE (à l'assassin). Toi qui donnas la mort,
sais-tu ce que c'est ?
L'ASSASSIN. Non.
LE PAPE (au bourreau). Toi qui vas la donner, le
sais-tu ?
LE BOURREAU. Je l'ignore.
LE PAPE (au juge). Et toi, sais-tu, devant ce ciel
qu'emplit l'aurore,
Ce que c'est que la mort, juge ?
LE JUGE. Je ne sais pas.
LE PAPE. O deuil !
LE JUGE. Qu'importe !
LE PAPE. Ainsi vous touchez au trépas,
Vous touchez à la hache, à la tombe, au peut-être !
Ainsi vous maniez la mort sans la connaître !"

Never has Victor Hugo's thought attained a loftier serenity, a more religious accent. The materialistic radicals who are his ordinary admirers will be a little embarrassed in presence of this book, which preaches God and Jesus Christ at every page; and the Catholics, too, will find a difficulty in taxing with impiety a book which only preaches the love of God and man.

CORRESPONDENCE.

PROF. STANLEY JEVONS AND MR. MILL.

Hampstead: April 27, 1878.

The writer of articles such as those upon "John Stuart Mill's Philosophy," which I have contributed to the *Contemporary Review*, cannot complain of criticism, unless that criticism involve misrepresentation, no doubt unintentional, but still criticism which represents me as having done what I

have not done. Now, in your issue of April 20, p. 346, I read as follows :—

"In a passage of the *Logic* which is conveniently overlooked by Mr. Jevons (Book III., ch. xxi., § 4). Mill says :—'The assertion, that our inductive processes assume the law of causation, while the law of causation is itself a case of induction, is a paradox, only on the old theory of reasoning, which supposes the universal truth, or major premise, in a ratiocination, to be the real proof of the particular truths which are ostensibly inferred from it.'"

Your critic cannot mean that I deliberately, that is *mala fide*, suppressed an explanation which I knew to have been given by Mill. He must mean that either I had not sufficiently read the book I was criticising, or that, with the bias common to too many minds, I unconsciously ignored what was against me. What, however, are the facts? Namely, that I had (*Contemporary Review*, April, 1878, p. 94) carefully traced the history of this passage, or of the place where it ought to have been, through all the editions of the *System of Logic*, with the exception of the sixth and eighth editions, which I did not possess. Your critic could not have been more unfortunate from his point of view than in thus drawing attention to the commencement of the fourth section of Book III., chapter xxi., because Mill here conspicuously displays his vacillation of thought. As will appear from the following extracts from my article in the *Contemporary Review* (April, 1878, p. 94), Mill twice altered the commencement of this section. In the third, fourth, and fifth editions he proposed to base the scientific upon the unscientific; but, having discovered how unsuitable a basis this is for a system of philosophy, he brought in the doctrine of the syllogism in the sixth edition.* The following is what I said :—

"This is Mill's position when driven to find a basis for his system. But then, why does Mill denounce this inductive process as loose, and uncertain, and insufficient, if it is really, as now appears, the basis of all certainty in induction? How can that be unscientific upon which all science rests? Why make the whole treatment paradoxical by such a sentence¹ as this :—'For the justification of the scientific method of induction as against the unscientific, notwithstanding that the scientific ultimately rests on the unscientific, the preceding considerations may suffice.'"

"Book III., chapter xxi., section 4. In revising this article I discover that this truly paradoxical statement does not appear in the earlier editions of the *System of Logic*, having been first introduced in the third edition. Later on it disappears again, and in the seventh and subsequent editions, the section commences as follows :—'The assertion, that our inductive processes assume the law of causation, while the law of causation is itself a case of induction, is a paradox, only on the old theory of reasoning, which supposes the universal truth, or major premise, in a ratiocination, to be the real proof of the particular truths which are ostensibly inferred from it.' Here Mill slides into a different position; but, did space admit, it could be made apparent that his theory of the syllogism quite excludes him from making the universal law of causation the warrant for inductive processes. According to Mill, the evidence for a general truth is resolvable into the particular ones on which it is founded, so that Mill's new position amounts to saying that certain past acts of induction are a warrant for future acts. But where was the warrant for the past acts. It is absolutely impossible to meet all Mill's arguments, because, as each new difficulty presents itself, he invents a new explanation, regardless, or rather oblivious, of consistency with his old ones."

Now I think I may submit to your readers whether I can be justly said to have "conveniently overlooked" an argument which I have thus quoted, and to which I have briefly but, in my opinion, effectually suggested an answer. It is true that the passage is quoted only in a footnote; but that is partly due to the fact that it was really an afterthought on the part of Mill,

* Since writing the article I have succeeded in obtaining the sixth edition.

and was not to be found in the fifth edition, which I formerly worked upon because it was the latest edition published when I first purchased Mill's *Logic*. Can I be said "conveniently" to have overlooked a passage when I really traced the history of the commencement of the section to which your critic refers through all the editions I could procure?

Although I have clearly indicated the line of my answer to the passage in question, it would not be suitable to argue the matter out at full length until I come to Mill's "Theory of the Syllogism," the intricate fallacies of which will demand such minute and prolonged analysis that my criticism can hardly be published in a monthly review, and must probably be postponed until I can complete my contemplated work.

W. STANLEY JEVONS.

April 30, 1878.

Mr. Jevons is right in supposing that by the expression "conveniently overlooked" I meant that the omission arose less from deliberate intention than from bias. I could hardly suppose, after all Mr. Jevons had said about his many years' study of Mill's *Logic*, that he had not read the passages referred to, inviting attention at the beginning of a section. Moreover, the general tone of Mr. Jevons's criticism was strongly suggestive of such an unconscious omission of an awkward passage. I now find that I was wrong in supposing that Mr. Jevons had overlooked this quotation, and I shall be very happy to substitute for the words "conveniently overlooked," the words "conveniently put away in a foot-note as an unimportant after-thought." Mr. Jevons will, I imagine, hardly dispute that this action was consciously performed. I can only add that to me this conscious neglect of a passage which gives the real clue to Mill's doctrine of causation in its relation to induction seems somewhat worse than a simple inadvertence. Every student of Mill who reads him in another spirit than that of minute textual criticism knows that his theory of the inductive processes hangs closely together with his doctrine of Syllogism or deductive reasoning, and cannot be dealt with apart from this. In the foregoing letter Prof. Jevons appears dimly to recognise this dependence, though he tells us that his criticism of the Syllogism is to form no part of the present series of magazine articles. To this I can only say, so much the worse for the effect of the magazine articles on every intelligent reader of Mill's *Logic*. To criticise Mill's version of the relation of premise to conclusion in the particular instance of inductive reasoning before examining his general theory of proof is, to say the least, so much waste of time. I beg to add that I am no blind admirer of Mill, and have long recognised most of the difficulties pointed out by Mr. Jevons. I only object, as I believe every thoughtful student must object, to Mr. Jevons's way of talking about his "discoveries" as though they were new, and to the spirit of his criticism—the very opposite to that of Mill himself, as exemplified in his *Examination of Sir W. Hamilton's Philosophy*—which excludes the possibility of reconciling apparent discrepancies by help of a wide interpretation of the writer's fundamental ideas.

THE WRITER OF THE NOTE ON MR.
JEVONS'S ARTICLE.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, May 6.—2 P.M. Royal Institution: General Monthly Meeting.
5 P.M. Musical Association: "On a practical Method for reading Harmony," by A. Rhodes.
8 P.M. Society of Arts (Cantor Lecture): "Some Researches on Putrefactive Changes," by Dr. B. W. Richardson.
8 P.M. British Architects: Annual General Meeting.
8 P.M. Victoria Institute: "Physical Geography of the East," by Prof. J. L. Porter.
TUESDAY, May 7.—3 P.M. Royal Institution: "Vegetable Morphology," by W. T. Thirlston Dyer.
8 P.M. Civil Engineers: Discussion on "The Ravi, Alexandra and Jhelum Bridges, P. N. S. Railway."

- 8 P.M. Photographic.
8.30 P.M. Zoological: "On Additions to the Menagerie in April, 1878," by the Secretary; "Note on the stridulating Organ of *Pantopus vulgaris*," by T. Jeffrey Parker; "Contributions to a Knowledge of the Hemipterous Fauna of St. Helena," by Dr. F. Buchanan White.
8.30 P.M. Biblical Archaeology: "Kurdish Folk-Lore in the Kurdo-Jewish Dialect," by the Rev. A. Löwy.
WEDNESDAY, May 8.—8 P.M. Society of Arts: "The Phonograph," by W. H. Preece.
8 P.M. Geological.
THURSDAY, May 9.—3 P.M. Royal Institution: "On Colours," by Lord Rayleigh.
8 P.M. Society of Arts: "Recent Improvements connected with Alkali Manufacture," by J. Maclear.
8 P.M. Mathematical: "Ueber die Transformation der elliptischen Functionen," by Dr. F. Klein; "Notes on the Solution of Statical Problems connected with Link-works and other plane Mechanisms," by Prof. Kennedy; "On the Theory of Groups," by Prof. Cayley; "Generalised Form of Certain Series," by J. W. L. Glaisher.
8 P.M. Historical: "Transition from Heathen to Christian Civilisation," by the Rev. Prebendary Irons; "Early Bills of Mortality," by C. Walford; "Historical Memorials of the Abbey of Cupar-Angus," by the Rev. Dr. Rogers.
8.30 P.M. Royal.
8.30 P.M. Antiquaries.
FRIDAY, May 10.—3 P.M. Quekett.
8 P.M. Astronomical.
8 P.M. New Shakspeare Society: "On the Devils in Shakspeare," by T. A. Spalding.
9 P.M. Royal Institution: "Effects of Stress on Magnetisation of Iron, Nickel, and Cobalt," by Sir W. Thomson.
SATURDAY, May 11.—3 P.M. Physical.
8 P.M. Royal Institution: "On Richard Steele," by Prof. H. Morley.
3.45 P.M. Botanic.

SCIENCE.

Botany (Morphology and Physiology). By William Ramsay McNab, M.D., F.L.S. (London Science Class Books.) (London: Longmans, 1878.)

Elementary Botany. By W. Bland. (Bemrose's School Manuals.) (London: Bemrose, 1877.)

SINCE the publication of the English edition of Sachs' *Lehrbuch*, which supplied the more advanced students in this country with a text-book where physiology received part of that attention given in former manuals almost entirely to systematic botany, the want has been felt among junior students of a corresponding class-book which should give them the outlines at least of Sachs' book. Prof. McNab has taken the matter in hand, and the first part of his work, devoted to morphology and physiology, has now appeared. The plan of the manual follows that of Sachs' *Lehrbuch*, from which also the illustrations are copied, and these not being reduced in size are out of proportion to the dimensions of the present book. It was perhaps technically unavoidable, and they are certainly better so than smaller and more indistinct. The plan of the morphological part is synthetical, beginning with a description of the structure and nature of the vegetable cell, followed by that of the tissues, and lastly of the external conformation of plants. The physiological portion begins like its model with the processes of nutrition of plants—their general conditions of life; their growth; their movements of variation; and their reproduction. The last chapter, which might have been deferred to the promised second part (to contain the outlines of classification), is occupied with a sketch of the classification of the vegetable kingdom.

In view of the class of student for whom the book is intended, it might perhaps be urged that Prof. McNab has given too much of detail. This, I venture to think, is the result of its having been prepared to suit the requirements of examinations, for which

purpose it would undoubtedly be of much use; but at the same time it must be a matter for regret that it is practically of little value as *preparatory* to such books as Sachs' *Lehrbuch*, which object it professes to serve. It is in most places quite as "advanced," and in others more difficult to understand from the excessively-condensed style of description, which has, as might be expected, led often to the omission of the relations in which one mass of facts stands to another, and occasionally a poverty of detail on important points. It may be satisfactory to the student who has to pass an examination to be told that "the composition of chlorophyll is unknown" (p. 19), but such is nevertheless scarcely in accordance with facts, and in any case is a very rapid way of disposing of a subject of the very first importance in vegetable physiology.

It must, however, be mentioned that the book is remarkably free from errors of any kind, and that on almost every point the latest authorities have been consulted. The mistake has been rather in the plan of the relation of the details than in the details themselves. As a manual containing perhaps everything that a student will require for an examination, it will be found convenient; but for teaching purposes, I venture to think it will scarcely serve its object.

Mr. Bland's manual of *Elementary Botany* has one feature in common with Prof. McNab's; it is divided into two parts. After this, similarity ceases. The first part is occupied with systematic and descriptive botany, and the second with morphology and physiology. The text is illustrated by woodcuts which have not already seen service in other manuals, and bear the mark of originality. Many of them have indeed never been seen before, and it is to be hoped will never be seen again. The information to be found in the text is often quite as new and surprising as that to be gained by a study of the illustrations. Indexes are not often chosen as the vehicle for conveying fresh information, and are usually rather dull reading, but the student of Mr. Bland's index (Part II.) will be surprised to find how interesting such literature may be made. He tells us there (among many new things) that an *antheridium* is so called because it is "like a flower;" and after *archegonium* the words "chief female" are added as an explanation. Such errors, it is only fair to add, do not occur so frequently in the body of the book, where they are usually introduced in the form of some quite superfluous statement. The omission of the paragraphs headed "Microscopic experiments" would rid the book of many of these. In the examination of *Spirogyra* the following instruction is given to the pupil:—

"Crush the plant by placing a few strips of blotting-paper on the cover-glass, and then pressing smartly down with the end of a lead pencil: observe the broken spiral bands and the cell-contents which have been ejected."

It is of course well known now that there is scarcely a more false method than the once fashionable "lichenological" one of microscopic examination, and to find it recur in a book professing to teach the young in con-

action with so transparent an object as *Spirogyra* must be a matter of regret to biologists.

GEORGE MURRAY.

Criticisms and Elucidations of Catullus. By H. A. J. Munro. (Cambridge: University Press, 1878.)

THIS interesting and lively volume is in part a reprint of articles contributed by its learned author to the *Journal of Philology*, partly a series of criticisms suggested by the publication of my commentary. Munro, I may say at once, has my work in view throughout, and thoroughly to appreciate the critique presupposes at least some acquaintance with the work criticised, the more so as the controverted points are and must remain so doubtful. The book will hardly fail to give additional impulse to a study which my discovery of the Oxford codex (1867) and my subsequently published commentary (1876) have placed, after an interval of nearly forty years, on a completely new footing.

The author's great learning and his wide knowledge of everything connected with Latin philology entitle his expressed opinion to all the deference which he deserves and has long received. More especially in the domain of grammar or orthography he claims in England an acknowledged mastery to which I for one am most ready to bow. Thus on Munro's showing the strange word *lecticulo* for *lectulo*, which Bährens, on the authority of the Oxford MS., introduced into lvii. 7, may be right, since *lectus* appears to have been sometimes a noun of the fourth declension, and might follow that declension in forming its diminutive in *-icul*, like *versiculus articulus quaesticulus*. And so again Munro's punctuation of x. 9-13, in which he places a full stop after *cohorti*, and begins a new sentence with *Cur quisquam caput unctius referret? Praesertim quibus esset i.* is, though certainly not convincing, so ingeniously defended by a number of passages from Caesar as to make one feel it ought to be true. Most instructive too is the long and learned discussion on xxii. 5-9, where Munro, following the MSS., retains *nembranae*, and begins the next sentence with *Derecta plumbo* instead of *Haec cum egas tu*, as had been done by all editors, including myself. Yet here too, in spite of the parallels from Lucretius, I confess that I cannot get over the difficulty of supposing these last words not to stand first in the sentence, a dislocation most unlike Catullus, and scarcely defended by lvi. 65.

One of Munro's most successful efforts—or no other word is adequate to describe the difficulty of the more obscure parts of Catullus—is his elucidation of the story contained in lxvii. This poem has baffled all editors alike. The new theory supposes an elder Caecilius Balbus and a younger of the same name, each of whom successively occupied a house at Verona; the younger Caecilius Balbus brought into it as his wife a woman who had committed incest with the father of her former husband. The weak point in his theory, is, I think, (1) that it gives hardly any force to v. 1, which, from the emphatic repetition of *invida*, has always

struck me as ironical; (2) that *uoto* is explained of the elder Balbus' dying vow, which seems arbitrary. More interesting to the general reader are the pages devoted to lxviii., but here I am in definite antagonism. There are two verses in this poem where much difficulty is removed by altering *-am* into *-ae*, 68 *Isque domum nobis, isque dedit dominam*, and 128 *Quamquam praecipue multivola est mulier*. Now the MSS. agree in *dominam*, *quamquam*, and I retain their reading, instead of altering to *dominae*, *quam quae*. Munro thus comments on this: "How any critic, after it has once been offered to him, can refuse *dominae* for *dominam*, a change so simple with MSS. like ours, I do not understand; 128 they have *Quamquam* for the unquestionably right *Quam quae*, though that too Ellis will not see." Why would I not see? Because I should have been returning to the facile and tempting emendation, after Lachmann had recalled the real, though difficult, tradition of the MSS. Corrupt as these MSS. may be, I hold no principle so inviolable as adhering to them so long as it is reasonably possible; and I do not think it will be denied that *dominam*, not *dominae*, is the natural sequence of *domum*, and that *Quamquam*, though harsh, is not without parallel.

This leads me to speak of the line adopted by my critic on the intricate question of the MSS. Starting from the fact that G and O (the Germanensis and the Canonicianus 30 in the Bodleian) are the only two extant copies made in the fourteenth century of the single original rediscovered about 1300 or somewhat later, Munro, like Bährens, discards all subsequent copies and holds G O to be the sole fountains of truth. Now G was written in 1375, O probably between 1370-1400, the Bolognese MS. 1411 (? 1412), and not much later probably, the first Laurentian; subsequent to these, in various degrees of integrity, the remaining MSS. Three of these, represented by the Datanus, which was not written till 1463, stand on a peculiar footing; though written very late, and in places presenting marks of interpolation, they bear in the general character of their readings a stamp of antiquity not found in any of the other MSS., not even in G or O. Hence the Datanus was accepted by Lachmann, and has been generally accepted since, as one of the best sources of information on the text of the poet. But Munro, following in the track of Bährens, part of whose theory it is to make G the parent of all fifteenth-century MSS. except O, prefers to regard the peculiarities of the Datanus, which he designates "strange and uncouth phenomena," as mere "figments and interpolations," and to consider the codex itself as "worthless." Now, either I am mistaken, or this whole conception of the relation of the MSS. to each other is wrong. The archetypal MS. was, as I said, brought to light early in the fourteenth century: a Veronese Anthology dated 1329 has three verses of c. xxii., no doubt extracted from it; seven citations occur in the *Compendium moralium notabilium* of Hieremias Index de Montagnone, whose death is stated to have been in 1300; about the middle of the same century Petrarch and William of Pastrengo quote from various

poems. It is not till 1375 that the Germanensis, presumably the earliest transcript still extant, was written. Are we to suppose that during this long period, at least fifty years and probably more, the rediscovered codex was not copied, and copied more than once? To suppose this would be to suppose that all the excerpts mentioned above were excerpts in the strict sense of the word—i.e., were jotted down in an isolated manner from the codex itself, without any complete copy being made; to suppose that the indefatigable Petrarch, the discoverer of Cicero's letters, the restless tracker of everything ancient, would be contented with a fragmentary knowledge of a poet whose whole works were within his reach. Yet nothing short of this hypothesis is presupposed by the Bährensian theory. For if even one copy was made of the original codex before 1375, it is impossible that the writer of the Germanensis could know, what he asserts, that he transcribed the only existing exemplar: that copy would inevitably be the parent of others, existing perhaps only in the libraries of the curious and for a long time not much known or even read. But it is in every way more likely that in the course of the fourteenth century several copies of the original were made; that in some of these the barbarous writing of many of the words still found in the Datanus was preserved intact, in others changed to a more modern form, as in the Germanensis. In one word, though, speaking generally, G O are the earliest and therefore the best conservators of the text of the rediscovered MS., there are cases where the nearest approach to the unaltered original seems to be made by one of the later MSS.

Once again, on the vexed question of the praenomen of the poet. Arguing in favour of Quintus, I quoted in the ACADEMY (March 24, 1877) the fact that Q. is found in the Cujacian MS., and I defended the integrity of the tradition by the similar case of Propertius, who is there styled Sextus Aurelius Propertius Nauta. By this I meant to say that if the Cujacian MS. has preserved in the case of Propertius a tradition which it must have got from an early source (for these names are found in most of the MSS. of Propertius, if not in all), it is as arbitrary to say that the Q. was taken from Pliny by scholars of the fifteenth century as to maintain that the two names Aurelius Nauta were forgeries of the same period. The tirade to which I have thus given occasion (p. 170) is, I venture to think, hardly called for; and even the learning of its distinguished author will hardly excuse its violence; on some readers it will almost have the effect of all dogmatism, doubt.

R. ELLIS.

SCIENCE NOTES.

GEOLOGY.

Geology of the Arctic Expedition.—Geological investigation in the Polar regions is beset with difficulties of so grave a character that very few collections have hitherto been brought home by Arctic explorers, and these have necessarily been meagre. It must be remembered, too, that most expeditions have been fitted out for purposes of search rather than with the view of making natural-history collections. During Sir George Nares's

Expedition, however, special attention was paid to geological observations wherever practicable, and Captain Feilden then contrived to collect more than two thousand specimens of rocks and fossils. He also had the good fortune to find his collections brought home in safety—a fact worth mentioning because some other fine collections have been lost to science through the mishaps incident to Arctic travelling. The recently-formed collections, and the results deduced from their study, were lately laid before the Geological Society. In working out the stratigraphical results Captain Feilden has had the benefit of Mr. de Rance's aid, and in the palaeontological department that of Mr. Etheridge. The fundamental rocks of the area under examination consist of gneiss which is probably of Laurentian age, the Canadian rocks extending into the Polar area. These are followed by unfossiliferous slates and grits, known as the Cape Rawson beds, which are evidently older than the fossil-bearing Upper Silurians. It is proved, indeed, by the recent expedition, that Lower Silurian rocks exist in Grinnell and Hall Lands, thus disproving Murchison's view that the Polar area was dry land during the Lower Silurian period. Sixty species of fossils have been determined by Mr. Etheridge, ranging from the Lower to the Upper Silurian, and including some characteristic forms of Llandeilo and Wenlock age. The cream-coloured dolomites found in abundance by some of the previous explorers are believed to represent the whole of the Silurian, and perhaps part of the Devonian period. True marine Devonians have been discovered for the first time in Grinnell Land. Here, too, the carboniferous limestone was found rising to a height of 2,000 feet. This formation extends to the most northern point yet reached, and probably strikes beneath the Polar Sea to Spitzbergen. About thirty species, chiefly Brachiopods and Polyzoa, were procured from the carboniferous limestone of Cape Joseph Henry, the most northerly of the twenty localities from which fossils were collected. Mr. Etheridge points out the greater resemblance of the Arctic palaeozoic fauna to that of America than to that of Europe. No Mesozoic rocks are known until we reach the Cretaceous strata, which are represented in Greenland by plant-bearing beds that indicate by their fossils a warm climate something like that of Egypt at the present day. The vegetation of the Miocene beds in the Arctic regions points to climatal conditions about thirty degrees warmer than those which at present prevail. The Miocene beds of Grinnell Land contain the common fir (*Pinus abies*), the birch, poplar, and other trees similar to those which occur in Spitzbergen. A seam of Miocene coal, thirty feet in thickness, was discovered by the expedition at Lady Franklin Sound.

Catalogues of Fossils in the Museum of Practical Geology.—For several years past the Catalogue of the great collection of British Fossils in the Jermyn Street Museum has been out of print. In view of arrangements for extending the palaeontological department which will involve serious alterations in some parts of the collection, it is the intention of the authorities to issue a new edition in separate parts, each forming a complete Catalogue of the fossils of a particular formation or group of formations. Three of these Inventories have lately been published. They have been drawn up, under Prof. Huxley's superintendence, by Mr. E. T. Newton, Assistant Naturalist; and the Invertebrata have been named by Mr. Etheridge, the Palaeontologist to the Survey. One Catalogue is devoted to the Cambrian and Silurian Collections, which have been much enlarged since the issue of the last edition; indeed we learn from Prof. Ramsay's preface that "there is probably no collection of Silurian fossils of any country more complete." Much of the growth of this department is due to the incorporation of the fine collection made by the late Lieut. Wyatt-Edgell, and presented to

the Museum on the decease of that young and promising geologist. The second of the new Catalogues includes the Cretaceous Fossils. With reference to the vexed question of the age of the "Blackdown beds," Prof. Ramsay remarks that, although the strata have lithologically an Upper-Greensand character, the palaeontological evidence points to their Lower Greensand age. The last of the three Catalogues enumerates all the Invertebrate Fossils of the Eocene, Miocene, Pliocene, and Post-Pliocene periods.

The Palaeontology of Victoria.—As palaeontologist to the Geological Survey of Victoria, Prof. McCoy has lately issued the Fifth Decade of the Survey publications. This is a series of ten plates, with text, illustrating some of the more interesting fossils which have lately come under the notice of the surveyors. One of the more noteworthy of the fossils here described and figured is a curious object resembling the calcareous axis of a large sea-pen living in Hobson's Bay, but considerably larger. It is believed that it can claim a place in the European Tertiary genus *Graphularia*, and is accordingly described as *G. Robinae*. In shape the fossil is conical below and quadrate above, while internally it exhibits on fracture a radiating crystalline structure. Its interest lies in its curious resemblance to a belemnite. Some time ago it was announced that a belemnite had been discovered in Tertiary rocks in Australia—an announcement which of course created much surprise, since it had previously been an article of geological faith that belemnites were exclusively Mesozoic fossils. Prof. McCoy now suggests that the fossil taken for a belemnite may have been the new *Graphularia* which he describes in the present Decade, or some other very similar fossil. Another notable Victorian fossil noticed here for the first time is an eared seal of Pleistocene age, to which the name of *Arctocephalus Williamsi* is given.

The Oldest American Land Plant.—Relics of terrestrial vegetation of extreme antiquity have been found in Ohio by Prof. Claypole, of Antioch College. During a geological excursion, one of his students called attention to a slab of fossiliferous limestone from the Clinton beds, which are of Upper Silurian age. This specimen is notable for presenting vegetable impressions which are strikingly suggestive of a *Lepidodendron* stem. In studying the character of the plant, Prof. Claypole has had the benefit of Dr. Dawson's advice. Probably it belongs to a new genus, closely related to *Lepidodendron*, for which the name *Glyptodendron* is suggested—a name which refers to the sculpturing of the stem. The interest of the discovery lies in the fact that indisputable traces of land-plants had not previously been found in America on so low a geological horizon. Nor indeed had remains of arborescent vegetation been found in strata of this age, either in the Old or in the New World.

METEOROLOGY.

The Temperature of Vienna.—Dr. Hann has published in the *Sitzungsberichte* of the Vienna Academy for November 16 a paper on the temperature of Vienna from one hundred years' observations—a work which had been commenced by Jelinek as a continuation of his previous paper referring to the ninety years (1775–1864) in the *Sitzungsberichte* for 1866. The general effect of the last ten years is to depress the mean by 0°·07 C. The most remarkable feature of the very latest years has been the extremely low temperature of the month of May in the years 1871–77, which are, on the mean, 2°·3 C. below the average. The investigation of the connexion between sunspots and temperature has not led to any very satisfactory result; so that no conclusions as to the probable temperature of coming seasons can be drawn, at least from Vienna, from the condition of the sun's surface. The order of succession of seasons has been very carefully treated

by Dr. Hann, and his results fully confirm those of Quetelet and Eisenlohr from Brussels and Carlsruhe respectively, which were based on much shorter periods. The general result is that if a season has a marked character, the succeeding season will deviate from the mean in the same sense. This tendency is weakest in the case of winter and spring. It is interesting to see that while in 70 per cent. of the cases a very warm, or a very cold, winter was followed by a warm or cold summer respectively, in only 45 per cent. of the cases did the winter show a deviation in the same sense as the summer which had preceded it.

The Range of Temperature in Sweden.—In the "Austrian Journal" for March 15, Prof. Rubenson gives an abstract of his recent paper in the *Transactions* of the Swedish Academy on this subject. He draws the following conclusions: The least variation occurs everywhere in December or January; the greatest in June or July, except in the west, where it takes place in May, and in the northern district, where a more strongly marked maximum is noticed in March. The climatic contrasts come out most emphatically in the summer. In winter the conditions of range are nearly uniform over the whole kingdom.

The Observatory at Pawlowsk.—Prof. Wild has published in the *Bulletins* of the Russian Academy a full account of the new Meteorological and Magnetic Central Observatory which has just been completed on land most generously given for the purpose by the Grand Duke Constantine. The whole establishment has been fitted out in the most complete manner, and several instruments procured by Kupffer years ago have now been brought into use. The existence of such an observatory had long been recognised as a necessity, for the old site in St. Petersburg, on which Kupffer had built his observatory, had become more and more deteriorated for magnetic purposes by the construction of wharves, &c., for the shipment of military stores. At the close of the paper Dr. Wild gives a preliminary comparison of the climates of Pawlowsk and St. Petersburg. The former is decidedly colder, and though it is further from the sea, the humidity is higher.

Instructions for Canadian Observers.—Dr. Kingston has just issued his "Instructions," which differ from all the others which have appeared, in that they contain a summary of the elementary principles of physics which are required for the prosecution of meteorology. In some respects the instructions appear to be too minute for European observers; but we must remember that, owing partly to the distances to be traversed, and partly to the insufficiency of funds, inspections cannot be carried out as frequently as is desirable, so that Dr. Kingston's observers must be furnished with ample directions to enable them to overcome all difficulties. The variety of instruments in use in Canada necessitates more varied notices than we require over here. The work contains very few tables.

The Weather Service of Iowa.—Dr. Hinrich's spirited exertions in the organisation of a State weather service have been repeatedly noticed in these columns. We have just received a broadsheet from him, entitled "A Few Facts about the Iowa Weather Service," accompanying the first part of his Weather Bulletin. This latter contains a number of special reports—e.g., On a Thunderstorm, and On an Earthquake, each with a map; with Rain-maps for the State for 1876 and 1877. The monthly sheets of "graphics" are most comprehensive, but, from their complexity, are hardly intelligible without much study. The whole is executed by the electric-pen, and is consequently very faint and in parts barely legible. In this respect, however, the Daily Weather Charts and the Hourly Readings issued by our own Meteorological Office are frequently almost undecipherable owing to bad lithography.

Curve of Pressure in Italy.—The "Austrian Journal" for March 15 contains a review of Prof. Ragona's *Andamento Annuale della Pressione Atmosferica* (*Meteorologia Italiana*, Supplement i., 1877), in which he has arrived at a remarkable result. On calculating by Bessel's formula, the curve of probable error of barometrical readings is identical with, but in the opposite sense to, that of the yearly march of temperature; while the curve of probable error of temperature is identical with, and in the same sense as, that of the yearly march of pressure. In addition to pressure and temperature, the behaviour of wind and of humidity is carefully treated.

Weather Telegraphy in Germany.—In *Petermann's Mittheilungen*, No. iii. for the present year, Dr. van Bebber gives a carefully drawn up summary of the system of the Deutsche Seewarte which has been now for some three years in full operation. He also gives a review of the other telegraphic systems of North-west Europe, in which, however, he strangely omits all mention of Holland, where storm warnings have been issued from the earliest times of electric telegraphy. He then takes instances of weather charts, and traces the history of some storms thereby. Such magazine articles would be very useful in this country as showing what our Meteorological Office really does.

The "Eurydice" Squall.—In Symons's *Meteorological Magazine* for April Mr. Clement Ley gives an interesting notice of this remarkably sudden and violent disturbance, based upon reports furnished by a number of observers throughout the country. The earliest notice of the occurrence he has procured has been from North Shields (9:35 A.M.), while the latest was Crowborough Beacon, Kent (about 5 P.M.). The lateral extent of the district affected was very great, for in the west of the county Limerick it was noticed about 11:30 A.M. Mr. Ley points out that during the squall the behaviour of the upper currents and the relation of the wind to the gradients was entirely different from what is usually noticed in storms. He adverts to the same fact of which Mr. Abercromby drew attention in *Nature*, that several secondary depressions existed over these islands on the day in question; and points out that no special warnings could have been issued for the storm from the information at the disposal of the Meteorological Office with its present expenditure on telegraphy. The moral Mr. Ley draws is that cloud study is a subject far too little prosecuted in practical meteorology at the present time.

The Motion of Storms.—In the *Comptes Rendus* of April 1 M. Faye returns to his old theories about the genesis and behaviour of cyclones, which he compares to eddies in a river, attributing their production to the interference of opposing currents in the upper strata, while their motion is that due to the upper currents. It is scarcely necessary to remind our readers that M. Faye believes that cyclones are connected with descending currents.

The Bulletin International.—On the 25th ult. the *Bulletin* of the Paris observatory has been altered, and now gives in addition to the ordinary chart of wind and barometric pressure, a chart showing the changes of temperature and the amount of rain fallen since the preceding morning. This additional information is of very considerable value.

MEETINGS OF SOCIETIES.

METEOROLOGICAL SOCIETY.—(Wednesday, April 17.) J. GREAVES, Esq., President, in the Chair. The discussion on "Waterspouts and Globular Lightning," which was adjourned from the last meeting, was resumed and concluded. The following papers were then read:—"On the application of Harmonic Analysis to the reduction of Meteorological Observations, and on the general methods of Meteorology," by the Hon. R. Abercromby. The meaning of

Harmonic Analysis is first shown, in reference to average barometric pressure, by tracing the geometrical and physical significance of every step from the barogram till the tabulated results are combined in a harmonic series. It is then shown that, whether we regard this series simply as an algebraic embodiment of a fact, or as a series of harmonic components, as suggested by Sir W. Thomson, it is simply a method of averages, and our estimate of its value must depend upon an estimate of the use of averages at all in meteorology. It is then pointed out where averages are useful, and their failure to make meteorology an exact science is traced to three causes. (1) That the process of averaging eliminates the variable effects of cyclones and anticyclones, on which all weather from day to day depends; and on this are based some general remarks on the use of synoptic charts not only in explaining and forecasting weather, but in attacking such problems as the influence of changes of the distribution of land and water on climate, and the cyclic recurrence of rain or cold. (2) That deductions from averages only give the facts, and not the causes, of any periodic phenomena. The position of diurnal and other periodic variations in the general scheme of meteorology is then pointed out, and it is shown that their causes can only be discovered by careful study of meteorograms from day to day. (3) That in taking averages, phenomena are often classed as identical, which have really only one common property. For instance, rain in this country is associated with at least three different conditions of atmospheric disturbance, and it is necessary to discriminate between these kinds before meteorology can be an exact science.—"On some peculiarities in the Migration of Birds in the Autumn and Winter of 1877-78," by J. Cordeaux.—Mr. Symons gave a verbal description of the recent heavy fall of rain, April 10 and 11, the greatest amount known to have been registered being 4.6 inches, at Haverstock Hill.

FINE ART.

EXHIBITION OF DRAWINGS BY DUTCH MASTERS AT THE BURLINGTON FINE ARTS CLUB.

(First Notice.)

THE rise of the Dutch school of painting at the beginning of the seventeenth century, and its almost immediate attainment of complete mastery of the language of art, is a fact difficult to reconcile with the current theories of development. In the various schools of Italy, Flanders, and Germany we can generally trace a period of growth, of perfecting, and then of decline, but the Dutch masters crowd all together in one brilliant northern summer and then die out. Their art, indeed, may be said to have almost had its beginning and end within the lifetime of Rembrandt, for although there were several good masters born before his time, and several who came after, yet the great mass of the work of what we know as the distinctive Dutch school was accomplished during his life, and greatly under his influence, those few good artists who came after him existing merely by reason of survival after the true life of the school had been extinguished among the painters of pots and pans, poultry and cabbages, fruit and flowers, who finish the century.

The present exhibition of the Burlington Club does not, it need hardly be said, profess to give anything like a complete view of the widely-spread attainments of this very comprehensive school. All that has been attempted by the Committee has been to make such a collection of drawings as was possible from the resources at command, and these resources it would seem lay chiefly in the direction of Dutch landscape. Ruskin, as everyone knows, sums up the Dutch landscape artists in one sweeping condemnation as "painters of fat cattle and ditch-water," even enforcing his contempt of their "petty skill" by retailing the old notion of their having been a low, drunken, immoral set, whose unerring artistic knowledge and power of hand were qualities "bred in the fumes of the taverns of the North." Hitherto we have known these masters chiefly by their paintings, so that in gathering to-

gether for the first time in England a collection of their drawings, so valuable in studying the intimate thought and mode of work of a master, the Burlington Club has rendered an important service to the art student; a service that is considerably enhanced by the carefully prepared Catalogue, which, beside giving a full description of each work, states the collections from whence it was derived and the date of birth and death of each master.

A short study, or as he calls it, "A Note on Dutch Drawings," which is prefixed by Mr. Frederick Wedmore to the Catalogue, is also of great aid in the study of these drawings, for it is written with the appreciation that comes only with knowledge. It must be admitted that these Dutch drawings have none of the taking beauty of Italian works of the same kind, such as those which charmed us at the Grosvenor Gallery. They require patient study to be appreciated, but if this is given, it is surprising to find how much of interest and even of beauty they really offer.

Strange to say, we do not find among them many of those roughly recorded ideas, first notes for pictures, if we may so call them, that we so often meet with among drawings by Italian masters. If the Dutchmen made such they have not been preserved, or at all events are not exhibited, those collected being evidently intended by their artists, as Mr. Wedmore says, "not merely as studies for themselves, but possessions for their public just as expressive and interesting as work more prolonged and elaborate."

Perhaps the principal value of the Burlington Club's Exhibition is found in its showing us how much the Dutch accomplished in the way of finished water-colour, a branch of painting that we are apt to consider as almost exclusively English. We are forced to recognise here that long before Cozens, Sandby, and Girtin were laying the foundations of our English school of water-colour, the Dutch were using this medium with thorough knowledge and very excellent effect. Rembrandt, supreme in etching, probably cared little for water-colour; but there are a few coloured drawings assigned to him in different collections, and there is one here—*A City Gate in Amsterdam* (No. 20)—with his name attached, in which, though it is uncoloured, the effect is produced not by delicacy and truth of line, as is usual in his drawings, but by subtle gradations of shading in monochrome.

But whatever Rembrandt may have done, it is certain that other masters of the school practised water-colour not as an occasional means of rapid expression but as a method for deliberate and carefully-finished work. This is especially seen in the splendidly finished drawings by Adrian van Ostade which are undoubtedly the *chefs d'œuvre* of the collection. There are no fewer than six of these highly-interesting works exhibited, in which all the well-known qualities of Ostade's art are displayed with the most delightful effect of rich and luminous colour. Nos. 28, 29, and 30, lent, the first by Mr. Francis Cook, and the other two by Mr. Malcolm of Poltalloch, are most perfectly-preserved works, and are of a beauty of finish and delicate subtlety of colour that can scarcely be too highly praised. The first of this group, No. 28, represents a village festival, with all its accompaniments of drinking, smoking, and merrymaking. Somehow in this scene there is more lightness of heart observable than is usually to be found among Ostade's peasants, who for the most part take even their pleasure sadly, as if they could not quite forget the cares of their work-a-day existence. And also in the next, No. 29, the gem of the whole collection, which holds the place of honour over the chimney-piece, the children seem freer from care than Ostade generally makes them; or is it simply that they are free from work, to which he often condemns even the smallest members of his peasant families? The little boy in the foreground is blowing a long

bladder, and another boy and a funny little Dutch child dressed in blue and yellow are looking on with interest in their poor little ugly faces. These little folk stand outside a large and well-to-do cottage home, the wall of which is covered by a vine, which is about the only unsatisfactory piece of work in the drawing, it being easier to Ostade to express human life and its surroundings than the beauty and intricacy of summer foliage. The somewhat conglomerate mass of the light-green of the vine dominates too much, and to a certain extent spoils the pleasant harmony of the composition, which for the rest is a rich example of Ostade's power of making a beautiful picture out of the most commonplace material. The same may be seen in No. 32, lent by Mr. F. Locker, in which a hideous old woman, with one of the largest and most ill-formed noses that even Ostade, who would seem to have had a predilection for such noses, ever ventured on, sits making pancakes over a fire in a large dilapidated chamber, apparently fashioned among the ruins of some ancient church or monastery. An ill-looking man stands by the side, and a boy with a nose that proclaims him to be the son or grandson of the woman is also present. Nothing to relieve the dark monotony of poverty-stricken existence, except the artistic insight of the painter, who by his skilful management of light and shade, delicate perception of colour, and true feeling for pictorial effect, makes a charming little picture out of this unpromising subject. Ostade's exquisite refinement of colour is especially felt if we look at two similar drawings by Cornelius Dusart that hang on an opposite screen. These might command admiration if seen apart, but turning from Ostade's finely-balanced compositions we are jarred by the crude pinks and yellows of the later and inferior master.

M. M. HEATON.

MYCENAE, TROY, AND EPHEBUS.

THERE have been few scenes of great events in the world during the past quarter of a century that have not been visited and sketched by Mr. William Simpson; and there is perhaps no other man living with whom travellers generally have so many sympathies. As a rule, his sketches have come before the public through the medium of the *Illustrated London News*; but at various times, and in the leisure between expeditions, he has taken the most interesting of his drawings as subjects for pictures, and has exhibited these pictures, in this way showing the extraordinary artistic facility of which he is master. The exhibitions of his pictures from Jerusalem, China, and India are recent enough to be well remembered; and now we have Mycenae, Troy, and Ephesus, scenes to which a double interest attaches, from their ancient importance and from incidents of our own times. From Mycenae we have first of all a view of the Acropolis (No. 10), which, short of a visit to the spot, tells us better than anything else of the rocky wilderness, with its wonderful light and formation of hills. There is a slight indication of the diggings that were going on at the time; but, altogether, the feeling of the picture is that of an undisturbed scene. In the next picture (No. 11) the old serenity of the spot has been broken into, and a new interest pervades it. We have a view of Dr. Schliemann's excavations, Agora and all. Apart from its other merits, this painting is of importance to archaeology, since it gives a considerably different aspect of the scene from that in Dr. Schliemann's book on Mycenae. The other sketches from this locality represent the so-called Treasury of Atreus, ruins of other Treasuries, and the Gate of Lions. Then we have two views of Cyclopean masonry at Tiryns, and several other pictures which, though not strictly to be included under the general heading of the Exhibition, are yet nearly related to it. From Mycenae we pass to Hissarlik, the site of Troy as many have thought, and as, according to some,

Dr. Schliemann has proved by the use of the spade. Others have been, and are still, of opinion that there never was such a place except in the imagination of the poet. At any rate, we have here what Dr. Schliemann did find, and again the picture differs in important particulars from that presented by the excavator in his book on Troy. No. 24, showing the excavations, is delightful, and very interesting; also No. 26, *The Troad from Renkoi*; No. 34, *Tombs of Achilles and Patroclus*; and No. 36, *Ujek Tepe*, the tomb of Aesyetes. Thence we journey further south in Asia Minor, first to Epheus, with the scene of the excavations, No. 38; and with a very bold restoration of the temple and its surroundings, No. 42, in which, however, it must be confessed that great care has been taken not to overstep possibilities in the desire to make a picture. From the same neighbourhood we have No. 53, representing the ruined Aqueduct, one of the most picturesque features of Ephesus; and again, No. 45, a view from what is known as St. Paul's Prison. Nothing in the Exhibition, perhaps, is more characteristic of Mr. Simpson's rapidity of effect than No. 42, showing *The River Melas, Smyrna*. At Bin Tepé, near Sardis, we have *The Tomb of Alyattes*, No. 50, which now looks more like a natural hill than a mound made by the "merchants, artificers, and young women" of Lydia. No. 51 is the rude figure sculptured on the rocks at Nymphi, near Smyrna, which has been identified as that executed by order of Sesostris, according to Herodotus (ii., 106); and still more rude is the figure of Niobe on Mount Sipylus, No. 57. The drawing is rather that of a bearded figure, and so it must have appeared to Mr. Simpson from what he says in the Catalogue. In conclusion we may remark that the Catalogue is full of most interesting information on the sites and scenes of the paintings.

THE ART COLLEGE FOR WOMEN IN ROME.

ATTENTION has been drawn from time to time to an institution in Rome now passing through the difficult first stage of existence. Art becomes for trained women an increasingly suitable and lucrative profession, and all efforts to render efficient education more attainable deserve encouragement. Study in Italy, and especially in Rome, the "High School of Europe," is evidently as desirable a means of culture for women as for men; but it is equally evident that parents and guardians cannot always take their girls abroad themselves, or afford to place them in expensive *pensions* or in suitable families; while it is highly undesirable, if not impossible, for young women to lead in Rome an artist's life of absolute independence, roughing it with their masculine *confrères* at life classes and art clubs without a background of guardianship. To meet the want and the difficulty here indicated, an establishment has been set on foot under the patronage of the English Ambassador and Lady Paget, the Lady Marian Alford, Lady Eastlake, and others, where young women studying art seriously are admitted *en pension* upon the lowest terms possible for an institution which aims at being self-supporting. These girls may lead a life combining independence with a certain amount of *surveillance* and care from a lady superintendent. The studies of those wishing for instruction are under the direction of a professor, the present holder of this post being Prof. Cammarairo, of St. Luke's Academy. In the summer it is proposed to remove to the mountains, where the professor might continue his instructions *al fresco* among the picturesque scenery and peasantry of the Alban Hills, or Perugia, or other high-lying districts. The house, or portion of the house, taken for the establishment is in the Via degli Artisti, on the Pincio, close to the convent of S. Isidore, well placed for health, and boasting fine views from its terraces. The lady superintendent now in office, Miss Mayor, the initiator of the institution, has devoted to it

much time and trouble, and she and her friends hope for fuller developments and increased success. Meantime the great point is to make known the existence of the institution, which needs only to be known to be used and appreciated. To meet the responsibilities at present lying heavily on a few disinterested promoters, and to widen the capacities of the scheme, subscriptions or donations are welcomed with gratitude. Information can be obtained from Prof. Mayor, King's College, London, or Miss Mayor, care of Messrs. MacBean and Co., 378 Corso, Rome.

ART SALE.

THE Easter holidays having ended, and the town having filled noticeably, the season of Art Sales has been resumed. Messrs. Christie, Manson and Woods have this week begun the dispersion of many of the numerous possessions of Mr. John Heugh, of Upper Brook Street, a gentleman who has before now had an important sale, and who for many years has been engaged in the acquisition of works of art of many kinds and qualities. The prints fell under the hammer on Monday, Tuesday, and Wednesday. We shall next week be able to give some of the prices obtained for the more important lots; but may state, meanwhile, that the chief feature of this week's sale, so far as it has at present proceeded, has been the dispersion of a great assemblage of the *Liber Studiorum* of Turner, which contained a large number of very indifferent and some exceedingly poor impressions which it is astonishing that so shrewd a collector should have taken the trouble to acquire, along with impressions of fine quality and engravers' proofs of the utmost rarity. A sufficient array of fine impressions and rare states of the plates has no doubt commanded for the assemblage of the engraved work of Turner an amount of attention from connoisseurs that would not have otherwise been bestowed on what can hardly, on the whole, be described as a typical "collector's collection."

NOTES ON ART AND ARCHAEOLOGY.

WE are very sorry to hear of the recent death of one of the most eminent of foreign amateurs of art. M. His de la Salle has just died, at the age of eighty-four. His name would long be remembered as one of the most enlightened of collectors, even if his recent munificent gift to the Louvre did not ensure for him a place among the benefactors of the French people in matters of art. The greater portion of his noble collection of drawings by ancient masters is now the property of the French nation.

WE have received from the publisher—Mr. Arthur Lucas, of 37 Duke Street, Piccadilly—two large etchings by Dr. Arthur Evershed. Each print consists, but with interesting differences, of a study of a beached boat, the lines of whose construction have been carefully followed, and the roundness of whose sides has been indicated with skill and knowledge. Dr. Evershed has never done stronger work: never, perhaps, anything so strong, though much that has possessed a more instant charm of easy grace. He has done well to depart, in this case, from his more habitual practice, and it is to be desired that his work—which the *Gazette des Beaux-Arts* has written of with approval—should include additional examples of severe study and elaborate design.

WE have received from the publishers, Messrs. Chatto and Windus, the illustrated Catalogue of the Grosvenor Gallery Winter Exhibition, with a Critical Introduction. The volume is handsomely and appropriately issued, and we shall take the earliest opportunity of saying a few words on the illustrations, on which much trouble has been expended, and on the critical writing, which is that of Mr. Carr.

THE Russian novelist Ivan Turgénieff is not only admired as a writer but is likewise esteemed in the art circles of Paris as a good connoisseur in matters of art. His collection of paintings, principally works of the modern French school, and specially of the great French landscapists, was old at the Hôtel Drouot last week. Beside French works, there were several by Dutch masters which commanded attention. The prices etched are not yet stated.

WE understand that Mr. Comyns Carr has resigned the post of art critic on the *Pall Mall Gazette*, which he has held for some years. The cause of his retirement from this paper is said to be a difference of judgment on questions of artistic taste between himself and the editor.

WE have before spoken of the series of large historical portraits which Gallait has been executing for the Senate House at Brussels. He has recently accomplished six more of these fine decorative works, namely, portraits of Pepin l'Herstal, Robert of Jerusalem, Baldwin of Constantinople, Bishop Notger, William the Good, and Philip the Noble, and it was thought that he would probably send them to the French Exhibition. The patriarch of Belgian painting is probably, however, tired of honours; at all events, he does not contribute one work to the very large collection of paintings by Belgian artists now to be seen in Paris.

WE have received the first part of a new German history of painting which bids fair to be a valuable work. It is edited by Dr. Alfred Woltmann, the learned biographer of Holbein, who will himself write the history of painting in the Middle Ages and in modern times, while Dr. Karl Woermann contributes the history of Egyptian and classical painting with which the work begins. The numerous illustrations given afford important aid in the study of the subject, and are specially interesting to English students as differing from those which our publishers have made to serve in so many works that the art-student has at last become quite weary of them. Several of the wood engravings in the present work are taken from photographs of ancient paintings, and have never before been published, while others executed in careful outline contrast very favourably with some of the same kind of illustrations offered us in English works.

THE wealth in old tapestries existing in the Vatican, some of it stowed away in cupboards or otherwise hidden, has always been suspected, and has recently been made known by Eugène Muntz in his articles on the tapestries of the Vatican in the *Chronique des Arts*. Whether in consequence of this revelation or from other reasons, the present Pope has now commanded that all the various pieces disposed about the building shall be collected and arranged in chronological order for exhibition. It seems that for two centuries the kings of France were accustomed to send every year a piece of Gobelin tapestry to the reigning pope; and as the manufactories of Flanders in the fourteenth and fifteenth centuries also contributed their share, it may be imagined what a large quantity has been accumulated. The well-known tapestries executed in Flanders from Raphael's celebrated cartoons will alone be excepted from this collection, as they are already exhibited, but even without these famous works the Vatican collection cannot fail to be of the highest interest.

THE paintings left in his studio by the French landscape-painter Paul Huet, who died in February 1869, have been until now religiously preserved by his family; but last month, for some reason, they were all sold—sketches and studies, as well as a fine collection of finished paintings, many of which had figured at the Salon and other exhibitions. Among these were the *Soleil Couchant, Seine-Port*, first exhibited at the French Exhibition of 1855, which fetched 3,020 fr.; *Le Parc, Matinée de Printemps* (Salon of 1835),

2,000 fr.; and *Marais Salants aux environs de Saint-Valéry*, 2,420 fr.

A COMPETITION has lately been held at the Ecole des Beaux-Arts for a statue to Voltaire, to be erected on the occasion of his centenary. The number of designs sent in was twenty-six, three out of the number being by sculptors who had received *prix de Rome*. None of them appear to have been remarkable, and though the prize was divided between two of the competitors, MM. Maillet and Caillé, it is not certain that either of their designs will be chosen. The statue is to be three mètres high, and will be erected on one of the public places of Paris.

THE *Zeitschrift für bildende Kunst* opens this month with an archaeological article on the "Theatre of Dionysos at Athens," the text being written by Dr. Leopold Julius, while the accompanying plans and illustrations are the work of Ernst Ziller. Another architectural subject is dealt with by Prof. Hans Semper—"Comparative Study of some of the Plans for Churches at the time of the Renaissance"; but the untrained will be likely to turn for relief from these severe studies to Mr. Bevington Atkinson's review of Crowe's *Life of Titian*, continued in this number; or even to the long-drawn-out correspondence between Bonaventura Genelli and Karl Rahl. The only article besides these is a dissertation by Dr. Richter on "Western Paintings in Eastern Lands," which gives some useful information respecting certain works of Byzantine art. An etching by Unger from a portrait of a young Dutch lady by Rembrandt, taken from Unger's *Vienna Gallery*, but not one of his happiest works, forms the frontispiece of the number.

PROF. FRIEDRICH PRELLER has just died at Weimar, at the age of seventy-four. Among his principal works are a series of seven large subjects drawn from the *Odyssey*, a series of landscapes from the same poem, and the decoration of the Wieland Room, in the Weimar Museum; the pictures of *Calypso* and *Leucothoe* at Munich; that of *Nausicaa* in the Razinski Gallery at Berlin, &c.

M. JAROSLAV CERMAK died suddenly at Paris on the 23rd ult. He was born at Prague in 1831, and was a pupil of Gallait and Robert Fleury. He exhibited in the Salon last year *Des Herzégoviens, de retour dans leur village pillé par les bachi-bouzouks, trouvent le cimetière ravagé et l'église détruite*. Two of his pictures will appear in the coming Salon.

THE *Tagblatt* of Schaffhausen reports the death of the aged landscape-painter Konrad Corradi on April 9, at Uhwiesen, in the Feuerthal. He belonged to a distinct school of water-colour artists (in "Aquarelle-Malerei" and "Gouache-Malerei") settled for some time in the Feuerthal and Schloss Laufen. He was an admirable draughtsman of Swiss scenery, and the views and panoramas drawn by him for more than one handbook of travel are among the very best of their kind.

THE STAGE.

PARISIAN THEATRES.

A REVIEW of some of the principal pieces now being played on the Parisian stage may be acceptable to those who propose to visit the Exhibition. Several plays have been already mounted with a view to the expected crowd of strangers, and others are being prepared.

At the Théâtre Français, the latest novelty at which, *Les Fourchambault*, has been already reviewed, the revival of Victor Hugo's *Hernani* has been a great success, and it will probably be given throughout the summer occasionally. The piece has now been for nearly fifty years before the public—it was played first in 1830—and the battle between the romantic and classical schools that was fought over it has become so completely

a matter of history that the representation is now undisturbed by any of those stormy manifestations of feeling that were then of nightly occurrence. The very lines that were once the signal for a shout of applause or a yell of disapprobation now pass almost without notice. It was not so in 1837, when the interdict on Hugo's plays was removed for the first time since 1852, at the express desire, it is said, of Napoleon III., in order that visitors to the Exhibition held that year might see one of the masterpieces of French dramatic literature. Then every line was carefully watched, to see whether the microscopes of the Censure had seen danger to the State in any of the words or passages that had formerly been called in question. When Don Carlos bitterly describes his court as—

"Basse cour où le roi, mendié sans pudeur,
A tous ces affamés émiette la grandeur,"

the audience fully expected that he would be compelled, as before, to speak only the feeble lines—

"Pour un titre ils vendraient leur âme, en vérité.
Vanité! vanité! tout n'est que vanité!"

and the whole house applauded the restoration of the true text. At the present time these and similar passages, which are really no finer than many less freely debated lines, are listened to in respectful silence. Even the famous exclamation of Doña Sol, which to the last Mdlle. Mars refused to utter,

"Vous êtes mon lion, superbe et généreux,
Je vous aime,"

would hardly be noticed if it were not for the marvellously dramatic gesture with which Doña Sol, as represented by Mdlle. Sarah Bernhardt, flings herself into Hernani's arms.

If, in this absence of excitement, *Hernani* be calmly criticised, it will be judged, we think, to be rather a splendid outburst of romantic poetry, born of a period of feverish political and literary excitement, than a work of art destined to live for all time. Has not, indeed, the reaction against the romantic school commenced already? Is not its despised classical rival once more in the ascendant? The violent extravagances of these splendidly-dressed heroes, "so gallant in love and so dauntless in war," approach dangerously near to that narrow limit which separates the ridiculous from the sublime; the high-souled appeals to feudal sentiments of patriotism, hospitality, and race fall coldly on our degenerate ears; the whole action is too far removed from common life for us to enter into the feelings of these creatures of a world that is not our world; the very fire of the passionate verse is as unreal as the characters, and though we are carried away while we listen to the lines, the impression fades as soon as the curtain has fallen. As a play, it is full of faults. *Hernani* is a nobleman who has been exiled and become a brigand. He always professes to be about to perform some great deed of vengeance, but nothing comes of it. His rank and lineage has been referred to in such vague and general terms that when, in the fourth act, he hurls defiance at Don Carlos in the lines

"Dieu qui donne le sceptre et qui te le donna
M'a fait duc de Segorbe et duc de Cardona,
Je suis Jean d'Aragon, grand maître d'Arms, né
Dans l'exil, fils proscrit d'un père assassiné
Par sentence du tien, roi Carlos de Castille!"

the revelation of the name makes no impression whatever on the audience. The whole of this act indeed is strangely out of place. There has been no previous reference to any conspiracy, and yet we are suddenly transported from Spain to Aix, and find ourselves in the vaults of the Cathedral, where a plot to murder Don Carlos is being concocted. The conspirators are so kind as to wait while he delivers his opinions on the world in general in a soliloquy which, even after it has been wisely shortened, occupies a quarter of an hour in delivery. It is a grand burst of eloquent verse, but it does not advance the action. Ruy Gomez again, who is intended to be the very flower and type of the chivalry of Spain, is

actuated by jealousy in its lowest form. Because Doña Sol does not love him, and is wedded by the Emperor to the man of her choice, Hernani, he exacts from him the fulfilment of a monstrous compact, and looks on calmly while the pair take poison on their wedding-night.

Victor Hugo must be delighted to see that his text is now followed as closely as the exigencies of the stage will permit, and that most of the passages omitted or shortened on previous occasions are now presented as he wrote them. The scene of the portraits, for instance, is now given entire. The acting is good, but on the whole not so good as in 1867, when Hernani was played by M. Delaunay and Don Carlos by M. Bressant. Those parts are now played by M. Mounet-Sully and M. Laroche. M. Maubant, as before, plays Ruy Gomez, and is as excellent as ever. The others, it must be admitted, are not quite up to the parts assigned to them. The tone of the whole representation is less "grand seigneur" than heretofore. The tall and handsome person of M. Mounet-Sully makes a fine effect on the stage, but he develops one side of the character only. He is the most picturesque of brigands, but he forgets entirely that Hernani is also "seigneur de lieux dont j'ignore le compte," and that his bearing should be princely through his disguise. His declamation is far too noisy, his gestures too violent. He is at his best in the love-scenes with Doña Sol. There he is sarcastic and tender by turns, as the author requires that he should be; and nothing could be better than the tone of intense love with which he poured forth his repentance for his doubt of Doña Sol's truth as he dropped on his knees before her and exclaimed,

"O je voudrais savoir, ange au ciel réservé,
Où vous avez marché pour baiser le pavé!"

Mdlle. Sarah Bernhardt, on the other hand, who now plays Doña Sol, is faultlessly perfect; and it is indeed fortunate for the theatre that they have such an actress to whom the part could be entrusted. In the earlier acts she represents to the life the truthful maiden who is ready, as Hernani says,

"Être errante avec moi, proscrire, et s'il le faut,
Me suivre où je suivrai mon père—à l'échafaud,"

answering to all his warnings, with deep feeling in her voice, the simple words "je vous suivrai." Her great effect is in the last act, when in the middle of the delicious love-scene by moonlight on the terrace, the revengful voice of Ruy Gomez sounds the knell of the happiness of herself and her husband. Then the passion of the woman flashes out terrible and strong, as she stands in front of Hernani, as though to shield him from his destroyer, and shrieks out the wonderful lines beginning

"Il faudrait mieux pour vous aller aux tigres même
Arracher leurs petits, qu'à moi celui que j'aime."

No description, however, can do justice to her performance; it is one of those admirable works of art that must be seen to be appreciated, and it is so complete in all its details that it will bear seeing again and again.

At this theatre *Le Joueur*, by Regnard, has also been revived. Regnard was one of the immediate successors of Molière, and this comedy was the first work that achieved a marked success after the death of the latter. The gambler is admirably played by M. Delaunay, but the character of a man who is a gambler and nothing more; who cares for his mistress only when he has lost and requires consolation, and forgets her when he has won; who raises money on the security of her picture set in diamonds which she has given him, with other mean actions too numerous to chronicle here, is so unsympathetic that, notwithstanding the excellent art of the actor, the piece is rather tiresome. *Les Caprices de Marianne*, by Alfred de Musset, has also been played again lately after a long interval, occasioned by the illness of M.

Bressant, who used to impersonate Octave with infinite grace and passion. His illness having taken so serious a turn that he has been obliged to leave the stage, the part of Octave has been given to M. Delaunay, and that of Celio has devolved upon M. Worms, the newly-elected *sociétaire*. The piece is now played with closer adherence to the author's text than heretofore, ending, as he wrote it, with the scene between Octave and Marianne in a cemetery after Celio's death. Since M. Perrin became director of this theatre, it has been one of his objects to present every work given entire, without reference either to custom or to the supposed exigencies of the stage. It is probable that during the summer a morning performance will take place here on Thursday in each week, when the best pieces of the *ancien répertoire* will be given. They will be specially mounted for the occasion, and the greatest care will be taken to present them in the most perfect manner possible.

The Odéon, which used to pride itself upon developing rising talent both in authors and actors, has departed from its traditions and produced a long spectacular play by the most fashionable author of the day, Alexandre Dumas. It is arranged from his father's novel, *Joseph Balsamo*, and bears the same name. It is more than doubtful whether this course has been a wise one. A more thrilling drama has rarely been witnessed; the skill of the older writer is seen in the characters and in the plot, that of the younger in the incisiveness and satire of the dialogue. It is admirably acted throughout; and, while mere lavishness of decoration has been avoided, historical accuracy in costume and scenery has been aimed at and achieved. A more beautiful picture of a stately Court ceremonial than the reception of Mme. Dubarry at Versailles was never seen on the stage. The inveterate repulsiveness of the plot, however, cannot be got over; and the attempts that have been made to soften it have only succeeded in bringing into fuller light its most objectionable features. The *débutante*, Mdlle. Jullien, though not exactly pretty, is a delightfully natural Andrée de Taverny, and the more charming she is the more does one execrate the brute Gilbert, who, while professing the purest love, is actuated only by the vilest passion. Vainly does the author try to account for his crime by accentuating the bitter sneers with which the aspirations of the young disciple of Rousseau are met; the more educated he is made the more odious is his return to the lust of a savage. Most powerful, and yet most painful, is the scene in which Andrée, mesmerised by Cagliostro (Balsamo), tells the story of the outrage. She piteously entreats him to let her be silent, but in vain. Then, with a modest timidity that would conceal the horrid truth if she could, she tells the story, every word being wrung from her lips against her will; till at last, overcome by emotion, she covers her face with her hands, and ends with a shriek more eloquent than words. The last scene also is a very fine one, in which Andrée, after listening to a passionate avowal of love from Gilbert, discovers that he is the guilty person, and drives him from her presence with the bitterest reproaches. Here, again, an attempt is made to redeem his character by bringing into relief his love for Andrée; and his last words as he goes out, "Peuple je suis né, peuple je reste," are spoken more in sorrow than in anger. M. Lafontaine as Cagliostro, M. Porel as the Duc de Richelieu, M. Talien as Louis XV., Mdlle. Léonide-Leblanc as Mme. Dubarry, and Mdlle. H. Petit as Marie Antoinette, are all excellent in their different parts. And it must be said of M. Marais (who made such a successful *début* as Vladimir Danicheff two years ago), that he plays Gilbert with a talent and discretion that soften the odious features of the character as much as possible.

When *Balsamo* is withdrawn, Victor Hugo's tragedy *Angelo* will probably be revived here, with Mdlle. Rousseil as La Tisbe, a character

undertaken originally by Mdlle. Mars, and afterwards by Mdlle. Rachel.

There is a new comedy by Sardou at the Théâtre du Vaudeville, called *Les Bourgeois de Pont-Arcy*. It is not equal in interest to *Dora*, but is more in the style of his earlier work, *Nos bons Villageois*, dealing with the small, ill-natured humours of a country town on the eve of an election. Much of the satire, brilliant as it is, deals so exclusively with French politics that it is difficult for a foreigner to appreciate its force. The serious portion of the story has the fault which spoils so many of M. Sardou's plays—the plot is so elaborate that the characters become mere puppets, pulled by wires of the author's contriving, and acting under conditions so far removed from those of ordinary life that it is difficult to imagine that they could have been brought about even under the given circumstances. In this comedy the hero, on the eve of his marriage, receives a visit from a mysterious lady, whom he has never heard of before, who proves to his satisfaction, by the production of a packet of letters, that she had been the mistress of his father, hitherto believed to have been a paragon of virtue and conjugal fidelity. His first idea is to save his father's reputation at the expense of his own; and he is actually driven by the persecutions of the town gossips and the anxious questions of his mother, to avow that the lady is his own mistress. His marriage is broken off, and he has to endure a most painful scene with his mother and his uncle, in which they entreat, command, even threaten him if he will not consent to the only reparation possible—marriage with the lady in question. Ultimately all is set right. But independently of the unpleasant feelings excited by the possibility of such a union as is suggested by these well-meaning persons, the utter improbability of the whole situation destroys the interest of the piece. It is admirably acted by one of the best companies in Paris.

The Théâtre de la Porte St. Martin, the chosen home of Melodrama, has produced a dramatic arrangement of the first part of *Les Misérables* of Victor Hugo, adapted to the stage by his son Charles Hugo. As in the case of most dramas borrowed from lengthy romances, it has been taken for granted that the audience would be familiar with the story; and therefore the adaptor has contented himself with selecting those scenes which he thought would be best suited to the stage, without troubling himself to connect them in any other way than by the appearance of Jean Valjean in every one of them. Consequently the piece is to a certain extent a monologue, divided into twelve portions by the fall of the curtain, and interrupted occasionally by the other characters. Who these are, why they appear when they do, and why they speak the words allotted to them, can only be understood by reference to the novel. However, as most people have read it, that does not much matter, and very great pleasure may be derived from M. Dumaine's performance of Jean Valjean. He is exceedingly well supported by M. Lacressonnière as the Bishop, M. Taillade as Javert, by M. Vannoy as Thénardier; and last, not least, by the charmingly natural child who plays Cosette. She is not that most odious of all dramatic objects, a "stage child;" but a real artist, though a child in years, who impersonates the poor ill-treated offspring of Fantine with a fidelity that, if it has a fault, is too exact for the feelings of the spectators. The play is mounted with great care; and lovers of sensation will be much gratified by the exciting episodes of the flight of Jean Valjean and Cosette; terminating with the ascent of the convent wall, over which Cosette is drawn by a real rope tied round her waist with a handkerchief.

The old Théâtre de la Porte St. Martin was destroyed during the Commune, and the new house has lost many of its former patrons, who feel out of place in a smart new theatre. Those who care

one of the ancient homes of drama in its original condition should go a few yards further to the Théâtre de l'Ambigu, where they will find several crimes receiving dramatic ration. At present the piece is *La Brésilienne*, a story of poisoning, which, notwithstanding the presence of Mdlle. Fargueil as the heroine, proved a failure.

There are several light musical pieces well known. The Théâtre de la Renaissance, close to Porte St. Martin, is still giving *Le Petit* with bright music by Lecoq. The Folies Matiques has played *Les Cloches de Corneville* early a year, and may very likely play it for a year to come; and *Nimiche*, with Judic and his, is filling the Variétés with audiences who will till they can laugh no longer.

All dramatic tastes exist in Paris, and all have their suited, *pièces féeriques* are still given occasionally for those who care to gratify the eye. The Théâtre du Châtelet has just mounted the ever-popular *Sept Châteaux du Diable* with its scenery and dresses; and the Théâtre de la Gaîté will produce *Le Chat Botté* at about the same time as the Exhibition opens.

JOHN WILLIS CLARK.

A new drama by Mr. Tom Taylor and Mr. Alfred Meritt, produced at the St. James's Theatre under the title of *Such is the Law*, is founded on the notion that under the present state of marriage laws it would be very inconvenient for a widower who had married again—and no more convenient for his second wife—if it should be that he had unwittingly espoused his first wife's sister. In this case the lady has enjoyed 16 years of connubial bliss, and is a happy being, when the evil genius of the play makes her appearance and harasses the couple by his welcome information. All this, of course, renders the distress of Miss Ada Cavendish in the case of Mrs. Belfoy very great; but as this distress would be no less whether the prohibition of marriages with deceased wives' sisters were reasonable or unreasonable, the case presented obviously leaves the vexed question where it was before. How it comes about that George Belfoy and his wife are so long without any suspicion of a relationship between the deceased and the living lady is set forth in the play—though at the expense of sacrifice, it must be confessed, of probability. A certain air of unreality indeed pervades the work. Its sombre and sorrowful character is, moreover, somewhat depressing. All, however, ends cheerfully on the discovery that George Belfoy had married a deceased wife's sister, because his proposed first marriage was invalid, owing to the lady having previously entered into the marriage with a husband who was still in existence. This is no doubt but a rude and primitive dénouement, but it serves its purpose of enabling the audience at the St. James's to dry their eyes for the fall of the curtain.

A NEW version of *La Fille de l'Avare*, by Mr. James Mortimer, has been produced at the Lympic Theatre. This play, which is founded on Balzac's novel, *Eugénie Grandet*, was familiar to London audiences some years ago, through a version by Mr. Palgrave Simpson entitled *Daddy Hardacre*, in which the late Mr. Robson achieved one of his greatest successes. Mr. Mortimer calls his adaptation *The Miser's Treasure*, and like his predecessor, he endeavours, not very successfully, to represent this *scène de la vie provinciale* as a picture of life in an English county. The scenes have been much reduced, and the dialogue has been rendered somewhat commonplace. *The Miser's Treasure* met with but a cold reception, but this was in a great degree due to the deficiencies of the performers. Mr. Anson's extravagances of action in the part of the miser provoked laughter, though manifestly intended to impress in a very different manner. It may be that confirmed misers when robbed of their hoards bark like distracted

dogs, but that they ought not to do so on the stage in a scene of a serious nature is so obvious that we cannot imagine any one dissenting unless it be the medical critics who lately blamed Mr. Irving's death-scene in *Louis XI.* because it failed to represent a complete set of symptoms of the disease which finally brought the reign of that monarch to a close.

MR. REECE's "comedy burlesque" at the Globe, entitled *Mind the Shop*, introduces Mr. Toole as a grocer who insists on keeping open shop on a Bank holiday, ostensibly from zeal for business, but really that he may be provided with an excuse for absenting himself from home on that occasion. Some indication of an intention of parodying *Pink Dominoes* is discoverable in the design of the piece. It is, however, little more than an excuse for Mr. Toole's drolleries.

L'Accordeur, by M. Saint-Agnan-Choler, *Les Vitriers*, by MM. Bernard and Grougé, and *Pour Sauver Femme du Monde*, by M. Abraham Dreyfus, are the titles of three pieces produced simultaneously at the Palais Royal. They are trifles of the vaudeville class—each confined to one act.

At the Théâtre Cluny a tearful melodrama in seven acts has been produced with the title of *Le Mariage d'un Forçat*. The author is M. Alexis Bouvier.

MR. WILLS's new historical drama, entitled *Nell Gwynne*, was produced at the Royalty Theatre on Wednesday.

MUSIC.

THE ITALIAN OPERA-HOUSES.

MR. GYE has been so hampered in his arrangements up to the present time that a certain amount of forbearance should be exercised in judging of his efforts to keep faith with the public. But no beneficial result can accrue from the suppression of facts, and it must be said that so far the establishment has not been strengthened by the additions made to the list of singers. Mdlle. Bertelli, who has appeared as Leonora in *Il Trovatore*, and as Agatha in *Der Freischütz*, has a voice of moderate calibre, and is not wholly deficient in vocal skill. But histrionically she is very unsatisfactory, her acting generally being forced and conventional, and her movements wanting in ease and grace. Mdlle. Sarda, who unwisely selected the part of Amina for her *début*, showed conclusively that she is a mere novice in all the technicalities of her art. Her natural gifts are considerable, but years devoted to careful study must elapse before she can be accepted as a finished artist. On the male side we have had two aspirants, Signor Carbone and M. Jamet, both of them baritones. The former has a pleasant voice, but, apparently, no stage experience; the latter is likely to be useful in subordinate parts. The return of Mdlle. Albani has been the only noteworthy feature during the present week; but the announcement of *Guillaume Tell* on Monday served to revive regrets that Rossini's *chef-d'œuvre* should never be presented save in a maimed and mutilated form. The fine duet between Mathilde and Arnold in the third act might, perhaps, be spared, but the suppression of the fifth act, and with it some of the most beautiful and impressive music in the opera, is unpardonable. The composer was truly inspired when he wrote the trio in canon, the storm scene, and the finale to this section of his last and immeasurably greatest opera.

Her Majesty's Theatre opened tamely enough with *La Sonnambula*, followed by a second-rate performance of *Zauberflöte*. But the revival of Meyerbeer's *Dimorph* has served to maintain the prestige of the historic house, for seldom has any opera enjoyed a finer *ensemble*. The work itself is an illustration of the oft-quoted fact that any nonsense is good enough to serve for musical purposes. The justice of Richard Wagner's censures on the anomalies of the lyric drama receives

forcible confirmation in such an instance as this, where we find a composer of genius condescending to set a libretto full of the most arrant absurdities. But the fascinating music which Meyerbeer wedded to Messrs. Barbier and Carré's fantastic book has saved the opera from condemnation, and *Le Pardon de Ploërmel* will always maintain a high place in the catalogue of his works. The principal character has been so long in the hands of Mme. Adelina Patti as to be considered almost her exclusive property. Mdlle. Marimon has fully dispelled this idea by her admirable performance, though her qualifications are chiefly, if not entirely, vocal. As a study of acting the impersonation lacks variety and natural impulse; but the Belgian artist sings the florid strains with which the part abounds with unerring precision and marvellous purity of tone. One becomes almost reconciled to an endless succession of unmeaning *roulades* when thus executed. Mr. Mapleson has without doubt secured a prize in Mdlle. Tremelli, a lady gifted with a contralto voice of great power and full, luscious quality, but of whose powers either as a singer or an actress it is as yet impossible to speak with certainty. Mdlle. Minnie Hauk has returned to us, after nine years' absence, greatly improved in all respects. Her voice is a fine soprano, and her method highly commendable. More than this, she manifests the possession of great histrionic ability, her presentment of the objectionable heroine in Verdi's *La Traviata* being more truthful and powerful than any that has been witnessed of recent years.

H. F. FROST.

MENDELSSOHN's music to the *Midsummer Night's Dream* formed an important part of last Saturday's programme at the Crystal Palace. With the exception of the comparatively unimportant numbers of melodramatic music, the entire work was given. With such an orchestra as that under Mr. Mann's direction, it need hardly be said that a treat of the highest order was afforded to those present. The solo parts were given by the Misses Allitsen, who also sang with great effect later in the afternoon the charming Bolero from the second act of Auber's *Diamans de la Couronne*. Mme. Arabella Goddard, who stands almost alone in keeping Bennett's pianoforte music before the public, gave a very fine rendering of his concerto in C minor. Rubinstein's interesting ballet-airs from his opera *Der Dämon* terminated the concert.

THE second concert of the Bach Choir, given at St. James's Hall on Monday evening, was one of the finest as yet given by this society. In the first place it was at least half an hour shorter than the preceding one—a decided change for the better; and beside this Mr. Goldschmidt conducted with far more fire and vigour than on some previous occasions, and the choir sang consequently with no less correctness, but with more spirit. The first work in the programme was Bach's *Magnificat*, which was superbly rendered throughout. The work had only once before been given in London (by the Borough of Hackney Choral Association, under Mr. Richard Payne, in 1874), and then without orchestra; so that the present was its first performance in a complete form in the metropolis. The choruses, especially the "Omnes generationes," "Fecit potentiam," and "Gloria," were given in a manner worthy of the reputation of the Bach Choir, while the solo music in the hands of Mme. Sherrington, Mdlle. Redeker, Mr. Shakespeare, and Herr Henschel, left nothing to desire. Mme. Sherrington sang her two solos, especially, in a most artistic manner; she has rarely been heard to better advantage; while Mr. Shakespeare gave the trying song "Deposuit potentes" with great effect. Purcell's anthem "O God thou hast cast us out," an interesting specimen of the composer's church music, came next, and was followed by the Sanctus, Benedictus, and Agnus Dei of Palestrina's "Missa Papae Marcelli," for unac-

accompanied choir. The singing of these pieces was remarkable, both for the accuracy of intonation, and the attention to light and shade. Schumann's "New Year's Song," given at the first concert, was repeated on Monday; and on its second hearing was even more warmly received than before. After a fine madrigal by Wilbye, "Draw on, sweet night," the concert ended with a really splendid performance of Mendelssohn's *Erste Walpurgis Nacht*, sung in German, greatly to the gain of the music, if not of the audience. It is very doubtful whether so fine a rendering of the work has ever before been given in London. The important baritone solos were magnificently declaimed by Herr Henschel, one number being well sung by a gentleman whose name did not appear in the book of words; while Mdlle. Redeker and Mr. Shakespeare took the contralto and tenor solo music. The choruses were without exception perfect, and the orchestra was hardly less so. The whole concert was highly enjoyable. The third and last concert of the season takes place next Saturday afternoon (the 11th), when Bach's Mass in B minor is to be given for the fourth time in London.

M. J. MASSENET, one of the most talented of living French musicians, appeared on Tuesday at the third of Mme. Viard-Louis's concerts in the double capacity of composer and conductor. His orchestral Suite, entitled *Scènes Dramatiques* (*Shakespeare*), composed expressly for these concerts, is an ambitious work purely French in style as it is wholly modern in spirit. The first movement, "Ariel and the Spirits," is impetuous and restless, the frequent changes of *tempo* suggesting the idea of an improvisation, or at least a *scherzo* of grotesque pattern. The second movement, "The Sleep of Desdemona," is sentimental, but very charming, though it pales in importance as compared with the third, which illustrates various scenes from *Macbeth*. A march, which plays an important part here, may be noted for its individuality, but the entire movement has tremendous vigour and a certain rude force. M. Massenet is not conservative in his ideas of tonality, nor is he by any means over-modest in his employment of exceptional orchestral resources. The scoring is in the manner of Hector Berlioz, of whose works one may suppose M. Massenet to be an admirer. Mme. Viard-Louis played the solo part in Hummel's B minor concerto, and also Beethoven's Sonata in D, Op. 28. The introduction of the latter in an orchestral concert was a mistake, and, coming immediately after the Suite, every chance of effect was lost. Mr. Weist Hill has his immense orchestra now well under control, and the rendering of Beethoven's *Leonora Overture No. 3*, and Mendelssohn's Italian Symphony, was nearly irreproachable. But the concert was much too lengthy, lasting as it did nearly three hours.

At the Philharmonic concert on Wednesday, M. Planté, the French pianiste, made his first public appearance in London. He is a player of fair technical merit, but he took an unwarrantable liberty with Mendelssohn's Concerto in D minor in making a pause at the close of the first movement, and thereby spoiling one of the best effects in the work. There were other licences of more or less blameworthy character in the performance, and, speaking generally, it cannot be said that M. Planté fulfilled reasonable expectations. Señor Sarasate introduced three movements from Raff's Suite for violin and orchestra, Op. 180. The work is interesting, and the playing of the Spanish violinist was simply superb; finer execution could scarcely be imagined. The band was not in such good form as at the previous concerts this season, the rendering of Mozart's "Jupiter" and Beethoven's C minor symphonies being mechanical and spiritless.

PROF. G. A. MACFARREN is to lecture at the Eyre Arms Assembly Rooms, Finchley Road, on Thursday, the 9th inst., at 8 p.m., on "Sir William Stendale Bennett: his Life and Works."

MR. SHEDLOCK concluded his series of Chamber Concerts at the Victoria Hall, Bayswater, last Wednesday week the 24th ult., with a "Schumann Evening." The specimens of the master which were given included the Piano Quartett in E flat (Op. 47), the "Märchenbilder" for piano and viola (Op. 113), a selection from the "Kreisleriana," and four songs. The miscellaneous second part of the concert concluded with Bargiel's trio in E flat. We are glad to learn that these excellent and really educational concerts have been well supported; Mr. Shedlock's perseverance certainly deserves success.

MR. H. HEATHCOTE STATHAM announces a series of organ Recitals on Sunday afternoons, at the Royal Albert Hall, commencing to-morrow, and continued weekly till the end of July. The special feature of the recitals is stated in the programme of the first, in the following words:—

"It is intended to include in the series of programmes all the principal organ fugues of Bach, with the special aim of suggesting a variety of effect and treatment such as the composer would probably have contemplated had he commanded the mechanical resources of a modern organ."

AGENCIES.

Copies of the ACADEMY can be obtained every Saturday morning in EDINBURGH of Mr. MENZIES; in DUBLIN of Messrs. W. H. SMITH AND SONS; in MANCHESTER of Mr. J. HEYWOOD. Ten days after date of publication, in NEW YORK, of Messrs. G. P. PUTNAM'S SONS. There are also Agencies in twelve of the principal cities of the NORTH and WEST of the UNITED STATES.

PARIS.

Copies can be obtained in PARIS every Saturday morning of M. FOTHERINGHAM, 8 Rue Neuve des Capucines.

SATURDAY, MAY 11, 1878.

No. 314, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Studies in Literature, 1789-1877. By Edward Dowden. (London: C. Kegan Paul & Co., 1878.)

BESIDES the now decried criticism which starts with certain hard-and-fast rules and prejudices, and simply measures the work to be criticised by these: besides the more fashionable and wiser criticism which does its best to take in the whole of its subject and give back such a reflexion as the nature and peculiarities of the critic's mind may be able to supply, there is a third possible way of criticising. The critic of this kind takes his subjects and asks to know their opinion on certain points which appear to him of supreme importance. He extracts their answers as best he can, and then sets himself to work to find out how and why they think thus. He aims, in short, at making a philosophical study of each writer rather than a literary representation of his idiosyncrasy. One advantage of this method when it is pursued by a thoughtful and instructed person is that it is pretty sure to be full of suggestion and improvement to the reader. Its disadvantage, even when pursued by such a one, is that it is apt to furnish a one-sided and incomplete view of the subject, and to supply rather what Wordsworth called "a chain of extremely valuable thoughts" than an adequate and integral critique.

It is to this third class of criticism that most of the essays which Prof. Dowden has here reprinted belong; and they are remarkable specimens of their kind both in its merits and its defects. On the one hand, they are crammed with thought, and it must be an exceedingly dull, or a wonderfully unreceptive, person who puts them down without feeling that he has enriched by a goodly amount his stock of theses to be argued about in solitary walks and other times of meditation. On the other hand, Prof. Dowden's method has sometimes led him into strange places. Thus he remarks that Victor Hugo's art "contributes little to the formation of the wise adult conscience." Without levity, we must say that it seems to us that it would be a remark as relevant to poetical criticism to say that the leaves and covers of the poet's books would contribute little, if burnt, to the warming of the cold adult body. But this is an instance of defect chargeable rather on the method than on the man; and it must be confessed that there are few other instances of such unguarded methodical excess. Generally Prof. Dowden's criticisms, whether we accept them as adequate or not,

must be admitted to be of much weight as far as they go; and that in the direction of stimulating thought is, as we have already said, a very long way.

The book contains thirteen essays, all of which are fairly, if not perhaps very closely, connected by a community of object rather than of subject. The first three deal generally with certain characteristics of cis-revolutionary literature, the last ten with particular exponents of those tendencies. One only of these seems to us to be out of place, though the essay itself is one of the best of the book, and that is the article on Landor; for of Landor it may surely be said, and indeed Prof. Dowden seems himself to admit, that he belongs to the post-revolutionary time merely as a matter of chronology. Its characteristics influenced him only as every man must of necessity be influenced by the characteristics of his time, the influence being purely external and modifying, not causal in the least. No such objection can be brought against the studies of Mr. Tennyson and Mr. Browning, of George Eliot and Victor Hugo, of the *Parnasse*—or rather of a few of its members—and of Whitman, of Lamennais and of Quinet. This is a goodly range of subject, and it speaks well for Prof. Dowden that he is able to cover it successfully. Range of knowledge is, indeed, one of his strongest points. There may be nothing extraordinary in a knowledge of the work of Ebenezer Elliott, and nothing extraordinary in a knowledge of the work of Leconte de Lisle. But one feels that the man who has given himself the trouble to read two poets who lie so widely apart is not dealing with literature from any contracted or specialist point of view. Particularly good, to our thinking, are the essays on Lamennais and Quinet, the former being by far the best. Prof. Dowden is obviously most at home in dealing with men and women of letters who have been strongly imbued with the practical spirit, and among such, odd as it may seem to those whose acquaintance with Lamennais extends no further than to the *Paroles d'un Croyant*, the author of that strange book must surely be ranked. It is this attraction of Prof. Dowden towards the literature of conduct which makes him dwell so lovingly on Wordsworth, on George Eliot, and on Whitman, a trio which may again seem an odd one to the unlearned. It makes him, too—as all such attractions will sometimes—a little unjust. We have cited one remark of his about Victor Hugo, for whom he has, notwithstanding, a great and eloquently expressed admiration. Here is another:—"Nearly every collection of his poems is prefaced with a page of prose, the purport of which is, 'Observe how beautiful, how interesting an attitude my soul assumes in the following volume.'" We cannot help thinking how exceedingly angry Prof. Dowden would be with anyone who should criticise George Eliot in this spirit. On the other hand, as an instance of the thoughtful and pregnant quality which we have praised in these essays we may mention the remark in the contrast between the two leaders of contemporary English poetry that in the treatment of moral temptation Mr. Tennyson displays prudence tempted to give way to

passion, Mr. Browning passion tempted to give way to prudence. This is the kind of observation which is spread all over these essays, giving evidence of thought itself and calculated to excite thought in others. This of itself renders any detailed notice of the book in a limited space somewhat difficult, and we shall only, therefore, further say that, full of value as the study on "Some modern French Writers of Verse" is, it seems to us to labour under the defect of attempting to cover too much ground. The whole of it would not have been too much to have given to Leconte de Lisle, with whom Prof. Dowden has evidently much sympathy, and who, well as he deserves it, has never had due introduction to English readers. We should have been glad, too, to see Prof. Dowden work out his proposition that the author of *Le Runois* and *Le Jugement de Komor* has come nearer the pole "opposite to Musset and the poetry of the heart than either Gautier or Baudelaire." We are not sure that we quite understand this expression, which seems to be a kind of development of the old antithesis between the poetry of sentiment and that of reflection. Yet it seems strange that anyone should rank Gautier or Baudelaire in opposition to poets of sentiment.

One word as to the manner of these essays. They are written with extreme care and in a somewhat elaborately designed style, much of which is very good and worth the attention of students of English prose. But Prof. Dowden's hand does not seem quite sure of its instrument, and the result is sometimes sundry slips upward into exaggerated metaphor, and sometimes downward into platitude. One very curious blemish we are surprised to find in so careful a writer. The use of the word *élite* as an English adjective cannot possibly be defended. With this vindication of the right to carp possessed by all critics in virtue of their descent from Momus their father and Zoilus who begat them, we return thanks to Prof. Dowden for certainly the most thoughtful book of literary comment which we have seen for a long time.

GEORGE SAINTSBURY.

History of the English People. By John Richard Green, M.A., Honorary Fellow of Jesus College, Oxford. Vol. II. The Monarchy, 1461-1540. The Reformation, 1540-1603. (London: Macmillan & Co., 1878.)

It is a pity—though the thing is hardly to be expected—that when one author is induced to undertake both a short history and a longer one of the same subject, he does not finish the long history first and publish the short one after it. In the present instance it is more than probable that the longer history would never have been written if the shorter had not attained an amount of success, and also called forth an amount of criticism, far greater than most books. The satisfaction which the author must have derived from the deserved popularity of his former work was no doubt clouded by the revelation of a multitude of errors; and though such a discovery was no more than in the nature of things ought to have been

anticipated—for who can write a history, especially a general history, without mistakes?—it was a question whether the inaccuracies pointed out did not in this case go far to discredit many of those rapid generalisations upon which the telling interest of the book depended. The result evidently has been that Mr. Green has been led to reconsider a considerable number of his former statements, and to rewrite at greater length the *History of the English People*.

How far, when the new work is completed, he will have succeeded in justifying the main idea of the former one remains to be seen. In the present instalment his success has not been great. His original idea, it is clear, was that the history of England had been generally related too much apart from the history of the people—which, indeed, is perfectly true; and that it was desirable to write a history of the people, as much as could be, apart from the history of their sovereigns—which is much more questionable. The division of English history into reigns and dynasties was accordingly scouted, and other epochs introduced as far as practicable, even though the definition of those epochs was often not a little arbitrary. It was a history of the people and of popular movements—not of princes, nor of battles, nor even of great events, that Mr. Green had made it his aim to write.

Yet for the period treated in the present volume it is indicated even on the title-page that two subjects mainly occupy the attention; the first being the Monarchy and the second the Reformation; and there is no doubt about the fact. We may, indeed, take some exception to a mode of representing these facts, which taken literally would imply that "the Monarchy" began in 1461 and ended in 1540, and that "the Reformation" began in 1540 and came to an end in 1603. Why ever the year 1540 should have been selected as a turning-point at all, it is difficult to understand; for the death of Cromwell led to nothing new, though his administration was a great epoch. The truth, however, is, beyond all question, that the history of the English people themselves is, under the Tudors, to an unusual degree bound up with, or rather absorbed in, the history of the Monarchy, and of a Reformation which made the monarch the supreme head of the Church. It was not, indeed, as Mr. Green called it in his former work, a "new Monarchy," but it was certainly a monarchy in which the power of the Crown was developed to an extent that had not been seen before. Nor does Mr. Green even yet state the case quite truly when he says, at the commencement of this volume, that liberty "suddenly disappeared" at the close of the Wars of the Roses, or that if English freedom was not utterly destroyed, it was arrested for more than a hundred years. Sudden changes of this sort do not take place quite so easily as is often represented; but then Mr. Green believes in what is evidently even now a very popular idea, that in the preceding age a great deal of liberty had been won by a long Parliamentary contest with the Crown—a thing of which, as I lately pointed out in the *ACADEMY*, there is no real evidence. So, of course, he considers

the character of the monarchy from Edward IV. to Elizabeth "something strange and isolated in our history."

Now, in histories, whether short or long, we are accustomed to look for some broad generalisations; but in a long history, at least, we might expect some degree of careful and accurate detail. It is a fault inherent, apparently, in the very plan of Mr. Green's work, that he never can give his mind to the real working out in detail of any political facts at all. All he wants is the history of the people; and what are wars, battles, negotiations, and diplomacy, royal marriages, papal Bulls, and a number of other high matters, in comparison with this? No doubt even fighting is not done without the "people," and the causes from which wars and revolutions arise are traceable ultimately to cabinet councils, so that affairs of State, even in this aspect, may fairly engage some little attention. But of these Mr. Green can afford to take only the briefest possible survey, and having apparently taken his facts for the most part second-hand, he sums them up in the same hasty, generalising way in which he speaks of the character of the Tudor monarchy.

If, for instance, there were any facts in political history to which we might have expected him to devote special attention, it is surely the facts relating to the original betrothal of Henry VIII., as prince, to Catharine of Arragon—facts which afterwards formed the pretext of Henry's breach with Rome, and are, therefore, one may say, the very starting-point in the history of the Reformation. Yet the account given by Mr. Green of this affair is a perfect marvel of inaccuracy. Indeed, it is such a curiosity in its way that, to do it justice, it must be quoted entire:—

"Catharine, however, was widow almost as soon as wife, for only three months after his wedding Arthur sickened and died. But a contest with France for Southern Italy, which Ferdinand claimed as King of Aragon, now made the friendship of England more precious than ever to the Spanish sovereigns; and Isabel at once pressed for her daughter's union with the King's second son Henry, whom his brother's death left heir to the throne. Such a union with a husband's brother startled the English sovereign. In his anxiety, however, to avoid a breach with Spain, he suffered Henry to be betrothed to Catharine, and threw the burthen of decision on Rome. As he expected, Julius II. declared that if the first marriage had been completed, to allow the second was beyond even the papal power. But the victories of Spain in Southern Italy enabled Isabel to put fresh pressure on the Pope, and on a denial being given of the consummation of the earlier marriage, Julius was at last brought to sign a Bull legitimating the later one. Henry, however, still shrank from any real union. His aim was neither to complete the marriage, which would have alienated France, nor to wholly break it off, and so to alienate Spain. A balanced position between the two battling powers allowed him to remain at peace, to maintain an independent policy, and to pursue his system of home government. He met the Bull, therefore, by compelling his son to enter a secret protest against the validity of his betrothal; and Catharine remained through the later years of his reign at the English court, betrothed but unmarried, sick with love-longing and baffled pride."

Where did Mr. Green get this version of the story? That last touch about the

love-longing and baffled pride has a slight air of Mr. Hepworth Dixon about it; but, any way, the statements in the above extract are throughout almost the exact opposite of the truth. It is not true, in the first place, that Queen Isabella "at once" pressed for her daughter's union with Henry. That which she and Ferdinand at once pressed for on hearing of Prince Arthur's death was that Catharine should be sent back to Spain, and the dowry which had been given with her repaid. Henry VII., however, did not think himself bound to repay the dowry, and Isabella was willing to adjust the dispute by the conclusion of the second marriage. As to the English king having been "startled" by a proposal to marry a deceased husband's brother, it is not very likely; for instead of Isabella's proposal shocking him, he, on the contrary, shocked Isabella soon afterwards by a proposal to marry Catharine himself. The man who could offer to wed his own daughter-in-law (and what was more, the proposal was immediately after his own wife's death) could scarcely have been so easily shocked himself. Then as to the decision of Julius II., the fact is distinctly otherwise; for the dispensation expressly allowed the second marriage, even though the first had been consummated. If it had not done so, indeed, Henry VIII. would have had better grounds for protesting against its validity than those which he was actually able to produce.

Again, in speaking of the power of Henry VIII., which he shows to have been increased and consolidated by the policy of Thomas Cromwell, Mr. Green ventures on a statement regarding the character of the Reformation which is contradicted most emphatically in a document with which he ought to be familiar. We are told that Cromwell "could claim for the monarchy the right of dictating at its pleasure the form of faith and doctrine to be taught throughout the land." Mr. Green has surely forgotten that the Thirty-Nine Articles were agreed to in Convocation in the year 1562—that is to say, less than thirty years after the period of Cromwell's greatest ascendancy—and that in Article 37 it is distinctly declared—

"We give not to our princes the ministering either of God's Word or of the Sacraments . . . but that only prerogative which we see to have been given always to all godly princes in Holy Scripture by God himself; that is, that they should rule all states and degrees committed to their charge by God, whether they be ecclesiastical or temporal, and restrain with the civil sword the stubborn and evil-doers."

The Church, therefore, never conceded to the sovereign the ministering of God's Word, or the definition of faith and doctrine, which Mr. Green says Cromwell claimed for him. It yielded, no doubt, everything short of that, but that it did not.

Now, errors of this sort—and there are various others of the same character—invalidate not merely the particular passages in which they occur, but the whole conception of the political history of the period; and they are clearly due to a wrong mode of going to work in the first instance. Mr. Green was so anxious to get at the history of

the "people," that at first he let the politics alone; and when he did apply his mind to them, he was content to take a few broad general views from untrustworthy authorities. This, indeed, was almost inevitable, and must be the case, it is to be feared, with those who select special subjects out of modern history, until a new race of general historians has condensed and made intelligible to the reading public the results of all the research of modern times. We shall understand the real history of the English people a good deal better when we know more about the kings under whom they lived, and the objects which those kings were pursuing; for the most essential point, after all, about the people is the relation in which they stood to their sovereigns.

On the whole, though this is doubtless a work of very considerable labour, it is scarcely an improvement upon the *Short History*. That publication had undoubtedly the merit of a certain unity which is the never-failing characteristic of a really able book. The author had devoted much attention to the best interpreters of each particular epoch of English history, and had combined the results of his reading in one vivid and interesting narrative. The book had the interest of a connected essay. It has not gained in attractiveness by the amplification of the original design, and the filling in of a quantity of matter about subjects passed over in the first instance. Nor, I fear it must be owned, is the falling off in interest compensated by very much greater accuracy than before. Still, it is the result of a larger survey and more mature reflection; and the many readers who gave such a cordial welcome to the first book will do well to bestow some attention on its successor.

JAMES GAIRDNER.

Life in the Mofussil; or, The Civilian in Bengal. By an Ex-Civilian. (London: C. Kegan Paul & Co., 1878.)

THIS autobiography of a Bengal civilian during twelve years of service in India is a remarkable record of the existence that Englishmen enjoy or endure, according to their disposition, while administering justice and realising revenue in the far East. The writer is fortunately one of those who have enjoyed their life. He takes the bright side of everything, is always cheerful and good-humoured; and, though his experiences have often been bitter and his fortune harsh, it is with genuine enthusiasm that he speaks of his own service and work devoted to a career "the finest in the world." The climate, he admits, is exhausting. From the first of April to the first of November there are, he thinks, very few Europeans in the plains of Bengal who can say that they feel really well. He gives the following description of the hot weather in Tirhoot:—"Every window closed to keep out the dense clouds of dust whirled along by the howling, tearing west wind, everything reduced to a state of tinder by the extreme dryness, the backs of all the books curled up, the ink too thick to flow from the pen, one's hair like tow, and a general sense of grittiness and hot discomfort that must be felt to be understood."

In the rainy season in Lower Bengal things

are even worse. A steamy heat, and drenching showers which are so incessant that the whole of the surrounding level rice-swamp as far as the eye can see is a sheet of water; when all your papers, books, and clothes are covered with mildew and damp; when the buzz of insects and the croaking of gigantic frogs silence the human voice, and hymenopterous swarms pollute the simple and unpalatable food that your faithful domestic servant has served up under difficulties, and your spirits fall to zero in such sunless skies—this is a picture of greater discomfort even than a hot season in Behar. To all this must be added expatriation, isolation in many cases, and, above all, the enforced separation from children and possibly from wife. But upon such topics the writer of *Life in the Mofussil* expatiates very sparingly; it is rather the pleasures and humours of society, and above all the interest of his own official work, on which he prefers to linger. He is proud to have been a member of a splendid service, to have inherited noble traditions, to have shared in a great administration. The solid advantages of the Civil Service are well known. You leap at once into independence; your field for action is immense; your occupation is full of interest and unlimited in variety; a sense of personal influence and power is pleasant. Your recreations are agreeable; the short sharp excitement of a game at rackets or lawn tennis after a long day's work, pig-sticking and tiger-shooting, riding and racing, may all be experienced in perfection. And then the keen feeling of enjoyment with which a civilian returns to Europe after an absence of years, the freshness of his sensations, the youthfulness of his ideas, the vigour of his appreciation, are a pleasure so unique that, all the drawbacks attendant on a voluntary exile in the tropics notwithstanding, it is hardly a subject for surprise that "An Ex-Civilian" should declare, as he does in the concluding lines of his book, that he retired from the service with poignant regret, and that the life of a civilian in India is to be envied.

The chief merit of "An Ex-Civilian's" volumes is their fidelity. They are less brilliant than the essays of a "Competition Wallah," but they are more valuable if accuracy is any test of value. They are quite exceptional in the truthful account they furnish of up-country life. The use of personalities was unavoidable from the method of treatment, but not an unkind expression occurs throughout. The identity of individuals is in all cases veiled. The cleverness and common-sense of the native subordinate officials, the elaborate dignity of the higher class of native noblemen with their decorous visits of ceremony, the indiscretion of the over-zealous English official (who is a far commoner type than the indolent and inefficient), the proverbial hospitality and generous reception accorded to the European traveller by all classes in the Mofussil, are described with kindly sympathy. Shrewd remarks on law and practice are interspersed with humorous anecdotes illustrating the premature introduction of Western ideas into a more backward civilisation. The book has its graver side also, for we

may trace in its pages a growing incompatibility between the governors and governed, which has recently been embittered by memories of the Mutiny and the increased worry of administering new taxes and of yielding vastly more work under more arduous conditions. The writer, however, does not devote himself to political considerations: the book is intended to be social and must be judged accordingly. As the observant and faithful record of a civilian's life it will be read with avidity in India; and it will, I trust, be read by many in England who feel (as surely all must feel) a curiosity to learn something of the life of Englishmen in a country so full of interest to us and so far away and different from our own.

H. J. S. COTTON.

The Position and Prospects of Catholic Liberal Education. By the Hon. and Rev. William Petre. (London: Burns & Oates, 1878.)

The New Departure in Catholic Liberal Education. By a Catholic Barrister. (London: Burns & Oates, 1878.)

THESE two pamphlets refer to a matter which has been the subject of lively controversy in the *Tablet* newspaper, and in Catholic circles, for some months past. A sub-commission on Higher Catholic Education was appointed at a conference in 1871, and the Rev. Father Purbrick made a special Report upon the evidence which was supplied. In that Report two or three very significant passages occur, which are well calculated to provoke anxious discussion:—

"I hold," he says, "that as schools for boys our colleges do a great and, in many respects, most satisfactory work. In morality they are infinitely superior to non-Catholic schools; they conscientiously train all comers, the dull as well as the clever, and secure a higher average of knowledge in a wider range of subjects. Still, if a comparison be made between the highest and cleverest boys at each respectively, I think that we do not come near Eton, Rugby, Cheltenham, Wellington, and some other non-Catholic schools, in three particulars—viz., first, in scholarship; secondly, and much more, in composition; . . . thirdly, in expansion of mind, earnestness of purpose, and definiteness of aim. This I attribute in part to our smaller numbers; . . . to the fact that we have but limited chances of comparison with other schools, even of comparison with the best; . . . lastly, to the terrible *vis inertiae* of comfortable, self-satisfied, mediocre, unambitious traditions. . . . Among our Catholic aristocracy I should say that there is a pretty universal sense of intellectual inferiority, by some acquiesced in, by some resented, by all deplored. The views of those converts whom I know are almost without exception identical with my own, not only as to our inferiority, but also, and very definitely and with strong conviction, as to its causes."

Mr. Petre, in his present pamphlet as in his former publications on the same subject, amplifies and enforces the same view as to the defects of the system of higher education among Catholics; and enumerates other causes which appear to him to account for those defects. He points out that the educational interests of his religious community have been until now almost entirely under the control of close corporations; and that Catholic schools, whether under the care of the Jesuits, of the Benedictine

or of the secular clergy, are to a large extent the sources from which the various corporate bodies draw both their revenues and their reinforcements. The schools are conducted exclusively by the clergy, even down to the lowest details of tuition; lay teachers are discouraged, yet "as all clerical corporations have other interests besides education, they are positively unable to give that pure, disinterested, and exclusive attention to educational science which any degree of excellence therein demands." Hence liberal education in such schools is "entangled with interests foreign to it, or restrictive of its fair growth, sometimes even inevitably in conflict with it." A further hindrance to the attainment of a high ideal of education in the Catholic schools is, in Mr. Petre's opinion, the prevalence in them of a system of *espionage*:—

"Supervision under panic, supervision demented, which is yearly irritating our boys out of all balance of intellect and out of all dignity of character—the spirit of ignorance and narrow-mindedness temporarily clothed in the garb of principles really foreign to it."

Accordingly, Mr. Petre pleads strongly for the adoption of some plan more nearly resembling the public-school life known to Protestants. His pamphlets are pervaded by a strong loyalty to his own Church, and filled with theories of education founded on a distinction between the *supernatural* virtues to be acquired in view of a pupil's eternal salvation, and the *natural* virtues tending to make him become a good citizen and a worthy member of a highly civilised and intellectual human society—theories for which it is difficult for a non-Catholic to find any intelligible basis. But his pamphlets contain throughout a sustained and earnest, often an eloquent, protest in favour of greater freedom and breadth in Catholic education, of a fuller recognition of the claims of modern science and literature, and of the importance of the civic virtues of manliness, self-control, and intellectual life. He accepts the establishment by the hierarchy of the Catholic University College at Kensington as a partial means of supplying the want, but is obviously not content with this provision until it is supplemented with some institutions less like foreign seminaries, and better suited to the character of English youth than the ordinary Catholic High School as it at present exists.

The reply to these arguments in the pamphlet of "A Catholic Barrister" does not strike an impartial observer as very conclusive. It is an acrimonious attack on Mr. Petre, criticising, often with a little justice, his somewhat pretentious and obscure style, and insinuating without much affectation of delicacy that the pamphlets are mere advertisements written in the interests of some pet educational project of Mr. Petre's own. On only one point does the "Barrister" reply definitely to the allegations of his opponent. He declares on the testimony of his own personal experience, that the system of *espionage* is at least not always adopted in Jesuit colleges:—

"Their educational system," he says, "is noted for its uniformity. Five of the very happiest years of my life were spent beneath the shelter of the Jesuits' roof. To them and to their care I owe

every good thing, moral or intellectual, that I may happen to possess, and I should feel myself guilty of the basest ingratitude if I stood silently by while their character or their system was assailed. In the Jesuit college where I and nearly 200 other boys spent the best days of my youth, *espionage* was a thing absolutely unknown. The fullest confidence was reposed in the honour and good feeling of the students, and rarely indeed was that confidence abused."

This testimony, however, is deprived of some of its weight by the grave and manifestly reluctant evidence of Mr. Langdale, who in a letter to the *Tablet* of January 17 says:—

"I believe the over-watchful discipline which still prevails in some of our colleges is not favourable to the development of that manliness and independence which so honourably mark the youths of the public schools of England. There can be no doubt that the rules and practice of our older and larger colleges still bear many traces of the days when they existed as foreign seminaries at Douay or Liège."

For the rest, the pamphlet of "A Catholic Barrister" is mainly filled with invectives and with irrelevant criticism of details. It does not, except by general and wholly unverified assertions, reply to the weighty criticisms of Father Purbrick and Mr. Petre, nor will it, we think, do much to reassure those of the higher Catholic laity who, while affectionately devoted to the ancient faith, desire for their sons a larger and more ennobling intellectual culture than has yet been within their reach.

On the merits of a discussion of this kind, it is difficult for one outside the religious communion in which it originated to form a trustworthy judgment. The soundness and care with which instruction is afforded in some of the Catholic colleges, especially in classics and mathematics, is attested by the great success often attained by Stonyhurst and Downside youths in the examinations of the University of London. But of the intellectual discipline, the moral tone, the life, the breadth of view, and the happiness which characterise such seminaries, none but Catholics can adequately judge. It is no discredit to these institutions that they do not court criticism and investigation. Shelter from secular authority, and from many influences which are operative upon other schools, is part of their essence, their *raison d'être*. "No college," says the Report, "under the charge of Religious could, even if it would, submit to a system of inspection and interference from without." In these circumstances the interest of the general public in what is after all a quasi-domestic controversy must be mainly that of friendly observers, who cannot doubt that if the Catholic laity are themselves alive to the need of a public school with freer air and more generous traditions, that need will ere long be supplied. J. G. FITCH.

The Origin and Development of Religious Belief. By the Rev. S. Baring-Gould. (London: Rivingtons, 1878.)

THE author informs us that he has made little change in these two volumes before sending them out to the world a second time ten years after the first publication of the earlier of them. It is therefore unnecessary to say much of the deficiencies and

inaccuracies which might be collected from the earlier volume, which treats of all non-Christian religions except Mohammedanism, and contains a summary of the results of comparative study of such subjects as the Origin of Mythology, Mysticism, Sacrifice, Sacraments, and the like. Mr. Baring-Gould always shows himself a perfectly free thinker; he is never, or hardly ever, in bondage to a tradition, or a thesis, or a method. Nor is he in bondage to his reading, as many enquirers upon such subjects appear to be; he does not tabulate and classify facts by the hundred before he has penetrated one. His synthesis may be, and probably is, premature; an adequate book on comparative theology would be based, perhaps, upon conceptions which he does not possess: but it will justify his resolution to proceed in the main deductively, applying his conceptions to facts, not constructing them out of facts. Then, too, he is thoroughly aware of the great truth that what we have to explain is what and how men worship, not why they think they worship. He has learned from Feuerbach, to whom he acknowledges his obligations with courageous generosity, that, so far as it is a science, theology is a department of anthropology. He begins boldly by two chapters of physiology, intended to lead up to a localisation of the nervous centres which are the respective seats of the spirit and the flesh; and here we come upon an inconsistency which runs all through the book. The writer has a definite, perhaps a sound, theory of the transfer of energy from one to the other, and thinks asceticism important chiefly as a means to the polarisation of force; but throughout he assumes that in the feelings or emotions we have something that is quite immaterial and transcendental as compared with anything given in the life of the senses, the muscles and the intellect, which in different ways are concerned with what can be seen or heard or handled. Of course if we once begin to look to nervous physiology for objective explanations of subjective phenomena, it is obvious to explain the emotions and feelings by the way in which the brain is affected by the state of the circulation of the different viscera and their nervous centres; though, as none of these can be seen or handled, the obscurity of the process by which the brain is affected may seem to promise results beyond the sphere of finite reality. Hence all sound ascetic writers give much more value to the least disinterested act of duty (especially if done against the grain) than to any quantity of the finest feelings and longings.

The author is on firmer ground in his ingenious theory of prayer and the sacraments, which he treats as correlatives: prayer being the outgoing of concentrated energy, which finds no ready vent in action; while the objective response of sacraments (the Calvinist definition *signa efficacia* would correspond to Mr. Baring-Gould's meaning) is needful to prevent this energy dissipating itself aimlessly. It is noticeable that Mr. Baring-Gould does not discuss whether "the concentrated energy discharged" in prayer is capable of contributing to determine changes in the objective order, as Mr. Brinton, for instance,* maintains. It is

* *The Religious Sentiment.* (New York: Holt & Co.)

noticeable also that in his zeal to demonstrate the validity of the Christian religion as the only and complete satisfaction of our inward needs, the writer makes short work of all external evidence. For instance, the beneficence of Nature is almost as sharply criticised as by J. S. Mill, with special reference to the disproportionate penalties by which natural laws are enforced. Again, the Scriptural proof of the doctrine of the Incarnation is given up as essentially unconvincing, in order to lay the greater stress upon its necessity to reconcile a number of Hegelian antinomies about the Finite and the Infinite, and to show that it contains and harmonises whatever was good in previous religions.

Such a line of argument is open to obvious dangers. For one thing, it might be urged that Mohammedanism seems to meet the spiritual needs of the average Mohammedan for comfort and guidance quite as effectually as Christianity meets the like needs of the average Christian. It is easy to reply that though Mohammedanism converted the Arab race into a most powerful instrument for transforming and diffusing all that was vital in Byzantine and Persian civilisation, it seems to have a real tendency to arrest the intellectual and social development of any nation which adopts it. But the objection might be easily retorted. Mr. Baring-Gould's chapters on Christianity and Individuality, and the social aspect of the Incarnation, might very plausibly be represented as a veiled, half-conscious confession that the civilisation of Christendom has a certain tendency to outgrow Christianity. Mohammedans are generally willing to admit that Allah has given this world to the Franks, and are content to enter into life halt and maimed; besides, Jews and Parsees find their religious traditions quite as conveniently elastic as we find ours. And then there is the fundamental question how far the spiritual needs which religion is to justify itself by satisfying are permanent. Perhaps it might be thought that there is as much difference between contemporary and primitive piety as between an old lady who upon the whole would really miss her glass of port wine and an ancient Bacchante. Of course our wishes are determined in some measure by our history as it has been, and in some measure by our history as it is to be; but it is quite unnecessary to justify the Elgin Marbles, or the Medici Tombs, or the Assumption at Venice, or the *Madonna di San Sisto*, by trying to prove that they satisfy the permanent desires of the frequenters of the Royal Academy. It is enough if they rebuke them. Classics and institutions are not merely, as Mr. Baring-Gould maintains, the medium through which the individual is educated to appropriate ideas to his own use. If the ideas embodied in them have permanent value, they are from first to last the standard he has to approach, the authority he has to obey.

It would take too long to examine Mr. Baring-Gould's criticism of different Christian confessions; but it is to be hoped that now his ingenious and suggestive treatise is reprinted in an accessible form he may soon have another opportunity of reconsidering

the startling statements that the Vatican dogma of Papal infallibility is simply a negation of the infallibility of the diffusive Church, and that Luther's doctrine of justification by faith only is simply a negation of the necessity of good works, and adds no affirmation, true or false, to the doctrine of Trent.

G. A. SIMCOX.

Memories of Our Great Towns. With Anecdotic Gleanings concerning their Worthies and their Oddities. By Dr. Doran, F.S.A. (London: Chatto & Windus, 1878.)

DR. DORAN'S last literary work was the correction of these papers for the press. The series had appeared during the past fourteen years in the pages of the *Athenaeum*. In most cases the papers relate to the towns in which the meetings of the British Association for the Advancement of Science have been held from time to time. They were, no doubt, hurriedly prepared, and must in justice be estimated by the standard proper for the measurement of occasional work of this kind, not by the far different one of the historian or minute local antiquary. Dr. Doran was not, and never professed to be, a great authority on the higher things of history, but there were very few men who had so wide a knowledge of picturesque incidents—the incidents, we mean, of the centuries since the bloom of the Renaissance—and no one who could communicate his stores of fact in a manner quite so entertaining. These occasional papers are, to our thinking, among the very best of the books which have flowed from the author's pen; they have less attempt at humour, are more pointed, and bring men, things and past times—especially the eighteenth century—more livingly before us than anything else of his that we have read. Errors of course may be found by anyone who has special knowledge as to this or that place or person, but we have not been fortunate enough to detect a single one which is in any way important.

A northern antiquary, now no more, once excused himself in our hearing for having made some rather glaring mistakes in lengthening the contractions of a Latin Chronicle by saying that all true art was irregular, and that if the author of the Chronicle himself had his own contractions to "pull out," as his editor called it, he would have executed the task in a far less workmanlike manner. This was good reasoning, but bad logic. We suspect some such rebuke would have been received by any pert antiquary if such a one had pointed out to Dr. Doran that Lords-Lieutenant of counties were not for the first time created as a consequence of Kett's rebellion (see *Archæologia*, xxxv., 350); that all laws which have become practically obsolete are yet unhappily very far from having been abolished by statute; and that it is not rigorously accurate to speak of the "hundreds of philosophical and religious men" who dwelt at Cambridge before the separation between England and Rome as "busily employed in the composition of legends and cognate matter." We cannot imagine hundreds of men at one and the same time engaged in writing biographies either in universities or

anywhere else. It would, however, have been well for us if a few more people in former times had devoted themselves to that kind of labour. In such a case we might perhaps have known something of the careers of Saint Gilbert of Sempringham, Saint Hygbald, and Saint Wulfran the Englishman—if, indeed, such a person as this last ever existed.

It is not, however, fair to treat little slips of this kind seriously. "Come, you will laugh now at my easiness," we can imagine the author saying, with Ben Jonson's Fulvius, and then, without a thought of denial, excuse or explanation, leaving his pedant objector behind and pouring out his stores of fact and deduction just as if no ripple of objection had ever disturbed the stream of discourse.

There are nineteen towns treated of in the volume, and there is not a single one of them whose annals are not rendered most amusing. Not one dull page disfigures the book, and there is hardly one from which the reader will not carry away something worthy of being remembered, for if the facts themselves be not new the setting and the grouping will be. It is not a common thing to find people with what last-century schoolmasters used to call "a scheme of history" in their heads. Most of us, if we know the annals of one State or of one town, have not sufficient strength of vision to see how the facts of our special knowledge fit into the wider concerns of the great world beyond. Many English writers of history, from Burnet down to persons now living, are glaring instances of this fault; but Dr. Doran had not a particle of such narrowness. He was not an historian in the higher sense of the word, but he knew the details of these latter times remarkably well, and when he was thinking of any event that had happened at Liverpool, Edinburgh, or Birmingham, he had at once before him what was taking place at other English towns and in other countries far away at the same moment.

The article on Norwich deals with many East Anglian matters of great moment; it was published in 1868, and is among the best in the collection. Sir Thomas Browne, scholar, antiquary, and man of science, would alone make the place in which he lived an interesting spot for travellers; and there is naturally much to say in the way of contrast between the man of science whom King Charles II. delighted to honour and the members of the British Association. Norwich was a clothing town, and made Norfolk rich and famous—thanks in great part to Flemings, Dutchmen, and Walloons—at a time when many of our great manufacturing cities were but villages; but Norfolk has a modern interest apart from what is commonly called trade. In that county arose what the Eastern counties' newspapers of thirty years ago used to call the "agricultural reformation." The great change for the better which took place at the end of the last and the beginning of the present century in every detail of farming had its rise, or at least its most rapid development, in Norfolk. When George III. came to the throne it is not an exaggeration to say that, in the minds of most men who were strangers to the district, Norfolk, Cam-

bridgeshire, and Lincolnshire were regarded as mere heath and fen. It was a mistake grounded on a few facts truly understood, and a great many which were entirely misinterpreted. A few energetic landowners, headed by "Squire" Coke of Holkham, took the matter in hand, and they were aided by an energetic tenantry and a body of labourers, as noble fellows as are to be found in the world. The consequence has been that a district which was a byword for its barrenness has become some of the finest farming land in England. We ourselves know more than one property in Lincolnshire the present yearly rent of which is the same sum as the money at which the estate was purchased in or about the year 1795. The subject of agricultural improvement is pleasantly treated of here; but it sadly wants a detailed history from the hands of one who understands farming as well as the politics of the time.

The Brighton article is also well worthy of note. A better sketch could hardly have been written. The writer evidently knew the place well. What is said about George IV. and his crew is not very memorable, but then the people themselves were in no sense noteworthy. We can take some interest—though, it is to be hoped, but a languid one—in the doings of Charles II. and his male and female following, but then these loose-living, godless people were, no thanks to themselves, making history. Martyrs, religious and political, were the result of their misdoings, but George and his friends were so weak that they had not power, even by their sins, to produce anything worthy of notice. One story of the time is told which reads more like a cutting from Pepys's Diary than an incident which happened almost within the memory of old men who are still with us. Dr. Vicesimus Knox, master of Tunbridge School, preached on one occasion at Brighton. It was during the great war with France. In the sermon he dwelt upon peace as a Christian virtue; for this he was insulted far more than he would have been had he advocated a breach of some at least of the Commandments. The incident was the cause of much commotion when it happened. At a time like the present it is not well that it should slip entirely out of memory.

EDWARD PEACOCK.

MR. SKEAT'S NOTES TO PIERS PLOWMAN.

The Vision of William concerning Piers the Plowman. Part IV., Section 1.—Notes to Texts A, B, and C. Edited by the Rev. W. W. Skeat, M.A. (Early English Text Society, 1877.)

THE English verse literature of the latter half of the fourteenth century is happily contrasted with the prose, inasmuch as the main works of the former are original, while those of the latter are translated. Religion, Philosophy, History, are represented by the Englished Wycliffe Bible, Trevisa's Higden's *Polychronicon*, and Trevisa's Bartholomaeus *De Proprietatibus Rerum*; Poetry by the English Chaucer and "long Will." Not that Chaucer did not translate; he often did: not that "long Will" did not draw

material largely from foreign stores; he often did: but each of these poets so passed his outland originals through his brain that they became inland products of English soil. From his appearance, the sun of Chaucer "ruled the day" in English literature—till Shakspeare eclipsed it—while the star of Langland was but seen faintly in the night. It has been reserved for our own time to perceive—and mainly through Mr. Skeat's diligence and skill—the full value of the work, the clear view of the personality, of "long Will." The comfortable plump Chaucer, on his ambling nag on the Canterbury road, has been a familiar figure to English readers any time since 1388; but the "long Will," striding up Cheapside, full of wrath at England's sins, full of visions for their reform, uttering his fiercest denunciations against that royal sham, Richard II. and his "empty sleeves" (or worthless courtiers) whom Chaucer condemned in his poorest and dullest poem—this figure was never rightly seen till Mr. Skeat drew it for us. It is to Mr. Skeat that we owe the discovery and proof that the powerful poem of *Richard the Redeles* was long Will's, and to him, too, that we owe both our only edition of the first or A cast of Will's *Vision*, and the only real edition of the third, or C cast of it. Though Mr. Skeat has improved on the late Mr. Thomas Wright's edition of the B cast from another MS., yet Mr. Wright's work was worthily done.

Having thus finished the text of Will's works, with full collations of all their best MSS., Mr. Skeat has now produced 463 pages of closely-printed Notes to the three versions of the *Vision*, with an Index to the chief subjects and words discussed in the Notes, and lists of the poet's library, the proverbs he used, his puns, &c. That the work is thorough follows from its being Mr. Skeat's; and anyone who will take the trouble to consult, for instance, the notes on Cato, the four Elements, Friars, Hermits, Minstrels, Pestilences, the author's name, the words *aseth* (p. 390), *baselard* (pp. 72, 343), *bollers* (p. 193), *buckwashing* (p. 321), *bowes of brake* (p. 414), *calewey* (p. 376), *colmy* (p. 116), *what dones man* (a man of what make, p. 419), *dwale* (p. 453), *frisketh* (p. 190), *a glass hood* (p. 447), *lyf* (man; see Index), can easily satisfy himself as to the quality of the work. I only wish that Chaucer's Minor Poems could be annotated with like care.

Mr. Skeat's name will go down to posterity in honourable alliance with that of Chaucer's great contemporary on whom he has bestowed his long labour of love. I only hope that his University will soon give him the reward he so well deserves at her hands, and thus secure the continuance of his work, under more favourable circumstances than of old, at those forgotten worthies, on the records of the rise of that noble tongue, whom and which we English of the nineteenth century are at length slowly beginning to value aright. F. J. FURNIVALL.

MESSRS. HURST AND BLACKETT will shortly issue a new novel, entitled *Margery Travers*, by Miss Bewike, author of *Onwards, but Whither*, &c.

NEW NOVELS.

John Orlebar, Clerk. By the Author of "Culmshire Folk." (London: Smith, Elder & Co., 1878.)

Strafford: a Romance. By H. G. Baker. In Three Volumes. (London: Tinsley Brothers, 1878.)

A Match in the Dark. By (George Rose, M.A.) Arthur Sketchley. In Two Volumes. (London: Tinsley Brothers, 1878.)

Straightforward. By Holme Lee, Author of "Sylvan Holt's Daughter," &c. In Three Volumes. (London: Smith, Elder & Co., 1878.)

It is not often one has the good fortune to come upon so well written a novel in small compass as *John Orlebar, Clerk*. The plot of the story may be said to be a poor one; too dramatic, too improbable, and too much made up of the doings of bad people. But this fault is compensated by the bright, racy, humorous manner in which some of the most interesting of our social problems are treated. This is done chiefly by means of talk, in which all the characters of *John Orlebar, Clerk* much delight. Long conversations are generally tedious, and a dangerous form in narrative. But in this case they run no danger of being skipped. The Bishop is admirably sketched, and so is the group of clergymen, of all shades of orthodoxy and honesty, of which he is the central figure; and every word he speaks is characteristic. Young Orlebar is his nephew, whom he has ensconced comfortably in the family living. This young man is intended to represent, from a friendly point of view, a class of clergymen, mostly young men, who, finding themselves in a rut different from that of their fellows, and not liking it, do their best to trudge on honestly in it, not seeing clearly their way out. Orlebar is one of them. He is painfully conscientious, given to ask questions, much too tolerant of the Doctor and his scepticism; he smokes, shoots rabbits, and is altogether unconventional, though very delightful and thoroughly harmless. The sceptical Doctor, who is at once his evil genius and good angel, illustrates on the other hand the tendency of our modern youth to practical work and scientific research, to a keen and wholesome enjoyment of this world and its duties, and also perhaps to a little less than the proper amount of reverence for things old and respectable though shabby. Orlebar woos and wins the heroine of the story with her twelve thousand a year, and so escapes with dignity from the difficulties of his rut. He is metamorphosed from a mediocre parson into a first-rate squire, and when we leave him he is about to remodel society, and to build churches in a totally new and astounding style of architecture upon his estate with his wife's money. The story in this case ends happily enough; but such rare good luck as Orlebar's offers no solution of the general difficulty.

The author of *Strafford* has selected for the groundwork of a romance one of the most picturesque episodes in English history. The principal characters are historical, and the interest of the reader is fixed mainly on the incidents in the life of the great earl. Some attention has been paid to the records,

and in many instances we have the identical words, written or spoken, of the king, of Strafford, and the leading men in Parliament, worked into the narrative. The scenery and events are described with an attempt at accuracy, and there is an elaborate account of Shirley's *Masque of Peace*, which was exhibited at Whitehall on the very eve of the Civil War. But, on the whole, whatever there is of history in this "romance" is mere distortion. Strafford is represented as a faultless hero, the king as an injured saint, and the arch-villain of the story is King Pym, who with the beautiful and scheming Lady Carlisle drags Strafford to his ruin. We do not feel quite sure that an author has the right, even after a lapse of two centuries and a half, to libel the respectable dead to the extent that is ventured in this romance. If ghosts could sue for damages, Pym would have an excellent case against the author and publishers of *Strafford*.

The name of "Arthur Sketchley" is so well known on our railway stalls and elsewhere that we are sorry to see it appended to so heavy and spiritless a story as *A Match in the Dark*. A young pair meet at a ball, marry before they know their own minds, repent, and part. We are not surprised; and only wish, as we drag along the dreary account of their bickerings, that they would be more expeditious in the process. The whole is very like an old minuet dramatised. The lady nags, the husband sulks; he runs away to his club, she to the Continent. Both are tediously well-behaved, except in the matter of squabbling. But the sea rolls between this pair in vain. Once more they meet. At this crisis, however, the minuet is drawing to a close, the dancers and the company also being tired; and we leave them, for a season at least, in the best of tempers.

Straightforward would deserve high praise if it were not so full of the absurdest improbabilities. It is too trying to our credulity to ask us to believe that a respectable country doctor would execute such a practical joke upon a worthy old maid, his patient, as Dr. Jacobson played off on Miss Joye when he made Nurse Batch lay a motherless baby one fine morning on her doorstep, and let her find it there and believe it was sent from heaven to cheer her virtuous old-maidenhood, and so take it to her kind and unsuspecting bosom and spend all the rest of her life and all her means for its good. Such a story as this may be said to have been invented rather than imagined; but, given the story, we cannot but admire the pretty descriptions of the old English country town, Myton, and its pleasant folk, and still more the admirably conceived character of Martin Joye, the strong-minded youth who fights his own way in the world as bravely as another Whittington, but with higher aspirations, and whose candid, "straightforward" spirit and honest energy in the end make a rough world smooth.

ROSALINE ORME MASSON.

CURRENT LITERATURE.

A Bibliography of Bibliography; or, a Handy Book about Books which Relate to Books. By Joseph Sabin. (New York: J. Sabin and Sons; London: Trübner.) Catalogues of English libraries

and "books on books" have increased so rapidly during this century as to render it necessary that librarians and their clients should be supplied with a handbook containing trustworthy particulars of all the works published on these subjects. One such "handy-book" has been published, but its sins of omission have tempted Mr. Sabin into another attempt to satisfy the wants of his fellow book-men. Mr. Sabin's labours, though more successful than his predecessor's, fall far short of perfection. There is one fatal flaw in his compilation. It gives with commendable detail the title of no inconsiderable number of books, but they are all arranged under the names of their authors, and in the absence of any index to its contents, the student desirous of knowing the particulars of a work on any branch of English bibliography must read Mr. Sabin's volume through until he has stumbled upon the name of the author he is seeking for. This defect alone would be sufficient to mar the value of the compilation, even if it did not omit the names of many of the most important works on English bibliography. We find an entry of Mr. Axon's essay on the Literature of the Lancashire Dialect, but search in vain for the volume of the Manchester Literary Club on Lancashire Authors, or the English Dialect Society's lists of books on local dialects. The old Catalogue of the Advocates' Library is entered, but the new Catalogue, many volumes of which have been issued to the public, is omitted. Mr. Collier's reprint of a portion of the Stationers' Registers is duly mentioned, but the far more complete reproduction by Mr. Arber is ignored. The London book-lover will start with surprise at learning that Mr. Sabin has forgotten to include the Catalogues of such well-known libraries as Gray's Inn, Dr. Williams's, Sion College, the Medical and Chirurgical Society, and the Mendham collection at the Law Society. The Cambridge student will be shocked at the neglect to include Dean Cowie's name as the author of a paper on the rare books in St. John's Library, and Mr. Pearson's as having published a hand-list of Emanuel Library. The list of omissions might, if necessary, be extended to a much greater length, but these instances will suffice to show that Mr. Sabin's compilation does not deserve the praise of thoroughness usually bestowed on American research.

The Globe Encyclopædia of Universal Information. Edited by Dr. John M. Ross. Vol. IV. K-E-P—P-A-S. (Edinburgh: Thomas C. Jack.) We are glad to see that this excellent popular Encyclopædia continues to make rapid progress through the letters of the alphabet. The first volume only appeared about two years ago, and now the sixth and concluding volume is promised within the next twelve months. We understand that though the pages are stereotyped before printing, the editor is already busy upon corrections in the earlier volumes, so that by the beginning of 1879 the public will have the complete work revised down to date, which ought to distance all competitors in the field. We are not quite sure that we are not doing the book an injustice by describing it as popular, though it merits that epithet from its cheapness and the miscellaneous nature of its information. Thoroughness and accuracy it shares with other more ambitious undertakings. Perhaps its strongest point lies in the articles dealing with geography and biography, which supply just those details of fact and figure which no person can carry in his head. The statistics are always brought down to the present year, and in some respects are fuller than can be met with anywhere else. But another class of articles, on literary and historical subjects, deserve equal praise. Among these we may single out "Mythology," "Newspapers," "Novels," "Oxford," and "Parliament." At the same time, it must be admitted that a careful eye can detect now a few misprints and blunders, which it is not yet too late to correct. For example, it is misleading to say (p. 415) that "the provisions of the law of copyright apply to

articles published in newspapers." Copyright proper can only be gained by registration at Stationers' Hall, and as a matter of fact no newspaper is so registered. It is possible, of course, to register individual contributions; but despite a well-known decision of V.C. Malins which has been much criticised in the legal profession, it is more than doubtful whether the contents of newspapers in general are entitled to any protection. Again (p. 502), the appellate jurisdiction of the House of Lords is very clumsily, if not inaccurately, defined; and it is no longer true that the Master of the Rolls may sit in the House of Commons.

An Attempt to Determine the Chronological Order of Shakspeare's Plays. The Harness Essay, 1877. By the Rev. Hy. Paine Stokes, B.A. (Macmillan.) This prize essay on a subject far too hard and involved for any Bachelor of Arts of two years' standing—to whose class the competition is limited—is nevertheless a very creditable performance. Granting that the absence of the results of Mr. Stokes's fourth method of enquiry, "Mental Tests," is rightly accounted for by the names of the examiners, who would not have tolerated "aesthetic considerations" of any kind, we find that Mr. Stokes has used great diligence and judgment in getting together all the external evidence relating to the date of every play, and that he has well combined this with the metrical methods of certain members of the New Shakspeare Society. But how Sir Thomas Overbury's *Characters*, first published in 1614, after his death in 1613, could have suggested any part of *Hamlet* in 1599–1600, Mr. Stokes's date for the play, we cannot see. The play in the treatment of which Mr. Stokes shows most independence of judgment is *Troilus and Cressida*. His conclusion is "that about 1599 Shakspeare composed a *Troilus and Cressida*, consisting of the parts above called 'The Love Story,' which was alluded to by *The Histrio-Mastix*, and rivalled by Dekker and Othello's work; that about 1602 'the Camp Story' was added to this, forming the long play we now have, and alluded to by Roberts, who wished to print it, early in 1603, 'as yt is acted by my Lo. Chamberlens men;' and that in 1609 it was published as 'a new play, as it was acted by the King's Maiesties Servants.'" This conclusion harmonises well enough with Prof. Dowden's date of 1603 for the play, both he and Mr. Stokes agreeing that Prof. Ingram's "weak-ending test" proves that *Troilus* cannot be so late as 1607–8. Mr. Stokes does not follow his authorities slavishly. His book will be found very useful even to advanced students, as putting together closely all that bears on the dates of the plays. And when he has, by longer work at Shakspeare, more dwelling on his development, and further use of those "Mental Tests," got for himself a firmer hold on Shakspeare, and a clearer view of his growth, if he will enlarge and re-cast his book, setting prosaic Cambridge examiners aside, he will turn his little Prize Essay into a work of sterling and permanent worth. At present it has many points open to criticism, especially in the arrangement of the early plays. The year 1596, to which most of the best commentators give *The Merchant of Venice*, is left without any play, while no less than eight plays are given to 1597–1600. 1602 is also made a playless year; and the plainly youthful shallow *Love's Labour's Lost* is put after *Romeo and Juliet*.

Der Grosse Kurfürst von Brandenburg im Elsass, 1674–75. Ein Geschichtsbild aus der Zeit als das Elsass französisch werden musste. Mit einer Karte zum Gefecht bei Türkheim. Von Dr. Heinrich Rocholl, königl. Divisionspfarrer der 31. Division. (Strassburg: Trübner.) This valuable study refers to the attempt of the Grand Elector of Brandenburg, Friedrich Wilhelm, to recover from Turenne the ten free cities of Elsass suddenly seized and annexed by Louis XIV. in 1673. It was very natural that the recent Imperial visit to

the new "Reichland" should suggest to a military chaplain the propriety of extolling one of the emperor's ancestors in connexion with the discovery of a "German patriotism" in Strassburg, Colmar, &c., two hundred years ago, and a more correct account than has yet been given of Turenne's doubtful victory at Türkheim, near Colmar, January 5, 1675, which was followed by the retreat of the Brandenburgers and Imperialists across the Rhine. The Grand Elector was undoubtedly a man of great mark, and he was one of the first Germans who when saying "Deutschland" was capable of really meaning Germany. But the fact that he almost rose, as Leibnitz seems to have done, to an anticipation of the modern conception of a united Germany is no reason why we should follow Rocholl, and others who argue like him, in abusing as traitors the Electoral, Episcopal, and other members of the League of the Rhine, who found their account in practices with France. The Rheinbund was an old German institution; the Grand Elector had himself joined it; and, while there was no Germany, it was perfectly reasonable that the western and southern principalities should play off Paris against Vienna. Rocholl praises the Grand Elector for rejecting French bribes of territorial aggrandisement in Holland; but omits to mention a circumstance which, of course, has entirely dropped from the canonical Prussian books—viz., that, although Friedrich Wilhelm nobly drew his sword for the independence of the Dutch in 1672, in one of his subsequent fits of "spirality" he signed a Treaty with Louis XIV. for an eventual partition of the Netherlands. Perhaps Rocholl is not aware of this, but he must surely know that when the Grand Elector made his famous quotation from Virgil—*Exoriare aliquis nostris ex ossibus ultor*—he was thinking of the disappointments and deceptions imposed on him in 1673 by France at the Peace of St. Germain, in reference to his private claims in Swedish Pomerania, and that he had no idea whatever, as suggested by Rocholl, of extending Dido's words to the loss of Elsass, and giving them a general German colour. Rocholl's local knowledge and special studies have enabled him to throw much new light on the battle of Türkheim, which followed the preliminary actions of Sinzheim and Enzheim. The Germans were quietly wintering in Upper Elsass, when Turenne unexpectedly burst through the Trou de Belfort, broke the van of the Imperialists near Mülhausen, and came upon the Grand Elector and Bournonville in a strong position in which they had planted themselves in front of Colmar. With his right he made a feint against the German left, and then, concealed by high ground, marched with his left upon Türkheim on the extreme German right, from which Bournonville, neglectful of the Grand Elector's orders to occupy the village in strength, had withdrawn the few troops he had posted in that important place. Turenne broke unsuspected into Türkheim, from which the Brandenburgers could not dislodge him, and the Germans next day retired in disorder across the Rhine, their retreat being less the consequence of the battle than of the Grand Elector's quarrels with Bournonville, whom Rocholl of course describes as a low Austrian scoundrel. According to the accepted accounts, Turenne marched his left over the hill called Hohelandsperg, an almost impossible feat according to Rocholl, who argues that the way taken was through the valleys, which road, he says, is indicated by the contemporary French memoirs. Rocholl should have read the remarks of Napoleon and Clausewitz on this campaign, in which the German authority does not think that the Grand Elector showed much professional skill.

The Lawyer's Nose. By Edmond About. Translated by J. E. Maitland. (Remington and Co.) In 1862 M. About published a slight tale entitled *Le Nez d'un Notaire*, which was, we believe, a pendant to an earlier work termed

L'Homme à l'Oreille Cassée. At this interval of time, when the clever *feuilletonniste* of Imperialist times has enlisted in the band of Republican journalists, J. E. Maitland has thought fit to present the first-mentioned of these two tales to an English reading public. The selection scarcely does justice to the reputation of the author. It may be doubted also whether even the title of the work has not suffered by its translation into English. The story is a repulsive one, and it is told in a manner that is not redeemed by its vivacity from being also repulsive. We do not know whether it is founded upon fact; but the main incident finds a curious verification in the pages of *Life in the Mofussil*.

OF HALLECK'S *International Law, or Rules Regulating the Intercourse of States in Peace and War*, Sir Sherston Baker, Bart. and Barrister, gives us a new edition, revised, with notes and cases (C. Kegan Paul and Co.):—

"I have taken," he says, "the opportunity of varying the position of the chapters, so as to group together those which treat more especially of peace in the first volume, and those which treat of war in the second volume; but the original text of the chapters is practically unaltered, the exceptions being some interpolations of my own, distinguished by means of brackets, and the omission of some unnecessary sentences. Elsewhere the new subject matter, whenever combined with chapters, is universally shown in the form of notes, and in smaller type."

An Index, which was a great desideratum in the original, has also been supplied by Mr. Louis J. V. Amos. General Halleck's work, as that of a practical soldier and statesman, ought always to be maintained in use, both by students and men of affairs, by the side of the writings of amateur or theoretical international lawyers. We are therefore glad to see this reproduction, in which Sir Sherston Baker appears to have done his part well, not overloading the text, but keeping it fairly abreast of the occurrences which have taken place since it was published in 1861. Acts of Parliament and official documents of different countries, set out *totidem verbis*, form no small proportion of the new matter, which is a valuable feature, and helps to preserve the solid and practical character of the book.

NOTES AND NEWS.

A BIOGRAPHY of the late Alfred Smee, F.R.S., with a collection of his miscellaneous writings on scientific and social subjects, will shortly be published by Messrs. G. Bell and Sons. The volume is edited by Mr. Smee's daughter, Mrs. Odling.

MESSRS. ALLEN will publish shortly a volume of *Natural History, Sport, and Travel*, by Edward Lockwood, Bengal Civil Service, late Magistrate of Monghyr.

THE same publishers announce as nearly ready an edition of Milton's Poetical Works, by John Bradshaw, M.A., LL.D.

MR. TENNYSON'S publishers are on the point of issuing a new edition of the Poetical and Dramatic Works of the Poet Laureate complete in one volume. The book is printed from a new fount of type, and consists of nearly 700 pages, crown 8vo, with a portrait.

THE eighth edition of Gesenius' small Hebrew-German Lexicon (known as the *Handwörterbuch*) is now happily complete. The editors, Professors Mühlau and Volck, have spared no pains to ensure accuracy, and in particular acknowledge obligations to Professors Fleischer, and Franz and Friedrich Delitzsch, the last-mentioned of whom has revised all statements relative to Assyrian matters. In no previous edition since Gesenius' death has this valuable work made so near an approach to being rewritten in accordance with advanced philology. We may conjecture that what is still lacking will be made good in the ninth edition, which cannot fail to be called for within the next

five or six years. Gesenius' Hebrew Grammar will also appear in a much revised form. Indeed, three Hebrew grammars (including works by A. Müller and Stade) are promised from Germany.

M. H. GEORGE, publisher, of Geneva, is about to issue *Le Catéchisme Français de Calvin*, reprinted for the first time from a newly-found copy, and followed by the Confession of Faith of the Church of Geneva (1537). M. Rilliet contributes a notice of Calvin's first visit to Geneva; and M. Dufour, a bibliographical notice of Calvin's Catechism and Confession of Faith, and of other books printed at Geneva and Neuchâtel from 1533 to 1540. The French text of the Catechism was supposed to have entirely disappeared.

DR. J. A. H. MURRAY, of Mill Hill, is to succeed Mr. Henry Sweet as President of the Philological Society.

A CRITICAL edition of the famous Talmudic and Midrashic dictionary, called *Aruch* (eleventh century), is appearing in fasciculi, under the care of Dr. Alexander Kohut. The text is based on the *editio princeps* (A.D. 1480), but has been revised in accordance with seven MSS. The Latin, Greek, and especially Zend words (the editor is a Zend scholar), are explained on philological principles.

PROF. ROBERTSON SMITH has issued an *Additional Answer to the Libel, with some Account of the Evidence that Parts of the Pentateuchal Law are later than the Time of Moses* (Edinburgh: David Douglas). Since the ACADEMY'S notice of the original *Answer* (April 13), the Synod of Aberdeen reversed the finding of the subordinate Court, but as the case will still come before the General Assembly "by dissent and complaint," it was desirable to deal with the charge of "dangerous tendency" in sufficient detail to enable weak Biblical scholars to apprehend the nature of the point raised. Prof. Smith selects "from an argument of enormous compass only a few of the simplest lines of evidence," and treats them in a popular way; but the freshness and intimate acquaintance with the position of criticism which these eighty-eight pages display justify us in recommending this pamphlet to the attention of all Biblical students. There is nothing startling in it, except, indeed, its moderation.

THE Early English Text Society's first issue of books for this year is now in the publisher's hands. It consists of (in the Original Series) Dr. R. Morris's completion of his four-text edition of the English *Cursor Mundi*, fourteenth century, with its seven supplementary Treatises; Mr. Furnivall's edition of Adam Davy's *Visions Concerning Edward II.*, a six-text *Life of Alesius, Solomon's Book of Wisdom*, &c.; in the Extra Series, the completion of the text of Mr. Furnivall's edition of Harry Lonelich's *Holy Grail*, and Mr. Skeat's edition of the fragment of the Alliterative Romance of *Alexander and Dindimus*.

MESSRS. SALMIN, of Padua, are about to publish the *Memoirs of Maurizio Quadrio*, by his friend and relative Emilio Quadrio, and will be glad if all possessors of any letters of Quadrio will entrust them to them for publication. Quadrio was styled by Garibaldi "luminare benefico in questi tempi di tristissima corruzione."

MESSRS. S. W. PARTRIDGE and Co. are preparing, for immediate publication, *Confession: a Doctrinal and Historical Essay*, by L. Desanctis, translated from the eighteenth Italian edition by the Rev. M. H. G. Buckle, Vicar of Edlingham, near Alnwick.

MESSRS. LONGMANS have in preparation:—*Congregational History*, continued to the year 1850, by John Waddington, D.D.; a *Handbook of Gold and Silver*, by an Indian Official; *The Past, Present and Future of the English Tongue*, by William Marshall; a *Treatise on Versification*, with reference chiefly to the mechanism of English verse; a *Treatise on Coal-Mine Gases and Ventilation*, by J. W. Thomas, &c.

Messrs. SMITH, ELDER and Co. have sent us a new edition of Mr. R. D. Blackmore's *Erema: or My Father's Sin*. It is in one volume, plainly printed, and well got up, with eight illustrations in harmony with the general tone of the story.

GUSTAV FREYTAG, the German novelist, has been so much out of health during the past winter, that the publication of the last two volumes of his great novel-series of German life *Die Ahnen* (The Ancestors) has been deferred *sine die*.

MISS ALBERT's *Holland and her Heroes to the Year 1585* (C. Kegan Paul and Co.) is described as an adaptation of Motley's *Rise of the Dutch Republic*. Mr. Motley is an author who lends himself easily to compression, and Miss Albert has done her work well. To many it will be a great boon to have the dramatic story which closes with the assassination of William the Silent told in one small handy volume instead of three ponderous octavos.

THE following gentlemen have recently been elected Foreign Members of the Linnean Society of London:—Prof. Teodoro Caruel, of Pisa; Dr. Ernest Cosson, of Paris; Dr. George Engelmann, of St. Louis, Missouri, U.S.; Prof. Eduard Fenzl, of Vienna; and Prof. Julius Sachs, of Würzburg.

AMID more important studies in Zend and Sanskrit, Dr. L. Myriantheus is preparing for publication, from the papers of M. Laskarides, a smaller dictionary for English and ancient and modern Greek. This will be preceded by a short grammatical sketch, in which rules for pronunciation will also be given. The author's intention is to make his book serviceable to students both of Greek and English, and the modern equivalent will be placed after the words of the ancient language. The first volume is to appear shortly. This will be as it were an epitomised version of the English-Neo-Hellenic Lexicon to which M. Laskarides has devoted his leisure for the last fifteen years, and which, when completed, will be the best study of its kind in our language, while answering a want long felt by students of the modern dialect.

DR. WESSELY, the author of *Grundriss des deutschen Rhythmus*, is about to publish in a collective form the posthumous poems of Carl Ziegler, better known under his pseudonym of "Carlo-pago." Some of these have lately appeared in the *Zeitschrift für vergleichende Literatur*. Ziegler belongs to the school of Klopstock and Voss, and few German poets have excelled him in the study of antique forms and anapaestic measures. He died at Vienna, May 20, 1877.

MR. ALB. CAMMERMEYER, the enterprising Christiania publisher, has sent us the following volumes, which we regret not to be able to review at length, but which we commend to those of our readers who follow modern Norwegian literature:—*Tuffelds i Ferierne*, by J. A. Friis, a series of stirring memories of hunting and fishing expeditions in the Norse mountains; *Fra Osterlandet*, by P. Blom, a study of Oriental manners; *Smaa-billeder af Folkelivet*, rather rough sketches of town-life in Christiania, by H. Meltzer; *Nordiske Toner*, a little anthology of modern Scandinavian lyrics, collected with admirable taste; Longfellow's *Evangeline*, translated by H. O. Knutsen; *Oplysninger om det pavelige Archiv og dets Inhold*, a posthumous treatise by the great historian, P. A. Munch, edited by G. Storm, relating to those parts of the Papal Archives which bear upon mediæval Norse history; the most important, however, of the works under notice is the *Udsigt over den norske Historie*, by J. E. Sars, the first two volumes of what promises to be a very learned and very exhaustive History of Norway.

DR. ARVID AHNELT, of Stockholm, has published (Lamm) a memoir of Linnaeus, drawn in part from autobiographical sources, which contains much that will be new to English readers. Not the least interesting chapter is that which deals with the passionate friendship of Linnaeus

for Abraham Bäck, the "Orestes" of his letters, without whom, as he often said, "the world would have been more than dark to me." This valuable work fills up the lacunae left in Stover's *Leben des Ritters Carl von Linné*.

THE current number of the *Altpreuussische Monatsschrift* has two interesting historical articles, one by Herr Prutz, on the beginnings of the German Order of Knights, their organisation in Prussia, and the way in which their sojourn in the Holy Land affected them. Dr. Rindfleisch also contributes a careful study on Albert of Hohenzollern and his relation to the progress of the Reformation in Prussia. Herr Höhlbaum publishes three letters illustrative of the commercial intercourse between England and Prussia in the thirteenth and fourteenth centuries: one is of the date 1295; the others, 1357.

THE *Indian Antiquary*, for April, commences with an account by the Rev. J. D. Bate of the nine-and-twenty or thirty ladies who as wives or concubines formed part, from time to time, of the harem of the Moslem Prophet. Mr. Fleet, of the Bombay Civil Service, then continues his very valuable papers on "Sanskrit and Canarese Inscriptions," by transliteration and translation of three mediæval grants to the Jain Temple at Pulikara, and by a general account of the contents of four others. Captain Brooke has an article on the curious custom of the *Mahā-prāsād*, or vow of sacred friendship cemented by the friends eating together of food that has been offered to Jagannāth. Captain Brooke is inclined to think that the custom is a relic of Buddhism, chiefly because men of different castes constantly take the vow and eat together. There follow a short account of Father Stevens, a Jesuit missionary to the Canarese in the sixteenth century; and a note on the distinction between the Buddhist *Swastika* and the very similar symbol on some of the ancient pottery discovered by Dr. Schliemann at Hisarlik.

MR. POOLE announces that of the 182 periodicals to be included in the forthcoming third edition of his *Index to Periodical Literature*, all have been given out to be indexed except twelve. These are wholly English serials, chiefly weeklies; and as the committee for co-operating with Mr. Poole have already placed three, and the Bodleian has promised to take part of the work, there ought to be no difficulty in the matter. Volunteers are needed for the *Artizan*, *Economist*, *Examiner*, *Literary Gazette*, *Spectator*, and *United Service Magazine* on Mr. Poole's list, and if possible for the *Reader*, *Chambers' Journal*, the *New Quarterly*, and the old *Monthly and Critical Reviews*. Offers of help may be addressed to Mr. Robert Harrison, of the London Library. Even if these are indexed here, we shall still be indebted to America for indexing by far the larger number of our own periodicals.

FOREIGN REVIEWS OF ENGLISH BOOKS.

THE ENGLISH BIBLE, by Cheyne, Driver, Clarke, and Goodwin. *Theologische Literaturzeitung*, April 13.
CAVE'S Scriptural Doctrine of Sacrifice. *Theologische Literaturzeitung*, April 27.

OBITUARY.

SIR WILLIAM MITCHELL died at Strode, Ivy-bridge, on May 1. He was born at Modbury, in Devonshire, in 1811, and on the death of his father, a small farmer in the neighbourhood of that town, was apprenticed to a printer at Modbury. Early in 1833 he came to London, and obtained an appointment on the staff of the *True Sun*, a daily newspaper which flourished in that stirring time of politics. The first number of the *Shipping Gazette* was issued by Sir William Mitchell in January, 1836, and after several trying years, during which it narrowly escaped shipwreck, it became the accepted journal of the shipping trade. Sir William Mitchell was also the founder

and editor, in September, 1856, of *Mitchell's Maritime Register*, and, in August, 1869, of *Mitchell's Steam Shipping Journal*. He edited *Maritime Notes and Queries* (1874-76), and published the *Mercantile Navy List*. His labours before committees of the House of Commons and in the pages of his own papers to introduce a general code of signals for all nations trading on the sea, and to improve the Consular system, were rewarded by the honour of knighthood, bestowed upon him in 1867. In 1869 he received from the King of Sweden the title of Knight Commander of St. Olaf.

THE New York *Nation* records the death, on March 17, of Dr. Charles Pickering, naturalist of the Wilkes Expedition, and author of *The Races of Men and their Geographical Distribution*, *The Geographical Distribution of Animals and Plants*, and *The Chronological History of Plants*, now passing through the press.

NOTES OF TRAVEL.

THE *Reforma* of Asuncion verifies the fact of the discovery of gold in the Sierra Maracayu, in the north of Paraguay, by the expedition of Messrs. Wisner and Mansilla. The miners have established head-quarters at Igatimi, where a considerable stock of supplies of all kinds has been accumulated. The general impression is that the precious metal is to be found in remunerative quantity, and great hopes are entertained of its becoming a source of value to the country and attracting numbers of European settlers; but the mining inspector, in his report to President Uriarte, speaks only of the finding of small quantities of alluvial gold. Colonel Mansilla is returning to Buenos Ayres, and carries with him a project advocated by a number of the Paraguayan citizens for the annexation of their country to the Argentine Republic. The country is in such a state of ruin and desolation that this seems to be the only way out of its difficulties; and the scheme, so far from being opposed by Brazil, is now, it is said, regarded very favourably by that country.

A LITTLE work entitled *On Trek in the Transvaal; or, Over Berg and Veldt in South Africa*, by Harriet A. Roche (Sampson Low), is a cleverly-written diary of a waggon journey by the ordinary route through Natal over the Drakensberg range into the Transvaal and across that country through Pretoria as far as the gold-bearing reefs of Eersteling in the north. Mrs. Roche has no extraordinary adventures to relate, and her descriptions do not go much beyond the incidents of travel and of housekeeping; but from her pages we gather a far clearer and more detailed picture of domestic life in the Transvaal than from any work we have yet seen, and her experiences and suggestions will be invaluable to any intending traveller or settler in this newly-acquired possession.

THE second volume of Dr. Robert Brown's *Countries of the World* (Cassell) takes us over the wide area of the United States, Mexico, and the West Indies, and fully maintains the promise of the first, both in the eminently readable and interesting text and in the fine illustrations which are thickly strewn through the work. With much of this country the author is familiar through former travel, so that his descriptions of men and scenes are from the actual life, and are enlivened by many characteristic anecdotes and incidents from his own experience. Elsewhere every recent account of travel in this region seems to have been duly searched for fresh and authentic information.

IN the current number of the *South American Missionary Magazine*, the Rev. T. Bridges gives an account of a journey which he made at the end of last February, in company with Bishop Stirling, through the unknown interior of Tierra del Fuego in an unsuccessful endeavour to open com-

munications with the Ona Indians. The party started from Gente Grande Bay, opposite Sandy Point, and found the country for a long distance from the shore entirely ruined by warrens of diminutive saápye, a rat-like animal, whose front teeth are an inch long and curved. Several lakes were met with, and, after the range of hills at some distance from the shore was crossed, the country was found to be, for the most part,

"a succession of hills, basins, and rolling prairie land. Bushes abound in the lateral valleys, and grass in the principal ones, in which only water is found. The south-west slopes are better covered with soil and pasture than the north-west, and peat abounds in the large valleys within the hills, but is entirely absent on the sea side of the range."

Towards the end of their journey the party travelled through a dense forest of tall bushes, in which were many fine clumps of *lanadura*, increasing in girth upwards, and ending in a table-like flatness at the top. The soil is deep and rich in this bush-land, which extends for many miles from the hills round the bay where the sea was reached.

THE proposal to construct a line of telegraph through Africa, of which we gave an account on August 11, 1877, is just now attracting considerable attention in Cape Colony. The Superintendent of Telegraphs there suggests a somewhat different route from that which we described, and he thinks that the project could be carried out in about a year, at a cost of some 200*l.* a mile. Mr. Sivewright, we understand, proposes that, after leaving the colonial telegraph system at Kimberley, the line should go to Tete on the Zambesi, and thence, *via* Livingstonia on Lake Nyassa, to Zanzibar. The adoption of this modification of the original plan would, no doubt, increase the chances of the commercial success of the scheme, and, besides, no single section of the line would be more than 300 miles long, so that there would be much less difficulty in transporting the necessary materials. Mr. Sivewright's proposed plan contemplates the establishment of stations at intervals of 200 miles, to which runners would constantly bring intelligence of the condition of the line. Mr. Sivewright appears to take the same hopeful view as Colonel Grant with regard to the interference of the native tribes and the danger to be apprehended from wild beasts.

INTELLIGENCE has been received that Sir John Coode has completed a survey of the Yarra River and Bay, in Victoria, and is now engaged in surveying various important ports on the coast.

MR. CAMERON, of the China Inland Mission, has recently succeeded in making his way into Burmah from the Chinese province of Yunnan.

MAGAZINES AND REVIEWS.

THE *Contemporary* of this month opens with the first of Prof. Max Müller's Hibbert Lectures, which, as it has been sufficiently reported in the daily papers, we may pass over. Besides this there are the usual number of theological or semi-theological articles of greater or less interest; among the former of which may be reckoned Canon Lightfoot's ingenious application of the discoveries of General Cesnola and Mr. Wood to confirm the traditional view of the authorship of the Acts of the Apostles. Mr. Goldwin Smith's paper on "The Greatness of the Romans" will be welcome to many of those who are tired of the writer's polemics. It is a very fresh and vigorous statement of the theory that Roman greatness was originally owing to physical causes, to her position of commercial vantage; that the she-wolf and the twins are not, therefore, "the appropriate emblems of Roman greatness;" but that "a better frontispiece for historians of Rome would be some symbol of the patroness of the lowlands, and their protectress against the wild tribes of the highlands." Commerce, wealth, and political experience came first; afterwards fol-

lowed war—first defensive, and then offensive; then imperial organisation and government, which for ever mark off Rome from the bloodthirsty conquerors of the East. The interest of the article consists in Mr. Goldwin Smith's view of the beginnings of Rome—viz., that she was *first* commercial, and only afterwards military.

THE *Cornhill* is good this month. It contains one of the translations from Italian verse by J. A. S. which we are always glad to read; a charming lyric, "The Maenad's Grave," by Mr. E. W. Gosse; another of G. A.'s attractive Darwinian papers on "The Origin of Flowers;" the usual amount of fiction; and an article on Athenaeus, in which we seem to detect the hand that dealt with Aulus Gellius a few months ago. The writer who treats these late classic encyclopædists is certainly one of the most amusing that we know of; but what he writes no more admits of extract and quotation than champagne will bear decanting. All who care for a rarely happy compound of fun and learning, effervescence and body, should read the article itself.

A CLEVER readable paper on Louis Börne in *Fraser's Magazine* reminds us so strongly of the book *Rahel; her Life and Letters*, which many persons read and enjoyed some two years ago, that we can scarcely be mistaken in tracing it to the same hand as that interesting and careful memoir, especially as the inference from style and subject is borne out by the initial at the close of the article. Many of those who read *Rahel* will have carried away a lively impression of Louis Börne, the excitable Jewish youth who at the age of seventeen twice attempted to commit suicide out of love for the brilliant but already mature Henriette Herz, the wife of the physician in whose house he had lived as a pupil, and who, later in life, when Goethe's attitude towards the German politics of the day had roused the passionate indignation of all German Liberals, except Rahel, exclaimed with typical bitterness, "Since I have been able to feel, I have hated Goethe; and since I have been able to think, I have known why!" A couple of pages, however, and a stray notice or two, were all that could be allowed him in the memoir of Rahel. The present study of him fills up the outlines then sketched, and gives us the picture of a man of rare ability and delicacy of nature, a curious compound of egotism and large devotion, of fantastic passions such as prompted the arsenic-escapade with Mme. Herz, and quiet persistent friendship such as bound him for life to Mme. Wohl—like, and yet wholly unlike, his contemporary and rival Heine. He was born of Jewish parents at Frankfurt, in 1786, at the time when the gates of the Jewish quarter were still locked at four o'clock on Sunday, and when no Jew might use the foot-pavement in the streets. He died at Paris in 1837, and M. Raspail spoke at his funeral. Thus his life is co-extensive with the most exciting years of modern European history. It began with the crash of the old order of things, and passed away in deep disappointment with the new order from which so much had been hoped. "My dreams about the freedom of France are all over," he writes despondently, in December, 1830:—

"In politics it is neither summer nor winter—the most pitiable revolution spring I ever knew. At home [*i.e.* in Germany] we have no doubt about it being winter, and we put on flannel. . . . But here the meadows were already green, and now the snow falls thickly upon them. The Chamber, that old coquette, who paints and makes eyes and abuses the young one, I should like to see it horsewhipped. When it was young was it not as bad as the rest? . . . Faith with the people has been deliberately broken; they have had promises without fulfilment. The authorities talk here as with us about misleaders of the people, disturbers of the peace, republican agitation, and so forth. But no man asks for a republic: they only want those republican institutions which were promised them in the day of fear. With these men 'agitation' is said to begin where their own advantage leaves off."

The above-quoted letter is one of the *Letters from Paris* to Mme. Wohl which made Börne famous in his own generation, and which have been constantly compared with Heine's work of the same kind—to very little profit, as the author of the article justly remarks, considering the radical difference between the two men. Heine and Börne, at one time friends, quarrelled hopelessly in the last year of Börne's life, and Börne was scarcely buried before Heine published a scandalous attack upon him: an attack which has not hurt Börne's reputation, however it may have damaged Heine's. We should like to see this sketch of Börne followed by one of Rahel's correspondent Gentz. Mr. Hayward's essay by no means exhausted the subject; nor, indeed, does what has lately been published about his part in the Congress of Vienna.

IN *Macmillan's Magazine* the article on "Novelists and Novel-Writing in Italy" is not so useful as it might have been. The great bulk of the space is devoted to two writers, Mantegazza and Nievo, and there is not that conspectus of the whole field which would have made the article welcome to many would-be readers of Italian. If, however, it is read along with an article by Prof. de Gubernatis on the same subject in the *Deutsche Rundschau* for last year, the two articles will supplement one another. Some interesting remarks are made on the special difficulties an Italian novelist has to contend with, owing partly to the great variety of terms used to express common things (the term used in one part of Italy being quite unintelligible in another), and partly to the purists. Prof. Ward's "Bohemian Literature in the Fourteenth Century" is in substance a review of Mr. Wratislaw's recent book on the subject. It is an attempt—too slightly done—to point out some of those connexions of Bohemian with other contemporary literatures, the omission of which, and the general ignorance of the conditions of those literatures, is the weak point in Mr. Wratislaw's book.

AMONG the minor magazines, *London Society* of this month contains an interesting article, entitled "A Peep into the Inner Life of an Ironclad." Though not a word is said about the equipment of the guns or the wonders of the engine-room, yet the marvellous care and precision with which the whole ship is managed, as a complicated piece of machinery, is described with much freshness of observation. The serial articles in the same magazine called "Club Cameos" and "Switzerland by Pen and Pencil" are also above the average. The strength of *Belgravia* lies in its novels, though the current number is brightened by some tripping verses from the pen of Mr. E. W. Gosse, which he has headed "A Pastoral in Dresden China." Mr. Julian Hawthorne will not raise his reputation either by the plot or the diction of "An Automatic Enigma." Of the two novels, Mr. James Payne's "By Proxy" is concluded with a somewhat weak *dénouement*. In "The Return of the Native" Mr. Thomas Hardy continues to bring before us his artificial country-folk, moving in a world of passion and intrigue, whom only his realistic genius could compel us to accept as actual men and women. We may take this opportunity of testifying that *St. Nicholas* (Sampson Low and Co.) maintains its character as the best of illustrated magazines for girls and boys.

THE *Church Quarterly Review* has the germ of a good critique on "The Poetry of Doubt—Arnold and Olough;" and an instructive, if not clever, article on "Preaching at the Council of Trent." The "Short Notices" of books seem generally to be better done, and the subjects better chosen, than the substantial articles.

THE LAW OF THE FOREST.

Macmillan's Magazine contains an excellent article by Mr. Charles Sumner Maine on a subject which has been left in obscurity on some points and

placed in a false light on others by great historical and legal authorities. Mr. Maine's article is only too short, putting as much as could well be put into five pages, but leaving something to be said on the antiquities and early history of forest law, about which Mr. Freeman takes up some questionable positions in his *History of the Norman Conquest*. In his antipathy to hunting and game laws, that very learned historian for once suffers himself to be misled by Judge Blackstone's rhetoric. He says (*Norman Conquest*, iv., 610): "In William's age what had once been very necessary warfare with savage enemies finally changed into a mere sport. It was then too that what hitherto, whether sport or business, had been the sport or business of every man, became the exclusive enjoyment of the King, and of those whom he might have allowed to share it." Of Henry I. he says (v., 163-4), "We read that he kept the right of hunting throughout the whole kingdom in his own hands," and he gives thanks in reference to this alleged "royal monopoly of hunting" to "the optimist Blackstone, not often the historian's friend," for the phraseology of the sentence in Book IV. of the *Commentaries*, that "the forest laws established only one mighty hunter throughout the land, the game laws have raised a little Nimrod in every manor." Mr. Freeman adds (*Norman Conquest*, v., 457), that "what the practice of Henry I. was we learn from the Assize of Henry II. It is an arbitrary code, setting up a separate and arbitrary jurisdiction within certain districts."

The last words alone of these statements are strictly accurate. The Assize of the Forest set up a separate jurisdiction "within certain districts," but, it is to be observed, within certain districts only. Hunting did not become a mere sport in the age of William the Conqueror, nor until after many later ages, and it never became an exclusively royal sport or monopoly. Nor was Henry II.'s Assize of the Forest "an arbitrary code" in the sense of emanating from the king's will and command alone; it was deliberately passed, like the Assize of Clarendon, in the Council which Mr. Freeman regards as a continuance of the ancient Witenagemot and the parent of our present Parliament.

Throughout the Middle Ages hunting had two objects besides sport—first and especially, to obtain fresh meat; secondly, to destroy beasts of prey and noxious animals. It is needless to bring proof that for some centuries after the Norman conquest the only kinds of fresh animal food during several months of the year were game and fish. On the other hand, the destruction of wolves, martens, wild cats, foxes, and other vermin, was a service of such importance that land was often held by it. John Engayne held a carucate of land in the county of Huntingdon, in the reign of Edward I., "per serjantiam currendi ad lupum, vulpem, et cattum, et amovendi omnem verminam extra forestam domini regis." Of another member of this family it is recorded that "he holds one hundred shillings of land by the service of taking wolves, and does his service daily." And the name of one of Edward III.'s tenants *in capite*, who held land by the service of hunting wolves out of the forest of Sherwood, is the significant one of Walter de Wulfhunte.

The afforestation of certain places in the eleventh and twelfth centuries followed a much more extensive royal encroachment, on which Mr. Freeman says too little, whereby the whole folkland became *terra regis*, and the national hunting-grounds within the folkland by consequence *foresta regis*. Further afforestations were made by the Conqueror, Henry II., and by Richard and John; but the forest laws never applied to all the coverts for game in the kingdom, nor "established only one mighty hunter" throughout it. Blackstone grounds that piece of rhetoric on the proposition that "these new constitutions vested the sole property of all the game in England in the king alone;" but a previous passage shows the uncer-

tainty and instability of his footing. For in Book II., chapter xxvii., he actually rests the alleged right of the king to pursue and take all beasts of the chase upon the principle that all the land in the realm is held of the king as chief lord, "and that therefore he has the right of the universal soil, to enter thereon, and to chase and take such creatures at his pleasure." Upon the same principle the king would have a right to enter on any man's ground and take his horses out of his stable. That great repository of royal rights and administration in the reign of Henry II., the *Dialogus de Scaccario*, distinctly states that only certain districts were *foresta regis*, and that in some of the comparatively unwooded counties there were none; although there must have been game of some sort in every shire. A wood or waste did not become a royal forest until it had been duly afforested by a somewhat tedious and costly process. Had all the game in the kingdom been the king's property, and all coverts for game subject to the forest laws, the particular afforestations made by Richard and John would not have excited so much anger, or seemed such violent usurpations as to call for Henry III.'s Charter of the Forest, in addition to the forty-seventh chapter of John's Great Charter. Henry I.'s officials, no doubt, by way of intimidation and extortion, asserted royal forest rights over woods that had not been afforested, and inflicted penalties and fines for their alleged violation, but the very passage which Mr. Freeman cites (v., 164) from Henry of Huntingdon shows that the pretext was that the ground had been duly afforested. And Henry I.'s Charter to the Citizens of London expressly confirms their ancient rights of hunting in Middlesex and Surrey, rights which we find them jealously maintaining in subsequent reigns. Nor is it likely that Henry I. would have said in his general Charter of Liberties, which Mr. Freeman calls "the immediate parent of the Great Charter itself," that he "kept the forests in his hands with the common consent of his barons, as his father had done," had he meant thereby to lay claim to every wood and covert in the realm. With the laconic brevity of our early statutes and records, the royal forests are sometimes called simply *forestae*, but the proper name for an afforested tract, over which the forest law ran, was *foresta regis*. *Foresta*, as Mr. Freeman remarks (iv., 613), means a wilderness rather than a wood; and he might have added that it does not necessarily mean a place out of the jurisdiction of the common law. Mr. Maine adopts the derivation of "forest" from *foris*, "out of," that is to say a place out of the jurisdiction of the common, and within the exceptional jurisdiction of the forest, law. It seems, however, to be simply a form of the same word as the German *forst*. It may, perhaps, have been brought into England in its present form by the Normans, and be in that sense of French origin, as Mr. R. G. Latham states. But the French *forêt*, which in Old French was *forest*, was, there is scarcely room for doubt, a form of the same word as the German *forst*; and some form of that word one may believe was in use in England long before the Norman Conquest, having been brought in by the Germans from their native forests.

T. E. C. LESLIE.

NOTES FROM CAIRO.

Cairo: April 20, 1878.

By this time all the objects which the Boulak Museum contributes to the Paris Exhibition will have reached their destination. As regards the Egyptian section, the design throughout has been to illustrate the arts and industries of the country from the earliest times up to the present day. Considering their antiquity, there are no classes of objects that will be studied with more interest than those which are intended to reproduce the arts and manufactures of ancient Egypt. With this object in view, a careful selection has been made from the museum at Boulak, the choice having

been regulated by Mariette-Bey, who, as president of the Egyptian Commission, has been for some time in Paris, while M. E. Brugsch, as sub-curator, has carried out his instructions in Cairo. There has been no idea of choosing objects for their intrinsic or purely historical value, but the development of workmanship is portrayed from the ancient empire to the times of the Ptolemies. The collection also exhibits as fully as possible the materials made use of during the period which the objects illustrate.

The specimens include household furniture, wood carving, vases, inlaid work, mosaics, jewellery, works of bronze, glass, and stone. In a few cases only casts have been sent instead of the objects themselves. Some ancient models have also been sent which explain the methods employed in statuary and other arts. With the Greek period the Boulak collection ends. The history of Egyptian art during subsequent periods is illustrated with the aid of the Egyptian Government and private individuals. Mr. E. T. Rogers, whose valuable collection of coins is lent by himself, and M. St. Maurice, are in charge of the Arab and Middle Age department, and the industries and productions of modern Egypt complete the series.

The Egyptian staff has lately devoted much care to the construction of large scale-maps, illustrating the explorations of late travellers. The results will be seen in a large map of Egypt and its dependencies, which is intended to incorporate all the latest information. As regards the southern extremity of what the Khedive seems to consider Egyptian territory, the limits are those assigned by Colonel Gordon, and to the West figures the recently annexed province of Darfour, which forms one of the most important features of the whole. This portion has been supplied by General Purdy—who, it will be remembered, returned last year from his laborious expedition—while the province of Kordofan has been surveyed by Colonel Prout. Care has also been bestowed upon the country of Harar. Victoria Lake appears as mapped by Stanley, and Albert Lake as according to Colonel Mason. The work done by Schweinfurth has been utilised, and the results of almost all recent travel have been inserted. Some of the more important routes are marked by dotted lines. Late publications of the Royal Geographical Society illustrating the work done by Gordon Pasha and his officers have been made use of. In a few cases, where there has been a conflict of evidence, a temporary compromise has been adopted. The whole map covers a space of about 4 by 5 mètres, being on a scale of 1 : 1000000.

The staff also sends specimens of arms, musical instruments, and various other objects of industry, illustrating the modes of life and customs of various tribes recently brought under the rule of the Khedive. Among other curiosities figure the chair and the ivory pipe of M'Tesa, as well as the copper lances used by him, not for war but for purposes of parade. There are also maps of Egypt, showing its extent during the time of the French expedition, of Mohammed Ali, and of Saïd Pasha. Plans have also been carefully prepared representing the city of Cairo in 1800, 1845, and 1878.

ROLAND L. N. MICHELL.

PARIS LETTER.

Paris: May 3, 1878.

The French Academy has just published the seventh edition of its famous Dictionary, and has reprinted at the beginning the prefaces to the six earlier editions. This is modesty, for the preface to the seventh cuts a rather poor figure. Nothing is more singular than the liberties which the Academicians take, save the feelings of squeamishness which restrain them. They have suppressed an *h* in *rhythme* (*rhytme*) and an *h* in *phthisie* (*phthisie*), on the pretext that they are not pronounced; as if nine words out of ten in French did not contain parasitic letters, and as if our

whole orthography were not a chaos of absurdity and contradictions. On the other hand, the Academy has refused to admit into its Dictionary the word *Actualité*, thus making the most piquant of epigrams at its own expense. The most serious charge that can be brought against the Academy is that it does not form a clear idea of the work it has to execute. Some people find fault with it for proscribing certain words, for being less eclectic than M. Littré. But this is not a fair accusation. The mission of the Academy is not to register all the words which are now in use or which have been employed by authors. It has to form a Dictionary of the language spoken in Paris by good society. Such is the object aimed at by the authors of the first edition of the Dictionary, and it is the best thing that can be done to compose a Vocabulary of good French. The misfortune is that the Academy thinks itself bound to give laws to good society, and that instead of taking account only of the language spoken by contemporaries, it busies itself too much with the language written by good authors. So it preserves words and phrases which have long fallen into disuse, while it rejects others which are universally admitted.

Despite these imperfections it performs a useful task, so that, notwithstanding the epigrams which are showered upon it, its membership remains an object of ambition to all those who pride themselves on being good writers. The coming elections of a successor to Thiers and to Claude Bernard have just been the occasion of the most amusing competitions. The French Academy is not a learned body, it is a *salon* into which enter the affectations, the susceptibilities, the petty intrigues of worldly life. As M. Thiers must be praised by his successor, and as his friends are numerous in the Academy, M^{me}. Thiers and M^{lle}. Dosne were allowed to give their advice as to the election. It may be imagined what complicated negotiations ensued, for these excellent persons thought less of the literary merits of the candidates than of the degree of their intimacy with M. Thiers. They were within an ace of accepting M. Giraud, undoubtedly a distinguished scholar, but an obscure and ponderous writer, and a person who, especially from the part he took in politics under Louis Napoleon, was as ill qualified as anyone could be to eulogise the founder of the French Republic. M. Laboulaye, who would have been an excellent choice, was also passed over; M. d'Audriffet-Pasquier is reported to have declined the honour—perilous for himself—of speaking of M. Thiers; and they fell back on M. Henri Martin, who has at least the advantage of being an historian like M. Thiers, whose character commands universal esteem, but who is far too deficient in subtlety and originality to trace a portrait of the smallest and the greatest of our statesmen. It is perhaps after all his very mediocrity which caused him to be selected. If there was not much to be said in his favour, there was nothing to be said against him, and it is possible that M^{me}. Thiers might have been pleased to see her husband's place occupied by a man whose talent or capacities could never be compared with his. It is true that now M. de Loménie is dead, there is a talk of electing M. Henri Martin to his chair, and of giving that of Thiers to M. Taine. This is a trick which the reactionary party in the Academy are anxious to play the founder of the Republic, and M. Taine will find himself as much embarrassed as anybody to speak of M. Thiers, whether favourably or unfavourably. If the object had been to get a really original portrait of M. Thiers, which would have struck Europe with admiration and would have remained for posterity, the choice should have fallen on M. Renan, who would have envied such a task and such an honour. But M. Renan will be elected to fill the place of M. Claude Bernard. It is at least a matter for congratulation that the Academy has at last decided to make reparation to the greatest of our contemporary writers; and

we may recognise in this election a gratifying token of the decline of the clerical spirit, already beaten in the field of politics. What will M^r. Dupanloup do, who gave in his resignation on the election of M. Littré, if M^m. Taine and Renan enter the Academy at once?

The reputation of M. Renan, however, is no longer one of those which are open to dispute, or to which anything can be added by Academic suffrages; but he is always finding means to cause us some charming surprise by showing us a new aspect of his talent. For the last two years he has given us pages from his autobiography; this year he gives us a politico-philosophical fancy in a dramatic form—*Caliban*,* a continuation of the *Tempest*, which has just appeared in the *Temps*.

This piece has not been to everybody's taste. *Caliban* represents the people, which, raised to civilisation by the aristocracy, turns against it the talents and the intelligence which it has received from it, and overthrows its sovereignty. It represents likewise the leaders of the people, who, when once they have got into power, turn Conservatives, and defend the principles of authority which they assailed before. Readers have naturally sought in the character of Caliban for all manner of allusions to our living statesmen, especially to M. Gambetta, who most assuredly was not in M. Renan's mind when he wrote. What, in the author's point of view, is most offensive to the partisans of modern democracy is his conviction that, while favouring free-thought and science, democracy is incompatible with idealism, with the highest nobility of heart and character. Ariel, who represents the chivalrous idealism of former ages, dies on the triumph of Caliban, after breathing forth his sorrow in complaints of exquisite poetry and harmony. M. Renan's general conception certainly lies open to more than one objection; but what constitutes the charm of his work is the details, the conversations between the nobles and the burgesses of Milan, who philosophise on life and the world with light and airy grace, and into whose mouths M. Renan has put the various points of view, contradictory and yet all true, which to his mind constitute the reality of things. The speech of the beautiful Imperia on the necessarily ephemeral character of beauty is one of the most exquisite pages which have ever come from his pen.

M. Renan's talent as it ripens is crowned with imagination and poetry, but his more important works are far from suffering thereby. They grow in size and in completeness. To the fifth volume of his *Origines du Christianisme* he has already added a sixth, which is ready to appear; then he contemplates a seventh on Marcus Aurelius and pagan wisdom, in which he will show what ancient civilisation might have been without Christianity; and, perhaps, an eighth which would bring us down to the final constitution of the Catholic Church under Constantine.

M. Renan's books have certainly greatly contributed to call attention in France to the history of ideas in the time of the Roman Empire. There are few subjects which are the object of keener curiosity, or of more careful study. We have already spoken here of the *Histoire des trois premiers Siècles de l'Eglise chrétienne*, by M. de Pressensé, which is to be almost entirely re-cast, and of the *Religion Romaine, d'Auguste aux Antonins*, by M. Boissier. M. Duruy, in the fifth volume of his *Histoire des Romains*, has given a leading place to the movement of ideas, and the sixth will contain a very interesting chapter on Christianity under Septimius Severus, in which he brings out the revolutionary character of the new religion. M. Aubé has devoted the whole of the second volume of his *Histoire des Persécutions de l'Eglise* (Didier) to the pagan polemic against Christianity, which is perhaps disproportionate; yet we cannot complain, for to this want of proportion we are indebted for an excellent book. The chapters on the Gnostics, Fronto, and Philostratus

contain nothing very new, but the chapter on Lucian determines with much subtlety the true attitude of this second-century Voltaire, who criticised Christianity without hatred, but who saw in the Christians simply *thaumaturgi*. What constitutes, however, the exceptional interest of M. Aubé's volume is the study on Celsus. Never has so much light been thrown on the noble figure of the worthiest adversary with whom Christianity in its time of growth had to reckon, a spirit liberal, tolerant, penetrating, nurtured on Plato and all the wisdom of the ancients. M. Aubé has reconstituted with much sagacity, from the eight books of Origen's *Contre Celsus*, Celsus' own book, that *True Discourse* which, like all books of pagan polemics, was unfortunately destroyed in the fourth century by triumphant Christianity. Henceforward we can form a very clear idea of it, and it is astonishing to see the force with which Celsus anticipated a great number of the chief arguments of the anti-Christian philosophy of the eighteenth century.

If I add to the books already mentioned M. Soury's *Jésus et les Evangiles* (Charpentier), it is not because of the merit of this pamphlet, but because it had for some days a *succès de scandale*. It certainly contains some excellent remarks on M. Renan's fifth volume, some brilliant passages such as are to be found in all M. Soury's writings, but this publication is not worthy of its author. The Introduction particularly has hindered readers from taking the volume seriously. In it the author gives his explanation of the life and mission of Jesus. He is represented as a sufferer from nervous disease, who showed in his brief career every symptom of mental alienation, and who would have become stark mad if the Jews had not done him the service of crucifying him. This thesis is supported by very poor positive arguments, and by a few texts most arbitrarily interpreted, but with a great display of the technical terms of medical science. It is rather curious to see one of the critics who maintain that we have scarcely any positive knowledge of Jesus diagnose and describe his malady as if he had a clinical journal before his eyes. In fact this is but a pure romance to be added to all those to which the life of Christ has given rise within the last eighteen centuries.

A book which deserves on the part of philosophers more serious attention than that of M. Soury is the volume of verse just published by M. Sully Prudhomme under the title of *La Justice* (Lemerre). It has a distinct savour of Lucretius, and the memory of the greatest of philosophical poets may be recalled without imprudence in speaking of this work, in which a profound knowledge of all the resources of the French language and poetry is placed at the service of singularly vigorous and profound thought. The poem is divided into ten *watches*, all but two of which are occupied with dialogues between the poet-philosopher, who expresses in sonnets the pangs of doubt and of despair which he feels at the sight of Nature and of humanity, and a mysterious Voice which answers him in the name of the heart and conscience. After showing the obscurity of the origin of things, the seeker sets forth with mournful eloquence the law of struggle for existence and of necessary egoism which causes war between the animal species, between individuals within the species, between nations and between the individuals of each nation; and finally recognises fatalism reigning in sovereign state throughout the whole universe. The Voice protests in the name of beauty, of love, of art, of devotion, above all of justice. The poet is struck by the last-named sentiment. He asks how it can have been implanted in man. He tells himself that perhaps he has been wrong to seek for exact justice in Nature, whose immensity escapes his vision, but that since he seeks it and requires it, it must be a need of his nature, it must exist in man and be developed with humanity. He then sees opening before him a new order of things which is based on conscience.

* See ACADEMY, May 4, p. 393.

The love of justice gives to man his dignity, and the city, created by men, will realise little by little the ideal demanded in vain of Nature. Thus an idealistic conception modifies little by little the fatalistic and naturalistic conception in which the poet's mind was at first entangled. Undoubtedly it is almost startling at first to see expressed in verse philosophical ideas so closely and logically reasoned out, especially when on entering into detail the reader finds that M. Sully Prudhomme has omitted none of the essential points of view of contemporary Darwinism and Positivism. Is poetry compatible with this scientific precision? The author asks himself the question in his preface, and hesitates to answer in the affirmative. We believe as a matter of fact that this kind of poetry is only accessible to a small number of readers, who are at once lovers of philosophy and of noble verse; but it is fortunate that this attempt has been made. One of the original points of M. Sully Prudhomme's genius is precisely this alliance of scientific philosophy and poetry; and it is good that he should have given in a work of high aim and of considerable length an example of the most perfect that he could produce in this kind. The verse, too, lends to the philosophical thought a certain completeness and attractiveness, which engraves it on the mind, gives it double relief and double value. In short, with M. Sully Prudhomme thought is never a cold conception of the brain; it shakes the whole being, it rings mournfully even to the innermost fibres of the heart, and this emotion clothes with poetry the very passages in which science speaks the most precise language. The answers of the Voice to the seeker have also enabled the author to give free scope to the warmest or most graceful outbursts of his imagination or his heart. This poem cannot be quoted by fragments. We must read it as a whole, grasp its powerful plan, and follow into its inmost recesses the thought, at once so vigorous and so sincere, which seems to reveal to you, in a heart-stirring and irresistible form, what was within you before only in the state of vague intuition.

I ought still to speak of more than one remarkable work, for the last few weeks have been productive. I ought to mention the second volume of the Correspondence of Ste.-Beuve, and above all E. Zola's fine novel, *Une Page d'Amour*, which appears to me to be his masterpiece so far. But I must postpone these subjects for a future letter, and end this, which is already too long.

CORRESPONDENCE.

THE DUTCH DRAWINGS IN THE BURLINGTON FINE ARTS CLUB.

London: May 6, 1878.

There are not a few among the drawings by the Dutch Masters now exhibited in the Burlington Fine Arts Club which, beside their artistic value, are also of historical interest. We know but little of the life and circumstances of most Dutch masters, and the marks of the artists on their pictures, etchings, and drawings are often the only guidance. C. Vosmaer informs us in his biography of Rembrandt (p. 295) that the Christian name of this master's mysterious pupil Renesse is indicated by C., C. A., A. C., and J. Alfred von Wurzbach has lately referred to an etching with the signature "Co. A. Renesse inventor et fecit." If the drawing No. 75 in the Burlington Fine Arts Club is ascribed to J. Renesse, the signature is apparently overlooked, for it clearly shows before the R. the two letters C. and A. The date (1669) of this drawing is not less valuable, because, according to Kramm, De Levens, &c. (p. 1358), the artist's activity only lasted from 1649 to 1661.

The year of Jacob van Ruysdael's birth is not yet known. Many catalogues have the dates 1630 and 1636. But the doubtless genuine drawing No. 92 has the signature "R. 1646," just as a similar one in possession of W. Mitchell, Esq. With this same date only an etching and one picture are known (cf. Waagen, W. Burger, Kramm), and these works were surely not produced by a boy of ten years of age.

Michael van Huysum, the brother of the celebrated flower-painter Jan, has held till now no position in the history of art. Kramm (p. 781) only names him as a drawing-master, and states that he could find only one of his drawings. The three water-colours of the exhibition 122, 123, 124, all bear his monogram. They are well qualified by their artistic excellences to secure for the master an acknowledgment which he undoubtedly deserves.

Is the drawing No. 71 really by Paul Potter (1625-1664)? Even the signature "... en 1616" (p. 1656) seems contradicted. No. 98, Study, probably a portrait from life, shaded drawing by Gaspar Netscher, is of great interest, because after it is executed the celebrated picture of the Dresden Gallery (No. 1,528), which is declared to be the artist's portrait of himself, and is dated 1665, painted, therefore, when the master was twenty-six years of age. The notice in J. C. Robinson's *Catalogue of the Malcolm Collection*, p. 243, "On the back [of the drawing], in the handwriting of Netscher, is inscribed 'C. Netscher geschildert Anno 1664 voor — guldens,'" agrees well with this statement.

JEAN PAUL RICHTER.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, May 13.—8 P.M. Society of Arts (Cantor Lecture): Some Researches on Putrefactive Changes," by Dr. B. W. Richardson.
 8.30 P.M. Geographical.
 TUESDAY, May 14.—3 P.M. Royal Institution: "Vegetable Morphology," by W. T. Thiselton Dyer.
 8 P.M. Anthropological Institute: "Description of a Male Skeleton found at Clisbury," by Prof. Rolleston; "Excavations at Ligwell in Cadbury."
 8 P.M. Colonial Institute: "Glimpses of Natal," by John Robinson.
 8 P.M. Photographic: "Dry Plate Processes," by W. England; "Photography at the least refrangible End of the Spectrum," by Capt. Abney.
 8 P.M. Civil Engineers: Discussion on "Steam Boilers for very high Pressures;" "The Design generally of Iron Bridges of very large Span for Railway Traffic," by T. C. Clarke.
 WEDNESDAY, May 15.—7 P.M. Meteorological: "Daily Inequality of the Barometer," by W. W. Rundell; "Meteorology of Mouzufferpore, Tirhoot, for 1877," by

C. N. Pearson; "The Great Rainfall of April 10-11, as recorded at the Royal Observatory, Greenwich," by W. Ellis; "Observation of Sea Temperature at slight Depths," by Capt. W. F. Caborne.

- 8 P.M. Archaeological Association: "Exploration of the recently-discovered Roman Station at South Shields," by the Rev. R. E. Hoopell.
 8 P.M. Society of Arts: "Dietaries, in their physiological, practical, and economic Aspects," by R. M. Gover.
 THURSDAY, May 16.—3 P.M. Royal Institution: "On Colour," by Lord Rayleigh.
 8 P.M. Chemical.
 8.30 P.M. Royal.
 8.30 P.M. Antiquaries.
 FRIDAY, May 17.—8 P.M. Philological (Anniversary): President's Annual Address, by H. Sweet.
 8 P.M. Society of Arts: "Agriculture in India," by F. C. Danvers.
 9 P.M. Royal Institution: "On Speech," by A. Graham Bell.
 SATURDAY, May 18.—3 P.M. Royal Institution: "On Richard Steele," by Prof. H. Morley.

SCIENCE.

The Physical Geology and Geography of Ireland. By Edward Hull, M.A., F.R.S., Director of the Geological Survey of Ireland. (London: Stanford; Dublin: Hodges, Foster & Figgis, 1878.)

PROF. HULL, whose duties as Director of the Geological Survey of Ireland have made him intimately acquainted with the geology of the land of "Giant Stags and Giant Causeways," has traced the broad outlines of its physical history in a small volume of great interest, which at once takes its place by the side of Prof. Ramsay's popular work on *The Physical Geology and Geography of Great Britain*.

The first part of the book deals with the geological formations of Ireland, which belong to "the oldest and newest periods of geological time as represented in the British Isles." A large portion of the Mesozoic strata, including the whole of the Jurassic series, is wanting; this feature is apparently due to absence of deposition, as it seems probable that the Irish area, with the exception of the north-east, was raised into dry land, at the end of the Carboniferous period, by terrestrial movements which have left striking evidence of their force in the crumpled strata of the mountains of Kerry. A clear sketch is given of the succession of events in the volcanic history of the north of Ireland during the Miocene period; and attention may be drawn to the arguments in favour of the great age of Lough Neagh, which was in existence before the glacial epoch, as well as to the remarks on the drift deposits which cover three-fourths of the entire surface of the country and rise up the flanks of the mountains to a height of between 2,000 and 3,000 feet. The second part, which describes the origin of the landscape features of Ireland, is perhaps the most attractive portion of the book. When Ireland was elevated into land, at the end of the Carboniferous period, its surface probably presented the appearance of "a plane, partly formed of coal-measures and partly of older rocks, with a slight inclination in various directions." Out of this "plane of marine denudation," the level of which would be 3,000 or 4,000 feet above that of the great central plain which stretches across the country from Dublin to Galway, the physical features were fashioned by the great sculptor water; and it is ingeniously suggested that at this time "Ireland contributed to the mineral wealth of England" by supplying materials to protect her vast stores of coal from atmospheric waste. The causes which have led the Shannon, the Blackwater, and other rivers to

assume their apparently unaccountable courses, are clearly explained by reference to their geological history, and the lakes are shown to be of mechanical or glacial origin, or to be due to chemical solution. To the last class belong the numerous sheets of water which lie scattered over the central plain, whilst Loughs Neagh and Allen are of mechanical origin, and the innumerable lakes in the mountain districts of Conne-mara, Donegal, Kerry, and Wicklow may, as a rule, be attributed to glacial agency.

The concluding part is devoted to the glaciation of Ireland, and gives a brief summary of our present knowledge of the subject, as derived from the researches of the Rev. Maxwell Close and the officers of the Geological Survey. These investigations show "that there exists a tract of country stretching across the island, which has been the axis of motion for the ice in opposite directions seawards." The cause of this ice-movement is at present somewhat obscure, and the explanation suggested seems hardly sufficient to account for the observed phenomena. Appendices containing lists of authors referred to; of characteristic fossils of the geological formations of Ireland; and of geological maps of the country, add much to the value of a book which will be welcome not only to the travellers who in increasing numbers visit Ireland during the summer months, but to all those who wish to make themselves acquainted with the physical structure of the country. C. W. WILSON.

Assyrische Lesestücke nach den Originalen theils revidirt, theils zum ersten Male herausgegeben. By Friedrich Delitzsch. Second Edition. (Leipzig: Hinrichs, 1878.)

THIS second edition of Dr. Delitzsch's *Assyrian Chrestomathy* will be found indispensable by all students of the Assyrian inscriptions. It is about double the size of the first edition, and the alterations introduced into what has been published before make it substantially a new book. It is marked by the careful exactness which characterises Dr. Delitzsch's work, and which can be fully appreciated only by the Assyrian scholar who knows how difficult it is to copy accurately the minute characters of the cuneiform tablets. What makes the book the more welcome is that it gives the syllabaries as completely as our present materials allow, correcting the inaccuracies of the texts published in the *Cuneiform Inscriptions of Western Asia*, and adding some fresh ones to them. The syllabaries are further arranged and classified, and a selection of other texts is appended which illustrate the various departments of ancient Assyrian literature. The syllabaries, however, form the principal part of the volume, and lend to it its chief value. They are preceded by a classified list of the characters with their phonetic values, and explanatory notes are added liberally. The latter furnish many important contributions to our knowledge of the Assyrian vocabulary.

The most striking feature of the new edition is the list of the names assigned to each character in the syllabary by the Assyrian scribes. These names are for the

most part of Accadian origin, and therefore mount back, as M. Lenormant has pointed out, to that early period when Accadian was still a spoken language. Indeed, they can be shown to be of yet greater antiquity. The cuneiform characters are a degenerated picture-writing, and the original pictures were frequently combined in order to express a single idea. Such combinations became compound characters, and, when the characters were classified and named, were denoted by compound names. But very often we have to go back to the bricks of the archaic Accadian Empire (B.C. 3000-2000) to discover the forms in which evidence of the combination is preserved, the characters having been much simplified in the later inscriptions, and so losing their primitive forms. In some instances where the name of a character denotes its compound nature the justification of this has been lost even in the forms found on the oldest monuments we possess, and we are accordingly referred to a still earlier period than that of the archaic Accadian Empire for the age in which the grammarians of Babylonia first began to classify the characters of their complicated syllabary and to give them each a name. The time which must have elapsed between the invention of the picture-writing out of which the cuneiform characters gradually developed and the classificatory work of the grammarians can be more easily imagined than stated.

Another interesting fact disclosed by the syllabaries is the existence of a women's language among the Accadians. Certain words, we are told, were peculiar to the women and not used by the men. This was also the case among the Caribs, where the women were usually stolen from an alien tribe; so, too, the pronunciation of the women in Greenland is said to differ from that of the men, and the Basque verb has special forms for addressing a woman. Even in this country we are familiar with the language of the nursery. It is evident, however, that the existence of a woman's language points to a want of intercourse between husband and wife, and may indicate, as among the Caribs, a difference of race. We know from other documents that the mother in Accad occupied the chief place in the family, in contrast to the later Semitic usage which regarded the women as inferior to the men.

Prof. Delitzsch's notes are full of new and striking observations. Naturally there are one or two with which I am disinclined to agree; thus I am still unconvinced that the two forms *suturu* and *subarruru* must not be assumed to exist side by side, and I am doubtful about the assertion (p. 63) that the Assyrian *salalti* means "three" when it translates the Accadian *pis*. At all events an unpublished tablet (K 4604 rev.) makes *mus* or *wus* the Accadian numeral "three."

In Assyriology as elsewhere Germany is vindicating its claim to scientific eminence. It now possesses two chairs of Assyrian in the most crowded centres of University life, Berlin and Leipzig, and the occupant of the latter of these has by the new edition of his *Lesestücke* laid all students of the cuneiform monuments, whether German or otherwise,

under a deep obligation. The German school of Assyrian decipherers cannot but prosper under such guidance.

A. H. SAYCE.

SCIENCE NOTES.

PHYSIOLOGY.

Brain is the title of a new quarterly journal of which the first number has just appeared (Macmillan and Co.). The names of the editors, Bucknill, Orichon Browne, Ferrier, and Hughlings Jackson, afford a sufficient guarantee that the undertaking is a serious one and likely to be adequately carried out. But where is the growing multiplication of scientific periodicals to end? If "neurology" must have an organ of its own, may not myology, osteology, splanchnology, &c., begin to assert a similar claim to independence? There is no single article in the first number of *Brain* which might not have found an appropriate home elsewhere. Mr. Lewes's valuable essay on Motor-Feelings and the Muscular Sense would not have been out of place in *Mind*; Duret's experimental enquiry into the nerves of the dura mater belongs to the *Journal of Physiology*; the papers of Hutchinson and Gowers are exclusively addressed to medical readers; while Dr. Allbutt's article on Brain-forcing makes one think that one has inadvertently taken up an old number of the *Cornhill*. It may seem ungrateful to say of a good thing that it is superfluous; but a protest is undoubtedly needed against the general tendency of which the present work is an instance.

On the Absorption of Carbonic Oxide.—Gréhan has performed some experiments in order to ascertain what proportion of this gas must be mingled with the atmosphere before it is capable of being absorbed by a living animal. Details of a single experiment will illustrate the method employed; 30 cc. of blood were drawn from the superior cava of a healthy dog; the animal was then made to breathe air containing $\frac{1}{30}$ of carbonic oxide for half-an-hour, and at the close of this period a second sample of blood was drawn. After another thirty minutes, during which pure air was supplied, a third specimen of blood was taken. The three samples of blood were defibrinated and shaken with oxygen; the gases contained in them were then extracted *in vacuo* and subjected to quantitative analysis. The first yielded 23.3 cc. of oxygen per cent.; the second, 14.9 cc.; the third, 20.3 cc. Inasmuch as the haemoglobin of the red corpuscles takes up oxygen and carbonic oxide in the same proportions by volume, the blood must have absorbed 13.4 cc. per cent. of the latter gas during the period of inhalation, and given up 5.4 cc. per cent. during the subsequent half hour. The general conclusion at which Gréhan arrives is that an animal breathing an atmosphere containing only $\frac{1}{75}$ of carbonic oxide will absorb enough of this gas in thirty minutes to incapacitate one half of the red corpuscles in its blood for taking up oxygen. If the atmosphere contain $\frac{1}{150}$ of the gas, only one quarter of the red corpuscles will be rendered functionally impotent. (*Comptes Rendus*, Avril 8, 1878.)

Influence of different Gases on Fermentation.—The following method has been employed by O. Nasse for investigating this problem (*Bücher's Archiv*, xv., 471). He introduced ice-cold solutions of cane-sugar mixed with invertin (a ferment derived from yeast) into glass tubes, and passed various gases through them to saturation; the contents of the tubes were then gently warmed, and after the lapse of one hour and a quarter, raised to the boiling-point. The amount of inverted sugar formed in each of the tubes was then quantitatively determined. The tube through which carbonic acid had been transmitted yielded 20 milligrammes; that treated with hydrogen, 8 milligrammes; that simply exposed to the air, 7 milligrammes; while those

through which oxygen and carbonic oxide had been passed contained none at all. The two last-named gases, accordingly, have power to inhibit the action of the ferment; but a very small admixture of carbonic acid to either of them is enough to abolish this restraining power and to enable the fermentation to proceed. The same method of enquiry, applied to the amylolytic ferment of the saliva, furnished much less striking results; carbonic acid, however, was found to quicken the operation of this ferment, though not to any great extent. The process of death in muscular tissue was then investigated. Bits of muscle were suspended in salt solution through which carbonic acid or air were transmitted; a comparative estimate was then made of the glycogen and muscle-sugar produced. The first effect of pure carbonic acid was found to be an acceleration both of the formation and the destruction of sugar, the former being more influenced than the latter; subsequently, however, both processes underwent retardation, the latter more than the former. In regard to the peripheral nerves, Nasse confirms Ranke's assertion that carbonic acid diminishes their excitability from the first (without an initial period of exaggeration), but does not annul it completely for a long time. When some other indifferent gas is substituted for the carbonic acid, the nerves speedily regain their normal excitability. But on the nerve-centres carbonic acid appears to act in much the same way as upon ferments; it first of all augments, and subsequently depresses their excitability.

On the Removal of Sugar from the Alimentary Canal.—We are still very ignorant concerning the fate of saccharine matter contained in the digestive tube—whether introduced into it as such, or generated by the decomposition of amylaceous compounds. Von Mering has carried out an elaborate series of experiments on the subject in the laboratory of Prof. Ludwig (*Dubois-Reymond's Archiv*, 1877, 4 and 5). The following are the principal results of his enquiry:—1. The lacteals take hardly any part in the absorption of sugar. 2. The lymph and chyle invariably contain sugar (independently of the kind of food taken) in approximately the same proportion as the serum of the blood. 3. The blood invariably contains a certain proportion of sugar, which is the same for all the vascular areas examined, and which is not diminished by starvation, even when this is carried far enough to deprive the liver of all its glycogen. 4. The portal blood alone may sometimes contain a larger amount of sugar during the digestion of carbo-hydrates; this excess being probably withdrawn from it during its passage through the liver.

On Disturbance of the Circulation by increased Intrapericardial Pressure.—By placing the pericardial sac of a dog, whose cervical cord had previously been divided, and whose respiration was maintained by artificial means, in communication with a reservoir of compressed air, François-Franck (*Gazette Hebdomadaire*, 1877, No. 29) was able to augment the intrapericardial pressure, either slowly or suddenly, to any extent desired. By means of suitable apparatus, the simultaneous alterations of tension in the arteries and veins, as well as the pulsations of the heart, were automatically recorded. A very gradual increase of pressure equivalent to 0.5 centimètre of mercury was not followed by any effect. When the pressure had risen to 1 centimètre the arterial tension began to fall without any change in the cardiac rhythm. When it reached 1.5 centimètres, there occurred a great and rapid fall of arterial tension from the normal level to 8 or even 5 centimètres of mercury. The fall then continued, but very gradually, till the degree of arterial tension had reached 1.5 centimètres. As soon as the intrapericardial and arterial pressures had thus been equalised, the pulse in the arteries ceased to be perceptible. The ventricles continued to contract in the distended pericardium, but they no longer drove any blood into the great vessels. To elucidate

the mechanism of these phenomena, a fresh set of experiments was undertaken. The excised heart of a tortoise, continuously supplied with a stream of defibrinated blood, was suspended in an air-tight glass vessel provided with two tubes, one of which was in communication with a mercurial manometer, the other with a pair of bellows. By injecting air into this vessel, any desired pressure could be brought to bear upon the surface of the heart. It was found that in proportion to the rise of pressure, the quantity of blood emitted by the heart in unit of time underwent diminution, the flow ceasing entirely when the pressure reached a certain point. The increasing pressure was observed to affect the relatively yielding walls of the auricles, which gradually collapsed and ceased to admit blood, the ventricle continuing its fruitless exertions and contracting on emptiness. These experiments throw light upon the circulatory disturbances caused by abundant pericardial effusions. The auricles are compressed, and the supply of blood to the ventricles is steadily diminished till, at last, it ceases altogether. The small, thready pulse, feeble impulse, distended veins, cyanosis, and oedema, are necessary consequences of this mechanical hindrance to the circulation which may at length attain a degree of severity incompatible with life.

CHEMISTRY AND MINERALOGY.

The Chemical Action of the Electric Discharge on Persulphuric Acid.—As this acid can be formed by the action of oxygen on sulphurous acid, it occurred to Berthelot that it might also be produced by the direct action of oxygen on sulphuric acid: $S_2O_3 + O = S_2O_4$. This fact he has now established (*Compt. rend.*, 1878, lxxxvi., 277). He subjected 277 milligrammes of sulphuric anhydride, in contact with 60 ccm. of dry oxygen, to the action of the electric discharge for the space of eight hours; the tube containing these materials was then heated to remove a few little drops of unaltered anhydride, and he then continued the transmission of the current for some hours. By this time the anhydride had completely disappeared, and in place of it there was a substance closely resembling persulphuric acid. Rather more than 20 cc. of the gas had disappeared. The new body possessed the composition of persulphuric acid. It was found that the anhydride and oxygen, when placed together, do not enter into combination unless the electric currents are employed. Persulphuric acid prepared in this manner is not a permanently stable body. The beautiful crystalline needles commence to crumble away in a few days, and are soon converted into a snow-like mass, which appears to be a compound of sulphuric acid and persulphuric acid. The same substance is formed when the discharge is first transmitted, and consequently appears to be an intermediate product.

The Separation of Minerals of different Specific Gravity.—Church has recently called attention to the applicability of Sonstadt's solution to the separation of minerals of different density. The liquid consists of a solution of mercury iodide in potassium iodide, and is prepared by adding them alternately to the solution until no more of either is dissolved. A little free iodine occasionally colours the liquid; but this can be removed by the addition of some sodium hyposulphite. The light straw-coloured liquid thus obtained may possess a density of 3.01, and can be employed for the separation of the mechanically-loosened ingredients of any rock which it is desired to examine. Hardman describes the successful isolation of a mineral occurring in the basalt of the North of Ireland. He used a solution having a specific gravity of 2.40, and was enabled to separate two grammes of a mineral having a density of 1.70. The quantity is one which the author questions his ability to have extracted after months of hard labour by any other method. He points out that it would be possible to separate completely the three constitu-

ent minerals of granite, mica, felspar, and quartz, to weigh them, and to determine almost absolutely their percentage, a problem which has yet only been solved by mathematical calculation, based on assumptions which can be at least only approximately correct (*Chemical News*, 1878, xxxvii., 108). In the current part of the *Mineralogical Magazine*, Prof. Heddle, of St. Andrews, draws attention to two properties of Sonstadt's "solution" which cannot too soon be impressed upon those who propose to use it: it is a rapid and powerful vesicant, and is exceedingly poisonous. It happened that some drops fell upon one of his hands, which was soon found to be in a state of violent inflammation. He does not regard the liquid as a solution in the strictest sense, but believes that a new salt is formed, which crystallises in long needles apparently belonging to the oblique prismatic system; they have a high dispersive power, a sulphur-yellow colour, and are extremely deliquescent (*The Mineralogical Magazine*, 1878, ii., 63).

Fluoranthene.—This is a new hydrocarbon obtained by Fittig and Gebhard from coal-tar (*Ber. chem. Gesell. Berlin*, x., 2141). In preparing and purifying a large quantity of pyrene, a substance was discovered having the formula $C_{15}H_{10}$, fusing at 109° and crystallising in large lustrous plates: this is the new body. When treated with the requisite reagents, it yielded the picric acid compound, $C_{15}H_{10} + C_6H_3(NO_2)_3O$ and the trinitro-derivative $C_{15}H_7(NO_2)_3$. When oxidised with the chromic acid solution, it, like phenanthrene, evolves carbonic acid and is converted into a mixture of a chinone and an acid having the formula $C_{14}H_8O_3$; the barium salt of this body crystallises in little warty concretions, and the calcium salt in small golden-yellow needles. It is isomeric with oxanthrachinone but has the same empirical formula only as that body; it is undoubtedly an acid, containing beyond all question the group COOH. When distilled with finely divided zinc it yields nearly the theoretical amount of fluorene, and when heated with lime splits up into carbonic acid and diphenylenketone, which has led the authors to give it the name of diphenylenketoncarbonic acid. Fittig believes the idryl of Goldschmidt to be identical with fluoranthene.

The Reaction of Nitrogen and Water.—Berthelot, having had occasion to repeat the experiments on the formation of ammonium nitrite by means of the electrical discharge, now finds that absolutely pure nitrogen, when exposed in the concentric tubes, in contact with water, to the discharge of a very powerful Ruhmkorff apparatus for from eight to ten hours, yields ammonium nitrite beyond all question. The salt does not appear to be formed unless the discharge is a powerful one. With currents of low tension nitric acid is not formed in moist air. The formation of nitrates and nitrites in atmospheric air is assumed, therefore, to be due to the action of lightning (*Ann. Chim. Phys.* [5] xii., 445). It must not, however, be forgotten that Zöller and Grete have reopened the enquiry whether ammonium nitrite is a product of the combustion of hydrogen in air, and the result of their experiments, conducted under most rigorous conditions, goes to show that during the combustion of absolutely pure hydrogen in perfectly pure air, small but distinct quantities of the nitrite are formed (*Ber. chem. Gesell.*, x., 2144).

The Ores of Tellurium.—E. P. Jennings describes the native tellurium of John Jay Mine, Boulder County, Colorado, where it is met with in large masses, associated with more or less quartz and pyrites. The tin-white mineral is found both massive and in the form of hexagonal prisms in druses of quartz. An analysis of the mixed minerals was performed. If of the results we discard those which indicate the presence of pyrites, iron oxide, and silicic acid, the pure mineral appears to consist of tellurium 98.30 per cent. and gold 2.29 per cent.; or native tellurium

97.07 per cent. and sylvanite, Au_2Te_3 , 4.52 per cent. Another specimen apparently consisted of 73.23 per cent. tellurium, 17.26 per cent. sylvanite, and 9.30 per cent. of altaite, PbTe . The sylvanite of the Smuggler Mine, Colorado, consisted of tellurium 65.84 per cent., gold 23.56 per cent., silver 9.45 per cent., and zinc 0.72 per cent.; the formula of this mineral, therefore, appears to be $(\text{Au}, \text{Ag})_2\text{Te}_3$ (*Oest. Zeitschrift*, xxvi., 5).

Fluid Cavities in Blende.—A. Schertel has observed the occurrence of a cavity, of the size nearly of a pea, and filled with liquid, in a specimen of Spanish blende. When the specimen was broken through the liquid was ejected. The walls of the cavity and the cleavage-faces were washed with distilled water and the transparent liquid qualitatively examined. The liquid appears to have contained sodium chloride and zinc sulphate, the former predominating (*Berg- und Hüttenm.-Zeitung*, xxxvii., 49). Little cubes of salt have not unfrequently been observed in the fluid cavities of other minerals.

The Thermal Springs of Asmannshausen.—Fresenius finds that 1,000 parts of the water of these springs contain 0.0278 part of lithium bicarbonate, a percentage which, he states, must place it foremost in the list of alkaline springs containing appreciable amounts of the salts of this rare metal (*Jour. prakt. Chem.*, 1877, No. 16). We believe, however, that the salts of this metal have been found in far greater abundance in other springs, such as the thermal water of the Cliford Amalgamated Mines in Cornwall, analysed by Miller in 1864 and found to contain 26 grains of lithium chloride in the gallon.

Some Melting-Points.—Berthelot finds that crystallised phosphoric acid, PO_3H_3 , melts at $41^\circ.75$; the fused mass remains liquid at 38° , and at the moment it solidifies the thermometer again rises to $40^\circ.5$. The presence of a mere trace of water suffices to lower the fusing-point considerably. Nitric monohydrate fuses at -47° ; this point is, however, probably a little too low. The acid was solidified by employing a mixture of solid carbonic acid with ether. Chloroform melts in the same mixture at -70° . These points were all observed by aid of a small air-thermometer, an instrument which appears to be equally adapted to the determination of very low or very high temperatures. The boiling-point of carbonic acid, as indicated by this thermometer, was found to be $-78^\circ.2$; Regnault's earlier determination was $-77^\circ.9$ (*Bull. Soc. Chim.*, xxix., 3).

Detection of Traces of Hydrocyanic Acid.—Böttger has devised a lecture experiment to demonstrate the presence of traces of this acid, and to show its direct production in bitter almonds or the kernels of plums and cherries by the action of water when heat is applied (*Pol. Notizbl.*, xxxiii., 15). Some freshly crushed bitter almonds are to be placed in a flask, two litres in capacity, and over them is to be suspended a long strip of Swedish filter-paper, which has first been moistened with an alcoholic extract of guaiacum (5 grammes of the resin in 100 cc. of alcohol), then dried and subsequently saturated with a dilute solution of copper sulphate (1 part of sulphate in 2,000 parts of water). The strip of paper remains colourless until the crushed kernels are warmed with a little water, when, in the space of a few moments, it is observed to acquire an intense blue colour (*Polyt. Notizbl.*, xxxiii., 15).

Dissociation of Barium Carbonate.—Isambert finds that this compound barely suffers decomposition by the application of any degree of heat. It does so, however, when mixed with carbon. The same happens when nitrogen is passed over it. From the amount of carbonic acid removed in a unit of time, the dissociation-tension of carbonic acid at the melting-point of copper appears to be 20 mm. (*Beiblätter zu den Ann. der Physik und Chemie*, 1872, ii., 214).

THE issue of the Second Series of the Royal Society's *Catalogue of Scientific Papers*, comprising those published or read in the decade 1864-1873, commences with volume vii., which has recently been published. In addition to the subjects embraced by the First Series, this includes inaugural addresses, biographical notices, and papers on the "History of Science." We are told in the Preface of this volume that "the numbering of the titles of each author's papers is consecutive from the First Series." Unfortunately this appears to have been an afterthought on the part of the compiler when the twentieth sheet of the volume passed through his hands; for as regards the first 304 pages (nearly one-third of the volume), the numbering is not consecutive from the First Series, the lists of the papers of the scientific veteran and the younger worker beginning alike with No. 1. As attention has not been prominently directed to the fact that this method has only been adopted in a portion of this volume, we think the defect calculated to mislead those who will make use of this in other respects useful work of reference.

A SOCIÉTÉ DE MINÉRALOGIE has been formed at Paris. M. des Cloiseaux is president, and the meetings are held on the second Tuesday of each month in the Mineralogical Laboratory of the Sorbonne.

PHILOLOGY.

Hermathena. No. V. (Dublin: Edward Ponsonby.) The present number of the *Hermathena* shows no falling off in the energy and ability of the members of Trinity College, Dublin. The periodical has now an acknowledged position which may serve as a useful example and encouragement to similar undertakings on this side of the Channel. Philosophy is represented by Mr. T. K. Abbott's vigorous and acute paper in continuation of his controversy with Prof. Fraser on Berkeley's theory of vision. He agrees with Prof. Fraser in dealing with the theory as an integral part of Berkeley's metaphysical system, whereas it is usually regarded as a discovery resting on independent grounds. Among the papers on classical subjects, the most considerable, both in length and in freshness of matter, is that of Dr. Allman on Greek Geometry. It will serve to introduce English scholars—or such of them as are still allowed to know both Greek and elementary geometry—to a line of investigation which has been carried on with great success in Germany; *ad nos vix tenuis*. Dr. Allman deals in the present paper with Thales and the Pythagoreans, promising to carry on the subject—as the title indicates—to Euclid. The scanty notices of Thales are pieced together with great ingenuity, but with some tendency to build on too slight foundations. Dr. Allman's reasons for ascribing to Thales the conception of geometrical loci are surely insufficient. Thales seems to have known that the angle in a semicircle is right—though the notice in Diogenes Laertius is confused—and perhaps it follows that he knew that the other angles are together equal to a right angle; but it does not follow that Thales gave that knowledge the explicit shape of a proposition regarding loci. Dr. Allman's treatment of Pythagoras is more cautious, and is full of interest, especially his explanation of the Pythagorean view of odd numbers as "generating," his suggestions as to the regular pentagon and regular dodecahedron, and his remarks on the relation of the Pythagorean to the Egyptian geometry, and on the combination of arithmetic with geometry which Pythagoras first accomplished. Mr. Mahaffy's theory as to the date of the capture of Mycenae by the Argives seems at first sight to be in opposition to all the authorities—Pausanias, Herodotus, and the inscription on the tripod of Delphi; but further consideration will probably convince most scholars that it is true. It is remarkably confirmed by Dr. Schliemann's excavations. Mr. Tyrrell contributes a good defence

of Quintus Cicero's claim to the authorship of the *De Petitione Consulatus*. The manner in which he deals with the coincidences between that book and the *Oratio in Toga Candida* shows thorough critical judgment. Mr. Barlow's paper is devoted to proving that Gibbon was unfair to Julian; his object being to acquire a character for religious impartiality. Mr. Crossley's account of the correspondence of Fronto and M. Aurelius is an historical study full of interest, and may be suitably read along with Mr. Barlow's estimate of Julian. Mr. Palmer contributes "Miscellanea Critica;" his notes and emendations always give proof of the truest and most finished scholarship. Mr. Sandford's suggestions on the *History of Tacitus* are meritorious, but do not often leave us with the same sense of finality. Dr. Maguire's contribution deals with legal and constitutional points. We may mention his commentary on *Cic. Leg. iii.*, 17, and on *Hor. Sat. i.*, 6, 17 ff., *ii.*, 3, 64 ff., *Off. iii.*, 4. The points which Mr. Keene notes in Dr. Smith's Latin Dictionary may be called, without offence, *minutiae*. The *Hermathena* never confines itself to classical philology, and accordingly we find a translation of "The Legend of Igor's Raid"—an old Russian song of the twelfth century—by Dr. Atkinson, whose rule appears to be to master a new language with its literature at least once a year. The Bishop of Limerick writes a paper on the Ogam Beithluiscin, with a note on Scythian Letters. He regards the Ogam character as cryptic, subsisting alongside of a generally known alphabet. The remaining articles are mathematical; one is a paper by Dr. Casey, of the Catholic University, the other a letter from Mr. Jellett regarding his claims to discoveries in the theory of friction.

In the last number of the *Hermes* (vol. xiii., part 2) Hübner has a long and elaborate essay on the *Epicition Drusi*, in which he enters more fully than has hitherto been done on the question of the obligations of its author to Ovid and (especially) Propertius. Hübner is inclined to think that the poem may, after all, be put as early as the second century A.D. Mommsen ("Die Familie des Germanicus") discusses the date and circumstances of the birth of Julia Agrippina, arguing that Tacitus and Dion were mistaken in connecting this fact with the mutiny of 14 A.D. Kirchhoff, in an important paper on Aristophanes, contends that the second parabasis of the *Knights* was probably the work of Eupolia. Notes on Nonnus are contributed by Tiedke, by Zurborg on Demosthenes, by Wilamowitz-Möllendorf on the *ὑπερμενέος* of Theocritus (?), and by Mommsen on the *Scriptores Historiae Augustae*.

THE *Rheinisches Museum* (vol. xxxiii., part 2) opens with a long essay by E. Rohde on the meaning of *γέρον* in Suidas. The writer argues that in the great majority of cases it is simply equivalent to *ἡλικία*. Bernays criticises Aristotle's *Elegy* on Eudemos, proposing to read in the last line *μοῦνα* for *οὐ νῦν δ'*, and contending that the friend to whom Eudemos erected his altar was not Plato but Socrates. Bücheler has an elaborate and important discussion on the old Italian poem or inscription found last summer near the walls of the ancient Corfinium. D. Meyer publishes (for the first time) some notes by Fruterius on the old Latin poets. These notes were copied by Erycius Puteanus into a copy of Stephanus' *Fragmenta Poetarum Latinorum* (Paris, 1564). Schultess contributes notes on Seneca *De Clementia*, Steup on Thucydides, iii.—v., and W. Foerster a paper on quantity in Latin as illustrated by the Romance languages.

At a recent meeting of the Académie des Inscriptions et Belles-lettres, M. Benloew commenced the reading of a paper entitled "Le Plan de la Langue Albanaise." He argued that the Albanian seems to be the descendant of a language spoken in Greece before the arrival of the Greeks, and though it has borrowed many words from Turkish, Slav, Latin or Roumanian, and

Greek, is in no sense a mixed language. A language which borrows usually adapts the form of the loan-word to the rules of its own phonology, the German *krebe*, for example, becoming *écrevisse* in French, or else it borrows the word entire, the grammatical termination being included. Thus the French infinitive in *-er* has passed into German under the form of *-iren*, and the German will say *ich marschiere, du marschirst, er marschirt*. New verbs of really German origin, like *halbiren*, are next formed by analogy by means of the same termination. Similarly, modern Greek verbs like *ἀφῆλπιζω*, "I arrive," *καυαπιζω*, "I call," are borrowed from the Italian infinitive in *-are*. The same phenomena appear also in Albanian. Thus the verbs borrowed from the Slav contain a suffix *it* which represents the Slav infinitive. Those borrowed from Greek similarly contain the *s* of the Greek aorist; *anankas*, for instance, being the Greek *ἀνάγκασα*. Hence in its mode of borrowing, as well as in its phonology, Albanian shows all the marks of independence and originality.

MEETINGS OF SOCIETIES.

LINNEAN SOCIETY.—(Thursday, April 18.)

Dr. J. Gwyn Jeffreys, F.R.S., V.-P., in the Chair. The Rev. H. H. Higgins exhibited photographs of *Dynastes neptunus* and of an undetermined large species of Bornean locust, bearing resemblances to the genus *Pseudophyllus*.—A paper "On the Geographical Distribution of the Gulls and Terns (Laridae)" was read by Mr. Howard Saunders. This group, notwithstanding wide marine dispersion, possesses several remarkable isolated forms. In numbers there are about fifty-three species of Terns and Skimmers, fifty of Gulls, and six of Skua gulls. The majority of typical Laridae inhabit the North Pacific, where alone the Arctic and white primaried forms are connected through *Larus glaucescens* with the groups which have distinctly-banded primary wing-feathers. In the same region can be traced the typical Hooded gulls which in *L. glaucoideus* reach unbroken to Magellan Straits, while in the Eastern hemisphere it is not found beyond 10° N. lat. In the same region there obtains the peculiar-coloured tern, *Sterna aleutica*, which connects the typical Sturnae with the intertropical Sooty-terns, *S. sumata*, *S. anaetheta*, and *S. fuliginosa*. Of isolated groups which have no apparent connexion with the Pacific may be mentioned the New Zealand *Larus Bulleri* and *L. scopulinus*, the Australian *L. novae-hollandiae* and the South African *L. Hartlaubii*. In the Arctic region there are the two isolated specialised genera of gulls, *Pagophila* and *Rhodostethia*, which are not found on the Pacific side; while among the Terns the intertropical genera *Naenia*, *Anous* and *Gygis*, although somewhat related among themselves, offer no particular points of union with the typical Sturninae. It results that the bulk of evidence favours the idea of the North Pacific probably being the centre of dispersion of these chiefly oceanic or shore-frequenting birds, the Laridae.—Mr. R. Irwin Lynch next read a paper "On the Mechanism for the Fertilisation of *Myenia erecta*, Benth." This West African acanthaceous shrub has a funnel-shaped corolla, with hairy anthers midway in the tube, their backs pressed against the wall. The lower slender flexible style has its double-lipped stigma so formed and placed that insects alighting and entering towards the nectar at the bottom of the flower on their return so move the lever-lip of the stigma as to produce pollenisation.—"Notes on the Action of Limpets (*Patella*), in Sinking Pit in, and in Abrading the Surface of, the Chalk at Dover" formed a communication by Mr. J. Clarke Hawshaw. The limpet-tracks are of a zigzag pattern, varying from eight to fourteen inches square, and nearly a line deep. These abrasions are made by the lingual teeth of the animal while feeding on the fine coating of seaweed covering the chalk. The total amount of chalk annually denuded must be considerable, though the individual track seems insignificant. He explains how by mechanical and not by chemical agency, as some aver, the limpets sink their pits, these often being basin-shaped hollows considerably below the level of the rim of the animal's shell.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, April 30.)

MAJOR-GENERAL A. LANE FOX, F.R.S., V.-P., in the Chair. Mr. Francis Galton, F.R.S., read a paper "On Composite Portraits, made by combining those of various Persons into a single Resultant Figure." The author remarked that when images of many different persons are successively thrown for a short time on the same portion of a sensitive photographic plate, the composite figure that results is found to have an unexpectedly good definition. No person who saw one of these composites for the first time would doubt its being the likeness of a real person, whereas it is no such thing; it represents the average of many. Of course the component images must all be in the same attitude and of the same size, but exactitude in these respects is unnecessary. The important requisite is that the images should be carefully superimposed, and this is a very easy matter to effect. The author begins by collecting photographs of persons of the same general type of features and taken in the same attitudes. These are reduced photographically to the same size, then they are severally adjusted under fixed cross wires until one wire cuts the pupils of the eyes and the other bisects the interval between them. Then a hinged arm, carrying two points, is pressed down and pricks two register marks. When all the portraits have been thus prepared they are hung one in front of the other on two pins sticking out of a screen in front of the camera and passing through their register holes. They are photographed successively by removing one after the other to the last. Suppose there are ten component portraits, and that it would require 100 seconds exposure to get a satisfactory image of any one of them, then each of the ten portraits is exposed ten seconds only. The composite retains what is common to all the components, while individual peculiarities have in it no perceptible trace; the result is a handsome and regular face. Many specimens were exhibited. Even two faces will often make a fair combination, but the larger the number the better, if they all have the same general cast of features. The uses of the process are to procure anthropological types, to compare the average likeness of a family of brothers and sisters with that of their near ancestry—viz. two parents, four grandparents, and the uncles and aunts on both sides; and to obtain a good likeness of the same person by averaging many portraits. The author exhibited methods of optically combining portraits. A stereoscope will do this in some sense, but the best instrument for the purpose is a "double image prism" of Iceland spar.—The director read a paper by Mr. C. Staniland Wake on "The Origin of the Classificatory System of Relationships used among Primitive People." After criticising Mr. Morgan's explanation of the classificatory system as having originated in the practice of marriage among *consanguine*, Mr. Wake proceeded to show that the social condition of the Polynesian peoples, who possessed the simplest form of that system, was inconsistent with the origin assigned to it by Mr. Morgan. The author of the paper then showed by the examination of various phases of the classificatory system, especially the Australian, that although kinship may for certain purposes have been originally traced through the mother, the regulations as to marriage were based also on the relationship of a father to his child, and that the ideas which gave rise to those regulations also originated the classificatory system.—Mr. A. L. Lewis then described a rude stone monument known as the "Devil's Arrows," near Boroughbridge, Yorkshire.

ENTOMOLOGICAL SOCIETY.—(Wednesday, May 1.)

H. W. BATES, Esq., F.L.S., F.Z.S., President, in the Chair. Mr. Dunning drew attention to the fact that the present meeting marked the forty-fifth anniversary of the foundation of the society.—Mr. Distant exhibited a specimen of the Hemipteron *Tetradia bilineata*, Walk., as a remarkable instance of immunity from the effects of damp, the same having been kept in a relaxing pan for more than four months. Mr. Distant also communicated a paper, "Notes on some Hemiptera-Homoptera with Descriptions of new Species," in which he drew attention to the uncertainty of generic calculations as to geographical distribution, the Homoptera affording a good illustration in the family Cercopida, especially the genus *Cercopis*.—Part I. of the *Transactions* for 1878 was on the table.

ROYAL SOCIETY.—(Thursday, May 2.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"On the Life-history of a minute Septic Organism, with an account of Experiments made to determine the thermal Death-point," by the Rev. W. H. Dallinger; "On the Reversal of the Lines of Metallic Vapours, No. II.," by Prof. G. D. Liveing and Prof. J. Dewar; "Preliminary Note on Experiments in Electro-Photometry, No. II.," by Prof. Dewar; "On the Determination of the Scale value of a Thomson's Quadrant Electrometer used for registering the Variations in Atmospheric Electricity at the Kew Observatory," by G. M. Whipple.

SOCIETY OF ANTIQUARIES.—(Thursday, May 2.)

Dr. W. SMITH, Vice-President, in the Chair. E. W. Cooke, Esq., exhibited an altar cross of Limoges enamel, having a figure of Christ crowned, and the Virgin below, and on the other side Christ in Majesty at the intersection of the arms, and at the extremities the symbols of the four Evangelists. Coloured pastes are also inserted on the arms of the cross. Mr. Franks was of opinion that the cross was of the thirteenth century, and made a few remarks about the Eastern character of most specimens of Limoges work of that period, as shown in this instance, by the figure of our Lord being crowned, and having the feet separately nailed, while in the West it was usual to represent the feet as crossed and fastened with only one nail.—Mr. Franks exhibited a bronze Roman breastplate found some years ago in Cleveland, among a mass of bones of horses, boars, *Bos longifrons*, and deer, which had probably been brought together by the action of water. The metal had retained its original colour in consequence of the dampness of the place where it had lain. It was ornamented with engraved patterns and human figures.—Mr. Franks also read a paper contributed by Count Ferdinand de Lasteyrie, on certain gold ornaments in the Museum at Ravenna. These are gold plates, probably for the embellishment of a cuirass, set with Oriental garnets *cloisonnés* with gold wire. The pattern resembles some sculpture on the tomb of Theodoric, and there is no doubt that the workmanship is Gothic, and of the time of Theodoric. It was suggested that they might have formed part of the dress of Odoacer, who was murdered at a banquet by Theodoric's order and secretly buried, but the place where they were found has not been identified as his tomb.

CHEMICAL SOCIETY.—(Thursday, May 2.)

Dr. GLADSTONE, F.R.S., President, in the Chair. A lecture was delivered on "The Chemical Aspect of Vegetable Physiology," by Sidney H. Vines. The lecturer commenced by giving an historical sketch of our knowledge of the absorption of carbonic acid and the evolution of oxygen by plants, the circulation of starch grains, and the functions and nature of chlorophyll. Sachs first proved that starch grains are not formed in plants which are bleached from the absence of light, and that their formation in the chlorophyll corpuscles depended on the exposure of the plant to bright sunlight. Godlewski showed that if no carbonic acid was present no starch grains were formed. So there are two sets of phenomena—viz. the evolution of oxygen (with absorption of carbonic acid) and the formation of starch grains—for both of which three conditions are essential—viz. sunlight, chlorophyll, and carbonic acid. These two sets of phenomena are therefore probably connected, and belong to the same function. Great diversity of opinion exists both as to the composition and functions of chlorophyll. The lecturer gave a short account of the views brought forward by Pringsheim, Karl Kraus, Pfaundler, Wiesner, &c., and entered more in detail into the statements and theories advanced by Sachs. In the second part the lecturer considered the formation of vegetable acids, and pointed out that the views of Liebig and Mulder had not been confirmed by subsequent experiments. The part played by pyrocatechin, asparagin, &c., in the formation of carbohydrates was next considered, and the lecturer concluded by pointing out the necessity for quantitative work before we could hope to attain clearer and more certain views on the important functions of assimilation, excretion, &c., in the vegetable kingdom.

LINNEAN SOCIETY.—(Thursday, May 2.)

DR. W. CARPENTER, F.R.S., V.-P., in the Chair. Mr. J. R. Jackson exhibited specimens of fruits, leaves, and portions of the stem (used as a substitute for soap), illustrating peculiarities of *Yucca baccata*, Torrey. This plant extends from S. Colorado far into Mexico. Northwards acaulescent, southwards it develops a trunk ten feet high. The fruit, a dark purple berry, is preserved and eaten as winter provision, and the plant is commonly known as the Rocky Mountain banana.—A note was read from the Rev. H. H. Higgins concerning a large new tubularian Hydrozoon (probably allied to *Clava*?) from New Zealand.—On behalf of Mr. Thomas Higgin there was exhibited a photograph of *Chitina ericopsis*, Carter, and also microscopic specimens of this rare species of Hydractiniidae from New Zealand.—Mr. J. C. Galton called attention to a spined dermal plate of the Ray tribe of fishes mistaken for a fossil, and obtained near Barking Priory.—The secretary read in abstract a paper "On *Marupa*, a genus of the Simarubaceae," by Mr. J. Miers. This is founded on a curious fruit and specimen of wood exhibited in the Brazilian department of the Paris Exhibition, 1857. Sig. Netto, in 1856, described a Brazilian plant under the designation *Odina Francoana*, and bearing the vernacular name "Pao Pombo," as did the above-mentioned woods. Mr. Miers, however, is of opinion that Netto's species cannot belong to *Odina*, as that genus is Anacardiaceous, and quite foreign to the American continent. There follow the technical characters of the new species, *Marupa Francoana* and *M. paracensis*.—A short paper was read by Mr. R. Irwin Lynch, "On the Seed structure and Germination of a species of *Pachira*." The seeds were received at Kew July, 1877, and labelled the "Provision Tree." Varying in size they consist chiefly of one fleshy cotyledon, the second being exceedingly diminutive and functionless. Germination occurs in a fortnight after sowing, and in one instance the larger persistent cotyledon did not appear to be exhausted for nearly six months.—The main facts of a detailed communication on "The Occurrence of Conical Fructification in the Mucorini, illustrated by *Choanephora*," by Dr. D. D. Cunningham, was in his absence read by the secretary. According to observations and experimental investigations conducted for a series of years in India, Dr. Cunningham proves that *Choanephora* is a genus of Mucorine and not Mucedine Fungi, as Currey had regarded it in 1872. It is, moreover, capable of producing four kinds of fructification as follows:—by 1, zygospores=sexual fructification; by 2, conidia; by 3, sporangial spores; and 4, chlamydophorous=asexual fructification. These phenomena afford a possible explanation of certain otherwise conflicting conclusions which have been arrived at by such competent observers and authorities as Brefeld, Van Tieghem, and Le Monnier. At all events it yields a note of warning that classification of fungal organisms based alone on one form of fructification may lead to false conclusions. The present researches likewise show that M. de Bary's suggested analogy between the Mucorini and Ascomycetes in respect of their fructification is well founded, although the author believes the observations which originated it to have since been shown to be fallacious. Dr. Cunningham states that the presence of *Choanephora* on plants certainly greatly facilitates decay; but it is a cause, not a consequence, of advanced putrefaction.

PHILOLOGICAL SOCIETY.—(Friday, May 3.)

DR. J. A. H. MURRAY, V.-P., in the Chair. Mr. H. Nicol read a paper on "Some English Derivations," of which the chief were:—*aitchbone* and *edgebone*, alterations of the older *natchbone*, from Old French *nache* (= *naticum* from Latin *natis*); *bush* (box), from O. F. *boiss* (Lat. *pyrida*, Mod. F. *botte*); *cellar* in *saltcellar*, an alteration of Mid. E. *saler* from F. *salere* (Lat. *salarium*); *daub* from F. *dauber* (in O. F. = plaster), and this not connected with *adouer*, but from Lat. *dealbare* (plaster, whitewash), as Spanish *jalbegar* = *dealbicare*; *folly* (arbour &c. in place-names), from O. F. *foillies*, Mod. F. *folie* with same meaning (= *foliatum* from Lat. *folium*); *moil* not Lat. *molliri*, but from F. *mouiller* (= *molière* from Lat. *mollire*); *owetty* from O. F. *uelté* (Lat. *aequalitatem*); *titile* originally identical with *title*, from O. F. *titile* "a title, a small line drawn over an abridged word" (Cotgrave, under

titire), just as Span. *tilde*, also from Lat. *titulum*; *toil* from O. F. *toellier* (of doubtful origin, Mod. F. *toillier*); *ure* preserved in *inure*, from O. F. *oeuvre* (Lat. *operam*, Mod. F. *œuvre*), as *manure* from *manuere*; *uss* (benefit), from O. F. *oes* (Lat. *opus*); and *sweetheart*, not a corruption of *sweetard*, but really *sweet heart* (Chaucer *sweet herte* in two words, and *herte swete*).—Miss E. Coleman read a short paper on "The Russian Language, its History, its Sounds, the Flexions and Tenses of its Verbs, &c."

LIBRARY ASSOCIATION.—(Friday, May 3.)

ROBERT HARRISON, Esq., Treasurer, in the Chair. Messrs. Brace, Ernest C. Thomas, and Welch were added to the committee in co-operation with the American committee for preparing a new edition of *Poole's Index to Periodical Literature*. Previously to the meeting, the committee on a General Catalogue of English Literature met for the first time and discussed the plan of such a catalogue. The majority of those present were in favour of an alphabetical catalogue followed by a series of class-bibliographies or subject-indexes.

ROYAL ARCHAEOLOGICAL INSTITUTE.—(Friday, May 3.)

R. H. SODEN SMITH, Esq., V.-P., in the Chair. Mr. J. H. Parker made some observations upon the progress of the excavations in Rome during the past season.—The Rev. C. J. R. Palmer sent a lengthy paper, "The Provincials of the Friars Preachers or Black Friars of England," giving an account of the order from the time of its foundation by Dominic Guzman in 1215 to its obliteration in the seventeenth century.—A paper by Mr. W. Thompson Watkin on the Roman Stations, Burrium, Gobannium, and Blestium, of the twelfth and thirteenth Iters of Antoninus, was taken as read. The author gave a careful and detailed account of the Roman discoveries which have been recently made at Usk (Burrium).—Mr. M. H. Bloxam exhibited a bronze finger ring, with the following inscription on the inside: ESYNERA EYNAISKE; probably a Roman "annulus nuptialis;" and a small bronze hammer of the Romano-British period.—Mr. J. L. Baldwin sent a small domed clock of the button and pillar type.—The Rev. J. Fuller Russell exhibited and described several painted and enamelled German Glass Roundels of the early part of the sixteenth century, including a Pietà, and a fine St. George and the Dragon.—Mr. Hartshorne exhibited a piece of painted glass representing an incident in the life of Sir Alexander Stuart, contained within a border representing a "Jesse," with figures of men in armour rising out of flowers, and having their names inscribed below them; the whole being dated 1574. Mr. Tucker said that the tradition ran that Sir Alexander Stewart encountered a lion in the presence of Charles VI. of France, and his sword breaking he seized a part of a tree, and with it killed the animal. To commemorate this action the King gave him, as an augmentation to his arms, "a lion debruised with a ragged staff in bend." The story is alluded to in more than one printed book, and in MSS. in the Herald's College. The augmentation was borne by Sir Alexander's descendants in various ways. William Stewart, of Ely, living at the Visitation of 1619, is recorded as having represented on glass the incident, described as follows:—"Sir Alexander Stewart in armour, standing with a knotted or ragged staff, or club, in the action of striking a rampant lion, his paternal shield of arms is pendant on his breast; another escutcheon, with his paternal coat, and the augmentation placed on it in an inescutcheon, is held out to him from clouds by a dexter arm clothed with the French arms; in the background is a town and castle." This accurate description of the glass exhibited left no room for doubt that it was the actual picture in the possession of William Stewart of Ely at the Visitation in 1619. The same subject was also represented on a ring engraved at page 466 of *Finger-Ring Lore*, the incident being taken back to the time of St. Louis, for which there did not appear to be sufficient evidence.—Mr. S. Heywood exhibited a sword carried by one of his ancestors at the battle of Marston Moor, and Mr. Bernhard Smith sent a fine Venetian broadsword with a hammer-worked basket hilt and the blade inscribed JOHANNES ZVCHINI, late sixteenth century, and a pommel of a Venetian sword having heads in profile, apparently blundering imitations of Macedonian coins.—Lady Charlotte Schreiber exhibited a Sack-pot of Lambeth

pottery lettered "Whit-Wine," and dated 1641; and Mr. Soden Smith sent another example lettered "Sack," and dated 1657, together with some ewers and drug pots of the early part of the eighteenth century, in the same ware. The chairman traced the origin of this tin-glazed ware from very early times, following its progress westward into Spain and Germany and Italy, where Della Robbia worked in it. From thence its manufacture was carried into France and Holland, where the art was extensively practised. In England it was first carried on by Dutch potters at Lambeth in the middle of the seventeenth century, where the works continued for about 150 years. The dates of sack-pots appear to range between 1641 and 1659.—The preliminary arrangements for the annual meeting to be held at Northampton on July 30 were read.

FINE ART.

THE ROYAL ACADEMY EXHIBITION.

It would be difficult to name an Academy Exhibition of recent years containing less to engage and fix the attention than that which opened to the public on Monday last: such at least is our own impression, and we think it is generally, though not universally, shared in. "Uninteresting" is the verdict; and a highly condemnatory verdict that is. We may say, and truly say, that the general level of skill is fair, and the sprinkling of able works considerable. But this makes little difference in the final result; we walk into the rooms with expectation and a willingness to be pleased, and walk out of them with a blurred sensation compounded of disappointment and ennui. Perhaps the most satisfactory feature in the display is the rather large number of clever and well-executed works by artists of secondary professional rank, in the nature of "landscapes with figures," or of that not easily classified order in which the subject counts for something, and the background, scenery, or general object-painting, for quite as much. This shows a pleasing diffusion, if not a fertile concentration, of artistic aptitude and working faculty. Without further preliminary, we shall proceed to treat of the works according to their several classes of subject-matter.

Sacred Pictures. Diligent research brings to light a few performances of this order; not one that could, even by the voice of flattery, be assigned to those higher regions of thought and aspiration in which alone does religious art become vital. Perhaps Mr. Armitage is entitled to the foremost place, in virtue of his picture, *The Cities of the Plain*; and even this is but a rocky and spacious landscape, with a conflagration in the middle distance, and an Arab sheikh with uplifted hands in the foreground. Sodom burns in front, on the margin of the Dead Sea, Gomorrah nearly out of the canvas to the left, both so far off as to produce almost a toy-like visual effect. The sky is blue and uniform: we see nothing of the fire and brimstone which the Lord rained out of heaven—the case looks more like one of spontaneous combustion. The artist has aimed to convey a sense of vast height overlooking a vast space: this he renders to the eye fairly enough, but does not stamp it deep at once into the imagination. After this, we find no sacred subject worthy of more commendation than the *Dives and Lazarus* of Miss Thornycroft; a composition arranged with some pictorial delicacy and success. Lazarus appears to be stiffening in his final agony at the foot of the steps of the columned summerhouse in which Dives, a young and handsome epicure, is feasting with his guests. In the upper section of the picture a red tint predominates—a whitish one in the lower. Mr. Andrew MacCallum's *Dream of Ancient Egypt, the Morning of the Exodus*, is hardly to be counted as belonging to the sacred art: it is a striking panoramic tableau—more than a mere architectural landscape, and less than a chapter of biblical history. Mr. Herbert sends two Scriptural pictures, both of them wanting in energy and style: they would serve as religious prints for Sunday School monitors. The better

of the two is *David, the future King of Israel, while a Shepherd at Bethlehem*. He harps in the soft and vivid moonlight, folding a number of conscientious-looking sheep, with which a lion, which peers over the stone fence, does not venture to interfere. The lunar effect is the most approvable thing here. *Joseph making himself known to his Brethren*, by Mr. Wynfield, is a fair but not a good specimen of the Biblical-oriental style: the like may, by straining a point, be said of Mr. Goodall's *Daughters of Laban*. Were we to go further, we should come to Mr. Haynes and Mr. Hart: but we will not go further.

Historic and Poetic Subjects. The one picture which redeems this section out of mediocrity, and which gives indeed a certain prestige to the whole exhibition, is *The Princes in the Tower*, by Mr. Millais: in saying this we intend no disparagement to some other good exhibitors, such as Mr. Leighton and Mr. Yeames, but they would scarcely avail for the same purpose. Even *The Princes in the Tower* looks at first a rather trifling affair—it carries simplicity of treatment to the verge of bareness: but the simplicity is so masterly, the sentiment so natural and touching, the whole thing comes so much home to one as one gazes, that no room and no inclination for critical dissent remain at last: we should, however, enter a word of protest against the negligent painting of Edward's left hand, holding his velvet cap. What we see can be very briefly specified. A brown stone staircase and wall; a light falling on the wall to left of the staircase, and hereon the shadow of a man, with the angle of the elbow defined—the warder, or rather, we surmise, the coming assassin; the two young princes stand pausing on the wider stair which leads down towards their apartment. The boy-king looks towards our right, his mouth slightly open, with an air of apprehension—the atmosphere of his approaching doom closes round him chill and thick. His right hand is held by the left of the other prince, who reaches his own right round to Edward's right shoulder, and looks out with a half-frown of disquiet, his lips firmly compressed. With vague anxiety they cling together in life, as they are so soon to abide unsevered in death. Besides the brown hues of the background, the rest is made up of the mourning black of the orphaned boys, set off with a little gold, and their fair flesh tints, and pale yet full-tinted profusion of yellow hair. There is absolutely no accessory, except two shreds of straw upon the principal stair. Such are the simple means by which the author produces his tragic impression: he hardly tells a story, indeed, but he strikes pathetically the chord of innocence and doom.

Mr. Leighton sends two principal pictures; one the more important in scale, the other from its classical association. The first is named *Winding the Skein*, and represents a woman and a child, on their white housetop in one of the Greek islands. Mr. Leighton works in an elevated region which would always be that of the beautiful if it were not sometimes that of the pretty; we hesitate to pronounce in the present case, but incline to say that the pretty predominates. At any rate there is a luscious smoothness, a cloying sweetness, a monotony of blandishment, which makes us almost long for a little intrusion of the acrid and the harsh. The woman is of large mould in the prime of maturity, her ample bust covered in white drapery; she holds an orange woollen thread lax over her two hands. The child is a girl of some ten years of age, with more roundness of contour than one frequently finds at such a period; she winds off the thread into a ball, and has already thus disposed of some other threads which lie on the roof-platform to the right. The background is bold and striking in its constituent parts—sea, and arid rocks, and whitish marbled sky. An elegant point in the composition is the contrasted foreshortening of the arms—the woman's right arm coming forward to

the eye, matched against the girl's left arm backward. The pose of the woman's naked feet also has been managed with a delicate sense of how to avoid commonplace—the right foot tilted up from the toes, the left foot advanced round the right heel, and its toes contracted against the ground. Mr. Leighton's other picture, *Nausicaa*, shows the princess standing within a porch, her right hand touching the chin and under lip, her left raised in wistful laxity along the white column. The small rounded head is in a yellowish kerchief; the complexion is of a golden brown; the type of face unites with the classical something of a Raphaellesque Madonna. The draperies are of sage green and white, the skirt, which droops rather stiffly over the small feet, occupying a large space in the canvas. All here is done with great refinement; and the simplicity, though not without its spice of artifice, remains within the limits of gracious art. Mr. Yeames this year is as much bent on sturdy realism as Mr. Leighton on delicacy of ideal. He takes as the subject of his large picture "Commissioners and soldiers of the Long Parliament in a manor house, questioning the inmates as to the whereabouts of the Royalists;" and his title consists of the query, "And when did you last see your Father?" This query is addressed to a small boy in sky-blue mounted on a stool, his hands behind his back: the questioner is a subtle man, with an ill-favoured smile which could become decidedly grim on occasion. Four other Parliamentarians are about the table with him, all well discriminated in character; one is bringing in a coffer, the contents of which may prove of moment. To the left are three guards; then two anxious ladies, indignant and heartsick; a girl, just older than her boy-brother, rubs her fingers into her tearful eyes; she is in charge of a stalwart halberdier. Throughout the whole assemblage there is a serious silent look: ominous resoluteness on one side grappling with unflinching obstruction on the other. This able, broadly-treated, and very interesting picture will certainly place Mr. Yeames higher in public and professional estimation than he had ever yet stood. The least satisfactory point is the boy's face, which has a soapy sort of look, and (what should hardly perhaps be objected to) an undefined expression: it might be well for the artist to try his hand on this again. We suspect that the little fellow is telling a filial lie, of bulk and downrightness adequate to the circumstances.

Like Mr. Yeames, Mr. Calderon has gone for a subject to the period of our Civil War. He represents (without any title in the catalogue) the removal of two nuns from the Convent at Loughboro', at the urgent suggestion of Cromwell, as conveyed in a letter addressed to Mr. Squire at Fotheringhay. Cromwell was commissioned to demolish the convent, and he begged Squire to get out of the way, ere the moment came, that gentleman's cousin Mary, and a Miss Andrews; for, as he wrote—"I like no war on women, prevail on all to go if you can." The picture shows the two young ladies, in their monastic habit of flannel with black and white head-gear, placed in the cart which a bluff young Parliamentarian soldier is driving. They are taking their agitated adieu of the abbess: one holds her hand, and the other utters some hurried exclamations. Three more nuns are in the doorway, one young, and saintly in her sorrowful resignation: they will not be "prevailed on to go"—not at all events as yet. The cart, with its back facing us, stands in the archway, well placed for the purposes of the picture, but the two horses make rather less show than might be appropriate: the green country and a mansion lie beyond. There is no parade or overdoing in the work—rather an evident purpose of simplicity, and earnest but wholly natural feeling: it does not strongly impress us, but has merits of an incontestable kind. *Ready*, by Sir John Gilbert, is one of his wonted pieces of splendid *bravura*—a band of horsemen of the time

of our Henry VIII. about to advance in the battle—pennants, and spears, and horses' manes. Here is no deficiency: all that the artist's conception of the subject requires, and most of what pertains to the subject in itself, is given with profusion: the multiform but indistinct nebulosity of the sky may perhaps be carried rather too far. Another soldiering picture, of a widely different period of history and accoutrement, is that of Mr. Crofts—*Wellington's March from Quatre Bras to Waterloo*: and here again little is left to be desired, all being treated with extreme good sense, steadiness, and efficiency. The thing most in default is subject-matter. It may be wholly true (Siborne, as quoted in the catalogue, vouches for it) that "the manner in which the Duke of Wellington withdrew his army from the position of Quatre Bras to the one of Waterloo must ever render that retreat a perfect model of operations of this nature performed in the immediate presence of a powerful enemy;" but of this military science the picture can exhibit nothing. All that we see is Wellington, mounted on his bay charger which paces right forwards out of the canvas, raising his cocked hat to the vigorously cheering Guardsmen on their greys, and a detachment of the army on its march, with a score or more of French prisoners; rain falls persistently over the clayey and soppy road. The most noticeable points of character are in the visages and actions of the prisoners. Mr. Andrew Gow's subjects are *News from the Front*—three invalided soldiers of the first Napoleon, reading the *Gazette de France*—and *A War-Despatch at the Hôtel de Ville*, in the time of the great French Revolution, to which we have before referred. Both are sound works, ably painted, with plenty of individuality. We cannot but regret, however, that Mr. Gow gives so selfish, calculating, and prosaic an air to his personages, in this incident of national patriotic excitement; the French Revolution was not the work of a bureaucratic plutocracy. [We take this opportunity of apologising to Mr. Gow for an error of printing in a notice of his last-exhibited water-colour, which was thus termed a "well-studied though roughly-treated picture." The fact is that we wrote "thoroughly-treated"; to call the work "roughly-treated" would have been not only unfair, but absolutely absurd.] *Zenobia Captive* is the sole subject-picture contributed by Mr. Poynter. This is a half-figure of a beautiful woman composed, not dejected, into sadness, in the prime of life—say thirty-three, which we presume (but history does not appear to settle the point with any exactness) to have been less than the actual age of the Palmyrenian queen when she stood, robed and jewelled, to grace the triumph of Aurelian. She wears a great diadem, heavy with gold and turquoises; some of the emblems hereon are of a pagan character, others seemingly Christian; but perhaps we should understand the haloed figures to represent deified emperors. The fingers of Zenobia's left hand toy with the gold fetter which serves as a necklet, and gold enchains her wrist and upper arm. Her face is more Greek than Oriental, which may be appropriate, as Zenobia claimed descent from the Macedonian kings of Egypt. She is weighted down with the pompous mockery of her adornments; and this justifies perhaps the appearance, detracting somewhat from her beauty and stateliness, of her having less than due length of neck. The background is of varicoloured marbles, green and grey. The calibre of this picture hardly rises into epic or heroic dignity; but Mr. Poynter was sure to make it excellent as far as it goes, both in essentials and in details, and he has not failed to do so. We cannot speak with equal praise of another of our more elevated painters, Mr. Watts. His *Britomart and her Nurse*, with figures of warriors appearing on the magic mirror behind, appears to us to be a piece of perfunctory and uninspired idealism: a certain vividness of conception was in the painter's mind at first, but, in its evolution on the canvas, it has lingered and faltered, until we

have at last as the result something which is neither poetry nor sound sense and self-consistency. Mr. Halswelle, undismayed by the rivalry of so conspicuous a master as Maclise, has undertaken to paint on a large scale *The Play-scene in Hamlet*, and has certainly put into his work a great deal of expression, picturesqueness, and aptitude for arrangement, especially as regards the lighting. The costumes are Danish, of an archaic period; which, however correct from one point of view in chronology, can hardly be made to harmonise with such a matter as the theatric display. The most serious defect in the picture is the violent demonstrativeness of the conscience-stricken and up-starting king: there are also two gleaming highlights in Hamlet's eyes which vulgarise the face, and throughout the picture too many differing colours appear, in costume and what not.

We will now go along the walls nearly in the order of the catalogue, picking up such other pictures, of the historic or poetic class, as seem to deserve specification.

Calthrop, *Meeting of Scottish Jacobites*. "In 1740 seven daring Scottish Jacobites signed an association engaging themselves to risk their lives and fortunes for the restoration of the Stuart family." One of the confederates is in the act of signing: the rest, with a single exception, are seated; the door opens slightly, and a hound is on the alert to watch it: a sensible and efficient realisation of a theme not peculiarly well adapted for pictorial treatment. Busk, *Psyche*; scared, as she hears her name called in the Palace of Love; the face lacks youthfulness, and is therefore far from being entirely successful—in other respects, adequate pains have been taken with a creditable result. Linton, *Biron*; a small half-figure, in armour and silk, cleverly painted: we hardly know why this grand seigneur, however culpable he may have been in a political sense, should be represented with a visage almost befitting a coalheaver. Swan, *Dante and the Leopard*; moderately good: Dante, who ought to be shown precisely at the age of thirty-five, looks a good deal too old; the best point is the half-fawning savagery of the "fera alla gaietta pelle." Poole, *Smithfield, the Morning after the Burning of Anne Acute for Heresy—looking for Relics*. This subject does not make a picture—not at any rate as treated by Mr. Poole. We see the stake, the pulpit-box in which a sermon had been preached, and some other adjuncts of the recent execution; then a young woman who has set her lantern on the ground, an old woman, a sleeping vagrant, and a friar (perhaps the renegade preacher Shaxton) spying for purposes of delation; also a miscellany of brown, green, and yellow tints which constitute the colour-scheme. No great amount of skill has been expended upon these materials. Mr. Poole's other picture is named *Solitude*, with a quotation from Shelley's *Alastor*; the picture, however, has no real relation either to that or to any other passage in the poem. The Post-hero of *Alastor* appears to be asleep on a scooped rock amid the sea, the moon coming just behind his profile. He is all brown, like a figure modelled in fresh clay; an owl has perched on his shallop. We cannot discern either sense, illustrative appositeness, or art, in this laxly-handled performance. It is remarkable that this year there should be two pictures taken from Shelley, and both from *Alastor*. The second is by Mr. G. Wilson—*The Quest*. Here the Poet is making way through a tangled thicket, his aspect attenuated and woebegone. This also does not appear to have much direct relation to any passage in the poem, and the picture bears obvious signs of immaturity; it is, however, by no means wanting in poetic suggestiveness, is quite the reverse of commonplace, and argues well of the capacity and future of its author. Pettie, *A Member of the Long Parliament*; a very vigorously-handled head of an unprepossessing man—cross-grained, self-opinioned, prompt with the argument of the pulpit or the musket. E. Bell,

Mariana; a life-sized full-length figure, having unity of impression. Rooke, *Death of Ahab*. The King of Israel, mortally wounded, is still in the thick of the battle, standing in his chariot. The figures are numerous, with adequate diversity of action, but movement and energy are deficient. Much curious matter of archaeology, in the way of horse-trappings, equipage of war, &c., has been introduced; indeed, we infer that the picture was undertaken mainly for this object, as it is difficult to think that any painter—especially one who seems to have so little vocation for battle-painting—would for any other purpose go back to so remote an event as the defeat and death of so obsolete a potentate as Ahab. Waterhouse, *The Remorse of Nero after the Death of his Mother*. Were it not for the fact that Nero is not in the least like the type of that emperor which has been transmitted by antiquity to modern times, this would be a well-considered picture. The matricide, with his head between his hands, clad in the imperial purple, is lying prone on a couch, haggard and restless: his face has perturbation without sensibility. Lucas, *An Ambuscade, Edgely*. A troop of improvised but mettlesome Royalist soldiers is advancing along a country road, when puffs of smoke come out of the standing corn, and one of the band drops back mortally wounded. A spirited work, with much decision and facility of execution; it belongs, however, too clearly to what may be called the "buff-jerkin" style; and Mr. Lucas seems to have no preference for good-looking people over ugly ones—rather the contrary. Armitage, *Pygmalion's Galatea*. This is the same subject which we saw lately at the Water-Colour Institute treated by Mr. Tenniel, and the main element of treatment is the same—the flush of life spreading over the statue, but not yet reaching the extremities. Like Mr. Tenniel, Mr. Armitage has handled his arduous theme with considerable propriety and success, stopping short of a genuinely poetical impression, which would alone be the full justification of such an attempt. Fyfe, *The Raid of Ruthven: an Incident in the Life of James VI. of Scotland*. A long quotation is supplied in the catalogue, as needed to show what the picture is about; the gist of it being that the boy-king, finding himself among a company of hostile nobles, attempted to leave the room, and was prevented by the Tutor of Glamis, who set his back against the door, saying to the flurried child, "Better bairns weep than bearded men." This is the sort of subject from Scotch history which a Scotch artist may be expected to paint, but which other people cannot see much in—it does not explain itself well, and, when explained in words, does not furnish much material for a picture: in especial, the colloquy of noblemen to the right has little or no significance to the eye. The merits of the work are decision, solidity, and fairly good flesh-painting: the chief defect is the tawdry diversity of colours in the costumes—they look like the doing of a theatrical costumier. Weguelin, *The Labour of the Danaids*. Without being conspicuously good, this is certainly one of the better poetical or classical subjects in the exhibition. In the centre of the picture stands a great copper-brown jar, which receives the contents of the pitchers of the Danaids, and lets them out again through a big hole below the level of the stand on which the jar rests: hence the water runs down in a profuse jet. The doomed women are restlessly at their task, coming and going: only one face is particularly prominent, jaded and drained of thought by the pauseless repetition. The colour has a neutral tendency, conformable to the sentiment of the subject; but this neutralism is not such as to indicate want of colourist faculty, were he minded to exercise it, on the artist's part.

We will name in conclusion a few works, of some importance in subject or treatment, which we cannot find space to criticise or describe:—Holyoake, *Richard Savage*; Bedford, *Fair Margaret*; O'Neil, *Loch Leven, A.D. 1568*; Charles

Gregory, *The Conversion of Ancient Britons*; Beavis, *Hall of Prince Charles Edward on the Banks of the Nairne after the Battle of Culloden*; Christie, *Introduction of Christianity into Britain, Christian Missionaries interrupting a Human Sacrifice*. W. M. ROSETTI.

EXHIBITION OF DRAWINGS BY DUTCH MASTERS AT THE BURLINGTON FINE ARTS CLUB.

(Second Notice.)

THE works by Ostade and Dusart, with a careful drawing by Nicolas Maas of a young mother seated by the fire with her infant on her knees, a work curiously modern in sentiment; another assigned to F. van Mieris, of a woman watching her fat baby asleep in its cradle, a highly-finished black chalk drawing on vellum; a peasant seated on a tub and looking at the contents of a small bottle, the only drawing in the collection assigned to Jan Steen, are the only works that call for remark among the *genre* subjects at the Burlington Club—indeed, there are but few others, for those given to Netscher are unremarkable, and the one bestowed upon Gerard Dow it is a charity to pass over. Nor is there much in the way of portrait to claim notice, except a study of a young man playing a lute, by Govaert Flinck (No. 43), finely executed in black chalk on grey paper, and a delightful and highly-finished portrait of a sedate young lady of eleven, by Jacob de Bray.

Turning then to the landscapists, we come first to Van Goyen, the father-in-law of Jan Steen and Ostade, whom one is always inclined to regard as belonging to an earlier time, though in reality he was only ten years older than Rembrandt. By him we have a large finished crayon drawing—a view of Leyden—(No. 1), with a busy scene of boats and masts in the mid distance; and (No. 2) a pretty, quiet river view with a church on the banks and river grasses in the shallows of the foreground, both drawn with care and precision, and the first showing even thus early the decided mastery of the Dutch school, though Roghman, who comes next, being born a year later, is far less advanced. His landscapes are more conventional in style, and he draws his lines and uses his bistre wash heavily. Peter Saenredam is represented by a street scene full of quaint Dutch figures, and Henri Van Avercamp, of taciturn memory, by a slight pen drawing tinted in colours, which is remarkable as being somewhat like a modern French work in style and sentiment. Peter Moleyn, or de Molyn, who was born in London some time before 1600, has two small drawings which show him to have been a good draughtsman, and then comes the great Albert Cuyp, who, however, is not well represented, the four drawings by him, although two of them are lent by Mr. Malcolm of Pottaloch, being by no means satisfactory when we remember the beauty of the rich moist pastures and hazy afternoon sunlight of his pictures. Such effects, of course, could scarcely be conveyed by mere tints, but in other respects also they lack the true Cuyp charm, and might more safely, we should think, be attributed to the father, Jacob Gerritz, a man of considerable attainment, than to his better-known son.

Rembrandt is placed "alone with his glory" on a wall to himself. He is the key-note as it were to the whole exhibition, though the splendid water-colours by Ostade form the chief interest. Of these eleven works, several are of the highest quality, and will doubtless call forth the enthusiasm of amateurs. We may mention especially a wonderful little drawing in sepia of a winter scene in Holland (No. 21)—an expanse of bleak open country, with just a cottage and some leafless trees in the foreground—drawn with a knowledge and skill that leave no doubt as to the master, though they cast a doubt on some of the other works assigned to him. Another most masterly drawing is that of a man paying rent to a receiver and his clerk. It is one of the finest

in the whole collection, and yet somehow it seems to lack the peculiar individuality of Rembrandt's style and touch. The types also are more like those chosen by Terburg.

The next master of note after Rembrandt is Jan Lievens, by whom we have a portrait of Jan le Heem, the original drawing for the print by Pontius; then comes the dominating Ostade, and then poor mistaken Jan Both, with three dreary (italianised) landscapes. Reiner Zeeman, the worthy forerunner of the great sea-painters, is seen in a clever study of masts and rigging, called *A Calm, with a large Ship at Anchor*, and a carefully executed drawing of a man-of-war under repair, intended, it is stated, as a frontispiece for a contemplated set of etchings. By Philip de Koningh there is a small flat landscape (No. 47), which is in every respect so admirable that it is surprising it has not been made to pass as Rembrandt's. Wouvermans is only seen to advantage in one out of the four works assigned to him. This is a small group of men, horses, and dogs (No. 51), which is quite a little gem in its way, but the large black chalk drawing of the *Adoration of the Shepherds* (No. 49), a sprawling composition, in which the figures seem to be playing at hide-and-seek rather than celebrating a sacred event, one would kindly wish to believe was a sin that might be laid to the charge of some pupil rather than to the master himself, who surely has enough to answer for in his own incongruities without being made responsible for all his vacuous imitators. A scene of the like composite order, called a *Scriptural or Pastoral Subject*, for its meaning is not clear, represents Gerbrandt van Eckhout, of whom we might have expected better things, seeing that he was one of Rembrandt's immediate pupils; and then we come to Nicholas Berghem, who is seen at his best in seven graceful drawings, one of them (No. 67) being a highly-finished work in water-colour of great repute, lent by Mr. Malcolm; then to Paul Potter, with three sketches of cattle; to Ludolf Backhuysen, who gives us five fine breezy sea pieces; to Van de Velde, who besides squalls gives us calms, and also an effective view of a forest of tall masts called the *Sea Face of Amsterdam* (No. 87); to Jacob Ruysdael, with four finished pencil drawings of trees and cottages such as Crome afterwards delighted in; to Jan Vander Heyden, with of course a fire-engine prominent in his work, which represents the burning of some large building with a great concourse of people looking on, the whole most elaborately drawn and finished; and then, passing by many pleasing and interesting works, to Jan Dubbels, a delightful master, less known than he deserves, who is represented here by a charming sea-shore view (No. 127), conceived with truth, and yet with an eye to picturesque effect, and executed with a rapid and entirely skilful hand. After Dubbels, who brings us down into the eighteenth century, we arrive at Jacob Oats, not the beloved "Father Oats," the proverbial philosopher of Old Flanders, but a Dutch master, stated to have been born in 1741 and to have died in 1799; he is represented by a rather clever drawing of a fair on the ice in Holland, and by an inferior landscape, feebly executed in water-colours. He is the last Dutch master whom we need notice, though there are several others here who carried on the traditions of their school for some years longer.

Where so much is given it seems unthankful to complain at what is left out, but it is impossible to help regretting the absence of many masters in whose paintings we are accustomed to take delight, such, for instance, as the genial Jan Steen, who, if seen at all, is only seen in an unremarkable little sketch; the brilliant De Hoogh, Gerard Dow, the supreme master of Litterness; the careful Metsu, and the "genteel" Terburg. All these, and many others whom we miss, must have made sketches; and although the Committee of the Burlington Club have not apparently found it possible to exhibit any we should be sorry to

"fear," with Mr. Wedmore, that this was because "these flying sheets were dust and refuse two hundred years ago." MARY M. HEATON.

THE EXHIBITION OF THE SOCIETY OF PAINTERS IN WATER-COLOURS.

THE Old Water-colour Society's Exhibition this year is a little less melancholy than usual. Of course there is the same profusion of mild sea-pieces and bloomy landscapes, simpering rustic figures and boisterous battle-fields, but it is possible to pass them by, and to take pleasure in a few things more serious and more capable. More of the members contribute, too, than often in past years, Mr. Holman Hunt, unfortunately, preserving his persistent retirement. Three important contributors, Mr. Alma Tadema, Mr. Henry Wallis, and Mr. Henry Moore, contrive to do themselves less than justice. To counterbalance this, on the other hand, two shy and much-valued members, Mr. Boyce and Mr. Alfred Hunt, send a number of very charming things. The picture of the Exhibition, however, let us say at once, is Mr. Carl Haag's magnificent work, *An Ancestor* (72), which hangs in the place of honour, and thoroughly deserves it. This represents an ancient British warrior—a ruddy, red-bearded athlete of almost gigantic proportions—standing with a fine expression of nonchalance on the steps of a temple, while in the background flare the towers of a Roman city. He grasps his battle-axe by the blade in his right hand while his left does not stray too far from the cross-hilted dagger hanging at his girdle. His forehead is adorned with two immense bullock's horns, between which peeps the fox-skin covering of his head; round each arm curls the golden snake that marks his chieftainship. The painting of this work is superb, as powerful as anything we have seen from Mr. Haag's hand. Its companion, *A Young Druidess* (129), is much inferior to it in force.

In reviewing the rest of the gallery we will adopt the plan of following the catalogue. *An English Home in Algiers* (66) exhibits Mr. North in the dreamy, misty style which has begun to be a mannerism with him: a girl lounges in a neglected garden overflowed with blossoming convolvulus, dog-rose, and dandelion. In *Lady Macbeth* (90), Mr. A. H. Marsh, an idyllic painter of very high talent, has chosen a subject unsuited to his powers. Mr. Boyce has painted *The Saxon Church at Bradford-on-Avon* (118) most conscientiously, but the result is a little uninteresting. *Low Tide at Whitby* (130), an exquisite effect of sunset on an iron coast, is, like *A Creek in Whitby Harbour* (242), a study for a large work of Mr. Alfred Hunt which represents his very delicate and poetical genius at its best. *A New Purchase* (121) is one of Mr. Birket Foster's most successful drawings: a connoisseur unpacks, in a room crowded with rarities in *virtù*, a precious blue-and-white bowl, which he holds up reverently against the light. Mr. W. Matthew Hale displays advanced feeling for the force of landscape this year; his *Lonely Moor* (151) is an exceedingly clever expression of the weight and solidity of colour in a Cumberland brae-side. The *When Love was Young* (159), by Mr. E. F. Brewtnall, like all the work of this artist, shows thought and a desire for genuine excellence, but in its presentation of a rose-pink nymph piped to by a dandified shepherd, does not attain a very high ideal; in the painting, moreover, there is something clumsy. Miss Clara Montalba, we are sorry to see, is decidedly more commonplace and less forcible than usual this year. Her *The Molo, Venice* (166) does not pass skilful mediocrity; it will be sad indeed if so very promising an artist should fall into apathy and be content to look at nature with conventional eyes. Mr. Clarence Whitehead has a capital subject in *Thürmere* (185), but his execution of it is rather poor. Mr. Lockhart gives us a sharply-drawn and clever study of rig-

ging in *Leith Docks* (197). Another painter who seems to be in a dangerous position is Mr. Arthur Hopkins, who has done some good things, and whose *Boy's Paradise* (208), a group of urchins bathing off a wrecked boat in a creek, is very carefully drawn, but excessively morbid in colour. The exhibition on the walls ends with what to our mind is the gem of the collection, *Shrimpers* (215), by Mr. A. H. Marsh, two girls with nets, and dressed in soft blue garments, stained green by the sea, who pass rapidly over the shining spaces of a great expanse of sand. The eye rests with complete satisfaction on the colour and light of this charming little work. On the screens, Mrs. Allingham appears with a crowd of little sketches, some of them too slight to inflict upon the public, but one, *A Bucket of Water* (229), in which a woman at Lynmouth, in black, with a yellow scarf across her shoulders, rises from the shore up a steep flight of steps, which is thoroughly delightful in feeling and adequate in execution. Mr. Alma Tadema's *Silent Counsellor* (225) is a marble sphynx, of whom a roguish boy, extended full length upon the bench of which his counsellor forms the end, asks advice in some doubtful matter of love or war. The idea is extremely happy, the composition perfect, but the sea behind seems harshly blue, and the drawing has not Mr. Alma Tadema's accustomed delicacy of atmosphere. Mr. Tom Lloyd is delightful in the flowery wilderness of his *Cottage Garden* (236), and Mr. Boyce most admirable in the freshness and careful drawing of his green *Valley of the Avon* (263). Mr. North's dreamy and poetical landscape, eccentrically named *The Cotter's Saturday Night*, is remarkable for the singular effect given by the small dark figure against a background of mist.

SIGNOR LUPARINI'S NEW PROCESS OF CLEANING PICTURES.

THIS new method is exciting much discussion in Italy among artists, picture-cleaners and dealers as well as in society and even in Parliament. It has been reported upon by a selected body of artists and picture-cleaners, some of whom are in favour of it, some opposed to it, and others doubtful. In Italy for a long period proprietors of pictures of every class, including the State represented by its chosen officials, the clergy, artists and picture-restorers, have worked together to injure, and in too many cases to destroy, instead of to preserve the works of the great masters of painting. In former times picture-restorers, for paltry professional gains, scoured, repainted, and varnished with coarse varnishes, frequently mixed with asphaltum or some other brown, many of the noblest treasures which Italy possesses, totally altering the original tone and appearance of these works, and frequently covering the surfaces with heavy opaque repainting so as almost entirely to hide the original. Those who live by repainting old pictures must naturally object to a process which rapidly obliterates all modern work, as well as dealers who sell pictures in a great measure repainted; and even those who conscientiously believe that all works of art are improved and mellowed by time must, however unreasonably, object to any process which professes to restore an old picture, if intact beneath the coating of modern handiwork, to the state in which it was when it stood last on its creator's easel.

The Report of any Commission, if partly composed of Italian *fabbricatori*, must be received with grave doubt. There is also an objection to it on the other side, and that is that, as the inventor has not revealed the nature of the process, the reporters are ignorant of it. They have consulted chemists, who state in reply that the mixture contains nothing injurious; but this statement is of little value in the face of the fact that it in an unprecedentedly short space of time dissolves the varnishes and repaintings and reaches the original

surface; what, then, is to prevent it from sweeping away the original glazings if they have escaped the first cleaners? It may be asked what is to prevent so strong a solvent from removing even the original solid paint? Its inventor says that it will not, that the safety of the original glazings must depend upon the judgment of the person using it, and it may therefore reasonably be inferred that so must the preservation of the solid paint. But in the hands of a restorer who is not an artist it must be a dangerous agent.

Three pictures have been submitted to the process in Florence, two of which were in the magazines of the Uffizzi, while the third hung in the Pitti gallery. Two of these especially were in a dreadful state, and there can be no question as to the perfect manner in which the new agent has evenly swept away brown varnish, accumulated dirt and repaint. On seeing the pictures we ask why they have been so covered up and hidden with such impurities; can it be that the number of fine pictures by the greatest masters in both galleries, leathery with yellow varnish, obviously extensively retouched and deplorably injured, are after all in excellent order under this misapplied covering?

The picture by Andrea del Sarto in the Pitti, which has been cleaned, holds out a hope that many other precious works would be found to be comparatively intact under the veils which now hide their beauties from us. It is a half-length, less than life, of a Tuscan peasant boy, as St. John the Baptist, naked to below the waist. This picture was obscured with dirt and repaint. The drawing and expression of the countenance had been deliberately altered, the pectorals marked in with dark touches destructive of their form, the fur mantle smudged over, a red drapery reduced to a dark brown, a cup in the youthful prophet's hand nearly obliterated, and the background streaked in parallel lines of dark oil-paint, hiding it altogether.

The countenance is now restored to its original beauty of form and feature, and the hair of the head is especially noteworthy for its grace and the refinement with which it is painted. The body, arms and hands are literally intact, as exquisite in painting, as pure and brilliant, as when first executed. The fur mantle is finished like a skin painted by Landseer; the red drapery is beautiful in colour and *chiaroscuro*; the cup, like every other part of the picture, is excellent; and the background consists of well-painted masses of rock, charming in tone and full of repose, as their position in the picture requires. We see the painting of Andrea del Sarto under a totally new aspect, but with all this evidence of power, of grace, of brilliancy, we are startled by a certain coldness especially in the shadows; and as we look at his other works in the same gallery, their lustre dimmed by ignorant hands, we ask ourselves whether, so long accustomed to the yellow tone of the pictures around us, we are fit judges of this one from which such a mass of superimposed filth has been swept away. Taken as it is, with its apparent coldness, it is perfect. It is Andrea's work, and his only. My impression is that we see it now as it stood on his easel before he added those delicate glazings necessary to its mellowness of tone. In closely examining the beautiful picture, it is hardly possible to doubt that it must have been finished with such glazings; but their removal is probably due to the maltreatment previously received, to reckless scouring which the new process clearly proves was not in any way necessitated by the actual state of the picture, as well as to the repainting, which was equally unjustifiable.

The question of the preservation of glazings under this new process is one of vital importance, in relation especially to Venetian and Flemish pictures. So various are the methods of painting of the old masters that no one particular process will avail for universal use. We must condemn much bad work done in Italy, but it would be unjust to omit acknowledging that, taught by the errors of the past, there are now skilful and con-

scientious cleaners in that country with a profound knowledge of old art. Among these Signor Mazzanti takes the first place, and he stands deservedly high as a judge of art. He also has his secret; and, having seen his process in operation, my impression is that it is safer far than that of Signor Luparini, while his technical knowledge of the processes of the old masters enables him to stop precisely at the right moment. I have lately seen two pictures, apparently in a very bad state, cleaned by Signor Mazzanti's method. He removed several coats of dark varnish, and at last reached the original varnish, under which the painting was found intact. It is now found to be enough to polish this with chamois leather, and it is hoped that it will not be necessary to revarnish the pictures at all. He has also cleaned by his process a work of Mariotti Albertinelli, which is now evidently as pure as when first painted. The official picture-cleaner at the Uffizzi may also be alluded to, as a sound judge of art, as very conscientious, and not given to repaint. It may be difficult to prevent private proprietors from having their pictures "put in order" with the rest of their furniture by unskilful hands, but in public galleries it would be fortunate if it were recognised that it is better to exhibit the fragments of a great master's work than to restore the picture in the manner formerly done. If only fragments remain, by all means let us have these rather than repaint. The famous *Madonna della Sediola* would be still more precious if freed from the modern stippings on its surface applied by a restorer of special incapacity, and so would it be with many another fine work of old art. Even frescoes have not escaped the dauber's profane hands, but have been stipped all over. Their restoration to the original surface is unhappily hopeless. I take this opportunity of stating that a primary cause of the deterioration of modern frescoes arises from the habit of all plasterers to polish the surface of the intonaco with a wooden instrument, with which they rub it smooth after wetting it by throwing water at it with a large brush. The surface thus obtained will certainly come away when painted. Intonaco for fresco painting must be finished with the trowel.

CHARLES HEATH WILSON.

ART SALES.

THERE were sold last Saturday by Messrs. Christie, Manson and Woods the collection of modern pictures—nearly all of them cabinet pictures—which had belonged to the late Mr. F. T. Turner, of The Cedars, Clapham Common; a collection of modern works belonging to Mr. Brogden, M.P.; and two important oil-pictures by J. M. W. Turner. The collection from Clapham Common contained works by W. P. Frith, R.A.; J. E. Millais, R.A.; the late John Philip; the late Clarkson Stanfield; T. Faed; J. O. Hook, and the late Sir Edwin Landseer. The picture of *Boats fouling entering a Harbour on the Zuyder Zee*, by Clarkson Stanfield—one of his worthiest productions—realised 1,400 guineas. The *Highland Nurses* of Sir Edwin Landseer was knocked down for 1,600 guineas. It is engraved by Thomas Landseer. The collection in all realised nearly twenty-seven thousand pounds. The two works by Turner, *Going to the Ball*, and *Returning from the Ball, San Martino, Venice*—examples of his later work, and exhibited in 1846—sold for 1,200 guineas each.

EARLIER in the week, Messrs. Christie, Manson and Woods had sold the first portion of the collection of Mr. John Heugh. It included proofs after Sir Joshua Reynolds, and a few etchings by Rembrandt, of which two or three were from the great Hume Collection, but consisted chiefly of a large number of impressions of the *Liber Studiorum* of Turner. There were the pure etchings in numbers unusual for such rarities; some rare unpublished proofs with the added work in mezzotint in various stages of completion; a few fine impressions of finished plates, and many very in-

different or poor impressions, of which the artistic value is almost nothing and the money value rightly very slight. We append only a few prices as generally indicative of the sums obtained. *Peat Bog*, the etching and the print, 7l. 10s.; *Jason*, etching and print, 8l. 6s.; *La Grande Chartreuse*, 5l.; *St. Gothard*, a fine first state and etching, 12l. 10s.; *Inverary Castle*, an engraver's proof and an impression of the finished plate, 19l.; *Basle*, engraver's proof and etching, 12l.; *Greenwich*, engraver's proof and etching, 13l.; *Little Devil's Bridge*, engraver's proof and etching, 23l.; the *Egremont Sea Piece*, proof and etching, 14l.; *Ben Arthur*, first published state, 15l. 15s.; the *Falls of the Clyde*, two engraver's proofs, one of which was particularly fine, 19l. 19s.; *Dumbarton Castle*, an engraver's proof of the unpublished plate, 20l.; the *Lock and Mill*, an engraver's proof much painted upon by the artist, 52l. 10s. Some of these impressions, but not always the finest of them, had belonged to Charles Turner, the mezzotint engraver.

On the 3rd inst. Messrs. Sotheby, Wilkinson and Hodge sold a few interesting coins and medals collected by Captain Telfer, R.N. Among them may be noted two rare lots from the Schultheiss-Rechberg collection—a Testoon of Mary Queen of Scots, after the death of Francis, 1561, and a Bonnet Piece of James V., 1540; these went for 3l. 16s. and 5l. 5s. respectively. A silver As, Head of Bacchus, full-face IP., rev. Wolf-dog lying curled up, ATR., 2l. 16s.; the Restoration Medal of Charles II., by Roettier, 4l.; a Medal of Louis XIV., Pacificator, 2l. 3s.; of John Frederick, Elector of Saxony, by Rietz, 3l.; of Charles V., by Rietz, 3l. 5s. (a similar one at South Kensington cost 24l. 10s.); of Hedwig, Duchess of Münsterberg, presumed by Albert Dürer, 4l. 4s.; of "The ferocious Duke of Alba," 1l. 7s. Among coins of the Greek Colonies was an Olbiopolis, obv. Head of Medusa, full-face, tongue protruding, rev. Eagle devouring a fish, APIX; a magnificent tessera in the finest condition, valued at eighty roubles at Odessa. It sold for 7l. 10s. The whole collection realised 164l. 12s. 6d.

NOTES ON ART AND ARCHAEOLOGY.

AMONG the most recent additions to the Greek antiquities in the British Museum are two terracotta figures from Tanagra, in Boeotia, a site which of late years has yielded an extraordinarily large number of graceful and beautiful statuettes in this material. The two new figures, however, are, besides being beautiful, interesting as examples of that stage of Greek art in which, the power of creating new types having failed, recourse was had to what appears to us now to be eccentric combinations of this or that element in the old types. For instance, we have here at first sight a figure of Aphrodite, holding a goose in one hand and an apple or ball in the other, and nearly nude. But the breast is that of a male figure, and there have been wings attached to the shoulders. Round the loins she has a short garment like that worn by acrobats in ancient and modern times, made of some heavy material in the form of scales overlapping each other so as to admit of movement. A figure of an athlete in terra-cotta, wearing a precisely similar garment, will be seen in the *Museo Borbonico*, ii., pl. 54. Altogether the combination seems to be the result of mere fancy. The other figure looks at first sight like Paris, wearing his Phrygian cap and holding out in his right hand the apple. But the face, drapery—a short chiton girt at the waist—and limbs are feminine. This figure also has had wings. Between the places for the insertion of the wings in both figures is a round hole, apparently for the attachment of some means of suspending them, the figures having probably been meant to hang against a wall. They remind one of the winged figures which float in the air in Pompeian wall-decorations, and which equally have defied identification. It has been

argued that these latter—and indeed the greater part of the mural decoration of Pompei—were artistically an inheritance from the Greek art of the period immediately after Alexander the Great. Another addition to the Museum collection is one of those small Athenian lekythi modelled in the front in the form of a Victory, or at any rate a winged and draped female figure standing and leaning her right elbow on a tall amphora of the class generally called Apulian. She holds out a patera in her left hand, and wears a plain crown in front which has been a wreath of ivy leaves.

THE collection of antiquities belonging to M. Albert Barre will be sold in Paris from the 16th–18th of this month. It consists of vases from Magna Græcia and Attica, terra-cottas from Tanagra, and pottery and glass from Cyprus. A catalogue handsomely illustrated with engravings of a few of the principal vases and photographs of a number of the terra-cottas has been issued, the text being the work of an excellent authority, M. Fröhner, who introduces the various classes of objects with a statement of the present position of knowledge in regard to them.

In the April number of the *Ecclesiastical Art Review*, Mr. Haweis makes a strong protest against the unmusical character of English church bells, and suggests that the objection entertained, in London especially, to living near a church with a bell, would disappear if there were two or three, and those tuneful. Most people would no doubt prefer music to mere noise; but even music, at odd times, when it is not wanted, is rather trying. The articles on celebrated Art Firms savour a little too much of the puff direct, but in printing such documents as the Inventory of the jewels and relics at Salisbury Cathedral, the *Review* is really doing a useful work. In such cases, however, it ought to be stated where the original document is to be found.

THE last meeting of the Imperial German Institute to celebrate the anniversary of the foundation of Rome, which had been postponed on account of the Easter holidays, took place on April 26, and was very successful. There was a large attendance of archaeologists. Dr. Lumbroso spoke first on the subject of the monument at Alexandria, known as Pompey's column, and was succeeded by Prof. Mommsen, who spoke of the *Augustales*. This afforded an opportunity to the distinguished historian of Rome of setting forth some new theories on a subject so often treated, the explanation of a stone discovered not long since in the neighbourhood of Corese, in the place where the ancient Cures once stood. Prof. Mommsen's speech was followed by one of R. Lanciani, on the discoveries in the Porticus Octaviae, and particularly on the pedestal of the statue of Cornelia, found there on April 13. Signor Lanciani exhibited an exact copy of the inscription and a photograph of the fine statue found in the excavation on the Palatine. Last came Prof. Helbig, who spoke of new discoveries made in the Latian Necropoles, on the Alban hills, endeavouring specially to estimate the degree of incipient civilisation of the most ancient peoples of Latium.

THE critical catalogue of Jacques Callot's drawings, by M. Fouquis de Vagonville, which has been continued for some months in *L'Art*, is now finished. Its value to students of Callot's work can hardly be exaggerated; for beside the full descriptions and acute critical remarks bestowed upon the subject a number of the drawings catalogued are reproduced in facsimile, and serve to give even those who are unacquainted with this wonderfully clever master an excellent idea of his power and skill. The catalogue, which, it may be hoped, will hereafter be published separately, enumerates no fewer than 343 drawings from the Uffizi and private collections.

THE Salon, in consequence of the request of the administration, will not be opened until May 25.

THE sale of the pictures, sketches and studies left by the great French landscapist Daubigny takes place at the Hôtel Drouot this week. Daubigny's drawings have hitherto been but little known, as the painter, it is said, never liked parting with any he had made.

L'Art, having finished a long critique of the drawings by Old Masters at the Grosvenor Gallery, written by Mr. Comyns Carr, and illustrated with numerous reproductions, now enters upon the subject of the Universal Exhibition, and gives in the last two numbers two large etchings from paintings of the French school. The first of these is a coarse, powerful work, very much in the manner of Caravaggio. It is painted by T. A. Ribot, and engraved by Masson, the subject being a *Norman Cabaret*, with ill-looking fellows playing at cards, the light and shade as strongly contrasted as with the Neapolitan master; the second, painted by Gustave Moreau and engraved by Gaujean, is a theatrical work called *The Apparition*. It would seem to represent the head of St. John the Baptist, appearing in a glory of light, but dripping with blood, before the eyes of the daughter of Herodias as she dances before the king. Neither king nor queen, however, appears much moved by the sight. Perhaps the apparition is not intended to be visible to them.

A NEW gallery of modern sculpture has just been opened in the Luxembourg. The works exhibited have been gained chiefly from past Salons, and are for the most part notable works of French sculpture in marble and clay, but among them is the beautiful little statue in silver of the *Chanteur Florentin* which formerly formed part of M. de Nieuwerkerke's collection.

THE placing of modern sculpture seems to have caused a great deal of difficulty at the Universal Exhibition. Up to the very last, the question as to which gallery should be devoted to it does not seem to have been decided.

WE have received the first number of Cassell's new *Magazine of Art*, which so far amply fulfils its promise of giving a comprehensive view of matters of art engaging popular attention at the present time. Foremost comes of course the Paris Exhibition, upon which there is a first article, giving views of the Trocadéro building and the Prince of Wales's Pavilion. Beside this we have "Half-hours in the Studios," which will be likely to please those readers who like to go to the exhibitions well primed so as to be able to astonish country cousins with their knowledge; a notice of the Dudley Gallery, from which is reproduced Mrs. Jopling's prettily-suggestive picture called "*It might have been*"; an interesting account, by Mr. Soden-Smith of the South Kensington Museum, of the "Vicissitudes of Art Treasures," an excellent subject for consideration; sketches of "Our living Artists," by Mr. H. W. Sweny, beginning with E. M. Ward, whose picture of *The Queen of Prussia and Napoleon* in last year's Academy is given as one of the illustrations; and "Artists' Haunts" by W. H. Tregellas, with views of Cornwall—haunted, it is to be feared, nowadays by tourists more than artists. Add to these subjects an account of the "Art Sales" of the month, and various "Art Notes;" and it will be seen that Messrs. Cassell, Petter and Galpin present in the *Magazine of Art*, as in their other popular magazines, full worth for the money expended in its purchase.

THE *Portfolio* certainly offers us very varied refreshment this month, but it is not quite so delicately served up as usual. The etching from Mr. Fildes' picture called *Marianina*, both by reason of the ugliness of the original and the coarse heavy work of the etching, is decidedly unpleasing; nor can much be said for the etching by F. L. Meyer from Piloty's picture of Galileo in prison. The other plate of the number—a facsimile by Amand Durand of an etching by Dürer—is more curious than beautiful, but it has an interest of its own from being one of the very few plates—six at

most—that Dürer is known to have etched. Even this is done more with the dry-point than strictly speaking with the etching-needle, or rather, as Mr. Hamerton explains, with the etching-needle held and used like the dry-point. Mr. Beavington Atkinson continues his "Schools of Modern Art in Germany," dwelling at some length on the second and third phases of the Munich school, and Mr. P. G. Hamerton gives a very short instalment of his "Life of Turner."

A SERIES of eight pictures by Hans Makart, *The Gifts of Sea and Land*, are exciting great interest at the Berlin Spring Exhibition, some connoisseurs pronouncing them perfection, and others mere charlatanism.

MUSIC.

THE selections from the works of M. Massenet performed at the Crystal Palace concert last Saturday did not tend to advance the composer's reputation in the estimation of those present. The excerpts from the opera *Le Roi de Lahore* included the overture, a dance of Persian slaves, and an Indian march. In the first and last of these the excessive use of instruments of percussion proved very fatiguing to the ear, and it is evident that M. Massenet has a strong tendency towards over-orchestration—the besetting sin of many modern composers. Three numbers from the incidental music to *Leconte de Lisle's* drama *Les Erinnyes* had a more pleasing effect, because quieter in style. But, so far as we have had the means of judging, M. Massenet has not the gift of individuality. Miss Agnes Zimmermann, who was announced to play the solo part in Schumann's *Introduction and Allegro Appassionato*, Op. 92, did not appear, in consequence of a sudden and severe domestic affliction. M. Henrik Westberg, the first tenor from the Court Opera of Stockholm, displayed a light agreeable voice; and Miss Anna Williams gave a careful, if rather cold, rendering of Liszt's scena *Jeanne d'Arc au Bûcher*.

M. MARSICK, the Belgian violinist, who made his *début* on Tuesday at the first *matinée* for the present season of the Musical Union, is rather uncertain in his execution of rapid passages, but his tone is rich and powerful, and his style of phrasing broad and dignified. The pianist, M. de Beriot, a son of Malibran, is also new to London. His *technique* is excellent, and, what is comparatively rare in a Parisian artist, he plays in a quiet and unaffected manner. The performance of Rubinstein's very fine sonata for pianoforte and violoncello in D, Op. 18, suggested feelings of regret that the composer of a work so full of melodious imagery and clear beauty should have subsequently allied himself to the school of ugliness and chaos in musical composition. The quartets performed on Tuesday were Beethoven's in C, Op. 59, and Haydn's in D, Op. 9. The other executants were M. Wiener, second violin; M. Hollander, viola; and M. Lasserre, violoncello.

FRAÜLEIN THERESE HENNES' second recital, which was given at the Langham Hall last Thursday week, more than confirmed the favourable opinion expressed after her first performance. The programme was calculated to test severely the abilities of so young a pianist, including one of the larger sonatas of Beethoven (in E flat, Op. 31, No. 3), and various compositions by Bach, Mendelssohn, Schumann, Chopin, and Liszt. In all these pieces Fraulein Hennes showed the possession of a beautiful touch, very clear execution, and an amount of fire and vigour, as well as of real musical feeling, very remarkable for one of her years. It would be no real kindness to flatter her by saying that she is absolutely perfect; there are some things that can only come with experience and age, and here and there in Beethoven and Schumann the true conception of the music seemed hardly to have been fully grasped. It would, however, have been nothing short of a miracle

had this been otherwise, for no child (and Fränlein Hennes is little more), however gifted, can sound the intellectual depths of the works of the great composers just named. In this present case, what is now lacking will doubtless come in time, and there is every reason to anticipate that in a few years the young lady will take rank among the first of living pianists. Higher promise of excellence than hers is seldom met with; and all who have heard her will, we are sure, join with us in best wishes for her future career.

MR. CHARLES HALLÉ'S Pianoforte Recitals commenced yesterday week at St. James's Hall. These excellent *matinées*, though modestly entitled "Recitals," are in reality chamber concerts, in which the piano bears a prominent part. The programme of the first included Saint-Saëns' clever piano quartett, Op. 41, Schumann's piano quartett in E flat, Op. 47, both of which were played by Mr. Charles Hallé, M^{me}. Norman-Néruda, Herr Straus, and Herr Franz Néruda; Schubert's *Fantasia-Sonata* in G, admirably rendered by Mr. Hallé; and the first book of Kiel's graceful "*Deutsche Reigen*," in which Mr. Hallé was joined by M^{me}. Norman-Néruda.

THE fourth annual concert of the students at the National Academy for the Higher Development of Pianoforte Playing was given at the Langham Hall on Saturday last. The pieces performed were Gade's sonata in D minor for piano and violin; Weber's Concertstück; Hummel's concerto in A minor; Beethoven's Sonata Appassionata; Grieg's "Humoresken," Op. 19; and Mendelssohn's Capriccio in B minor, Op. 22. Such a programme was a formidable one for young players who were chiefly amateurs; but the ordeal was successfully passed, while in some cases, which under the circumstances it would be invidious to specify, a very high degree of excellence was shown.

THE Borough of Hackney Choral Association concluded a very successful season on Monday last by its fourth concert at Shoreditch Town Hall, when Gade's *Crusaders* was performed, the solo parts being given by Miss Marian Williams, Mr. Barton McGuckin, and Mr. Thurlay Beale. The second part of the concert was miscellaneous. The band and chorus numbered nearly two hundred performers, and Mr. Ebenezer Prout conducted as usual.

THE 140th Anniversary Festival of the Royal Society of Musicians was held at Willis's Rooms on Friday, the 3rd inst., the chair being taken by the Lord Chief Justice, Sir A. Cockburn. During the past year over 3,000*l.* has been expended by this society in the support of widows and orphans, and of aged and infirm members of the society. Fifteen members, forty-three widows, and twelve children are at the present time receiving support. There is, probably, no charitable association in existence more efficiently and economically managed; the printed statement of expenditure issued at the meeting shows that the entire working expenses of the society are less than ten per cent. of the whole outlay. During the evening donations were announced amounting to rather more than 500*l.*

HANDEL'S *Solomon* was performed at Rotterdam for the first time on the 12th ult., with additional accompaniments written by Fr. Gernsheim.

THE first performance in Italy of Beethoven's Choral Symphony in its entirety took place at Milan, on April 18, under the direction of Signor Faccio.

THE *Rheingold* and *Walküre*, which our readers will remember are the first two parts of Wagner's *Ring des Nibelungen*, were performed for the first time in Leipzig, at the Stadt-Theater, on the 28th and 29th ult., with very great success. The remaining portions of the work will be produced as soon as they can be prepared.

THE performance of Wagner's *Siegfried*, which was to have been given at Munich on April 22, was postponed at the last moment, owing to an accident that befell Herr Vogl—who was to play the part of Siegfried—at the last rehearsal. In the fight with the dragon in the second act, Herr Vogl fell, spraining his arm so severely that his physician, fearing inflammation, forbade his appearing on the stage. Fortunately, in falling, he had the presence of mind to fling away the sword which he held, or his injury might have been even more serious.

MISS FLORENCE MAY'S series of Harpsichord Music of the seventeenth and eighteenth centuries is now in course of publication. The first three numbers represent the Italian and English schools, with Pergolesi, Alberti, and Dr. Greene. Nos. 4 and 5 will be devoted respectively to the German and Swedish composers, Mattheson and Agrell; and No. 6 to Henry Purcell. A short biographical notice accompanies each selection.

No. 315, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Illyrian Letters; a Revised Selection of Correspondence from the Illyrian Provinces of Bosnia, Herzegovina, Montenegro, Albania, Dalmatia, Croatia, and Slavonia, addressed to the *Manchester Guardian* during the Year 1877. By Arthur J. Evans, B.A., F.S.A. (London: Longmans, 1878.)

MR. ARTHUR EVANS has already won himself a name by his former work, *Through Bosnia and Herzegovina on Foot*, and the present volume cannot fail to increase his reputation. He possesses most of the qualifications for a good traveller and a writer of an interesting narrative. In the first place, he has in large measure that spirit of adventure, and that restless craving for information, which cause Orientals to say, with a certain element of truth, that the Englishman is driven abroad by a demon, which will not allow him to remain at home. The following passage, which describes his crossing the river Unnatz when swollen by rain and melting snow, in order to reach some villages which had been the scene of recent Turkish outrages, may illustrate this feature:—

"However, go I must and go I would; so, climbing down the somewhat precipitous rocks to the river, I divested myself of the greater part of my apparel, put a notebook and a few necessities in my hat, and, leaving clothes, revolver, and other impediments to the charge of the astonished Bosniacs, made the fatal plunge. The intense cold was far more dangerous than the current; but Father Unnatz was propitious, and I did succeed in reaching the opposite shore: and, after a period of enforced inactivity on the bank, started without guides or guards, and in a singularly primeval condition, to find my way as best I might to the burnt villages, over the mountains of Bashi-Bazouk-land."

Another of Mr. Evans's qualifications is one which in a greater or less degree honourably distinguishes the whole class of English newspaper correspondents, the determination never to state facts on hearsay without verifying them. Over and over again in this volume we find him collecting and comparing the evidence for an occurrence in different places from various sets of informants, whose names he gives when there is no fear of compromising them. By this means he has done good service in disproving and exposing the misrepresentations of the existing state of things in Bosnia which have been sent home to England on consular authority. In his determination to arrive at the views of all sides, he visits in turn the refugees who are congregated at various points on the frontier; the insurgents in that part of the

country, bordering on Dalmatia, which they have now made their own; the localities where the chief atrocities have been committed; the headquarters of the leading Mohammedan landholders; Montenegro and Niksic, which latter place he reached immediately after its capture; and the confines of Albania at Durazzo. His visit to the Bosnian Begs at Kulen Vakup was especially important, because it enabled him to sound the feelings of the party in the country most opposed to the insurrection. Beforehand he was assured "that it would be considerably easier to pay a visit to another world," and that "his head would be added to a considerable collection already accumulated by the local Begs;" but his experience was that, being regarded as a sort of representative of England, and as qualified to communicate their views to the English people, he was received with extraordinary honour; and individual chieftains, representing different parties—some more moderate, others more fanatical—communicated to him without reserve their ideas as to the present condition and future prospects of the country. He possesses also an admirable gift of descriptive power, to illustrate which we may quote his experience of the effects of ice and snow in working destruction in a forest.

"The hut I was in was in the middle of a forest, and as the sleet continued during the night one branch gave way under the weight of ice and then another, till crash followed crash in such quick succession that it sounded like a roar of artillery around, interrupted as the lesser branches gave way with sharp, snapping, explosive noises, like pistol-shots at close quarters. The spectacle next morning was stupendous! The whole forest was wrecked! There is no other word that will describe it. The whole ground was covered waist-high with piles of fallen branches; spreading forest-queens had been stripped till they were mere naked trunks—mutilated torsos. Fragile trees had been crushed—Tarpeia-like, but with a girdling weight of crystal. Tender saplings and trees of more elastic growth had been simply bowed down, like weeping willows, their slender sprays poured down towards mother earth in taper icicles, till every tree looked like a frozen fountain."

The charm of variety is also communicated to the narrative by the numerous subjects in which the writer found an interest, such as the antiquities and remains of art, and the legends and superstitions which could not fail to reveal themselves to one who became so intimately acquainted with all classes of the people.

We could willingly dwell on the interesting and amusing incidents in the volume—and there is no lack of the latter of these elements—but at the present time it will probably be more serviceable to our readers if we give them Mr. Evans's conclusions as to the actual state of the country, his views as to the hopeful elements which may be discovered, and his opinions as to the probable political future. The present condition of these western provinces of Turkey certainly appears very nearly desperate. The number of refugees on the frontier is estimated at a quarter of a million souls, and fifty-two thousand have perished on Christian soil through hunger and exposure and their attendant diseases. Mr. Evans's description of the frightful state of destitution of the fugitives in the caverns will be familiar to

many of our readers, as it was frequently quoted in the newspapers when it first appeared. This exodus was the result of the insurrection which was caused by the intolerable oppression of the Mohammedan proprietors; and the return of the serfs has been rendered impossible for the present by the outrages that have been committed on those who have attempted it, when their employers promised that they should be unmolested. Indeed, the cruelties and devastation of which Bosnia has been the scene for some time past do not come far behind the more familiar atrocities of Bulgaria. One of the few bright spots in this ruined condition of the country is found in Miss Irby and Miss Johnston's work of relief, of which an interesting account is here given: by means of this, two thousand children of the refugees are taught in twenty-two schools, and some of the children are being apprenticed to trades. But the most hopeful feature is the character of the people themselves, who are described as quick and imaginative, and fond of learning from childhood upwards; singularly teachable, with a certain uniformity in type of character, corresponding to a similarity in physical make and expression, which endues them (to use the author's phrase) with a large capacity of being drilled; genial and fond of games, among which are described rudimentary cricket, football, and "putting the stone;" and, what is of the first importance in respect of their future development, gifted with a marked power of organisation, so that, even among the most destitute of the fugitives, every cavern has its house-father and house-mother, according to the old Slavonic system of Zadruga, or living in large family-communities which hold all things in common. The habit of discussing their affairs which is thus engendered seems to have given these rayahs a faculty of debate and "parliamentary capabilities" which would hardly be found in the corresponding class in our own country; and among the insurgents Mr. Evans was much struck by the straightforward, business-like manner in which debate was carried on.

As regards the political future, the author expresses his conviction repeatedly and decidedly that the only hope for these provinces of Turkey lies in their incorporation with Austria. To this view he has been led, not from any love for that Power, but from the persuasion that this is the only means of escape from a deadlock. The present position of things is a remarkable one. The withdrawal of the Ottoman troops from Bosnia to serve against the Russians has left that country, with the exception of the part occupied by the insurgents, much in the same condition in which it was before 1851, when the power of its old ruling caste of Mohammedan Slav families was broken by Omar Pasha, and the bureaucratic rule of Constantinople took its place. Now, this aristocracy finds itself once more master of the situation, and is likely to offer the strongest opposition to the return of Ottoman rule, except as a form of suzerainty. To anything like a "Constitution" they are utterly averse, and if the rayah is to come back it must be on the same terms as before. The inferior Mohammedan farmers

are disposed to be more conciliatory, but matters have gone too far to allow of an arrangement being possible. Nothing, it would appear, but the interposition of some strong hand could restore order. The Turks, independently of their administrative weakness, would only aggravate the situation, as they have always opposed any common action between the Christian and Mohammedan Slavs, well knowing that their own domination depends on the jealousy that exists between these. At the same time, the idea of Austrian occupation arouses a feeling of repugnance among all classes. The Mohammedans would even prefer annexation to Servia, knowing that practically this would mean that Servia would form part of Bosnia; and the rayahs say, "if we must be slaves, we had rather be the slaves of our own nobles; they at least speak our tongue." But, notwithstanding this, an outsider cannot help feeling that nothing but the control of a really commanding Power can remedy the distractions of the country, and it is only from Austria that this can come. Whether she will undertake the task, we may perhaps learn before long, if a war does not postpone the possibility of settlement. If we may trust the views of a Bohemian statesman, an interesting conversation with whom forms the last chapter of the book, such an annexation has long been a favourite scheme of the present Emperor of Austria, and the Magyar opposition to it is not likely to form a permanent obstacle. Supposing this to happen, these provinces would amalgamate with the neighbouring Slavonic countries of Dalmatia, Croatia, and Slavonia; and in case of a break-up of the Austrian Empire, which is not a highly improbable contingency, a compact nucleus would have been formed for a powerful South-Slavonic State, which would prove the surest barrier to Russian aggression.

H. F. TOZER.

The Chief Actors in the Puritan Revolution.
By Peter Bayne. (London: Clarke & Co., 1878.)

MR. BAYNE possesses many of the qualities which go to make an historian. He has the power of throwing himself into the characters he describes, and he frequently abstains from pronouncing an absolute verdict for or against his personages on the just ground that it was impossible for them at the time to reach more than a partial attainment.

Where Mr. Bayne goes astray he errs from the insufficiency of his preparation. No doubt all allowance should be made for a series of sketches originally published in a magazine; and if a writer gives us his best we need not find fault with him for not doing more. But we may fairly complain when an author attempts to pass off as a virtue what is in reality a weakness. He tells us jauntily that his "original researches have been confined to the pamphletary catacombs of the British Museum;" and then goes on to say that—

"The Puritan Revolution was not done in a corner; and a just apprehension of its moving forces and cardinal incidents is, after all, to be attained rather by honest and intelligent study of documents, like the Great Remonstrance of 1641,

embodying the views of the parties, and of books, like those of Clarendon, Whitelocke, and May, and of letters and speeches, like those of Baillie and Cromwell, which are accessible to all the world, than by antiquarian research."

Even the poor antiquary might have something to say to this. He might argue that it was even worth while to be sufficiently well informed to abstain from producing such unheard-of spellings as Caloma and Carendolet (p. 41), or from hazarding a wild speculation about the cause of Lindsey's failure at Rochelle (p. 172) for want of having read Lindsey's own despatches, or from attributing to Somerset an important document (p. 151) which in reality proceeded from the Spanish Embassy. Such mistakes as these, however, are of no great importance, except so far as errors of fact tend to reproduce themselves as errors in the general conceptions of the writer.

If, indeed, Mr. Bayne were an ordinary specimen of the literary showman who moves his puppets about to dazzle the eyes of the world, it would be easy to make short work of him. It needs no great effort to point out the absurdities of such men. Mr. Bayne has a right to be criticised in a different spirit. Even when his conclusions are most unfair he has evidently attempted to be just and honest.

"Selecting," he says in his Preface, "a certain number of actors in the drama of the period, I have endeavoured to put myself into their position, seeing with their eyes, and, in the exercise of at least dramatic sympathy, feeling as they felt."

Not only has he tried his utmost to accomplish this, but he has frequently succeeded. The sketches of Cromwell and Vane should be read together, to see how ably Mr. Bayne tries to contrast two high-minded men without assuming that either of them was perfect. Henrietta Maria is well handled, though Mr. Bayne attributes far more steadiness of purpose to the queen than she really had. In short, he would have known her better if he had read the letters in which Con and Rosetti pourtray her to the life. His account of David Leslie's strategy too, is a marked feature in the book, and serves as a good protest against the hero-worship which treats Cromwell as standing entirely alone.

When we get to the controversy between the Puritans and their opponents, Mr. Bayne is at his weakest. Yet even his weakest is stronger than the best of the old school of constitutional lawyers. Mr. Bayne is ready to make extreme allowance for the errors of Puritans and Presbyterians.

"Looked at from without," he says, "the Presbyterian Church wears a formidable appearance—battlemented and grim with palisado formularies and great guns of dogma. But, within, it has always been easy-going and popular, governed by the sentiment of its members, and issuing its censures at long intervals" (p. 232).

Surely this is to ignore the real charge. By the very nature of things a democratic Church governed by the sentiments of its members will not be felt as oppressive by the majority. What is really complained of is that it bears hardly on the minority who do not share in those sentiments, and that it represses originality of thought in those who do. It is all very well to attack Mr. Buckle as a pedant for his assault on the

tyranny of the old Presbyterian system; but it should be remembered that Bacon, who at least was no pedant, was of precisely the same opinion. Presbyterian government, he said, was "a thing, though in consequence no less prejudicial to the liberties of private men than to the sovereignty of princes, yet in first show very popular" (Spedding, i., 100). A writer who thinks as Mr. Bayne thinks could hardly do justice to that school of thought the defects of which were exaggerated by Laud. No doubt Mr. Bayne struggles hard. He points out all the finest parts of Laud's character. Nothing can be better done than his conclusive reply to the folly of calling Laud a driveller. "It is inconceivable," he writes, in speaking of a certain portion of his correspondence—"It is inconceivable that Strafford should have graciously and gratefully taken schooling like this from Laud, if he had not believed him to be intellectually his fellow. There is nothing in Strafford's part of the correspondence to suggest that he had any consciousness of writing to an ecclesiastic. He speaks as statesman to statesman, imparting to Laud all his ideas, apprising him of all his plans, solicitous of his approval and valuing his advice."

There are other passages, too, such as the one in which Mr. Bayne takes evident delight in the discovery that Laud aimed through uniformity at a higher spiritual unity, which do the highest credit to his discernment and to his honesty of purpose. But, as a whole, the article is disappointing. The moment we read that James was told something by "surpliced prelates," we suspect that Mr. Bayne is not very familiar with the external appearance of a bishop; and when we read that "the theology of Anglicanism according to Laud was essentially Roman," on the strength of Laud's statement that the Church of England "professes the ancient Catholic faith," we become quite certain that he does not know much more about the ecclesiastical principles of Laud and his followers. Groping his way in the dark, Mr. Bayne is sometimes led into direct, though of course unintentional, misrepresentation.

"Not only," he tells us, "did Laud receive an offer of a cardinal's hat, but he did not at once and peremptorily reject it. He took it into consideration, he consulted the King about it, and it was made to him a second time before being finally dismissed" (p. 89).

There is not a tittle of evidence that Laud gave the offer a moment's consideration. It was his duty to inform the King that the proposal had been made, and he merely noted down in his diary the fact that that duty had been fulfilled.

It is evident that Mr. Bayne's want of appreciation of Laud's ecclesiastical position leads him to carelessness about the facts that he examines, and that carelessness about the facts reacts upon his appreciation of the position.

What may be said of Mr. Bayne's study of Laud is true in a less degree of his study of Clarendon. He does not sufficiently enter into the spirit of the man whom he is describing. Yet his work even here is far above the average, and it is because the merits of the book are so great that every reader will hope that Mr. Bayne may be induced to devote yet further attention to

the period which on the whole he has so well illustrated, and that he will not despise even those antiquarian researches which he counts so cheaply now.

SAMUEL R. GARDINER.

Memorials of John McLeod Campbell, D.D.
Being Selections from his Correspondence. Edited by his Son, the Rev. Donald Campbell. In Two Volumes. (London: Macmillan & Co., 1877.)

THESE volumes have an interest very similar to the *Letters* of Mr. Erskine of Linlathen, lately reviewed in the ACADEMY. The two men in fact bore a strong resemblance to each other, and moved in nearly parallel, if not exactly identical lines of thought. Mr. Erskine had perhaps more of genius and of the impulsive versatility which belongs, or is at least akin, to genius, Mr. Campbell more of the sustained power of calm and patient thinking. Both of them lived and walked almost exclusively in the light of the unseen world. Both of them had the same remarkable gentleness and affectionateness of nature—Mr. Erskine's affection being perhaps more diffused; Mr. Campbell more limited and special in his love. Mr. Erskine had seen more of the world and had more of an intensely social nature, Mr. Campbell was more of a shy, retiring, self-involved student, looking at men a good deal from the outside, and keeping somewhat apart from ordinary human interests and activities. His brother used to complain that a letter from him at Edinburgh or Oxford was as destitute of outside personal details as one from Kilninnver or Skye. Yet this shy, gentle, modest, humblest of men knew both how to think for himself and how to trust his own thought. Few things in human character could be finer than the curious mingling of firm determination with which, when accused of heresy before his presbytery, he maintained his peculiar opinions, and the gentle submissiveness with which he bore the angry criminations of his co-presbyters, and afterwards his expulsion from the Church. No word of anger or bitterness seems ever to have escaped him, and though nothing could have been more easy for him (and he himself was quite aware of it) than to explain away the difference between himself and his opponents as more verbal than real, he felt that by doing so he would "pass without challenge only by not being understood," and that "through the false associations formed with right words, though he might say the right thing, he would yet convey a false meaning." In a letter to his father, written at the time, he says, with touching conscientiousness:—"It is a comfort to me to find the difference so great, because it makes the path of duty more clear and the call of duty more imperative." And in accordance with this feeling, throughout the whole of his painful trial, with deposition staring him in the face, he showed only a simple, straightforward candour and open-heartedness in explaining all the points of his teaching; his sole anxiety evidently being that his doctrine should be fully understood and accepted, without a single thought as to the consequences that

might result to himself. We cannot help wishing that Mr. Campbell had given a somewhat fuller account of his father's trial before the presbytery, as some of the best features of Dr. McLeod Campbell's character are lost sight of by the omission, and it would have been worth while too to have had a thorough exposure of the weak and malignant obscurantism of Dr. Campbell's opponents—of that obscurantism which in Scotland has long been the inevitable torment of genius, of thought, and of high scholarship, whenever these appear in theology, and which should never be suffered to escape the infamy it deserves. The obscurantists, however, ought to be grateful to Mr. Donald Campbell for his generous forbearance.

Coleridge has somewhere remarked that whenever a new truth is proclaimed, decent Mediocrity acts towards it like a herd of cows in a field when a post is set up for them to scratch themselves upon—first they run away from it in alarm, then they timidly gaze at it from a safe distance, then cautiously approach a little nearer, and last of all quietly put it to the use for which it was intended. And so it was with the Church of Scotland in reference to Mr. Campbell; first it was in horror at the shocking heresies of the minister of Row; then it found out that what he preached was pretty much what all Christian men in their hearts believed; then, upon the publication of his remarkable book on the Atonement, the theological faculty of Glasgow conferred on him the degree of D.D.; then in various ways the insults and hard usage he had received were exchanged for honour and veneration from all the wise and good; and so at last it dawned upon pious Stupidity that there had been nothing all the while to be troubled or alarmed about. The only thing which was not done was the General Assembly, either Established or Free, making confession of its own folly by reversing the decision of 1831.

After his expulsion from the Church, Mr. Campbell spent several years in travelling through the Highlands and elsewhere, propagating his peculiar views of the Gospel; and ultimately, his health having given way under his severe toil, he settled in Glasgow and became the minister of a regular congregation there. It is a curious illustration of the bitterness with which this excellent man was pursued that the presbytery to which his father belonged actually wished to compel the old man to exclude his son from his house unless he ceased to preach; and when foiled in this by the firmness of the elder Campbell, they issued a paper charging McLeod Campbell with holding sundry odious opinions which he utterly abjured, and of which he had not even been accused at his trial, and ordered this lying indictment to be read from every pulpit within their jurisdiction. In this precious document the people were not merely warned of the danger to which they exposed their souls by going to hear Mr. Campbell, but threatened with deprivation of the ordinances of baptism and the Lord's Supper if they persisted. This proceeding, it should be added, was not a mere outcome of the narrow bigotry of a remote Highland

presbytery, but was understood to be taken after consultation with Dr. Inglis, one of the ministers of Edinburgh and the leader of the Moderate party in the Church at the time.

In after years Dr. Campbell used to congratulate himself that when driven from the Church he had not yielded to the temptation of founding a sect. And no doubt he was right. His calling was not that of a popular leader, but of a thinker; and not only would he, as a mere unit in a new denomination, in all probability have soon found himself trammelled by the ideas of men scarcely less narrow-minded than those from among whom he had been driven, but as the member of a small Presbyterian sect his great work on the Atonement could have had very small chance of commanding general attention; whereas, coming as it did from a persecuted outcast of Presbyterianism and a martyr to free thought, he was able at once to obtain not merely a favourable hearing, but intelligent appreciation from a wide circle of the best-informed theological thinkers both in his own country and in England.

These letters of Dr. Campbell, which in the volumes before us have been extremely well selected and intelligently edited by his son, will, I have no doubt, fully confirm the reputation he has already achieved as a man both of great intellectual power and of rare loveliness of character. Throughout they exhibit an exceptional amount of really fresh and independent thought. Even when writing on the tritest subjects, it is remarkable how he avoids conventional remark, and gives a new and interesting aspect to a familiar topic. In style and character his letters, more frequently than any others which we can recall, remind us of those of John Foster, the essayist, published about thirty years ago. His thought, in fact, appears to have the double quality of including both that meditative and imaginative musing which results in the presentation of new ideas to the mind, and also what may be called excogitation, or that discriminating insight into the elements of any subject of investigation, which results in separating the false from the true. The chief defect of his writing, both in his books and in his letters, is a certain involution and complication of style. His very anxiety to make everything clear has sometimes the effect of making it obscure. At the same time this may quite as often arise from the nature of the thought as from the mode of presenting it, and Dr. Campbell might perhaps have repelled the charge of obscurity by retorting on the reader—*Intelligibilia non intellectum adfero*.

The principal charm of the book, however, is the singular goodness of the man whose biography it records. As was so often said of Mr. Erskine, that he was the best man one had ever known, so Dr. Campbell's friends seem to have felt in regard to him. Dr. Norman McLeod, writing of him after his death, said:—

"Dr. Campbell was the best man, without exception, I have ever known. His character was the most perfect embodiment I have ever seen of the character of Jesus Christ. I never perceived in any other such a constant sense of

God's presence. One felt as if there were another person, though unseen, always with him."

In reading the book, one often feels that if all the professed followers of Christ had so shown the power of the Gospel upon their characters as Mr. Erskine and Dr. Campbell did, perhaps men would not have so often doubted of the truth of Christianity as they have done. The truth would have been recognised in the effects which it produced.

J. T. BROWN.

Transactions and Proceedings of the Conference of Librarians held in London October, 1877. Edited by the Secretaries. (London: Chiswick Press, 1878.)

THE suggestion for a Conference of Librarians, originally made by Mr. E. B. Nicholson in these columns, has been successfully carried out; and not the least valuable of its results is before us in this handsomely printed volume, which does great credit to its editors, Mr. Nicholson and Mr. Tedder, and to the Press which has lavished such pains upon it.

Though it cannot indeed be said to do for this country what the liberality of the American Government has done for the United States in the production of the great *Report on Public Libraries in 1876*, it contains many admirable suggestions and much valuable information. It marks, if it does not make, an epoch; and may, we trust, constitute a fresh starting-point for library management and development among us. Besides authoritative accounts of some fifteen of the great London libraries visited by the Conference, and a description of the library appliances exhibited, we have here no less than thirty papers and notes, with the discussions upon them. It may be that a survey of the whole field of librarianship was too much for the Conference to attempt, and that if it had handled fewer topics it might have handled them more thoroughly. Still, though it came to few practical conclusions, a good deal is no doubt to be said for deliberation before deciding important questions once for all.

It is, of course, impossible to notice all these papers here. Questions of cataloguing, of slip-catalogues, of the rules for entering anonymous books, of library book-keeping, of building, and of binding, specially (though by no means exclusively) concern the working librarian, and he will do wisely to turn to these pages and see for himself what the recorded experience of so many of his colleagues has to offer him.

Among the papers of more general interest we must single out a few. Mr. Wright, in a paper "On the best means of Promoting the Free Library Movement in Small Towns and Villages," proposes (1) the union of small towns; (2) the utilisation of Board Schools as library centres. The latter happy suggestion (made some time ago in these pages) has already, we believe, begun to be carried into operation. The French delegate, Baron de Watteville, told the Conference that France has founded, within the last ten years, more than 1,000 "popular libraries," and 17,500 "school libraries."

Mr. Roberts's paper on "University Libraries as National Institutions" is only his

familiar proposal to add All Souls' to the Bodleian, with an establishment of librarian-fellows. The advocacy of the scheme might have been effective if it had been put into three pages instead of twelve.

Mr. Axon (also under a high-sounding title) appeals to the British Museum to print its Catalogue in the interests of "Provincial Culture," about which Mr. Axon must be sadly despondent if he thinks that the Museum Catalogue can help it much. The question at all events was very warmly debated by some of the chief officers of the Museum. Mr. Bullen was in favour of printing; Mr. Winter Jones was as decidedly against it. The arguments of the Principal Librarian and his supporters (pp. 142-144) do not seem to us very convincing. To say that such a Catalogue would be superseded is an argument that would be fatal to nine-tenths of all human endeavour. And the Catalogue, as an extensive if not a complete register of four centuries of printed literature, would not in any real sense be superseded. Again, when Mr. Winter Jones says that "to look for a particular book in the Catalogue, unless it were properly classified, would be tantamount to looking for a needle in a bottle of hay," this, if it means anything, is a condemnation of the present MS. Catalogue. There can be no doubt that a printed catalogue even of "fifty or sixty" volumes would be infinitely easier to consult than the present bloated armament of 1,970 brass-clad tomes.

Mr. Garnett's paper on the "System of Classifying Books" at the Museum will be read with interest, and probably with surprise and amusement. Not content to defend this system on the ground of practical convenience or historical accident, Mr. Garnett asks us to accept it as "logical and philosophical." He must surely be ironical. At least his argument is not an exemplification of logical method, but an ingenious use of the principle of association, worthy of one of Poe's tales. Because, for example, the classification begins with Theology (with the general subject of Mythology thrown in late between Homiletics and Jewish History!) Ecclesiastical Law is made to begin the next class of Jurisprudence. And thus not only does the Canon Law precede the Roman Civil Law upon which it was built, but the general treatises on Jurisprudence come later on, and half way through the works on particular branches of law. In "Natural History and Medicine," "Mineral Waters" is made a co-ordinate head, with Therapeutics before and Surgery after it. All the sciences not included here go into "the extensive and miscellaneous division" of Philosophy—where we find such subjects as Railway Administration, Spiritualism, the Nautical Sciences, and the Military Art, and a great many other things that unpleasantly recall Hegel's sneer at the English use of the term philosophy. In addition to the absurdity of placing Photography under Philosophy at all, it is separated from Painting, Engraving, &c., which are duly put under the Arts. But no illustrations can give an idea of this ingenious "system" of unscientific confusion and bewilderment, and we may well ask whether Mr. Garnett seriously proposes to make

it the basis of any subject-index to be submitted to public criticism. The fact that there is no separate class for "Science" and none for "Sociology," under that name or any other, is quite enough to show that this classification is utterly inadequate to our present needs. If the writer's reference to the American librarians is anything more than an idle compliment, the Museum might take a lesson from them, and might then produce a classification that would probably be useful, and would certainly not be ridiculous.

A matter incidentally touched upon by Mr. Garnett is the economy of space at the Museum. One of the ablest of the American librarians who attended the Conference expressed an opinion that the Museum books might all be stowed into the King's Library. And it can scarcely fail to strike anyone who looks at a ground-plan of the Museum that much of the delay of which readers complain is due to the great distances that the attendants must traverse in bringing books.

Mr. Cornelius Walford proposes a General Catalogue of English Literature, a subject which the Library Association and the Society of Arts (at the suggestion of Sir Henry Cole) have now under serious consideration. Mr. Ashton Cross goes still further, and argues very vigorously for a "Universal Index of Subjects." He rightly assumes that the work must be done some time or other, and shows how much has been done, and is being done, in an unconnected way, so that what is chiefly wanted is the organisation of existing effort. The special feature of his plan is that the work is to be carried on by the co-operation of libraries and institutions, one checking and supplementing the other, and the whole controlled by a central clearing-house. The work would thus be done in sections, each section being complete in itself, and falling into its proper place in a complete and harmonious scheme. In this way the future and not the past only would be provided for. The proposal has great and obvious merits: whether the Library Association will develop sufficient strength to carry it out remains to be proved. That is the only chance we see for it at present.

We must not omit to mention that besides founding a permanent Association of those "engaged or interested in library work," the Conference concluded its useful labours by appointing a committee to promote an extension of the Free Libraries Act to the metropolis, which is now actively at work. The inhabitants of London can hardly be too often reminded that in library facilities for all purposes of home work and home reading they are immeasurably behind nearly every considerable town in Great Britain. Let us hope that this may not long continue to be so.

ERNEST C. THOMAS.

Francesco Cenci e la sua famiglia. Notizie e documenti raccolti per A. Bertolotti. (Firenze: Tipografia della Gazzetta d'Italia, 1877.)

Few strangers in Rome have looked on the sweet and mournful face which Guido Reni painted, as is supposed, from Beatrice Cenci

in prison, without feeling the eloquence of its mute despair. Guerrazzi too—to mention only one of the many writers who have been attracted by her tragic story—has spent pages of his fervid eloquence in drawing a portrait of her father, Francesco Cenci, which for fantastic depravity, grotesque impiety, and morbid hypocrisy, recalls some legendary despot satiated with flattery and drunk with power. And now comes Signor Bertolotti with a prosaic narrative extracted from the archives of Rome, reducing Francesco Cenci to the proportions of an ordinary vicious and violent noble, and stripping even more than the poetry from the person and story of Beatrice. We find that Francesco Cenci's mother was so alarmed at the precocity of her son's profligate tendencies as to have hurried him into marriage when he was but fourteen years of age.

His father—who was a Churchman, though only in deacon's orders—had died the year before, and Francesco, already formally emancipated, was forced to make restitution to the State of 35,000 scudi of his parent's ill-gotten gains. The fortune which he inherited must have been enormous, as from first to last he reimbursed 58,000 scudi to the public treasury, beside paying some 125,000 scudi on his own account to compound various suits. In return for his efforts to make good his father's malversations, the Pope pronounced him legitimate, and decreed that the doubtful connexion which had resulted in his birth should be thenceforth regarded in the light of a legal marriage.

Francesco's first wife, and the mother of all his children, was Ersilia Santa Croce. She died after twenty-one years of wedlock, and her husband remained for nine years a widower: a fact which, by the by, disposes of one charge commonly brought against Francesco—namely, that of having poisoned his first wife in order to marry his second, Lucrezia Petroni. But if innocent in this case he does not appear to have been equally so in others, at least so far as intention goes. Already in 1567, when he was but eighteen, he was tried for having lain in wait for, and maliciously wounded, his cousin Cesare Cenci. On this indictment and on others he was imprisoned in his own palace and banished afterwards from the Pontifical States, under a penalty of 10,000 scudi if he returned within the prescribed time—though Cardinal Caraffa went bail for him and brought him back before the end of five months.

Seven years before his second marriage he made a will. This document is curious as showing him under a religious aspect very characteristic of the age in which such reprobates still sought to drive hard bargains with Heaven. He gives minute directions as to his funeral and place of sepulture, and is very particular in limiting the number of attendant priests to twelve, and of torches to seven. He leaves various sums to hospitals and other charitable institutions; and mentions with great affection all his children except his eldest son. To him he is careful to assign only that portion of the inheritance which he could not legally alienate.

During the whole period of his widow-

hood Francesco Cenci appears to have given himself up to a career of unbridled licentiousness. Once, at least, he is summoned before the tribunals on a charge that cannot even be mentioned, although it attests a state of morals that was only too common in the Rome of those days. That all classes were equally tainted is the solitary fact to be urged in extenuation of individuals. The punishment inflicted was imprisonment accompanied by enormous fines. Francesco Cenci was condemned to pay 100,000 scudi; and his resources appear to have been crippled in consequence from that time to the end of his life.

During his imprisonment his sons contracted debts which he subsequently repudiated; and this conduct on his part seems to have sown the seeds of hatred between himself and his children. His sons sued him for an allowance on the ground that they were legally emancipated, and won their cause. But they spent double the sum assigned to them, and made up deficiencies by reckless abuse of their father's credit, and by the primitive process of actual robbery!

The most notorious of these sons of Francesco Cenci was Rocco. We find him violent, arrogant, fantastic; a midnight brawler and a midnight thief. He was a great friend of Monsignor Guerra, the supposed young, chivalrous, and devoted lover of Beatrice. This personage appears now for the first time on the scene, accused of being Rocco's accomplice in a nocturnal robbery committed at Palazzo Cenci. The two unmarried daughters of the ill-famed house, Antonina and Beatrice, are witnesses in the trial against their brother and his friend; and while the eldest, Antonina, is careful only to speak from hearsay, Beatrice roundly accuses the Monsignore of complicity in the robbery. There is no evidence that the case was proved against him; nor does it appear what punishment, if any, was inflicted upon Rocco. Later we find him in exile at Padua, after having been publicly whipped, by order of Monsignor Guidone, for a night attack on some fisherman, by whom he had been, or fancied himself, insulted. He was eventually killed in a duel.

At the time of the parricide three only of Francesco Cenci's sons were still alive. These were Giacomo, the eldest, Bernardino, aged eighteen, and Paolo, a year younger. The last-named, who had always been delicate, died almost immediately after the terrible deed, and thus escaped the agony of the trial.

Beatrice was the sole surviving unmarried daughter at the time of her father's murder. Guerrazzi and Del Bono represent her as affianced to Monsignor Guerra, who, being only in deacon's orders, could at will put off the priestly habit, and desired so to do for her sake. Romance, in the pages of these writers, introduces him to us as a young, handsome, and charming *abatino*. Fact, in the ruthless researches of Signor Bertolotti, reveals him as corpulent, ruddy, and middle-aged. His connexion with the Cenci family brought him a good deal of misfortune, for, beside the accusation of theft already, as we have seen, brought against him, he was suspected of a share in Francesco's murder.

Frightened or guilty, we know not which, he fled from Rome, and was pursued by a sentence of banishment which was only annulled after some years and many petitions.

To return to Beatrice: tradition represents her as exquisitely lovely and only sixteen. Signor Bertolotti states that at the time of her father's murder she was twenty-one; and he suggests that her being so long unmarried—with her large dowry, and in those days—is presumptive proof that she was not beautiful. In regard to the supposed portrait, he lays stress on the sufficiently significant fact that the first of Guido Reni's accounts found in Rome bears the date of 1608. This was nine years after the execution of the Cenci. No earlier trace of the painter's presence is to be found. Moreover, an inventory of the pictures in the Palazzo Barberini made in 1604 contains no mention of any portrait by Guido of Beatrice Cenci. Yet the names of the originals of the portraits given in the catalogue are mostly appended; and it is difficult in consequence to account for the absence of all notice of a likeness that would have been so deeply interesting. No picture by Guido Reni appears in the list at all. On the other hand there figures a *Madonna in Egyptian Dress*, by Paolo da Verona, which Signor Bertolotti, mindful of the turban, suggests might be the portrait known as the Cenci. He adds:—

"Torn by remorse and lacerated by torture, Beatrice could hardly have had the girlish and serene countenance which we admire in the picture, nor at such a mournful moment was she likely to have arrayed herself as an *odalisque*. Rather would feminine vanity have induced her to exhibit her abundant tresses."

Our author, as may be seen, is remorseless in establishing what he conceives to be the truth; and worse lies behind.

The Cenci while in prison all made their wills; of these Giacomo's is reproduced in part, and Beatrice's in entirety. Beside a legacy to each of her three step-sisters, she leaves various sums to charitable institutions, and provides for many masses to be said in perpetuity for the repose of her soul. Conspicuous among the legacies are numerous dowries to poor orphan girls, in which fact Signor Bertolotti finds a probable element of remorse; for we now come to the existence of a codicil in a sealed packet not mentioned in the will, and only opened thirty-five years after the unhappy woman who signed it had been laid in her dishonoured grave. This instrument leaves a sum of 1,000 scudi between two women, named respectively Margherita Sarocchi Birage and Caterina de Santis, who are enjoined to draw the interest, but never to alienate the capital. Attached to the legacy is the obligation of maintaining a child not mentioned by name, who is stated to be known to the legatees. "With them," says the codicil, "Beatrice Cenci has conferred on the subject by word of mouth." In the event of the child surviving both women, it is to inherit the whole thousand scudi without conditions of any kind.

The mystery which surrounded this codicil, the care taken to conceal its existence, and its general tenor, would point to a secret in Beatrice's life the nature of which may be guessed. It was an age of much licence,

and Beatrice was the daughter of a profligate house. But her father, while vicious himself, showed on many occasions the desire to restrain his children from similar courses. It is consequently possible that his harsh treatment of his youngest daughter—hitherto ascribed to infamous motives—may have been provoked by lightness of conduct on her part. Signor Bertolotti points out that the horrible practices attributed to Francesco Cenci, and adduced in extenuation of Beatrice's crime, rest upon the bare assertion of her advocate Farinaccio. He was passionate, as was natural, in his client's cause, and yet had little to say in her favour. The plea which he did put forth may have had no further foundation in fact than the other one which he urged in defence of Bernardino. This youth Farinaccio represented to the judges as absolutely imbecile, and consequently not responsible for his actions. The supposed imbecile was spared from death, but condemned to witness the execution of his sister, his brother and his step-mother. Nevertheless, fourteen days after this awful spectacle, which might easily have turned a strong brain, we find Bernardino busy in prison providing for his interests. He empowers Virgilio Jacopino Aquilano to look after certain castles belonging to the Cenci which, being outside the Pontifical States, had not been included in the confiscation of the family property. On leaving prison he was exiled from the Papal dominions, and for some years lived miserably enough. But he never ceased memorialising the Pope on the subject of his poverty and generally deplorable condition. He had frequent lawsuits with various members of his family, and eventually recovered a portion of his patrimony. It may here be mentioned that one of the reasons generally accepted for the execution of the Cenci was the desire of the Government to seize their property. Signor Bertolotti, on the other hand, asserts that the Pope was very unwilling to order the trial. He hesitated long, and was only led to the stern resolution at last by a second tragedy in a noble house. This time it was a matricide, and public indignation clamoured for vengeance. It was felt that a great repressive act was necessary, and the hand of the law descended heavily upon the Cenci. But the scandal of their crime touched the honour of many patrician houses, and thus every possibility that could be found in palliation of the deed was eagerly accepted and widely circulated. As to the confiscation of the Cenci possessions, this was accomplished in the usual course of the law. The fact of the accused being allowed, while awaiting trial, to make their wills lends colour to the charitable supposition that there was no deliberate original intention of despoiling them.

In proof that their imprisonment was not, as usually asserted, made a period of great hardship, Signor Bertolotti quotes from the book of their daily expenses. It would appear that they were well attended to and well fed. Some of the items of the meals are given. We find cakes, fruit, fish, salad, *chiarello* (wine largely diluted with water), and snow. Judging from the nature of the food, and especially from the snow,

the prison-cells were not the damp and icy dungeons generally supposed.

In reviewing Signor Bertolotti's evidence it may be conceded that its character is, on the whole, negative. But it is interesting and curious as throwing quite a new light on a celebrated trial. Nor can it be denied that the facts brought forward by our author go far to justify his persistent determination to see in Francesco Cenci a profligate, but no monster, and in Beatrice a criminal whom we should pity rather than a victim whom we should exalt. BELLA DUFFY.

NEW NOVELS.

Proud Maisie. By Bertha Thomas. In Three Volumes. (London: Sampson Low & Co., 1878.)

Through My Spectacles. By "Proavia." In Three Volumes. (London: Sampson Low & Co., 1878.)

So Young, my Lord, and True. By Charles Quentin. In Three Volumes. (London: Tinsley Brothers, 1878.)

Salthurst. By Mrs. Arthur Lewis. In Three Volumes. (London: Samuel Tinsley & Co., 1878.)

THE choice by Miss Thomas, for title-page purposes, of the opening words of one of the most perfect lyrics which Scott ever penned—those single gems which far exceed the worth of his longer and more laboured poems, pure metal though they be—was scarcely a happy one. Madge Wildfire's dying words, if they were to be worked up for the purposes of a story, ought to be linked with tragedy instead of with an ordinary novel of society. And, further, pride is very far indeed from being the heroine's characteristic, since the motive of the story throughout is her hankering after a man who paid her attentions and then married somebody else. Her refusal of all the other gentlemen who propose to her—three in number—seeing that she is quite willing to get anything she can out of them in the shape of amusement or advantage—can scarcely be called pride, and the pleasure she takes in noting the growing unhappiness of her faithless lover's married life with an uncongenial wife, and in triumphing over the latter when she detects her in an intrigue likely to lead on to her ruin, so far from being pride, is the most grovelling kind of mean spite; so that it is not easy to get up much sympathy for Proud Maisie when her rival dies of a fall from her horse, after just failing in an intended elopement, and she hooks the widower. This is not a wholesome type of story, and there is a tendency to walk up and down before the doors of the Divorce Court without quite going in, which makes it no better. Apart from this cardinal and inexcusable defect, the book is cleverly put together, though imitative throughout, and recalling familiar books from stronger pens in many characters and passages. For instance, Von Zbirow, the musical genius, one of Maisie Noel's suitors, is a rather weak study after M. Paul Emmanuel in *Villette*. Miss Thomas is quite capable of better things.

Through my Spectacles, in straining after novelty, has produced only a frigid conceit,

by no means successfully carried out. The idea is that of writing an ordinary society novel projected in the spirit of prophecy into the twentieth or twenty-first century, wherein everything is just the same as at present, except that a somewhat heavy and laboured attempt at satire tells us how, women's rights having been fully conceded for three generations, there are female members of Parliament, Cabinet Ministers, barristers, and superintendents of police, besides the doctors and preachers whom the sex supplies now even under existing restrictions. The army and navy are the only field still monopolised by men, and we are told of an agitation in Parliament, supported by large bodies of Amazon Volunteers out of doors, to abolish this solitary restraint. There is no imaginative faculty whatever displayed in forecasting social or mechanical improvements, for the entire framework of society and government is described as unchanged in form, save for the larger feminine element, which is quite extraneous to the plot, and unhelpful; while the only predicted "new" inventions are the actually long-planned submarine tunnel between Dover and Calais, and a watch constructed to tell the hour by the sense of touch for blind people, a machine purchaseable here in London any time these thirty years at least, even if there were no minute-repeaters in existence to do the work still better. The author has not been able to master the English nobiliary system, and constantly describes a duke's daughter, Lady Eleanor Howard-Brooke, by the alternative title of Lady Howard, and similarly makes a Lord Rufus Sunderfield appear also as Lord Sunderfield and as owning a coronet. The story is clumsily contrived, and uniformly dull, and the only possible breath of twentieth-century air noticeable is in the vocabulary, as there are several words not to be found in current dictionaries, which may perhaps be coined in the future, while an active voice is given to some now passive verbs, such as "glow" for example. But the philological interest of such vocables is not sufficient to redeem the general dullness of the book.

Despite the masculine name on the title-page of *So Young, my Lord, and True*, the book is apparently from a woman's pen, as evidenced by the far greater elaboration and reality of all the feminine characters and their thoughts and doings, and also by a minuteness of detail, which, aided by a smaller and closer type than is usual in novels, makes these three volumes nearly equal in bulk to six of the ordinary pattern. This is a mistake, because it causes a story that has some genuine merit to drag, and inevitably wearies even a diligent reader, who can hardly be expected to go carefully through long conversations which, though sufficiently probable in themselves, do not advance the story or throw any fresh light on the characters of the speakers. One such dialogue, not an exceptional instance, occupies twelve pages without a break, and leaves things exactly where they were at the beginning. There are many good bits in the talk and in the story, but the whole book wants pulling together to make it move properly, since it is not a novel of incident, but of character, and the stages of the plot

lie too far apart. But this is the chief defect observable. Unlike the prophetic work just noticed, it is written in very pure English, the characters are individually well imagined and react on each other as they would probably do in real life, being most consistently worked out, and neither sketchy nor exaggerated. There may be this one objection taken to the account of the heroine's disposition, that, whereas she is depicted as exceptionally frank and high-minded, she has at once recourse to falsehoods when in a serious difficulty, uttering them with fluency and composure, and never afterwards seems to have entertained a scruple on the subject; whereas a woman of such a type, though she might very possibly yield to the temptation at the moment, would despise herself bitterly then and subsequently for her weakness. The author has displayed no little courage in the ending of the story, which is not such as readers commonly expect, but is all the more true to life for that very reason.

Salihurst is written with no little skill, and has more of the character of French art about it than of English, both in the situation and the descriptions. That is to say, although the framework of the story is English throughout, and not even imaginable as foreign, yet the main motive of the plot belongs to a class of incidents which has been far more subtly and variously elaborated by French novelists than by those of any other nation, and their influence is clearly visible in the treatment. There is, consequently, not a little skating on very thin ice indeed, a peculiarity which this tale shares with its predecessor, *The Master of Riverswood*; but the ice, though marked "Dangerous," never does quite give way under the feet, rather because of the tact which shifts at once from the perilous spot than because the danger is really less than it looks. The misunderstandings and cross-purposes which bring about the trouble of the story seem its weakest part, as they are unreasonably blind and perverse; but there are several vigorously drawn characters and telling episodes. The actual hero is rather vague and colourless, save in his love-making; but his elder brother, and that brother's low-born and ill-assorted wife, stand out boldly on the canvas, as also does the heroine's husband, whose many good qualities do not make him a pleasant companion for life. A shipwreck near the close of the last volume is particularly well told, and reads more like a personal experience than a compilation, however painstaking, from the reports of others.

RICHARD F. LITTLEDALE.

CURRENT LITERATURE.

THE first number of the *Revue de Droit International et de la Législation Comparée* for 1878 has just appeared. This Review has now reached its first *decennium*, and it continues to maintain its high character under the editorship of M. G. Rolin-Jacquemyns of Ghent, the able secretary-general of the Institute of International Law. The present number (Tom. x., No. 1) contains two very important articles, one of more immediate interest, being a comprehensive survey of the international relations of the European Powers since the termination of the Conference of Constantinople, *rebus infectis*, on January 8, 1877. This article is from the pen of M. G. Rolin-Jacquemyns himself, and is the third of a series of essays on the Eastern Question, one of which, entitled "La Conférence de Constantinople et ses suites," has been published in a previous number of the Review. The second article, of more permanent interest, is entitled "A Study of a Publication from the pen of Professor Bluntschli of Heidelberg, Vice-President of the Institute of International Law," and it is the continuation of an article in the number immediately preceding, entitled "On the Right of Booty in General, and especially on the Right of Maritime Prize." The details of the first article will be found useful to diplomatists as well as to students of International Law. Its author is disposed to consider the attitude taken up by England on the subject of the treaty of 1856 as too rigid, and that the provisions of that treaty, affirming the independence and the integrity of the Ottoman Empire, were intended as means to a given end, which the treaty has failed to secure, and not as objects to be pursued for their own sake at the sacrifice of the interests of humanity and of European peace. His desire is that England should take a broad view of the treaties of 1856 and of 1871 in their bearing upon the general interests of humanity and of Europe, not sacrificing, indeed, any vital interest of her own, as laid down by her at the commencement of the war. The article is necessarily a little behind the present state of the question. It advocates the early assembling of a Congress, and hopes that the Great Powers, which are not so immediately interested in the details of the earlier treaties, will exercise a moderating influence over the counsels of the Congress. The second article, which announces itself as a study of a publication from the pen of Prof. Bluntschli, we presume to be a free translation into French of a work entitled *Das Beuterecht im Krieg und das See-beuterecht insbesondere*, 1878, in which the learned Professor has set forth the history of military booty and maritime prize from a very early period, tracing the history of the latter down to the Declaration of Paris of 1856, and encouraging nations to march onward, and to renounce altogether the belligerent practice of capturing enemies' merchant ships and their cargoes on the high seas. There could not well be found a more learned or a more competent advocate of the proposed change in the law of maritime capture than Dr. Bluntschli, whose work on *International Law Codified* has a well-earned European renown; and the reader may feel assured that the most forcible arguments in favour of the proposed change have been presented to him in the present article. But Dr. Bluntschli assumes, in accordance with the influential teaching of a modern school of international jurists, that war is to be regarded as a contention between Governments, not between nations, and that the private property of individual citizens, as distinguished from the public property of States, should be exempt from capture upon the sea, equally as much as it is exempt from plunder upon the land. The latter fact, we regret to say, although it has been often assumed in theory by modern text-writers, has been negatived in practice by the startling realities of human suffering which have tarnished the crusade of Russia against the Crescent. It may be said that the atrocities of that recent war have happened *invito Marte*, but nevertheless it is calculated that at least 500,000 human beings have perished, as it were, in the track of the armies, and their homes have been devastated, while, according to the modern theory of belligerency, they had no concern in the war. We fear, therefore, that it cannot be assumed as a fact that war upon land spares private property any more than life itself. Dr. Bluntschli is constrained to admit that the military question in the case of an island-State may justify the capture of enemies' merchant vessels to prevent invasion, and this we conceive to be the "Gordian knot" in the question of maritime warfare, which no juridical subtlety can untie. The interest is not simply an English interest, nor is it simply a European question;

for how shall Japan defend herself against a great continental Power of Asia like China, any more than Great Britain against a great continental Power of Europe like France or Germany, unless she may rightfully anticipate invasion by capturing the merchant vessels and merchant seamen of the enemy, and so deprive him of his locomotive means of attack? Dr. Bluntschli does not close his eyes against this practical difficulty, and he suggests that in such cases a belligerent Power should content itself with sequestering the enemy's vessels and their cargoes during the war, and should not confiscate them as prize. This opens out a new view of the question, which may admit of reasonable discussion, as its effect would be, not to cripple the defensive power of an island-State, but to vary the ultimate incidence of the losses which war entails on the weaker party. Our space precludes us from saying more than that the treatise of Dr. Bluntschli well deserves the attention of the older school of jurists who adhere to the teaching of Grotius, and that the island-States may fitly depute a champion to break a lance with him on this new phase of the subject of maritime prize. An article by Dr. Bulmerincq on "International Regulations for the Transport of Goods by Railway" concludes the number.

Leben des Generals Clausewitz und der Frau Marie von Clausewitz, geb. Gräfin von Brühl. Mit Briefen, &c., &c. Von Karl Schwartz. (Berlin: Dümmler.) Clausewitz is known to our public by his strictures on the Duke of Wellington's generalship in 1815, to which the Duke, *praeter solitum*, vouchsafed the honour of a reply. He stands in the highest rank of literary strategists, and his historical and critical estimates of the campaigns and methods of great commanders have not been without influence on the recent German developments of the art of war. His career was uneventful: his correspondence throws singularly little light on the great transactions of which he was cognisant, and that little his present biographer has turned to darkness. The new information given is an amazing minimum, the most readable and instructive parts of the work, where Clausewitz himself does not speak, being quotations from previous authors, which are fortunately rather frequent. The author's real strength seems to lie in the *Almanach de Gotha*, for in proportion to his feebleness as a biographer and historian, he is powerful and explicit as to every individual of the "old nobilitie" with whom the general ever came into contact, parents, brothers, wives, sons, sons' wives, being all conscientiously described. In the Jena campaign Clausewitz was *aide-de-camp* to Prince Augustus of Prussia, and like the Prince had to surrender after the rout on the Ucker. The prisoners were provisionally allowed to reside in Berlin, and afterwards, by Napoleon's directions, proceeded to France, where the Prince was offered a choice of towns for his residence. He selected Soissons, where his Highness and his adjutant prosecuted their professional studies, drew up schemes of Prussian military reform, and studied the manners and language of their Patmos. Some new memoirs and letters show in Clausewitz fine powers of observation, and a high capacity for philosophical thought. It is interesting to note the impressions which Prussian military men of his stamp brought from the rout of Jena and Auerstädt. Like most of the officers of his generation, Clausewitz saw in the catastrophe of 1806 a military incident whose consequences could be certainly, perhaps easily, repaired. At the peace of Tilist the House of Brandenburg suffered such a collapse as had not been inflicted on any great Power since the days of the Gaugamela, but the civil and military advisers of the Prussian Darius were, with a few exceptions, inaccessible to dejection or despair. Ranke's recent work shows how, when Hardenberg retired to Riga from Napoleon's vengeance, he drew up plans of reform and reconstitution for the monarchy

as confidently as if the French had never crossed the Elbe: old Blücher went about asserting that it was his destiny to lead his sovereign to Paris, a prophecy which twice came true. Clausewitz, less enthusiastic and more theoretical, analysed the late French successes, and traced them to accidental causes, which, he said, must soon cease to operate, whereupon the Germans would recover their superiority as a fighting nation. With respect to the military spirit of the French, writes Clausewitz, vast exaggeration prevails. Every branch of the administration bears the military stamp, but this does not make a people warlike. The conscripts are brought to the prefectures thirty or forty in a batch, tied two and two, which does not look like enthusiasm. The real successes of the French armies have arisen from the superior talents of their generals, especially of the Emperor.

"As soon as Bonaparte is no longer here, and the specific military superiority, which does not exist in any other shape, has vanished, the German and French nations will stand together for direct comparison, and then the moral proportion of the two will be plainly seen, and will define the political."

Clausewitz goes on to remark that the idea of calling the French a particularly warlike people is something new, and that it is inconceivable how on the strength of ten victorious years they should have been able to usurp such a reputation and extend it to their whole previous history. The words "glorious" and "victorious" do not apply to their wars with the English and in Italy in the fifteenth century, with Charles V. and Philip II. in the sixteenth, or to the War of the Spanish Succession in the eighteenth century. In the Thirty Years' War they did not play a brilliant part; in the War of the Austrian Succession they had three victorious campaigns under a German general, which were balanced by six unfortunate campaigns in the Seven Years' War. Looking at all this, it is clear that the French have no military glories to show but those of the epoch of Condé, Turenne, Luxembourg, and Vauban; and the antecedents of a long history entitle the Germans to much more confidence than the French should feel on the strength of a short victorious career. It is interesting to compare these observations with Dr. Arnold's admirable discussion of the question "whether history justifies the belief of an inherent superiority in some races of men over others, or whether all such differences are only accidental and temporary; and we are to acquiesce in the judgment of King Archidamus, that one man naturally differs little from another, but that culture and training make the distinction."

Arnold proceeds to say that the experience of 1796 to 1809, and of 1806, might seem to justify a belief in the military superiority of the French over the Austrians and Prussians;

"yet in the long struggle between the Austrian and French monarchies the military successes of each are wonderfully balanced; in 1796 while Napoleon was defeating army after army in Italy, the Archduke Charles was driving Jourdan and Moreau before him out of Germany; and Frederick the Great defeated the French at Rossbach as completely and easily as Napoleon defeated the Prussians at Jena."

Several of the battles of 1813 might be quoted in support of this argument, which is not weakened by the facts of the French campaign against the Austrians in 1869, or the results of the war of 1870.

Paris Universal Exhibition of 1878: Handbook to the British Indian Section. By George C. M. Birdwood, C.S.I. (Officer of the Royal Commission.) Under the guise of a handbook to the Indian Court, which occupies such a conspicuous place in the Palace of the Champ de Mars, Dr. George Birdwood has presented us with a little treatise of permanent value, on the arts, industries, and trade of India. Handbook in the strict sense of the term it is not. The visitor, or the intending visitor, will look in vain for a catalogue of the exhibits, or even a ground-plan of the building;

but he will find instead what ought to be of infinitely greater interest—a magazine of information, contributed from a richly-stored mind, concerning the industries of our great dependency in the past and at the present time. It is Dr. Birdwood's especial merit to combine the knowledge gained by a lifelong service devoted to India with that hereditary sympathy with native modes of thought which can only be expected from an Anglo-Indian born and bred. Interspersed throughout these pages are elaborate pictures of native life, in the quiet village and in the busy town, intended to illustrate the social conditions amid which Indian handicrafts have reached their degree of excellence. To some readers these charming scenes will constitute the chief attraction of the book. But its real value lies in the full discussion which the writer has bestowed upon two aspects of his subject-matter, on which he is entitled to speak with authority. The earlier chapters contain a summary of all that is known about the course of Indian trade from the earliest dawn of history; through the later sections there runs a continuous undercurrent of protest against the debasing influence which the example of European designs and the ill-regulated competition of our market are now exercising upon Oriental workmanship. The historical discussion fairly bewilders the reader with the profusion of its facts, dates, and suggestions. The Bible, Homer, Arrian, Pliny, the hieroglyphics of Egypt, and the cuneiform inscriptions of Assyria are all laid under contribution, and each made to throw a light of illustration upon the rest. As we are inclined to doubt not a few of Dr. Birdwood's innumerable derivations, so also we must be allowed to feel some scepticism about the superstructure of theory which he raises upon his vast collection of quotations. We may accept his views generally on the prehistoric wealth of the Indian peninsula, without pledging our faith to the submerged Lemurian continent, "the Indo-Germanic shore," or the statement that "as sure as the fall of a plummet the commerce of the future between India and Europe will gravitate to a line" passing across the Caspian Sea. Dr. Birdwood's opinions regarding the decline of Indian art and manufacture, though no less original, are deserving of more careful consideration. The swamping of the indigenous trade of weaving by the importation of Manchester cotton-goods, the recent establishment of steam factories in the Bombay Presidency, the imitation by native artisans of European patterns, the demand for cheap Indian goods in the English market—all these, according to Dr. Birdwood, are so many stages in the process by which the original abundance and excellence of Indian handicrafts have been gradually destroyed or debased in recent times. But a century ago India was known as the busy centre of manufactures which not only supplied her own wants, but exported largely to the rest of Asia, to Africa, and to Europe. Judged by the trade returns of the present day, she has become simply a tropical forcing-house for the cultivation of raw products. Excepting the three presidency capitals, which are to a large extent merely depôts for the collection and shipment of these raw products, the many large towns and cities once scattered throughout the country have gradually fallen to ruin or sunk into little villages, where all the operations of husbandry are conducted in the grass-grown streets. During a century of British rule the urban population, supported by manufactures, has dwindled away, while those handicrafts which remain have lost their original grace of design and honesty of workmanship. It is in this connexion, and in this connexion only, that we can adopt Dr. Birdwood's sweeping assertion: "Undoubtedly the period of the East India Company's sovereignty and monopoly, from 1757 to 1833, was the happiest India ever enjoyed since the time of the supremacy of Buddhism under the Maurya dynasty." We have touched upon only a few out of the many topics of interest

which this handbook suggests. It may probably be attributed to the haste with which it was compiled, as much as to the encyclopaedic character of its contents, that there are a few inaccuracies affecting those provinces of India of which the writer may be presumed to have a less intimate knowledge than he has of Bombay. The value of the whole is enhanced by statistical tables, compiled from the Blue Books annually issued from the India Office; and a brief monograph on chin-chona cultivation.

NOTES AND NEWS.

A SMALL volume will be published next week by Messrs. Simpkin, Marshall and Co., entitled *Characteristics of Leigh Hunt*. We are informed that the author, a gentleman resident in the north of England, who writes under the *nom de plume* of "Launcelot Cross," had the privilege, in his youth, of corresponding with the genial essayist and poet, and has retained his admiration of him. The object of the volume is to present to those unacquainted with Hunt's writings his special characteristics; these the author finds admirably exemplified in that delightful *omnium gatherum* of fancy, beauty and wisdom—*Leigh Hunt's London Journal*, 1834-35, which the writer considers a typical literary miscellany. It may not be generally remembered that Christopher North, who at one time was a bitter political antagonist of Hunt's, and allowed that antagonism to blind him to the merits of Hunt as a writer, had the manliness in later years to make this very graceful *amende*, on the appearance of the *Journal*:—

"The animosities are mortal, but the humanities live for ever. . . . Mr. Hunt's *Journal* is not only beyond all comparison, but out of all sight, the most entertaining and instructive of all the cheap periodicals; and when laid, as it duly is, once a week, on my breakfast-table, it lies there—but is not permitted to lie long—like a spot of sunshine dazzling the snow."

MR. JAMES DUGUID MILNE has compiled a series of tables (Aberdeen: Brown) to illustrate the curriculum of Aberdeen University, as compared with the course of studies at Oxford and Cambridge. His object, apparently, is to suggest that the preliminary examination proposed by the Scottish University Commission should permit students to begin their academical career without any knowledge of the classics.

THE Secretary of State for India has signified his approval of a scheme by which selected candidates for the Indian Civil Service may pass their period of probation at the University of Aberdeen under supervision in the house of one of the Professors.

ON Monday next a sale will take place at Messrs. Sotheby's of the "Hayley Papers." Foremost among them we would name thirty-four letters, unknown and unedited, from the poet Blake; and five remarkable letters from Lady Hamilton. In one of these she represents Nelson as saying, "If there were more Emmas there would be more Nelsons." The bulk, however, of the collection is of special interest to anyone who might contemplate a new Life of the poet Cowper. There are very numerous letters from him, from Hayley, and from Lady Hesketh, which the late Mr. John Bruce considered of great value.

At a meeting of the Committee of the Index Society on Tuesday last it was announced that an Index to Dugdale's *Warwickshire* had been undertaken by one of the members. It was proposed to compile from the official Calendar an Index of such Englishmen, Scotchmen, and Irishmen as have matriculated at the University of Leyden. Such a list would be of great value as containing the names of a large number of our worthies who sought an education abroad. A useful companion to this would be an Index to the Padua Registers, but it is feared that these may not be so available. Reprints of the excessively rare list of those who

subscribed to the defence of the country against the Spanish Armada; and of the Lists of Justices of the Peace printed in 1650 and 1660, were also suggested.

THE murder of Lord Leitrim, and the re-opening of the question of landlord and tenant in Ireland, have suggested to Mr. A. M. Sullivan, M.P., a new chapter of his work on *New Ireland*. The "new chapter" will appear in the forthcoming issue of *Mayfair*.

THE first Hibbert Lecture, *On the Perception of the Infinite*, delivered by Prof. Max Müller on April 25, and published in the *Contemporary Review* of May, has appeared in German in the *Deutsche Rundschau*, and in Italian in the *Nuova Antologia*.

SIGNOR ANGELO DE GUBERNATIS delivered three lectures on Manzoni, at the Taylor Institution at Oxford, on Monday, Tuesday, and Wednesday last. Though the lectures were delivered in Italian, there was a fair audience. Signor De Gubernatis is well known in England by his *Zoological Mythology*. He is Professor of Comparative Philology at Florence, and ranks among the best writers of prose and poetry in Italy.

WE regret to hear of the death of the Rev. Charles Arnold, one of the Masters at Rugby, who for many years has been known and loved by all Rugbeians. After undergoing a painful operation, he went to Italy, having apparently quite recovered his health. He died on the 12th, of fever, at Rome.

MR. W. B. SCOTT has declared his intention of some day giving to the British Museum his two unique leaves of W. Wager's *Cruell Debtor*, to accompany their unique fellow-leaf in the Bagford Collection there. Mr. Russell Martineau has lately identified two leaves in another volume of fragments in the Museum, as part of an unknown edition of the old play of *Hickscorer*, intermediate in date between the unique copy of Wynkyn de Worde's edition in the British Museum and the unique copy of Waley's edition in the Bodleian.

PROF. DELIUS is lecturing in Bonn on Shakspeare's last play, *Henry VIII.*, part of which Mr. Spedding, Mr. Tennyson, and Mr. Browning, followed by the Cambridge editors and the leading members of the New Shakspeare Society, give to Fletcher. Prof. Delius intends to combat this somewhat formidable host, and, though a foreigner, to maintain that the earlier English critics who assigned the whole play to Shakspeare were better judges of style than the later ones who recognise Fletcher's hand in it.

THE publishing firm of Messrs. Brigola, of Milan, is about to bring out, among other works of fiction, a romance by Verga, which will be the first of a series treating of social subjects. The experiment is a novel one in Italy, and will not be devoid of interest, especially as Verga is a writer of some realistic poems. The same firm is also issuing the third edition of Prof. Mantegazza's *Elements of Social Science*.

THE second volume of the *Annals of the Building of the Duomo*, an interesting work for students of art criticism, will also be shortly forthcoming.

THE Socialistic press of Germany boasts no less than seventy-five publications, with 135,000 subscribers: an increase of eighteen in the number of the papers since last year.

THE libraries of Berlin and Munich have refused to buy the original MSS. of Schiller and Goethe's correspondence, which were offered to them for 4,000 thalers. To save the collection from being broken up or bought by foreigners, the publishing firm of Cotta in Stuttgart has secured it.

ON May 16 an exhibition of books, periodicals, music and maps, which are to give a faithful picture of modern Bohemian literature, was opened at Prague.

NICOLA ZANICHELLI, of Bologna, is preparing a translation by Giuseppe Chiarini of Heine's *Atta Troll*, with a Preface by Carducci, and notes by Prof. Karl Hillebrand.

IGNAZIO GALEATI AND SONS, of Imola, are printing two comedies of Plautus, translated by Giuseppe Finali, ex-Minister of Agriculture, with a Preface in the shape of a letter to Quintinio Sella, ex-Minister of Finance; some *Rhymes of Bernardo Bellincioni*, printed for the first time from the original MS., and annotated by Pietro Sanfani; the history of *Caesar Borgia and his Times*, supplemented by many hitherto unpublished documents, by Odoardo Alvisi; the Report of the Romagna branch of the Commission for Italian History—a commission which is appointed by each province in Italy to collect materials for a general history of the country.

THE Aramaic dialect spoken by the Jews of Kurdistan and Urmiyah has already formed the subject of a paper by the Rev. Albert Löwy in the *Transactions* of the Society of Biblical Archaeology. At the meeting of the society held on May 7, Mr. Löwy communicated a translation of two stories containing traditions current among the Jews concerning the object of the cuneiform inscriptions. Whether, however, they can fairly be called "Folk-lore" will probably be doubted by our readers, as two of them merely give expression to the fancy of the natives that Europeans explore the cuneiform records with magic aid from greed of gold, and the third states a legend, without any tincture of mythology proper, relating to the grave of a local Rabbi called Abraham. The philological portion of the essay will undoubtedly prove of more scientific value. It treats of the position which the Kurdo-Jewish dialect holds among other Aramaic dialects, and shows the influence of the fortunes of the people in the large reinforcement of the vocabulary from Kurdish, Persian, Arabic, and Turkish sources.

THE *Theologisch Tijdschrift* for May opens with a very careful paper on the animal-worship of the Egyptians, by Prof. Tiele, which we should like to see published in an English dress in the *Transactions* of the Biblical Archaeological Society; a collection from various sources of emendations on the text of the Psalms, by J. Dyserinck; a further paper on Hexateuch-criticism, by Prof. Kuenen (referring this time to Deut. xi., 20, 30, xxvii., Josh. viii., 30-35); and articles on Nippold's account of the Ultramontane movement in Holland, on Drummond's *Jewish Messiah*, by Prof. Oort (written in too blunt a style, but, on the whole, favourable), and on Wellhausen's edition of Bleek's *Einleitung* to the Old Testament.

BISHOP COLENZO has published, through Messrs. Longmans, a critical examination of an important recent treatise of Wellhausen on the composition of the Hexateuch (the Pentateuch and Joshua). Those who have not access to the *Jahrbücher für deutsche Theologie*, in which Wellhausen's papers appeared, will do well to procure the bishop's pamphlet, which contains, in that cross-examination style to which he has accustomed us, a detailed statement of his author's views (so far as the first two papers in the *Jahrbücher* are concerned), together with his own estimate of them. He has been led by Wellhausen's example to separate the parts of Exodus, &c., due to the "Second Elohist" from those due to the Jehovist in what he calls the "Original Story." He has also been stimulated by an article of Dr. Kuenen's in the *Theologisch Tijdschrift* for September, 1877, to seek for some definite results with regard to the supercriptions and subscriptions in Joshua. It is noteworthy that the bishop still maintains the view that a "First Elohist" was the oldest writer of the Pentateuch, and had nothing to do with the later Levitical legislation; and that his work was early supplemented by a "Second Elohist," and, soon afterwards, much more largely by "the Jehovist."

WELLHAUSEN's revised and in some parts re-written edition of Bleek's well-known *Introduction to the Old Testament* (Berlin: Reimer) needs no commendation. We only regret that he has not more attended to the counsel *suaviter in modo*.

STUDENTS of Spanish and Portuguese literature will be glad to hear of the approaching completion of the catalogue of the Ticknor collection in the Boston Public Library, compiled by the Assistant-Superintendent, Mr. J. L. Whitney. In 1871 Mr. Ticknor's bequest—3,760 printed volumes and many MSS. and pamphlets—was added, as a separate collection, to the library. Other books have been purchased since with the income of a fund of 4,000 dollars bequeathed by Mr. Ticknor, and increased to 7,000 dollars from the reserved fund of the library, and the collection now numbers about five thousand volumes. "No single library in Spain" (we quote from a Report) "possesses all the books it contains. The only collections of equal value are the great Spanish library in the British Museum, and the private collection of Lord Holland." The catalogue, upon which Mr. Whitney has been engaged for six years, will contain full entries of works under the authors' names, with bibliographical notes—many from Mr. Ticknor's MSS.—and cross references under subjects and titles. Transactions of societies and periodical publications have been analysed and indexed, and to each of the more important titles the compiler has subjoined full and admirable notes concerning the writer and his subject, with references to illustrative works in other languages. It is hoped that the volume, a handsome quarto of 400 pages, will be ready this year. We may add that in the year 1876-77 1,140,572 volumes were issued to readers in the Boston Public Library, which is open from nine to nine to any person over fourteen years old, and that the arrangement, the catalogues, and the courtesy and promptness of the officers leave nothing to be desired.

IN the *Revue Historique* for May M. Mercier discusses the historical importance of the Battle of Poitiers (732), and points out the exaggeration of the statement that it saved Christendom from Islam; he traces the causes of the cessation of Mohammedan invasion to the disturbances in Africa itself, which cut off the flow of invaders, the perpetual supply of fresh soldiers, which was the secret of the Arab successes. M. Léger translates some letters of Charles de Zerotin, a Bohemian who was in the camp of Henri IV. during the siege of Rouen in 1592, and who gives an account of the progress of the operations. M. Destrem has collected from various archives a number of documents bearing upon the banishments for political offences decreed by the Consular Government by the Act of 19 Brumaire. M. Duruy publishes, from MSS. discovered by him in Rome, the Bull of Pope Paul IV. against the Colonna family, which does not exist in any of the published collections of Papal Bulls.

THE *Rivista Europea* has the beginning of an exhaustive study, by Signor Beltrami, on Camillo Porzio and his history of the conspiracy of the Neapolitan barons against Ferdinand I. The beginning of an article on the life of Edgar Poe is another token of the great interest which that writer has inspired among the Latin nations.

THE annual assembly of the Allgemeine Schweizerische geschichtsforschende Gesellschaft will be held this year on August 5 and 6, at Stans in Unterwalden. Two volumes will then be ready for distribution, the *Jahrbuch* for 1873, and the second volume of the *Quellen zur Schweizergeschichte*. The society's *Jahrbuch* will contain, among other matter, an essay by Prof. A. Stern of Bern on the relations of the Protestant Cantons of Switzerland to Charles I. of England, Archbishop Laud, and other English statesmen and divines of the middle of the seventeenth century. M. G. Monod of Paris contributes a paper on the home

and the work of Fredegar Scolasticus. A young German scholar, a pupil of Dümmler, writes on the Alpine Passes in the Middle Ages. The new volume of the *Quellen* will contain the reports from Switzerland to the Republic of Venice by the Venetian ambassador Giovanni Battista Padavus. A short biography of the author, prepared by the editor of the documents, Victor Cérésolo, consul in Venice, will serve as introduction. The whole volume is already in print. The third volume of the *Quellen* will contain the documents and cartularies of the monasteries of All Saints at Schaffhausen, Rheinau, and Muri.

KARL LEONHARD MÜLLER, the venerable student of the history and antiquities of the Canton of Uri, has just issued at Altdorf a new work upon Wilhelm Tell. It is entitled *Der Landsgemeindebeschluss vom Jahr 1387: Eine Urkunde für Wilhelm Tell's Existenz*. The document cited by Müller has already notably given occasion to comprehensive researches and enquiries on the part of several Swiss historical scholars, especially of Prof. E. Kopp, Prof. A. Lütolf, and F. Hisely, all of whom combat its authenticity, and violently shatter the entire tradition of Tell and the liberation of the three Forest Cantons. The new advocate of Tell is fully aware that he is undertaking no light task when he endeavours to confute such weighty authorities; but the arguments brought forward by him, although not convincing, cannot be denied the possession of a scientific and historical foundation, and the essay certainly deserves to be read.

WE hear of a forthcoming commentary on Spenser's *Faerie Queene* which claims to catch, for the first time, the clue to the political meaning of the poem, and to show its rebuke, as well as its praise, of Queen Elizabeth.

WE have much pleasure in recording the election of the Rev. W. W. Skeat to the recently-founded Professorship of Anglo-Saxon at Cambridge.

NOTES OF TRAVEL.

THE latest part of the *Journal* of the Geographical Society of Berlin (No. 74) brings a most important contribution to physical geography and meteorology in the form of a large-scale rainfall map of Europe, by Dr. Otto Krümmel. Though the rainfalls of special parts have been studied and mapped out at various times since Heinrich Berghaus first sketched out the main features of the distribution of rain in Europe in his physical atlas, no one has, till now, attempted to combine more recent data into one large map of this division of the earth. Dr. Krümmel, having marked out the lines of equal annual amount of fall for intervals of centimètres, has tinted the spaces between these in shades of increasing depth of colour for the greater amounts, and has succeeded in giving a most distinct representation. The zones of maximum seasonal fall in winter, spring, summer, and autumn, are also marked out on the chart. The same number contains a study of the changes of level and outline which are in progress in the coasts of the Mediterranean, by Dr. Theobald Fischer. The corresponding parts of the *Proceedings* of this society contain a description of the various projects for canals through the central American isthmus, and their relative merits, by M. W. Erman, and an interesting account of an ascent of the volcano of Cotopaxi from Quito by Freiherr M. v. Thielmann in January of this year. The ascent, which was accomplished in 6 hours 15 minutes, proved to be much easier than was anticipated.

IN June 1876, Mr. L. H. Mitchell, a mining engineer attached to the Egyptian staff, was sent to Massowa to study the geology of the country between the Red Sea and the Abyssinian plateau. He accomplished an exhaustive reconnaissance of the line between Massowa and Gura, and next year set out to explore the country about the hot-

springs of Ailet and between the sea and Sanhilt, when he was captured by the Abyssinians, and carried off prisoner to Adowa. An interesting Report of his proceedings and adventures in Abyssinia, accompanied by a valuable map of his routes, has just been issued from the printing-office of the General Staff at Cairo.

M. PAUL SOLEILLET, who is known through his journeys on the Algerian Sahara, left Bordeaux on March 20 for St. Louis on the Senegal, intending to undertake a great journey thence to Timbaktu, and from that to In-Salah and Algiers. The projected journey will occupy about two years, and is planned to further the opening of the markets of the Sudan to Algerian trade, and to draw the caravan traffic, which now passes by way of Morocco and Tripoli, to the French colony. M. Soleillet intends to make a preliminary tour from Bathurst to Pisanía, Bondu, and Medina, and thence back by the Senegal river.

M. BINET-HENSCH of Geneva, at the request of the Swiss Alpine Club, has drawn up an Itinerary of the Bernina district, which has been selected by the club as its specific field for excursions during the coming summer. The author has worked out a truly valuable topography of the Upper Engadine, an Alpine region through which he has travelled every year without intermission for the last twenty-two years, and which (as he says) has always exercised and still exercises an irresistible fascination over him.

News has been received by the last mail from Zanzibar that, as soon as intelligence of the murders of Lieut. Shergold Smith and Mr. O'Neill reached the Rev. C. T. Wilson at King Mtesa's, he at once retired to Unyamwezi, the ruler of which is well disposed to foreigners, instead of remaining in Uganda, as the Church Missionary Society expected.

IN addition to Prof. Bryce's address on Armenia and Mount Ararat, and Capt. F. J. Evans's "Lecture on the Magnetism of the Earth," the new number of the Royal Geographical Society's *Proceedings* contains several papers of more than usual interest. Among the "Additional Notices" we find a letter from Capt. the Hon. G. Napier, furnishing barometric and hypsometric observations to fix the height of Mount Demavend, a subject on which there appears to be much diversity of opinion. Next we come to Mr. A. Goldie's account of his journey in the interior of New Guinea from Port Moresby. This is followed by Mr. St. Vincent Erskine's remarks on the line of inland telegraph suggested in the African Exploration Committee's Circular, a paper which has been communicated to the society by Sir Bartle Frere. Mr. Erskine's observations will merit consideration, as he is an experienced African traveller, and well known for his discovery of the mouths of the Limpopo and his travels in Gaza Land. The most important contribution, however, from a geographical point of view, is Col. Mason-Bey's report of a reconnaissance of Lake Albert, undertaken by order of Col. Gordon. From a note appended to this paper, it appears that Sir Samuel Baker calls in question the accuracy of Col. Mason's determination of the latitude of the SW. and SE. corners of the lake; and he maintains that the southern end of the lake lies much further south than 1° 11' and 1° 22' N. lat. As Col. Mason is a man of high scientific attainments, it will be interesting to see what he has to say by way of rejoinder.

WE hear that Captain Burton is so satisfied of the wealth still existing in the mines which he recently inspected in Midian that he intends to recommend the Khedive to allow him to form a company in England for the purpose of working them. Among the riches of the region which Captain Burton has examined, may be mentioned gold, turquoise, and pearl oysters.

THE Government printer at Calcutta has just issued the General Report of the operations of the

Marine Survey of India for the year 1876-7, prepared for submission to the Government of India by Commander A. Dundas Taylor, late I.N., the superintendent of the Survey. The Report is accompanied by an Index Map, showing the surveys completed, together with sheets published or in course of publication, and among the appendices will be found valuable notes by Dr. Armstrong on some birds collected in the eastern or Rangoon district of the Irrawaddy Delta.

THE GREAT GLOBE IN THE LYONS LIBRARY.

CONSIDERABLE attention has been lately attracted to the large globe which has been in the possession of the town library of Lyons since 1701. It had become known that it furnished information agreeing in the main with the discoveries of modern explorers, and the Geographical Society of Lyons in consequence recently appointed a special commission to enquire into the origin of the globe, the scientific documents on which it is based, and other cognate matters. They have just issued a preliminary Report of the results of their investigations, of which the following are the leading features:—The globe, it appears, was constructed in 1701 by Henri Marchand (known as Père Grégoire), a celebrated mechanician of Lyons, with the assistance of the Venetian Contadini, a pupil of Nolin, and belongs to the Flemish cartographical system. Speaking generally, it reproduces the data of the maps of Huterius (1546), Frisius (1540), Ortelius (1570), Mercator (1613), and Hondius (1631), as shown in the best editions of Blöeu and Janson, but it corrects the greater part of the geographical projections, fixes positions previously uncertain, and furnishes, in addition, a considerable amount of information, much of which was important and unknown to the earlier geographers. The globe, in fact, embodies all the best information of the geographical school of the sixteenth and seventeenth centuries; it is, moreover, a solemn protest against the privileged heresies of the famous Guillaume Delisle, the geographer of Louis XIV., who, however, eventually succeeded in imposing upon posterity his own maps, in which chimerical hypotheses and blanks took the place of the precise information furnished by the cartographers of the previous century. These considerations, in addition to the great rarity in these days of the maps to which Marchand was indebted for his information, have induced the Commission to cause the surface of his globe to be reproduced in a series of maps.

In investigating the details of the globe, the Commission naturally take Africa first. In the midst of incoherences and strange errors, due to the preconceived opinions of the school, it is easy, they say, to distinguish the great geographical lines to be the same as our actual knowledge now teaches us that they are, and this is especially the case in three particulars—viz. the equatorial reservoirs of the Nile, the Congo having the same direction as Stanley assigns to its course, and the Zambesi running according to Livingstone's showing. After very careful research, the Commission think that the Flemish engravers, and Marchand later on, probably derived their data from the following sources among others:—The *Description du Congo*, by Pigafetta (1592); the *Historiale Description de l'Ethiopie* of Dom Francisco Alvarez (1558); the *Afrique* of Léon l'Africain (1556); and ancient maps—of these they enumerate twelve—which appear to have had some influence at the period in question.

In the complete account of their investigations which will be issued hereafter, the Commission propose to state to what extent the various documents they allude to have contributed to the composition of the Flemish maps. They will also furnish an essay on the travels (whether known or unpublished) which from the tenth century contributed to the progress of the African geography of the Middle Ages and the Renaissance.

Among the unpublished works which will be consulted, we may mention the following:—*L'Expédition de huit dominicains de Montpellier aux Sources du Nil* (1317–1350); *L'Expédition du Catalan Ferrer*, en 1346; *L'Exploration du Hollandais Jean de Herder, dans le pays Akkas; El Derrotero desde Lisboa al Cabo de Buena Esperanza y India Oriental*; *La Description du Congo*, par Martinus Abarca de Boléa et Castro (1601); *Le Livre Universel des Navigations du monde* (1590?); and *Le Voyage du Belge Pierre Fardé, d'Alger au Congo* (1686).

THE BRITISH MUSEUM.

THE account of the income and expenditure of the British Museum for the financial year ended March 31, 1878, has just been issued. It is accompanied, as in previous years, by a return of the numbers of visitors, a statement of the progress made in the arrangement of collections, and an account of the different objects added during the year.

The number of visitors has greatly increased of late years. In 1872 the persons admitted to all collections numbered 548,404; last year they numbered 699,511. The number of readers has increased during the same period from 105,006 to 113,594. The Gold Ornament Room seems to have gained most in popularity; in 1872 it had but 5,925, in 1877 there were 21,054 visitors.

The most important acquisition to the Department of Printed Books has been a copy of the great Chinese Encyclopaedia known as K'in Ting Ku Kin T'u Shu Tsih Ch'eng, of which a full account was given in the ACADEMY of February 9.

To the series of specimens of early typography great additions have been made—upwards of 100 works printed in the fifteenth century, and many rare books of the sixteenth century having been acquired. These include a magnificent Missal for the use of the Diocese of Trèves, printed on vellum, probably about the year 1480, the musical notes being inserted by hand on red printed staves; a rare edition, printed at Burgos in 1488, of the code of Spanish law compiled by A. Diaz de Montalvo, at the instance of Ferdinand and Isabella, and afterwards known as the “Ordenanças Reales;” a copy of the Mentz Missal, printed by Schoeffer in 1483; a rare work, printed at Barcelona, entitled *Comentaria Jacobi de Marquilles super uaticis Barchiñ. Barchinone* 1505; a very handsome service book, *Graduale secundum morem S. Romane Ecclesie* (Venetiis: Lucantonio di Giunta, 1515), distinguished by fine woodcut initial letters (only four copies of the book are known); two editions of the rare Catechism of Edward VI., composed by Bishop Poyntet; and a copy of Cary's *Dante*, with critical MS. notes by Coleridge, formerly belonging to Mr. Gilman, of Highgate. Another noteworthy volume is *The orders, laves and ancient costumes of Swanns, caused to be printed by John Witherings, Esquire, Master and Governour of the Royall Game of Swans and Signets, throughout England* (London, 1632)—a very rare and curious tract on swans and swan marks, which purports to be “taken forth of a booke which the Lord of Buckhurst delivered to Edward Clerke, of Lincoln's Inne, Esquire, to peruse, An. Eliz. 26; on the backside of which booke it was thus intituled: Taken out of an ancient booke remaining with Master Hamden, sometimes Master of the Swannes.” It contains engravings of the marks of the king and queen and various owners, and it formerly belonged to Roger Pepys, Master of the Swans on the River Oam, whose autograph it bears.

Of historical interest is a collection of German and Dutch tracts and newsletters, partly original and partly translations, relating principally to the affairs of England in her relations with the Continent, between 1528 and 1670.

The Music Collection has gained some valuable additions from the library of the late M. de Coussemaeker, some of them unknown to biblio-

graphers. Among them may be named a fine collection of Motetts, by Orlando di Lasso, original edition; the first edition of P. Aron's *Toscanello in Musica*; the very rare 1512 edition of the *Practica Musica* of F. Gaforius; two editions of *Les Rossignols Spirituels*, by Peter Philips, &c., &c. Also a unique collection of the early editions of Playford's well-known *Dancing Master*, a work of great interest, in that it contains many of the tunes, chiefly traditional, of our early English ballads.

Mr. R. H. Major, of the Map Department, includes the following among his most interesting acquisitions of the year:—A Portolano, drawn on vellum, by Grazioso Benincasa, of Ancona, in the year 1470. A fine copy of Ol. Ptolomei *Geographia* (Strassburg, 1513, fol.) which, though bearing the names of Jacob Aeszler and Georg Uebelin, was really the result of the literary labours of Mathias Ringmann (Philesius) and Martin Waldseemüller (Hylacomylus), the originators of the name of America at St. Dié in Lorraine in 1506. It contains the earliest known map of the province of Lorraine; and this map, with the coats of arms surrounding it, is the earliest example known either of cartographical or heraldic printing in colours from wood-blocks. We may also mention a photograph fac-simile of a superb Mappemonde, executed by Pierre Desceliers at Arques, near Dieppe, in the year 1546, now in the possession of the Earl of Crawford and Balcarres—one of the few French MS. maps which show the discovery of Australia in the first half of the sixteenth century; and a photograph fac-simile of a large MS. map on vellum, by Giorgio Sideri, surnamed Callapoda the Cretan, of the date of 1550, from the Museo Correr in Venice. It is in Italian, Spanish, and Greek.

The chief acquisitions for the Manuscript Department of the Museum have already been noted in these columns; it will be enough, therefore, to observe that the number of special visitors to this Department rose from 1,662 in the year 1876, to 2,041 in 1877, and that the total number of new manuscripts acquired by gift or purchase was thus distributed—to the General Collection, 278 volumes; to the Egerton, 24 volumes; and 209 Rolls and Charters.

To the Oriental manuscripts 174 additions have been made, chiefly Arabic, Hebrew, and Persian. Two collections of great value are included in them—one of Sir Henry Rawlinson, formed by him in Persia and Mesopotamia, between the years 1836 and 1854, consisting of 104 volumes; the other of M. W. Shapira, of Jerusalem, consisting of forty Hebrew Manuscripts, chiefly from South Arabia, ranging in date between the eleventh and seventeenth centuries. Fifteen of these are Pentateuch Rolls, written on red leather, and measuring from 100 to 200 feet in length with a width of about two feet. The remaining twenty-five are book-manuscripts, twelve of which are written on vellum and thirteen on paper; they contain portions of the Hebrew Canon, with the larger or lesser Massora in the margins, and with Chaldee Targums and Arabic versions alternating with the paragraphs of the original.

To the Department of Coins and Medals Mr. Reginald S. Poole reports the following additions, among others: a tetradrachm, bearing Samian types, struck by Samian exiles at Rhegium, early in the fifth century B.C.; and early electrum coin of Parium, type Gorgon-head; two rare tetradrachms of Cappadocia, struck by Ariarathes, son of Mithridates the Great; a rare medallion of Severus Alexander and Julia Mamaea, having for the reverse type the Emperor accompanied by Zeus, and crowned by Victory, holding the circle of the seasons. In the Oriental Series are:—A unique gold coin of the “expected Imam,” El-Muntadhir, struck by the Wezeer El-Afdal, and bearing his name; two gold coins of Abou Bekr, founder of the dynasty of the Murabiteen; two gold coins of the rare camp-mintages of Akbar, Moghul Sultan of Delhi; a rare silver medal of

Suleyman I., Sháh of Persia, and five copper coins of the small dynasty of Danishment; an interesting series of medals struck by Ahmad III., Selem III., Mahmood II., and 'Abd-el-Mejeed, Sultans of Turkey; and a medal of Sháheen Giray, last Khan of the Crimea.

Beside the above must be named the splendid donation from the Governors of the Bank of England, which includes, in the Roman series, the following rarities:—

“An extremely fine aureus of Julia Domna, with seated figure of Vesta; also rare aurei of Volusian, with the Emperor sacrificing; of Tetricus and Carinus, both with figure of Pax, and a solidus of Fausta, with the Empress holding two children.

“A gold aureus of Domitian II. (Achilleus), the Usurper, who revolted against Diocletian and Maximian, and reigned at Alexandria from A.D. 288?–297. This is the only known gold coin of this Emperor; previously to its discovery, only copper coins of his reign had been found.

“A denarius of the Pomponia gens, with the Muse Erato; a series of the coins of Galba, struck in Spain; a denarius of the Empress Matilda, with figure of Pietas, and eight coins of Pescennius Niger, all struck at Antioch, and of great rarity.”

Of wider interest in the same collection is perhaps the series of English medals, which includes a silver medal of Philip and Mary, by Trezzo; a gold medal of James I., by Passe; a beautiful medal of the Earl of Pembroke, by Stephen of Holland (silver); a fine and rare medal of Martin van Tromp (silver); a medallic portrait by Warin, of Thomas Cary, gentleman of the bedchamber to Charles I. (silver); a medal of Baron Reede de Renswoude, Dutch ambassador extraordinary at the Court of Charles I. (silver); a beautiful gold medal of Charles, Elector Palatine, nephew to Charles I.; the Scottish coronation medal of Charles II., in very fine condition (silver); a fine medal of Charles II., by Rawlins (silver); three medals commemorating the murder of Sir E. Godfrey (two silver, and one copper gilt); a silver medal commemorating the pacification of Amsterdam in 1690; two silver medals commemorating the battle of the Boyne; a silver medal commemorating the battle of Neerhespen; a very rare silver medal commemorating William III.'s passage to Holland in 1694; two silver medals commemorating the Peace of Ryswick, one struck at Gouda, the other very rare, type, Europa and Bull; German medal on death of William III.; some interesting medals struck for the adherents of the Pretenders; two of the Elder Pretender and Princess Louisa (copper gilt and silver); one of the Elder Pretender, with bust of Queen Anne; the oak medal of Prince Charles, and the medal of Prince Charles and the Cardinal York, &c.

Notices of the additions made to other departments must be deferred till another occasion.

MAGAZINES AND REVIEWS.

THE *North American Review* contains an essay by Mr. Emerson which, like all that is now written by that veteran of letters, is rather sermon than essay. Its title is “The Sovereignty of Ethics;” and its purport, that no change in man's view of his own origin and history can weaken the moral tie, or, conversely, make the moral sentiment insufficient for his needs. The style of the paper is what the style of all Mr. Emerson's later writings has been, oracular, not argumentative. A string of *sententiae* takes the place of a chain of reasoning, *sententiae* sometimes brilliant, sometimes paradoxical, but only pleasing to those who are attracted by that strange compound, a sort of Swedenborgian Laroche-foucault. Here are some of the better sayings:—

“We attach ourselves violently to our teachers and historical personalities, and think the foundation shaken if any fault is shown in their record. But how is truth hurt by their falling from it? The law of gravity is not hurt by every accident, though our leg be broken. No more is the law of justice by our departure from it.”

"The word miracle, as it is used, only indicates the ignorance of the devotee, staring with wonder to see water turned into wine, and heedless of the stupendous fact of his own personality."

"Montaigne kills off bigots, as cowage kills worms; but there is a higher muse there sitting where he durst not soar, of eye so keen that it can report of a realm in which all the wit and learning of the Frenchmen is no more than the cunning of a fox."

"Shall I make the mistake of baptising the daylight, and time, and space, by the name of John and Joshua, in whose tent I chance to behold daylight, and space, and time? What anthropomorphists we are in this, that we cannot let moral distinctions be, but must mould them into a human shape! 'More morality' means—not put into a personal master of morals."

"Luther would cut his hand off sooner than write theses against the Pope if he suspected that he was bringing on with all his might the pale negations of Boston Unitarianism."

In effect, the article tells us little that Mr. Emerson has not told before, or that might not be gathered from the writings of any preacher of "an Eternal and Immutable Morality;" but it says what it has to say in a manner not without signs of that genius which all must admit that Mr. Emerson possesses. But in his writings, as in those of his follower Lowell, the man himself is always too prominent; the very turn of the phrases has an air of effort, and even, if it is respectful to say so, of working for effect. There is in Emerson a sort of struggle between sympathy and self-consciousness that is distressing to the impartial reader, who comes to him ready to admire. The gospel preached is the gospel of sympathy, but the manner is the manner of one who cannot for a moment lose himself in his doctrine. The remaining articles in this Review mainly touch questions of immediate American interest, such as the very thorough paper on "Chinese Immigration." Mr. Edison, the inventor of the phonograph, writes in a tone of proper enthusiasm about the future of his instrument, which is to absorb all the functions of the photograph and the telegraph, and transform them into something transcending our wildest dreams. We are to have "books of 40,000 words upon a single metal plate ten inches square;" songs "reproduced with marvellous accuracy and power;" "a doll which may speak, sing, laugh, or cry, may be safely promised our children for the Christmas holidays ensuing;" and "it will henceforth be possible to preserve for future generations the voices as well as the words of our Washingtons, our Lincolns, our Gladstones, &c., and to have them give us 'their greatest effort' in every town and hamlet in the country, upon our holidays."

In the *Atlantic Monthly* a paper called "May Days," consisting of extracts from a spring journal by Henry Thoreau, gives us a welcome glimpse into the qualities of a writer and observer who has been for some time in America the object of a special cult, but who is very little known in England. Thoreau appears in these extracts as a faithful, and generally speaking a poetical, observer of nature, as an ornithologist and naturalist crossed with a Hawthorne-like vein of reverie. His knowledge of the Concord landscape, of its river, its fields, its birds and beasts, appears to have been marvellously minute, and to some extent he possessed Hawthorne's power of photographing not only things, but impressions of things: of bringing before his reader, for instance, not only the minute sounds and sights which greet an evening wanderer on the hills—the "faint multitudinous sound" of the frogs, the first "whip-poor-will," the spears' lights on the river—but the whole weird aspect of the "vast wild earth" of the twilight. In this gift he approached Hawthorne; but these extracts, taken as a whole, are a decisive proof of how far he stands behind his master. Thoreau's touch is uncertain; his taste far from unerring. The careless freedom of Hawthorne's journal-style at its best, a freedom observable in his treatment of trivial and great things alike, Thoreau is able to rival only so long as he deals

with things small and tangible and perfectly familiar to him; with creatures and their habits, with the changing colour of trees, with the strange suggestive scents of the woods and hills. As soon as he takes the forward step into the world of human analogy and sentiment, which Hawthorne was perpetually taking, he seems to us to drop at once to the rank of an imitator, now of Emerson, now of Hawthorne, and sometimes of a singularly unsuccessful imitator. The fatuity of some of the quasi-philosophical utterances of these extracts is depressing, and shows a sublime belief in the writer's own inspiration, which may perhaps account for the *animus* which marks the notice of a recent memoir of him in the *North American Review*. It is rightly felt by many that Thoreau was not a great enough man to despise his kind. There are other articles in the magazine worth reading—for instance, Mr. Henry James's paper on "Recent Florence," which is slight enough, but sometimes pretty, and sometimes amusing, and marked, moreover, by some rather happy criticism of the general tone and standpoint of Mr. Ruskin's famous little books.

CORRESPONDENCE.

SHELLEY REMINISCENCES.

King's College: May 11, 1878.

With the permission of my friend Prof. Craig, University College, Wales, I give the following extract from a letter lately received from him:—"I walked the other day to Rhayader. You remember, no doubt, that Shelley went there on a visit to his cousin T. Grove in 1811 and that it was from there that he went up to London, urged by the pressing letters from poor Harriet Westbrook. . . . I saw the house; it is about five miles from Rhayader. . . . I did not succeed in finding the exact house in which Shelley lived when after his marriage with Harriet he came to live there for the second time. As you remember, this was shortly after his return from Ireland (from his second visit) and just before he went to Lymouth, Devon. It was at Nant Gwillt he lived, going there after, Shelley-like, traversing the whole of North and part of South Wales for a house; I think about the end of April, 1812. All I can say is that he chose well, for a more delightful valley than this

Cwm Elan I never saw. . . . I went to Nant Gwillt House, and was referred to a certain old gardener of eighty-five. He did not know much [about the object of my enquiries]; but I had a most interesting conversation with his wife, an old woman of seventy-eight or so. She said that she had never heard of anybody of the name of Shelley; but that she knew the Groves, both the old gentleman and the young one. I take it that the young one was Shelley's friend. She carried the post-bag to the house when a little girl. I did not expect to get any information from her; but, as I was waiting for her husband, I asked her about the Groves. She said they had often visitors. I asked did she remember any of the young gentleman's visitors. She did not at first; but, at last recollecting herself, said, 'Oh! there was a very strange gentleman used to come here, he who put the 5l. note on the boat.' This made me prick up my ears, remembering Hogg's tale about the 5l. note Shelley set a-sailing on the Serpentine; and I asked her what she meant. It came out that this visitor, who must surely have been Shelley, used to do a great many strange things. He used to go about with a very long pole to keep out of the rocks and from the bank his little wooden boat, 'about so long'—i.e. about a foot; and that she herself saw him put a 5l. note on it to sail it [which got lost], but it was brought to him afterwards by a man. I showed her a likeness of Shelley, a bad one, in that little Dugdale's 2-vol. Shelley. She said it was something like him, and that he always used to keep his neck bare and his shirt open (just as he is always painted), but not so open as in the picture. She then remembered that he afterwards was there with his wife, and ladies, I think she said [Eliza Westbrook was with them], and that his wife was very pretty. She could not exactly remember where they lived, but spoke of two houses, one of which it must have been (there are very few houses there), but she told me that she would find out more from her brother and another old man. . . . I will go again and find out the cottage which Shelley described as all covered with roses, I think, and in which he would have stayed longer if the farmer who owned it would have allowed him."

I feel sure your readers will think that this picture of the young poet with his "very long pole" and his boat and its costly paper-sail is not one to be lost. "Ipse ratem conto subigit, velisque ministrat" with a 5l. note. In one of his letters he writes thus of the neighbourhood in which he presented this strange figure:—

"We are now embosomed in the solitude of mountains, woods, and rivers, silent, solitary, and old, far away from any town, six miles from Rhayader, which is nearest. A ghost haunts this house, which has frequently been seen by the servants. We have several witches in our neighbourhood, and are quite stocked with fairies and hobgoblins of every description."

In another, to Godwin, he speaks of "this scenery—mountains and rocks seeming to form a barrier round this quiet valley, which the tumult of the world may never overleap."

JOHN W. HALES.

THE BODLEIAN MS. OF CATULLUS.

Oxford: May 8, 1878.

In an article on Catullus, by Mr. Henry Nettleship, in the *Fortnightly Review* of this month, the following statement occurs:—

"Our existing text of Catullus depends on a single copy, which, after having been lost for more than three hundred years, reappeared at Verona in the fourteenth century, and was afterwards again lost to the world. Until Dr. Baehrens undertook his recension of the text only one copy of this manuscript, preserved formerly at St. Germain, but now at Paris, was known to be in existence. Dr. Baehrens has been fortunate enough to discover, in the manuscript Catullus of the Bodleian Library at Oxford, a sister copy to that of St. Germain, dependent likewise on the lost Verona manuscript."

It might be supposed from this that Dr. Baehrens was the discoverer and first editor of the valuable Oxford MS. of Catullus (Canonicus 30). A friend to whom I submitted the paragraph did actually make this inference. Now, my edition of Catullus

published in 1867, in which a complete collation of this MS. was given to the world for the first time, and in which I state (Prolegom., p. xxxv.) that it was believed by Mr. Coxe to be written at the end of the fourteenth century, and (p. xxxvi.) that it was, in my own judgment, either the most ancient of our extant MSS. or only inferior to the Germanensis, preceded the *Analecta Catulliana* of Dr. Baehrens (1874), and his subsequent edition containing a re-collation of G and O (1876), by a period of not less than seven years. In fact it was published while Baehrens was a youth at school; and my first acquaintance with the MS. (about 1860) must have been made when Baehrens was still a child. It was not difficult with my statement before him, as well as the large apparatus of other MSS. collated in my edition—to say nothing of the peculiar typography by which the coincidences of the two fourteenth-century MSS. were often brought prominently before the reader by being marked in red ink—to arrive at the conclusion which Dr. Baehrens put forth in his *Analecta*. Whether that conclusion is the right one I have discussed in another place. But, if Mr. Nettleship means to assert that the two MSS. G O (the St. Germain and the Oxford) are both direct copies of the lost original rediscovered early in the fourteenth century, I say with confidence that the assertion is not proved and is on many grounds improbable. This does not impair their value as the earliest extant drafts of that original; but it does greatly affect the importance of Dr. Baehrens' so-called discovery. It is of some consequence in a country where scholars are little ready either to examine the MS. treasures within their reach or to collate them or publish them, that the exceptional few who do should not lose the credit of their undertaking. The Canonici MS. from its antiquity and integrity has changed the position of Catullian criticism. I had always held it one of my chief claims to consideration as a scholar that I was the first to bring it before the world. Mr. Nettleship's statement is pretty certain to make most of those who read it believe that this glory is not mine but Baehrens'.

ROBINSON ELLIS.

Oxford: May 11, 1878.

Mr. Robinson Ellis has complained of the words in which, in a recent article in the *Fortnightly Review*, I spoke of the services rendered by Baehrens to the criticism of Catullus. The sentences in question are quoted in full in Mr. Ellis's letter to the ACADEMY, and he adds this comment: "It might be supposed from this that Dr. Baehrens was the discoverer and first editor of the valuable Oxford MS. of Catullus (Canonici O). A friend to whom I submitted the paragraph did actually make this inference."

In a private letter to Mr. Ellis I have distinctly disclaimed the interpretation which he says might be put upon my words. Here I will only say that I am much surprised that either he or anyone else has thought it possible. The natural sense of my last sentence is this: "Dr. Baehrens has been fortunate enough to discover that the Oxford MS. of Catullus, with the name of which scholars are familiar, is a sister copy," &c. I do not know what appeal lies against the claim *Ego sum vis Britannus et super grammaticam*; but were I to say, "Until recently Smith was supposed to have only one cousin, but Brown has been fortunate enough to discover in Jones another cousin of Smith," neither Mr. Ellis, nor his friend, nor any educated Englishman, would suppose that I intended to attribute to Brown the glory of having discovered Jones. I assumed the existence of the Oxford MS. as a known fact, and did not mention Mr. Ellis's collation of it made eleven years ago, because I was speaking only of the most recent works which have left their mark upon the criticism and interpretation of Catullus. In discovering the exceptional value of the MS. Baehrens, no doubt, started by employing Mr. Ellis's collation; but this fact does not, in my

opinion, affect the question of the credit due to him as the discoverer of that exceptional value.

I would gladly have been spared the necessity of entering into this discussion; but the rest of Mr. Ellis's remarks compel me, in mere justice to myself, to explain and defend my paragraph in the *Fortnightly Review*. Mr. Ellis's letter might easily lead an ordinary reader to forget a distinction which is all-important to my case: I mean the distinction between the first collation of a MS. and the right estimation of its value. The first collation of the Oxford MS. was, as all scholars know, published by Mr. Ellis in 1867: but the question with which I am concerned is this, whether he or Baehrens was the first who really perceived its importance.

The authority to which I shall appeal in support of my opinion is one which Mr. Ellis will recognise: his own Prolegomena and *apparatus criticus* of 1867. Before I wrote my article in the *Fortnightly Review* I read, for the second or third time in my life, all that Mr. Ellis says in his Prolegomena about the Oxford MS. (O). I may be wrong in my inferences; but I must confess that I never could, nor can I now, discover from anything that Mr. Ellis said in 1867 that he had then formed anything like the same judgment of this MS. as he now expresses in his letter. The Oxford MS., he now says, "has changed the position of Catullian criticism." Very probably: but on p. xvi. of his Prolegomena Mr. Ellis, when distinguishing between two classes of MSS., one represented by the Datanus (D), the other by the Germanensis (G) and those like it, *quae maxima turba est*, does not mention O at all. In this important context it is passed over, left nameless in the *maxima turba*. On p. i. it is indeed mentioned, but only as one of a number of *boni codices* which resemble G. When he comes to speak of his MSS. in detail, Mr. Ellis says that he thinks O the oldest Catullus MS. known, or at least the oldest except G; but (and this is very important) he gives no hint that he takes its antiquity to be any measure of its value. This passage in Mr. Ellis's Prolegomena must not be taken by itself, but in connexion with his whole argument; and his argument distinctly is that the Datanus, though written some seventy or eighty years after G and its cognates, really represents an older and better tradition than they. One cannot infer, then, that because Mr. Ellis said in 1867 that O was one of the oldest, he therefore thought it one of the most important, of his MSS.

But did Mr. Ellis, in 1867, bring out the importance of O by giving its readings a prominent place in his *apparatus criticus*? I may again be wrong; but, often as I have examined that *apparatus*, I am unable to find that he did so. Sometimes, indeed, the readings of G and O are mentioned in juxtaposition; but quite as often, I think, those of O are thrown promiscuously together with those of the *maxima turba*: a strange way, surely, of treating a MS. which "has changed the position of Catullian criticism." Mr. Ellis apparently thinks that a mere reading of his Prolegomena and inspection of his *apparatus criticus* would have made it easy for Baehrens to arrive at his view of the value of O. On this point I must confess to having the strongest doubts; at least I can only say for myself that it would have taken me a great deal of time and trouble to arrive on such data at such a conclusion. And in behalf of Baehrens it must be remembered that, though his first impressions were derived from the readings given in Mr. Ellis's *apparatus criticus*, he has since confirmed them by an independent collation of his own.

I think I am justified, then, in saying that there is nothing in Mr. Ellis's Prolegomena and *apparatus* of 1867, which would lead his readers to suppose that in 1867 he put the same value upon O as he now does. And the scholar who was the first to put a really high value upon it is Baehrens.

I must now say a word on the question

whether G and O are directly copied from the lost Verona original.

"If," says Mr. Ellis, "Mr. Nettleship means to assert that the two MSS. G O are both direct copies of the lost original rediscovered early in the fourteenth century, I say with confidence that the assertion is not proved, and is, on many grounds, improbable. This does not impair their value as the earliest extant drafts of that original; but it does greatly affect the importance of Dr. Baehrens' so-called discovery."

With regard to G, I do not understand Mr. Ellis to abandon the position which he took up in 1867 (Prolegom., p. xvi.), where he says of the scribe who wrote G: "*Vere colligitur ipsum illum codicem transcripsisse quam quinquaginta ante annis Veronensis invenisset.*" As to O, the remarkable agreement of whose readings with those of G is notorious, I can only say that, so far as I know, all recent critics of Catullus, except Mr. Ellis, are agreed that it is likewise a direct copy of the lost original; and that there is nothing in his Prolegomena of 1867 to contradict such a conclusion.

The sum of my argument is, that the value of the Oxford MS. of Catullus as a twin-representative, with the Germanensis, of the lost Verona original was not recognised by Mr. Ellis in 1867, so far as it is possible to judge from his Prolegomena and *apparatus criticus* then published; that whether it be a direct copy of the Verona MS. or not, Mr. Ellis did not attribute to it, in 1867, anything like the importance which he now does: and that the merit, not of having first collated it, but of having discovered its importance, belongs therefore to Baehrens.

H. NETTLESHIP.

MR. STOKES'S HARNESS PRIZE ESSAY.

Trinity College, Cambridge: May 13, 1878.

The writer of an unsigned article in the ACADEMY of May 11 on Mr. Stokes's "Harness Prize Essay" on the chronological order of Shakespeare's plays has gone out of his way to attack Mr. Lumby and myself. He assumes "that the absence of the results of Mr. Stokes's fourth method of enquiry, 'Mental Tests,' is rightly accounted for by the names of the examiners, who would not have tolerated 'aesthetic considerations' of any kind," and urges Mr. Stokes to enlarge and re-cast his book, "setting prosaic Cambridge examiners aside."

As the results of Mr. Stokes's fourth method of enquiry are not absent from his essay, it is useless to speculate as to the reason of their absence; and, whatever may be the reviewer's opinion of my mode of dealing with "aesthetic considerations," I can assure him they will not deter me from giving his method of criticism a very prosaic epithet.

W. ALDIS WRIGHT.

May 15, 1878.

As Mr. Wright's scorn of aesthetic or, as it is called, "the higher criticism," was loudly proclaimed by Mr. Wright himself in his *King Lear*, 1875, p. xviii.; as he there declared that aesthetic notes were "beside the scope and purpose of these books as vehicles of instruction and education," thereby assuming that the leading-out of the higher faculties of a boy's mind—its education—was to be accomplished by looking out words and allusions in a dictionary, &c., for him; as Mr. Wright has intentionally kept out of his Introductions—since he has written them alone—such grateful passages as those which refreshed the dryness of their fellows on pp. iv. of *Richard II.*, and xvi. of *Hamlet*, when Mr. W. G. Clark's name was signed before his; as Mr. Wright's one and entire attempt at aesthetic criticism since has been the following on the lovely *Midsummer Night's Dream*:—"We know that Malvolio's strange conduct is described by Olivia as very Midsummer madness, and a Midsummer Night's Dream, therefore, is no inappropriate title for the series of wild incongruities of which the play consists;" as this characteristic of Mr. Wright's comments was the reason that the Rugby editions of Shakespeare's

Plays were not withdrawn but continued; as perhaps nine out of ten of the many English teachers and intelligent pupils the Reviewer has met have complained of the absence of any attempt on Mr. Wright's part to enable them to catch the points of character of the *dramatis personae*, and the special poetic and dramatic "notes" of each of Shakspeare's plays: the Reviewer feels that he was justified in saying that Mr. Wright would not tolerate "aesthetic considerations" *qua* Shakspeare. Deeply grateful as he, in common with all other Shakspeare students, is to Mr. Wright for his careful and conscientious work at Shakspeare, he does but echo the wish of hundreds of readers in desiring that Mr. Wright would give signs in word "that the gods have made him poetical."

THE REVIEWER.

THE DERIVATION OF "FOREST."

52 Thornhill Road, N.: May 11, 1878.

As in this country the belief that his opinions on linguistic questions connected with any language of which he has some knowledge are sufficiently valuable to be published appears to be shared by every educated man who is not a scientific philologist; and as life is short; I rarely notice the results of that belief. But as the derivation of the English word *forest*, discussed by Mr. Cliffe Leslie at the end of his instructive letter in to-day's ACADEMY (p. 415, col. 2), is of more than merely philological interest, I hope he will not think it impertinent in me to furnish some information on the subject.

1. The Old French *forest* and the German *forst* are, as Mr. Leslie states, forms of the same word. 2. It is all but certain that the German *forst* was borrowed from the Late Latin or Early Romanic *forestis* (-ta), if not from the Old French word itself. 3. The word *forst* was pretty certainly not introduced into German until long after the Teutonic settlement of Britain. 4. One can therefore hardly, *a priori*, believe that some form of *forst* was brought here by the Germans (English) from their native forests. 5. Forests are frequently mentioned in the extant Old English literature, and are never called by that name, or any allied form, till considerably after the Norman Conquest. 6. One therefore cannot, *a posteriori*, believe that some form of the word *forest* was in use in England long before that event. 7. The word *forest*, in its present and only English form, was certainly brought here from France by the Normans. 8. The derivation of the Old French *forest* (Italian *foresta*, &c.) from the Latin *foris* or *foras* is, though hardly certain, decidedly the most satisfactory that has been proposed.

HENRY NICOL.

London: May 14, 1878.

A German philologist writes to me in reference to the etymology of the word "forest" suggested in my note on Forest Law, in the ACADEMY, May 11, that although J. Grimm at one time connected it with *fohra* (Mod. Germ. *föhre*), a "fir," the derivation now generally accepted is from the Latin *foras*, *foris*. He adds, however, that *foresta* does not mean a district out of the jurisdiction of the common law, but one *extra murum* or unenclosed, as distinguished from a walled or enclosed park. "The Italian *forestiere*, a foreigner, a man from without, comes from the same root. The English word *forest* thus can scarcely be called French, but is one of the many feudal terms formed in the *infima Latinitas*, which passed into all modern European languages."

T. E. C. LESLIE.

APPOINTMENTS FOR NEXT WEEK.

MONDAY, May 20.—4 P.M. Asiatic: Anniversary.

8 P.M. Society of Arts (Cantor Lecture): "Some Researches on Putrefactive Changes," by Dr. B. W. Richardson.

8 P.M. British Architects.

8 P.M. Victoria Institute: "Physical Geography," by J. Thornhill Harrison.

TUESDAY, May 21.—3 P.M. Royal Institution: "Vegetable Morphology," by W. T. Thiselton Dyer.

7.45 P.M. Statistical: "Progress of the Foreign Trade of the United Kingdom since 1856," by W. Newmarch.

8 P.M. Civil Engineers: "The Design, generally, of Iron Bridges of very Large Span for Railway Traffic," by T. C. Clarke.

8.30 P.M. Zoological: "Description of a New Genus of Snake in the Family of *Ophimacridae*, from Southern India," by Lieut.-Col. R. H. Beddome; "Reports on the Collection of Birds made during the Voyage of H.M.S. *Challenger*, X," by P. L. Slater; "On New and Little-known *Asiatidae*," by J. Wood Mason.

WEDNESDAY, May 22.—8 P.M. Literature: "On the Turkish Race as a Nationality," by J. W. Redhouse; "On the Present Greek Race," by Sir Patrick Colquhoun.

8 P.M. Society of Arts.

8 P.M. Geological.

THURSDAY, May 23.—3 P.M. Royal Institution: "On Colour," by Lord Rayleigh.

8 P.M. Society of Arts.

8.30 P.M. Royal. Antiquaries.

FRIDAY, May 24.—3 P.M. Linnean (Anniversary): Presidential Address.

8 P.M. Quckett: "On the Structure of the Eyes of Insects," by B. Thompson Lowe.

9 P.M. Royal Institution: "Geology of Gibraltar and the Opposite Coast of Africa," by Prof. Ramsay.

SATURDAY, May 25.—8 P.M. Royal Institution: "On Richard Steele," by Prof. H. Morley.

3 P.M. Physical.

3.45 P.M. Royal Botanic.

SCIENCE.

A Monograph on the Development of Elasmobranch Fishes. By F. M. Balfour, M.A. (London: Macmillan & Co., 1878.)

THERE is no branch of biological investigation which did not, as it were, date a start of fresh life and vigour from the time of the enunciation of Mr. Darwin's great theory. It is a constant source of gratification to Mr. Darwin's disciples to find that in whatever direction careful biological research is pushed, the results always drop into their places in the scheme, and are found replete with an interest which in the absence of the theory would have been entirely lost. Embryology is probably the particular branch of biology which has received the greatest impulse, and the largest accession of significance in its details, from the establishment of the theory in question; and among the many workers consequently evoked in this field, Mr. Balfour is one of a select few who have been pre-eminently successful. The largeness of the number of new facts of the highest interest which Mr. Balfour has discovered by dint of gallantly persevering in the investigation of the minutest details in the development of a few closely-allied animals appears astonishing when we encounter his results brought all together in the present volume.

No one who has not had experience in the investigation of anatomical problems by the method of microscopic sections can adequately realise the amount of labour which is represented in the work now before us. In choosing the elasmobranch fishes, the sharks and skates, as the subject of his investigations, Mr. Balfour advisedly selected forms which were most likely to retain in their embryonic conditions an instructive recapitulation of historical development, for the elasmobranchs, to quote the opinion of Prof. Gegenbaur, must, of all known forms, be considered as standing nearest to the main stem of the family tree of the gnathostomous vertebrata, that is, that of all the vertebrates except the lampreys and Amphioxus. Mr. Balfour's anticipations are fully borne out in his results.

Most remarkable facts have lately been ascertained by various observers concerning the process of impregnation and cer-

tain changes which are found to take place in the ovum during its maturation prior to this event. In the case of a large number of widely differing animals, where this process has been carefully watched, it has been found that at the time of the ripening of the egg the germinal vesicle loses its membrane, which becomes absorbed, and that its contents assume the form of a spindle-shaped body, which becoming divided discharges at the surface of the egg a part of itself, termed a polar cell ("Richtungskörperchen"). A second polar cell is formed in the same manner as the first, and then part of the spindle remaining is converted into a nucleus, the female pronucleus. The formation of the polar cells has as yet been determined with certainty only in the case of invertebrates; but there seems every probability that the same process occurs in the ovum of vertebrates. In the invertebrates the process is a rapid one; but it appears from the observations of Calberla that in the ovum of the lamprey, *Petromyzon Planeri*, the formation of the female pronucleus from the germinal vesicle takes place very slowly while the larval Ammocoetes is being converted into the mature Petromyzon. It seems proved that normally only a single spermatozoon is concerned in the impregnation of an ovum. The head alone of the spermatozoon penetrates the ovum, and becoming converted into the male pronucleus conjugates with the female pronucleus, and out of the resulting mass is formed the first segmentation nucleus. In the case of the lamprey a special string of protoplasm, the Spermgang of Calberla, serves as a path for the passage of the male pronucleus from the micropyle to the female pronucleus. Calberla has watched the approach of spermatozoa towards the egg in the lamprey. Numerous spermatozoa may be seen to swim towards the micropyle, but miss the opening, and striking the egg membrane around, to adhere and perish. Only one spermatozoon at last hits off the right spot, and within fourteen or fifteen seconds after it has reached the outer micropyle opening, the protoplasm of the ovum within, though as yet untouched by it, shows consciousness of its presence by raising itself up at a spot opposite the inner opening of the inner micropyle into a crater-formed prominence. The entrance of a second spermatozoon is carefully precluded. Mr. Balfour has given a most valuable summary of our knowledge concerning the phenomena accompanying the maturation and impregnation of the ovum in the last number of the *Quarterly Journal of Microscopical Science*.

Mr. Balfour finds that in elasmobranchs the mesoblast is formed entirely from the hypoblast, and with regard to its origin he says that "the tendency of our present knowledge appears to be in favour of regarding the body cavity of vertebrates as having been primitively the cavity of alimentary diverticula, and the mesoblast as having formed the walls of the diverticula." The cavities of the diverticula survive in the elasmobranch embryo as the hollows within the muscle-plates which extend to the summit of the plates in these vertebrates; and even in the mammalian embryo the same

extension of the body cavity into the vertebral portion of the mesoblast occurs. Mr. Balfour, following the lead of Prof. Ray Lankester, suggests that in the ancestors of vertebrates, as development progressed, the muscular system of the diverticula of the alimentary canal gradually took the place of the primitive muscular system of the body, which was originally, as now in coelenterates, a specialisation of the epiblast.

Only a few of Mr. Balfour's most interesting results can find mention here. One of his best-known and most startling discoveries is that of the derivation of the notochord in elasmobranchs from the hypoblast. Mr. Balfour is of opinion that the balance of evidence is in favour of the notochord being a true hypoblastic organ, and considers that Hensen's observations on mammalia, and Kowalewsky's and Kupffer's on ascidians and Amphioxus, give support to this hypothesis. The fact that the notochord is unsegmented is certainly in favour of its being hypoblastic in original derivation. Gegenbaur considers the fact to point to the great antiquity of the organ as belonging to an ancestral form in which a metameric structure had not yet been developed.

The paired fins are found in elasmobranchs to arise as special developments of a continuous ridge which appears on each side of the body of the embryo, and which extends from just behind the head to the level of the anus, and this fact strongly supports the hypothesis that the two pairs of limbs of all vertebrates are the remnants of continuous lateral fins. In harmony with this conclusion is the fact that in the derivation of the muscles of the limbs from the muscle-plates, portions of several muscle-plates grow out into the substance of each limb.

The derivation of the generative elements is a point of great importance. Mr. Balfour finds that the primitive ova give rise to both male and female products, which are thus of mesoblastic origin; and since in elasmobranchs at least the mesoblast is entirely derived from the hypoblast, the condition is entirely at variance with that which obtains in Hydractinia, where, as Van Beneden has shown, the spermatozoa are formed from the ectoderm. The generative products of vertebrates are thus no more homologous with those of coelenterates than are the muscular systems in the two groups, and the resemblances in the form of the spermatozoa must be considered as due to homoplasy.

Most remarkable is Mr. Balfour's discovery concerning the development of the spinal nerves. The posterior roots grow out as discontinuous processes from a continuous outgrowth from the spinal cord, whereas the anterior roots arise quite separately from one another as conical outgrowths from the cord itself. The cranial nerves appear to show by their mode of origin that they are nerves of one root only, and that a dorsal one; and no traces were found of cranial nerves corresponding to anterior roots. In Amphioxus, as Mr. Balfour has shown, only dorsal nerve roots are present throughout the body. Such he conceives was the condition in primitive vertebrates, the ventral roots being secondary acquisitions. The ancestral condition is thus retained in the case of the cranial nerves of the higher vertebrates.

The series of sections into which the head cavities within the head of the embryo elasmobranch are divided on either side are regarded as equivalents of the muscle-plates of the body. A table is given by Mr. Balfour, in which the correspondence of these sections of the head cavities with the cranial nerves and branchial arches is given. The number of segments included in the head of gnathostomous vertebrates is considered to be at least eight, but behind these, in ancestral forms, once existed a number of other segments now lost.

It is impossible within the limits of the present article to describe more of Mr. Balfour's brilliant results; reference must, however, be made to his very satisfactory elucidation of the relation of meroblastic to holoblastic ova, and to his account of the development and adult condition of the organs of excretion and generative ducts. The series of segmental tubes with mouths freely open into the abdominal cavity present in elasmobranchs are certainly remarkably like the segment organs of annelids. Gegenbaur, however, considers that the two sets of organs must not be considered as homologous or genetically connected, because in the elasmobranchs these organs all open into a single longitudinal canal. He considers that the true representatives of these so-called segmental tubes and their duct are to be found rather among less highly differentiated forms—viz., the flat worms.

In the present very imperfect condition of knowledge of embryology, interpretation of observed facts is extremely difficult, and in very many cases bare conjecture only as to the meaning of embryonic structures or modes of growth is admissible. Mr. Balfour is extremely careful and guarded in the very numerous and brilliant suggestions by which throughout the present work he seeks to connect the facts which he has determined with the past history of the vertebrata. The greatest difficulty is caused by the obscuration of the recapitulative phases of embryonic life, which are caused by larval adaptation, and the loss of ancestral structures by disuse.

The present work, consisting as it does of a series of papers already published at various times, and now bound up together, would certainly have been far better had a revision been possible, but no doubt the author avoided this on the ground of expense in a work which will probably, from its very technical nature, not command a large sale. It would, however, surely have been better to have given the date of publication of each of the chapters.

With regard to the illustrations, it may not be out of place to express an opinion that the custom of giving in monographs such as the present exact drawings of particular microscopic preparations is to be deplored, and should, except under exceptional circumstances, be abandoned. Why should all kinds of irregularities caused by unequal shrinking of the object cut, or oblique cutting of sections, or breakage, be represented in the figures to puzzle the reader? The preparations, figures, &c., can only be one or two out of many hundreds made use of by the investigator to attain his results. It is quite impossible to place the entire

evidence before the reader, and the results must after all be taken on trust in the powers of observation of the author. Hence it seems much better that drawings should be given in which are combined results attained from a series of preparations, and representing conclusions as clearly as possible. It is certain that the reader would benefit greatly by the adoption of such a plan.

H. N. MOSELEY.

GUYARD'S ARABIC PROSODY.

Théorie Nouvelle de la Métrique Arabe. Par M. Stanislas Guyard. (Paris: E. Leroux, 1877.)

ARABIC prosody has hitherto always been a difficult problem to European scholars; and even those who have treated the subject at considerable length, as Ewald, for example, have been obliged to arrive at the conclusion that it is neither based on accentuation, nor on a strict observance of quantity. It is true that, in spite of the many and complicated modifications which a single foot may undergo, an Arab, or one who has once learnt the Arab method of reading poetry, will never make a mistake in the rhythm of a verse; yet it is no less certain that our ordinary system of notation utterly fails to render an intelligible account of it. In the metre called *Rejz*, for example, the foot --- may be interchanged at will with ---, ---, or ---; but, as the metre in question is professedly composed of repetitions of one and the same foot, it would at first sight appear impossible to introduce such licences without destroying the character of the verse, while, in fact, their presence does not really affect the unity of the rhythm. Even greater apparent liberties may be taken in some metres, and yet the rhythm of a verse is at once evident to an Arab eye and ear. M. Stanislas Guyard, in the treatise before us, has hit upon the solution of the difficulty, and has given a scientific analysis of the Arab prosodial system. He recognised first that the principle of rhythm depends on no artificial laws of quantity or the like, but on the natural pronunciation of the words of the language itself; and he also discovered what is, like most great discoveries, quite obvious—namely, that the difficulty of transcription is due simply to the imperfection of the notation employed.

Regarding words from a purely acoustic point of view, the author concluded that the words of any language have a natural rhythm which is capable of being expressed by musical notation; and he further proved that all metres are nothing more than a development of this, and depend in fact upon the natural rhythm of sentences.

Every word consists of a succession of sounds, the duration of which depends on strong or weak syllables regularly spaced, which by their periodical recurrence constitute a 2-4 time, the strong syllables corresponding to *beats*, and the weak to *half-beats*. For a word to be perceived by the ear as possessing the natural rhythm which constitutes its *unity* it should not exceed a 2-4 time. The long and short vowels which mark the measure have a normal duration of

half a quarter of a time: thus, if we take a second as the duration of a time, a long vowel will last a half-second, and a short vowel a quarter of a second; but in some cases, as in prepositions, &c., either the long or the short time may be wanting, and the word must then be pronounced as though attached to another. Some words, again, consist only of a long and a short, and in these cases the quarter-time that is wanting to complete the measure is made up either by the production of a *supplementary syllable* or by a *silence*. Thus, in the French word *reste*, where the *e* of the first syllable which receives the *ictus* lasts a *time*, and the second, or mute *e*, lasts a *half-time*; to make up the unity of the word another *half-time* must be produced, and this is really done by the almost imperceptible sound made by the mouth acting as a resonator immediately after pronouncing the consonant *s* without a vowel. This sound, which is entirely neglected in the old prosodiocal system, is a real and important factor in the analysis of a word; some languages have a special sign to express it.

In Arabic, when two consonants come together without a vowel between, this *buccal resonance* is expressed by the sign *‘* (*jezma*, “cutting off,” or *sukûn*, “rest”). Where the same consonant is repeated, as in the Italian *caval-lo*, a *silence* is produced instead of the *buccal resonance*. This in Arabic is noted by the sign - (*tashdîd*, or “strengthening”). Having thus explained the elementary sounds of which words are composed, M. Guyard proceeds to demonstrate the applicability of *musical notation* to express them all, and at the same time shows how utterly inadequate for this purpose was the old system of longs and shorts (- and ∪). Thus by the latter the Arabic word *fa’ala* was considered to be represented by ∪∪∪, no account being taken of the increased force given to the first syllable by the accent of intensity, by which it becomes equal to a long (-); *fū’ilun*, again, was noted ∪-, whereas the first syllable is really equal to a long and a short (- ∪). Measured by M. Guyard’s principle these two words become ∪∪ and ∪∪-: that is to say, they each possess the natural rhythm of a 2-4 time. Longer words, composed of three or more syllables, will in the same manner be found divisible into measures of 2-4 time, and may be considered as *bars*; these, again, may be arranged in *phrases*, so that every sentence composed of words will have its natural and distinctive rhythm capable of accurate musical notation. If in the two members of consecutive phrases words of the same measure be employed, the result is verse. From this it is evident that verse is nothing more than a particular case of the natural rhythm of prose.

The advantages of this treatment of the question of prosody are manifold. In the first place, it becomes possible to analyse a metre and to give a reason, instead of an arbitrary rule, for the changes or licences which are permissible in particular feet; secondly, it affords a means, not only of noting the true rhythm of a metre, but of expressing that hitherto indefinable something—the intonation and inflection of the voice—which we are accustomed quite erro-

neously to call “accent.” It is a well-known fact that those persons who begin to learn a language by repeating poetry after the declamation of a native arrive much sooner at a correct accent, because they learn from the first the correct rhythm of words and sentences. With us in Europe few persons speak a foreign language well who have not lived in the country where it is spoken; in India a Moslem child begins to learn to read Persian poetry, and to learn it by heart, before he is even taught the grammar or vocabulary, and as a result he learns to speak and write Persian correctly ever afterwards. However we may prove such a system to be theoretically wrong in principle, it is a fact that the ordinary Indian child who repeats like a parrot his *Kerimâ* ultimately acquires a better knowledge of Persian than the ordinary English schoolboy who is early instructed in the scientific subtleties of grammar acquires of Latin.

M. Guyard’s system applies in reality as much to one language as another, but he has in the present work developed it in the investigation of the Arabic metrical system; the choice was a good one, for it is evident that any theory which can satisfactorily explain all the anomalies and intricacies of Arabic prosody will be capable of universal application. He finds that the various feet, expressed by technical words, which constitute the Arabic metres are the types of the most common forms of words in the language. These feet, differing in the arrangement of *longs* accented or not, of *shorts*, of supplementary articulations and of silences, are nevertheless all composed of measures of 2-4 time. Thus feet of which the rhythm is closely similar may be substituted one for another in a verse. Most of the *shorts* of which feet are composed are invariable, while the *longs* may be either simple, or consisting of a long and a half, of a double long, or of a long followed by a silence equivalent in duration either to a short or a long. If we transcribe the scansion of a verse after the method proposed by M. Guyard all the irregularities disappear, whereas by the old Latin method of longs and shorts they are for the most part inexplicable. M. Guyard uses two forms of notation, one purely musical, writing down a sentence or a verse as though it were a tune; the other a modification of the old system. The following example will explain the method employed:—

TAWÎL.

Fa . . ‘ouou . lôn Ma . . fâ . i . lôn Fa . .

‘ouou . lôn Ma . . fâ . i . lôn

This, of course, only expresses the intervals, but by writing it out with the notes, key, &c., the exact *tune* in which it is declaimed may also be shown. This metre in the old notation would be expressed simply by ∪∪ | ∪∪∪ | ∪∪ | ∪∪∪!

A knowledge of prosody and facility in reading verse with the proper accent and intonation is so important an aid in textual criticism that Arabic scholars should be grateful to M. Guyard for this most useful and practical manual of the subject.

E. H. PALMER.

OBITUARY.

By the death of the Rev. Robert Main, M.A., F.R.S., the Radcliffe Observatory at Oxford has suffered the loss of its painstaking and industrious director. After taking his degree at Cambridge in 1834, Mr. Main was selected in the following year by the present Astronomer-Royal for the post of first assistant at the Royal Observatory, Greenwich. In this position Mr. Main acquired those habits of order and regularity which enabled him, since in 1860 he was appointed to succeed the late Mr. Johnson in the charge of the Radcliffe Observatory, to get through the work of the observatory, and to publish its annual volumes with a promptitude and regularity similar to that of his predecessor, or to that which distinguishes the work and the publications of the Greenwich Observatory. For some years before his death Mr. Main was engaged on preparations for a great catalogue of stars, which is intended to embody the results of the observations of stars made under his directorship, but which he has not been spared to finish. Considerable progress, however, has been made with the reductions, and the mean results are stated to be nearly completed. Beside his labours contained in the Greenwich and Radcliffe volumes, Mr. Main has contributed papers to the *Memoirs* of the Royal Astronomical Society, and has published some separate books, especially, in 1863, a *Practical and Spherical Astronomy, for the Use chiefly of Students in the Universities*. He has also published a series of sermons. His health had been failing for some time past, and he died on May 9, in the seventieth year of his age, much respected and regretted.

We hope to give a detailed account next week of the life and works of Prof. Joseph Henry, the distinguished Secretary of the Smithsonian Institution, who died on the 13th inst., in his eighty-first year.

SCIENCE NOTES.

ASTRONOMY.

Astronomical Observations made at the University Observatory, Oxford, under the direction of C. Pritchard, Savilian Professor of Astronomy. No. 1. —The publication of the first fasciculus of results of the new Oxford Observatory fairly claims a somewhat detailed notice. The Observatory was erected at the expense of the university, and was so far in readiness by the autumn of 1875 that observations were then commenced, the results of which up to the end of 1877 are recorded in the present publication. The objects for which the institution has been established are twofold. The main and fundamental intention is stated to have been to provide the university students with the means of efficient instruction in practical astronomy, while at the same time the professor shall have at his disposal adequate instrumental appliances for extending the science by actual observation. The instrument with which the observations were made is an achromatic telescope of 12½ inches aperture and 175 inches focal length, mounted equatorially, and provided with all the accessories suggested by the present state of science. The quality of the object-glass has been very carefully scrutinised, and it is stated that to the extent of a circle of at least twenty minutes of arc in diameter, and centrically situated, there has been no distortion detected in the telescopic field of view amounting to one-tenth

of a second of arc. The entire instrumental equipment has been executed by Mr. Howard Grubb, of Dublin, and it is considered a highly satisfactory instance of his well-known skill. The greater part of the observations recorded in this first publication were made with an ordinary filar micrometer, previously tested by the usual methods. The record of the observations has been divided into four parts. Part I. contains the results of three series of observations of the satellites of Saturn during the last three oppositions of the planet. The method at first adopted for measuring the coordinates of the satellites was to bisect the disc of the planet by estimation, and then measure the distance of the satellite from the estimated centre, but after a short time the method left an unsatisfactory impression on the observer's mind, and henceforth the measures were taken from each limb of the planet. In some cases, when the satellites were too near the limb of the planet to admit of certainty of measure, the distance was taken from the further limb, and then the diameter of the planet itself was measured under the same conditions in which the satellite was observed. The coordinates resulting from the observations are given as differences of right ascension and of north polar distance. Contrary to custom, the differences of right ascension are reckoned positive when the satellite precedes the planet. In all cases in which these differences are not determined by transits, but by micrometrical measurements, it would have been preferable to give the direct results without reduction to the parallel of Saturn, so as to avoid a needless double reduction. The number of resulting differences of right ascension in the case of Enceladus is 10, of Tethys 48, of Dione 53, of Rhea 82, of Titan 97, and of Japetus 45. There is also one observation presumably belonging to the innermost satellite Mimas. Part II. contains 400 observations of 118 double stars. Part III. gives the results of the observations of all the comets newly discovered in the year 1877. They were regularly observed at Oxford from the day of the first telegraphic intimation of their discovery until they disappeared from view. Approximate elements of their several orbits were completed as soon as possible. The comet discovered by Borrelly was observed between February 20 and April 4 on 16 days, that by Winnecke between April 7 and July 4 on 37 days, that by Swift between April 16 and June 4 on 16 days, that by Coggia between September 18 and December 7 on 12 days, and finally that discovered by Tempel in October on three days. The elements of these comets are also given, together with an ephemeris of Winnecke's comet, with which the observations themselves have been compared. Part IV. contains newly computed elements of the orbits of the three binary stars, ξ Urae majoris, 70 Ophiuchi, and μ^2 Bootis, and their comparison with observations. While engaged on this interesting work Prof. Pritchard has reluctantly come to the conclusion that in consequence of the often excessive discrepancies between the observations of different observers, the accurate determination of the orbit of a double star remains for the astronomy of the future. The contribution of the university Observatory towards this object will be made by careful and often repeated observations of a very few double stars included in a selected list. Some observations have been attempted of the newly-discovered satellites of Mars; but the aperture of the Oxford telescope is hardly sufficient to cope successfully with such faint objects. Independently of the foregoing work, the Observatory has been diligently engaged upon the task of photographing the moon. Nearly 1,200 measurable photographs have been secured by means of the admirable reflector of thirteen inches aperture, made by Dr. De la Rue, and presented by him to the university. A very beautiful engine for completing the measurement of the lunar photographs has recently been received from the same generous quarter; and the hope is expressed that

in due time, and by means of this instrument, the amount of the moon's physical libration may be ascertained, if any exists to an appreciable extent. Prof. Pritchard acknowledges the assiduity and skill with which his two assistants, Mr. W. E. Plummer and Mr. C. A. Jenkins, have done their work at the Observatory. The geographical position of the place, as furnished by the Ordnance Survey, is stated to be "Long. $1^{\circ} 15' 5'' 991$ W. of Greenwich, Lat. $51^{\circ} 45' 34'' 152$," which statement is not devoid of an unwonted degree of apparent precision, as it corresponds to about an inch on the earth's surface.

The Transit of Mercury on May 6.—Most observers in England, who looked hopefully forward to observing the transit, have been disappointed by the unpropitious state of the sky. At the Royal Observatory, Greenwich, great preparations had been made. For, in addition to the instruments belonging to the Observatory, the equatorials and detached telescopes returned from the Transit of Venus expeditions were mounted, so that there were not less than fourteen instruments, with apertures ranging from 12.8 to 2.8 inches, available, to each of which an observer was assigned. But the sun was completely hidden by cloud throughout the transit, with the exception of a short break beginning about ten minutes after internal contact and lasting perhaps a quarter of an hour, during which some observations referring to the aspect of the planet could be made. The accounts of the several observers apparently disagree. While some saw a minute bright spot, slightly diffused, but with a brilliant starlike nucleus very near the centre of the planet's disc, others could not detect the slightest trace of a permanent white spot within the disc. And while some observers saw a bright halo round the disc, much brighter than the ordinary surface of the sun, and with an inner and much brighter ring close to the disc, the halo or corona appeared to others evidently fainter than the sun, and still other observers could not detect any ring either luminous or shadowy surrounding the planet. The reconciliation of these and other discrepant accounts, and the convincing explanation of the true causes of the discordant appearances, will probably not be an easy task. Observers in England generally seem to have been little favoured by the clouds. Circumstances appear to have been more favourable in Scotland, the transit having been successfully observed at Lord Lindsay's Observatory, Dun Echt, Aberdeen. Though a thin cloud covered the sun at the time of the beginning, the external contact was well observed spectroscopically by Lord Lindsay, who detected the approach of the planet by the covering of the C line thirteen seconds before the limb encroached upon the continuous spectrum of the photosphere. At the Paris and other Continental observatories more or less satisfactory and valuable observations have been obtained. But whatever disappointment some observers in Europe may have experienced, it is gratifying to know that observers in America, where the whole transit has been visible, have been successful, and especially that the expedition sent out by the French Government to Ogden, Utah, U.S., has not been sent in vain. Very satisfactory observations and many photographs are reported to have been taken there.

THE periodical comet discovered by Tempel in 1873 returns to perihelion at the beginning of September. An ephemeris of its path, prepared by M. Schulhof, is published in the *Comptes Rendus* of May 6, according to which the comet is to be searched for near 16h. Om. right ascension and in about 6° northern declination in the constellation Serpens.

BOTANY.

At a recent meeting of the Schlesische Gesellschaft für vaterländische Cultur, Prof. Cohn mentioned a case of the poisoning of hundreds of sheep, at Namslau, from eating *Lupinus*. Two

circumstances were spoken of as probable causes. Prof. Cohn had, a year previously, demonstrated the existence in *Lupinus* of an active bitter principle of which the poisonous properties, closely allied to the poisonous alkaloid of the water-hemlock, are established. The other probable cause was found to be the occurrence, at any rate in most of the specimens submitted, of sclerotia, which, when unripe in autumn, burst out in the form of small black warts closely arranged in vertical series; they were supposed to belong to a *Peziza*. In the specimens sent from Namslau this year, *pycnidia* were found to have taken the place of the sclerotia. Prof. Cohn remarked that the question as to whether the poisoning should be attributed to the *Lupinus* or to the fungus must be settled by chemical experiment. Dr. Eidam then gave an account of his cultivation of the sclerotia. Pieces of the stem of *Lupinus* were placed in a damp atmosphere under a bell-jar, and were soon covered with *Botrytis elegans*, Lk. The oval spores of this fungus were easily obtained in a pure state, and on being placed in a suitable nutritive solution were caused to grow without difficulty. They first became globular and then emitted a germ-tube which soon branched and formed a septate mycelium. It grew so abundantly that in order to examine the different stages of its progress satisfactorily it was found necessary to employ the method usual in cases of this kind, of selecting a single spore and cultivating it alone in a very weak nutritive solution spread out on a slide. Soon there appeared on the mycelium sessile or shortly stalked excrescences, usually with a broad base and sometimes isolated, but oftener in groups. Each of these cells, some of which were divided by a septum and others branched laterally, came to a conical point where a number of small bodies were successively produced. These small bodies were believed by Dr. Eidam to be of the same nature as the spermatia described by Dr. Stahl as occurring in *Collema*. No trichogyne nor any analogous organ was discovered in this case, however probable the existence of such an organ may have been. The next process observed was the formation on the mycelium of sclerotia, which ultimately proved to be the same as those found on the stalks of *Lupinus*. Dr. Eidam believes that after a period of rest these sclerotia give rise to the fructification of a *Peziza*, but he could not induce any farther development. The only result obtained from continued cultivation was the observation of the production of large druses containing oxalate of lime, and of course a repetition of the formation of the conidia of *Botrytis elegans*. This case seems, so far as the observations go, to bear considerable resemblance to that of *Peziza Fückeliana*, in which Prof. de Bary found that if the sclerotia germinate shortly after their formation, the result is a mycelium bearing conidia again; but if germination is delayed for a month or two, the basin-shaped fructification commonly known as *Peziza Fückeliana* is formed. By following Prof. de Bary's plan of cultivation in this case, the circumstances justify the expectation that Dr. Eidam will obtain a similar result.

IN No. 11 of the *Botanische Zeitung* will be found a description of a new apparatus for measuring the quantity of watery vapour absorbed by plants.

IN the *Botanische Zeitung* (Nos. 13 and 14) there are the reports of two lectures by Prof. Max Reess on *Saccharomyces albicans* (*Oidium albicans*, Robin). The first gives an account of his experiments, and the second deals with the question as to the identity of the above fungus with *Mycoderma vini*. Prof. Reess's experiments show pretty conclusively that they are different plants, and he therefore denies the accuracy of the Grawitz doctrine (see *Virchow's Archiv*, Bd. lxx. Heft 4, August 1877), which he says has a very slender basis. The lectures seem to be of much medical as well as botanical interest.

AN interesting discussion on some disputed points of botanical nomenclature has lately been engaged in by Profs. De Candolle and Caruel, and Messrs. Hiern and Ball, in the *Journal of Botany*. The next number will contain the views of the editor (Dr. Trimen) on the disputed points.

WE have received the second edition of Mr. W. Robinson's *Parks and Gardens of Paris*. It is well printed, and contains many excellent illustrations.

Pine Plantations in France, by John Croumbie Brown, LL.D., is very little more than a compilation from the works of various authorities (chiefly foreign) on matters relating to forestry, and this special branch of it in particular. Nearly the whole book consists of long quotations which have been already published, and therefore require no notice here.

MEETINGS OF SOCIETIES.

SOCIETY OF ANTIQUARIES.—(Thursday, May 9.)

LORD CARNARVON, President, in the Chair. Mr. Nesbitt exhibited drawings of two vases in the church of St. Mark, Venice. One of these is made of sardonyx, mounted on a silver gilt foot, and is surrounded by fifteen half-length figures of cloisonné enamel, representing Christ, the Virgin Mary, and divers saints and angels. An inscription on the rim mentions the name of the emperor Romanus, referring to the last of that name, who reigned in the latter half of the eleventh century. The other bowl is of dark brown glass, with medallions of human figures copied from the antique, and an unintelligible Kufic inscription. The workmanship is Byzantine. Mr. C. K. Watson read a paper on the use of the word *Celtis* for chisel, from which is derived the word *Celt*, commonly used by antiquaries. The only authorities for the use of the word are an inscription—which has since been shown to be forged—and a single example in the Vulgate in Job, c. 19. In this case, Mr. Watson argued, *celte* was a mistake for *certe*, which appears in some early and good MSS., and the word thus owes its existence to an error. Mr. Coote referred to the similar case of the word *Hebrides*, which originated in a misprint of the word *Hebudæ* in an early edition of Solinus. Mr. Evans remarked that some editions of the Vulgate have *scelte* or *scelte* in place of *celte*, and was inclined to think that *certe* was a transcriber's correction of an obscure word which he did not understand.—Mr. Brabrook exhibited a matrix of a seal bearing a hand, holding a lamp and a fleur-de-lis, found near Barnstable.—The Rev. J. R. Shepard exhibited a bronze mediaeval candlestick; and Mr. Evans exhibited a fine specimen of a twisted bronze anklet, found near Toulouse.

LONDON MATHEMATICAL SOCIETY.—(Thursday, May 9.)

LORD RAYLEIGH, F.R.S., President, in the Chair. Prof. Henrici communicated a paper by Dr. Klein, of Munich, "Ueber die Transformation der elliptischen Functionen." Prof. Cayley spoke on the theory of groups. Prof. Kennedy read his "Notes on the Solution of Statical Problems connected with Linkworks and other Plane Mechanisms." The special object of the paper was to give an elementary solution of the problem: given a linkwork or plane mechanism of any number of links, with any force acting on any one of them; to find the magnitude of the force necessary to balance the mechanism if acting in any direction on any other link. The method employed was the replacement of the two links on which the forces acted by two others, which had the same instantaneous centres and the same angular velocity ratio, but which were so chosen that they could be directly connected together by a third link. In this way a simple combination of three links was used as a "virtual mechanism" to replace the original complex linkwork, and the solution became extremely simple. Incidentally Prof. Kennedy took occasion to insist on the advantages of the consistent use of the notion of the instantaneous centre, even in the most elementary treatment of mechanical problems. Mr. Glaisher gave the gist of his "Generalised Form of certain Series," and Mr. Kempe read part of his paper "On conjugate Fourpiece Linkages."

ROYAL SOCIETY.—(Thursday, May 9.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"On the Action of Sonorous Vibrations in Varying the Force of an Electric Current," by Prof. Hughes; "Note on the Minute Anatomy of the Thymus," by Dr. H. Watney; "On the Classification of Locci," by Prof. Clifford; "Description of the Harmonic Analyser," by Sir William Thomson.

NEW SHAKSPEARE SOCIETY.—(Friday, May 10.)

F. D. MATTHEW, Esq., in the Chair. Mr. T. A. Spalding read a paper on "Elizabethan Demonology"—an attempt to sketch out the leading features of the belief in evil spirits as it existed during the Elizabethan epoch, more especially with reference to Shakspeare and his work. The paper was divided into three sections. The first dealt with the general laws that appear to have operated in creating and modifying the belief in the existence of good and evil spirits:—(1) The impossibility of Monotheism; (2) The Manichean error; and (3) The tendency to convert the gods of hostile religions into inferior, or even evil, spirits. This last tendency was traced through the Greek, Neoplatonic, Jewish, and Christian systems; with the difference in this last, that the mediaeval Church in its missionary efforts compromised to a certain extent with the heathen mythologies, and identified their purer beliefs with its own. The foundation, therefore, of the diabolic hierarchy was the exploded beliefs of the heathen nations; but the more important of the Teutonic deities are not to be traced in it on account of this absorption. In the second section the actual belief of Shakspeare's contemporaries was discussed under three heads:—(1) The Classification; (2) Appearance; and (3) Powers of the Evil Spirits. Under the first head the reader took occasion to point out the relation of *King Lear* to Dr. Harsnet's *Declaration of Egregious Popish Impostures*. Under the third head the capacity to assume various forms—human, animal, or divine—was discussed, with special reference to the transitional belief of the Reformation period on the subject of ghosts—the Conservatives believing in the return of disembodied spirits, the Reformers attributing such appearances to the machinations of the evil one—and the manner in which the transition is reflected in *Hamlet*. The second power was that of possession; and the various methods of exorcism were also described. The power of causing bodily diseases and the incubus theory were also alluded to. The reader opened the third section by pointing out that the only difference between fairies and devils was the difference in degree of the evil they wrought—fairies, malicious; devils, malignant. This has an historical origin. When a nation, as in the pre-Reformation times, has unity of creed, and its attention is directed to agricultural and domestic matters chiefly, its spirits take their tone from this—become fairies, mischievous in homestead and field. When, however, the ancient creed gets exploded, and men have to encounter for themselves theological doctrines, the belief is in spirits who are scheming destruction of body and soul. But the change first occurs in the towns: the old belief hangs on much longer in country places. Hence, at both ends of Shakspeare's work, when he was most influenced by country life, we find fairy plays—the *Dream* and the *Tempest*. and in the middle, while his life was affected by town-thought, we get the great tragedies, in which devil-agency is so predominant. But the *Tempest* is not a mere return to the *Dream*. Shakspeare's works seem to bear the impress of a mental struggle that most men have to undergo. The starting-point for this is the first stage—of hereditary belief—where a man accepts unhesitatingly what he is taught: the *Dream*. The second stage—when doubts arise as to the truth of the customary belief, the period of scepticism, is illustrated by the great tragedies, the leading feeling of which is that an overruling evil fate sweeps good and bad equally to destruction: that man is the toy of malignant beings. The third period—the period of intellectual belief—is illustrated by the *Tempest*, where Shakspeare, Prospero-like, teaches that man, by nobleness of word and work, by self-mastery, may overcome this evil; that his great duty is to fight out the cause of truth and right in the present; to leave peering into the sleep that rounds this little life, and make the world happier and better than he found it.

FINE ART.

THE GROSVENOR GALLERY.

(First Notice.)

THE second exhibiting season of this important enterprise does not show any falling-off from the first: rather on the whole an advance. Mr. Burne Jones is as fine, if not, to the unaccustomed eye, quite as surprising; Mr. Millais finer; Mr. Watts, on the whole, less impressive, but on the same dignified level of purpose and performance. In landscape, Mr. Lawson creates a sensation which was not paralleled last year by any work in that class of art. Then, to keep up the calibre of the display, there are such artists as Herkomer, R. W. Macbeth, Legros, Gregory, Whistler, Tadema, Tissot, Spencer Stanhope, Leighton, Boughton, Armstrong, Crane, Albert Moore, Poynter, Boehm, and Lady Waterford, not to name others who might nevertheless well be specified. The most serious deficiency is in historical painting: we have and we enjoy here the ideal, but not to any reasonable degree the historical, with its deep interest in strong and significant facts. As to any comparison that might be raised between the Grosvenor Exhibition and the Royal Academy, it would be futile to deny that the former leaves a far more serious and satisfying impression: it is like the sensation which one receives from joining a circle of highly-intelligent and cultivated people, as contrasted with a haphazard miscellaneous company: one finds more to stimulate, and is conscious of more delicate gradations of appreciation. Even if the total of active working faculty be not really greater, the opportunity for profiting by it is vastly increased. Not indeed that there are no commonplace exhibitors or no bad works at the Grosvenor: for, with all its merits of tone and material, this is far from being the case. We could name various instances in point, where mere personal indulgence, or lax good-nature, seems to have given the *entrée*; but we would rather abstain from so invidious a proceeding.

In spite of formidable competitors, the leading and informing spirit of the Grosvenor Gallery is again Mr. Burne Jones. This gentleman contributes a set of six single figures, the *Seasons* and *Day* and *Night*, making a connected series, and in addition four other pictures, and a work in a novel metallic process. There are four main constituents throughout Mr. Jones's art which deserve to be defined at the outset: to name them may stand in stead of a good deal of attempted description of subject-matter—which, in fact, is never the strong point with this delightful painter—and of that labour of word-painting which after all can go but a little way towards expressing the intrinsic properties of pictorial art. These four constituents are—(1) Imaginative *naïveté*; (2) Sentiment in the guise of self-absorption—or (as one may prefer to call it according to the several phases it assumes) abstraction, languor, or dejection; (3) Amorousness as the general key-note; and (4) Splendour of colour. We might add—but this belongs more to the artist's idiosyncrasy and his method of work—an old-world sympathy which clothes everything in a chivalric or a classic garb: for Mr. Jones, poetry is something which belongs to the past, and the present knows not of it, and does not admit of its development. The painter's series of the *Four Seasons* is admirable according to these lines of thought and sentiment: the beautiful little quatrains, inscribed on scrolls for the respective figures, should be read by the visitor, and will be found as gracefully sad as the pictures themselves: they are the work, we believe, of Mr. William Morris. The *Summer* and *Night* may be singled out for special praise: the former a queenly lady "to the bath addressed;" the latter magically blue. *Luna* may be classed along with these; a lovely colour-invention of veiled though brilliant blue tints: the curled female form, with drapery clouding the face, is charmingly apposite. *Pam* and *Psyche*, the

nymph received by the shepherd-god as she emerges from the river, is sweet and fine, with ripe simplicity of colour. It may, however, be allowed that Pan's left arm and hand, poised on the rock, are small and feeble; and the petrology of the picture is innocent of anything that was not within the range of Italian painters of the fifteenth century. The two most important works yet remain, *Laus Veneris* and *Le Chant d'Amour*: the first, it is noted in the catalogue, was painted in 1873-5, the second in 1873. Of the two, we prefer the *Chant d'Amour*, which represents a mediæval lady playing on a hand-organ in the pleasure of a castle; Love plies the bellows, and a knight listens, reclined on the path close by a flower-bed. This has a truly extraordinary intensity of colour; we do not exaggerate in saying that it would stand comparison with a Giorgione; the sentiment also assimilates closely to that of the same magnate of Venetian art, and is even sustained at a more uniformly high pitch than one mostly finds it in his works. The *Laus Veneris* portrays a lovely and love-pallid queen in her bower, with her crown doffed and set on her knee, and her maids of honour diversely occupied in the preliminaries of music and song; five knights on white horses pass outside the casement: one of them looks in with a peculiar thrill and expectancy, which finds its response in the throbbing heart of the queen. It appears to us a rather disagreeable piece of mannerism that the helmed visages of these men should all be perfectly hairless. The queen's countenance is a triumph in its way, though we do not think it a flawless model of beauty: poetry is the right verbal medium for expressing its meanings, and this has been done (with more or less accuracy of interpretation) in a sonnet by Mrs. Moulton. The colour is like a flower garden for vividness—not, indeed, unassailable by the critic, but none save a great colourist could keep it so near as Mr. Jones does to being unassailable. Last comes *Perseus and the Graine*, executed on wood in a very peculiar fashion, the figures being all made out in metal of very low relief, except the heads, and any part where flesh is exposed. This is to be "the first of a series to illustrate the tale of Perseus." The effect, close to the eye, is cold, shiny, and crinkled: no doubt, however, it is not quite fair or reasonable to estimate the effect until the series shall be placed *in situ*—whatever its destined position may be, for this is not explained in the catalogue.

Along with Mr. Jones we will name two other painters, Mr. Crane and Mr. Spencer Stanhope. *The Fate of Persephone*, by the former artist, is a large work, of considerable pretension and no little achievement. We do not think, however, that it is quite within the proper range of Mr. Crane's faculty: it comes rather too near to classical severity and completeness, and does not sufficiently draw upon those powers of capricious fancy, romantically irresponsible, with which he is richly endowed. Mr. Stanhope, who is as marked though not as consummate a mediævalist as Mr. Burne Jones, sends three pictures—*The Shulamite*, quaintly accomplished and attractive in its way, but unreasonably mannered; *Night*; and *Morning*. We like *Morning* the best: the invention here is extremely bold, if also somewhat crude, in its literalism of symbol. The naked youth, swathed only with fluttering wrappings of pink and blue (which we may construe into tints of cloud and zenith) is pouring out of a lamp upon his outstretched fingers a jet of golden light—actual gilt in the picture—which splinters downwards into a profusion of luminous shafts.

Of Mr. Watts's contributions, the chief one is that entitled *Time and Death*. This is a noble invention, which in a healthy state of art-patronage would at once find its proper place in some public building. Time is shown eternally young, immeasurably strong, forward-eyed: he advances with his inevitable unpausing gait, holding his mighty scythe: the puny globe appears

just in front of his knee. With his left he holds the right hand of Death, a white-faced woman with drooped eyelids, draped in white over green: her lap is full of cropped flowers—the rose, the lily of the valley, and others. Clouds are before her path. Above these two portentous forces hovers Retribution, a vast female form with the balance and the sword. The sky is of full unchanging blue. In the close proximity of an exhibition-room, this grand work shows some deficiency in handling and colour-treatment; and certainly the torso of Time is yellow to excess. The other large picture of Mr. Watts, an allegory of *Mischief*, is in a lower line of invention, and has technical shortcomings which we shall not pause to specify. *Ophelia*—the face of the forlorn demented lady seen bending over the willow-shaded stream with a kind of fascination in her gaze—strikes one at first as distressful almost to the point of squalor, and the mode of painting is somewhat slight though masterly; this work, however, gains greatly upon further inspection. The small *Sir Galahad* had been seen before; but we gladly re-behold it, and along with it the very fine portrait of *W. Strickland Cookson, Esq.*

Of Mr. Herkomer's two principal works we have already spoken with the unstinted praise they deserve: the large water-colour of *Richard Wagner*, which appears here also in the form of an etching, and the peasant-group "*Who comes here?*" Mr. Robert Macbeth's picture, *Coming from St. Ives Market*, is excellent in movement: a strong work, but comparatively sketchy, which appearance arises partly from the horrid clouds of dust with which it is half-filled. Mr. Legros shows unequally. The one thing that is exceedingly fine is the *Interior of a Church in the North of France*, with a few praying or silent figures; the faces come out perhaps a little too clearly for the general effect of half-tone, but this is hardly to be blamed. The sentiment of that intimate, personal worship which is to be witnessed in Catholic churches, habitual and casual at once, was never more exquisitely conveyed. The praying woman in the middle distance, with her open palms in downward action, is a lovely figure: yet not superior to the *femme du peuple* of vivacious strong temperament and dark complexion who comes in front, and the placid woman, of clear conscience and engaging good-temper, beside her. The old man and woman in the background could not be missed without great detriment to the picture; they are precisely where they should be, and as they should be. A larger canvas than this has been given by Mr. Legros to *Le Repas des Pauvres*—three men at table at a very humble but not actually sordid sort of restaurant. This work has the wonted merits of its author—seriousness, actuality, a superiority to all kind of trick or factitious embellishment, the pathos which arises from the mere presentment (the mere verbal statement, as one might call it) of cheerlessness in real life; we can hardly say, however, that it makes a picture. *The Close of the Day*, an old wayfarer resting on a roadside bank, and dozing off, is again strongly pathetic in this direction, but is not among the artist's finer pieces of execution. The portraits of *Prof. Cassell* and *Prof. Clifford*, "painted before the students of the Slade School of Art," are manly, capital performances. Another excellent portrait is that by Mr. E. J. Gregory—*W. T. Eley, Esq.*: grey hair, full weatherworn complexion, costume of yellowish-brown velvet, crinkled here and there with a most telling touch; he holds the collar of a dark-brown spaniel, which looks upward, muzzle and eye pointing to his master's visage with craving affection. The mixture of facile slightness with force in the painting of this dog is remarkable: the general tone of the picture, solid and dark. The pendant to Mr. Gregory's portrait is one by Mr. Millais, very nearly of his finest quality; full of lifelike directness and painterlike certainty and accomplishment: *Twins, the Daughters of T. R. Hoare, Esq.* The twin ladies in dark-green riding-habits, and accom-

panied by a deerhound, are, as one might expect, extremely alike: the painter has rightly kept up the same likeness, with several minor points of diversity, in the costumes and the general disposal of his sitters. Mr. Millais's other contribution is named *A Good Resolve*: a Scotch country lass turning down the corner of a page in the Psalms, to break herself of a "besetting sin." This is not a particularly interesting work: but, like almost everything that Mr. Millais does, it has that distinctive property of an actual person or object in nature—that what seems commonplace at first gets less and less so as you look, and at last hardly looks commonplace at all: familiarity quenches contempt. Mr. Whistler re-announces his eccentric gospel that human beings are, for the purposes of art, not human, but merely so much opportunity for colour or tone—colour-pegs though not clothes-pegs. An *Arrangement in Blue and Green* means a portrait of a young lady in blue velvet very finely treated, and with a little (hardly any) green discernible in her hat; a *Variation in Flesh-colour and Green* means a number of Japanese women with a prospect of the river (Japanese rivers appear to be very like the Thames at Chelsea) through an open window; an *Arrangement in White and Black* means a young lady thus arranged or arrayed: her very brilliant complexion is too much assimilated by the painter to rouging, and in fact his system in these works does not allow adequate scope for genuine flesh-painting. We have frequently expressed our sincere admiration for Mr. Whistler's remarkable gifts, and we do so again now; though a little less of personal whim, and more willingness to take the world on the same terms on which other people take it, would by this time be of advantage to him as to most of us. Of Mr. Alma-Tadema's six pictures we have already made some mention: there is not so much in them to describe as to enjoy, and certainly the enjoyment to be got out of such admirable work as *A Bacchante* and *Painting* is of no ordinary kind. Next to the six of the semi-anglicised Dutchman come five works by a semi-anglicised Frenchman, M. Tissot. *Curiosa felicitas* is the distinguishing mark of Tissot's works; but it has a bad trick of lapsing into *curiosa infelicitas* every now and then, and we cannot say much for any one of his present specimens, except the *Study* (a young lady's face drawn with much refinement, the rest of the figure being left uncompleted), and *Croquet*. Here a girl of about fourteen, dressed in black and white, with her mallet poised behind her back, stands shadowed from the bright sunshine which swathes the lawn behind her: two other girls are further off, one lying forward, one kneeling: a white Pomeranian dog and a fountain enhance the life of the scene. This is a very enjoyable and uncommon production. M. Heilbuth has one fairly characteristic example, *Roman Orphans*: his other three count for nothing to his reputation, and for little, we should think, to the visitor's gratification. Mr. W. B. Richmond is represented by four portraits. One of these is a sensible, straightforward, and very carefully finished work, *W. Stewart, Esq., painted for the Wakefield and Barnsley Bank*, a head not much unlike Mr. Layard's. The others are all a little forced—the artist evidently aiming to do something that shall be at once charming and impressive; and he attains refinement, but rather at the expense of first-hand single-minded spontaneity.

We reserve for another article the landscape-art of the exhibition, and with this a certain number of the figure-subjects; also the water-colours and sculpture.

W. M. ROSSETTI.

SIR HENRY THOMPSON'S NANKIN CHINA.

THIS collection, now on view at the galleries of Messrs. Marks, the well-known china-dealers in Oxford Street (No. 395), contains over five hundred specimens—all good, and some matchless

—of this beautiful old ware. If not the finest collection in England, there are few finer, and it is particularly rich in choice specimens of the hawthorn pattern, two of which were recently sold at Captain Lukis's sale at Christie's for over 1,300*l*. Of the so-called "ginger jars" of this pattern Sir Henry possesses several, two of which are quite equal if not superior to Captain Lukis's. Nor would it be easy to match the exceptionally fine pair of vases (No. 6), with their spirited figures, rich colour, and pure glaze; the set of pots and beakers decorated with the Dog Foa (No. 21); such a curiosity as the pomegranate teapot (No. 243), with its quaint shape and decoration; the elegant ewers and bottles (Nos. 254 and 255), with their graceful arabesques and fine form; nor the magnificent beaker (No. 206). Although the sapphire-like blue of the best periods or factories dominates throughout, the range of colour is considerable. Sir Henry has not disregarded the claims of those deep indigo tones so frequently found in the aster bowls, nor the less lustrous beauty of the powder blue; while, as in the splendidly-decorated bottles (No. 204), he has admitted pieces of a rather poor and shallow colour on account of the superlative merit of their shape and ornament. On the whole, it is not often that even artists and china-lovers get so good an opportunity of studying decoration and comparing tints; but to the public generally the exhibition offers a rare chance of forming some judgment as to the wisdom or folly of the present taste or "craze" for the "old blue-and-white."

That two blue-and-white jars of no special beauty of form, and but ten and a-half inches in height, should be worth more than one thousand pounds, and that the loss of a cover should make a difference of one or two hundred pounds in the value of one, will always appear preposterous to many persons; but these hawthorn jars are not only "gems" metaphorically speaking, but have much the same relation to other china of the same description as the Koh-i-noor and other diamonds of remarkable size and brilliancy bear to ordinary stones. They are comparatively as rare, and as supreme in colour and lustre, and suffer as much in value by a flaw.

Indeed, there is much "method" in this so-called "madness," for the productions of the old Chinese factories at their zenith (now long past) have a value—both artistic and historical—which is unique. The blue colour without a tinge of red, the white paste without a tinge of yellow, blend with a perfection unknown to other porcelains, and with the even, bright, colourless glaze produce an effect on the eye of coolness and repose unapproachable by the soapy or chalky paste and staring or dull colour of even the best modern blue-and-white.

Those without a natural sense of decorative fitness and harmony of colour cannot be expected to appreciate the artistic properties of the Old Nankin; but even to such its historical importance must appear great if they consider it as the base of decoration for more than half the pottery and porcelain of Europe. All the blue-and-white Delft of Holland (despite the opacity of its body, the nearest approach to a perfect imitation of Nankin that has ever been made), the faience and much of the porcelain of France, the porcelain and pottery of the factories at Liverpool, Bristol, Worcester, and other places too numerous to mention, both at home and abroad, were at first a mere imitation of this ware, and, oddly enough, not of its finest patterns. If we except Italy, whose rich artistic heritage needed no external impulse, there is not a country in Europe that has not made attempts more or less unsuccessful to imitate the paste, the colour, the patterns, the glaze, and even the marks, of old "blue-and-white." Yet after two centuries of such efforts, never wholly abandoned, these hawthorn jars of Old Nankin, with their exquisitely modulated ground of translucent blue and their blossoms of pure milk white,

are still as unrivalled in their special beauty as the sculpture of Athens or the paintings of Venice.

The catalogue, with its beautiful paper, type, binding, and illustrations, is almost as choice in its way as the china itself. The drawings by Sir Henry Thompson and Mr. Whistler not only illustrate the collection, but the special merits of that kind of decoration carried to perfection by the Chinese, giving as they do as much essential truth and beauty as is possible with the means and labour employed, and wholly fulfilling the intention of the artist. They have been reproduced almost faultlessly by the Autotype Company's mechanical process, nor should scanty praise be given to Messrs. Marks for the taste shown in the binding and general "get-up" of this precious volume. COSMO MONKHOUSE.

ART SALES.

MR. HEUGH's important collection of pictures, which was sold by Messrs. Christie, Manson and Woods on Saturday last, included many works which had been not long ago sold under the hammer, Mr. Heugh having apparently been an active purchaser of much that was offered in the market. Another noteworthy point about his collection is that it contained certain conspicuous examples of the work of English "Pre-Raphaelite masters," which had been talked or written into much publicity at an early period of their existence, but which, when, after some change of fashion, they were offered at Christie's, realised considerably lower prices than we should have been led to expect. It may be said that the prices as a whole were not very high. A picture by Mr. Keeley Hilswell, a justly distinguished member of the Scottish Academy, fell for 100 *gs*. It represented a view on the Grand Canal, Venice. *Head of a Roman Girl*, by Leighton, 72 *gs*.; *Isabella*, by J. E. Millais, R.A., 61 *gs*.; *The Carpenter's Shop*—representing an habitual incident in the boyhood of Christ—by J. E. Millais, R.A., 450 *gs*.; the *Scapegoat*, a Scriptural subject by Holman Hunt, painted on the margin of the Dead Sea, with the mountains of Edom in the distance, 480 *gs*.; a portrait of Sir Walter Scott, by C. R. Leslie, R.A., exhibited at the National Portrait Exhibition in 1868, 120 *gs*.; *A Calm with Boats*, by John Sell Cotman, 105 *gs*.; Raeburn's portrait of his wife, Lady Raeburn, 610 *gs*.—a sum considerably less, it was stated, than it had fetched within the last two years; *Crossing the Brook*, a work of conspicuous merit from the brush of H. Thompson, R.A., painted about 1803, 780 *gs*.; *A Scene in Westmoreland*, a very fine example of George Morland, signed and dated 1792, 300 *gs*.; *The Masters Gaffer as Schoolboys*, by Sir Joshua Reynolds, a very well-known engraved picture, offered for sale quite recently, 320 *gs*. A portrait by Gainsborough of one of his daughters sold for 350 *gs*. and that of the other with a guitar, introduced into the composition, sold for 360. A landscape by the same master, representing, it was said, a view in Shropshire, sold for 500 *gs*. We further note a few among the foreign pictures, some of which were of good quality. *A View of Old London Bridge*, dated 1630—being an interesting picture by C. de Jonghe, which had appeared at the Wynn Ellis sale—750 *gs*. A good example of Netscher, *La belle Limonadière*—a room interior with a young woman in crimson velvet and white satin—208 *gs*. This was from the collection of the Count de Pourtales, and had been exhibited, we believe, at Burlington House. A picture of a group of roses, peonies, and pinks in a terra-cotta jar on a marble table, exhibited in 1834 and 1872, sold for 330 guineas. It was ascribed, and no doubt justly, to the great Dutch master of flower-painting, J. van Huysum. By William van de Velde there was a *Calm*, with fishing-boats at anchor, and a jetty at the left of the picture. It realised 235 guineas. A most agreeable example of Wynants, with figures probably by Lingelbach, was knocked down for 250 guineas. It represented

a sandy road, the like of which is so familiar to those acquainted with the works of this charming Dutch master of landscape. The Italian and Spanish pictures in the Heugh sale were not generally such as to attract great interest. A small painting of the *Madonna and Child*, by Murillo, was, however, handed over to a celebrated dealer, for the sum of 500 guineas. The day's sale realised 11,800*l*.

On the previous day Messrs. Christie, Manson and Woods had sold Mr. Heugh's water-colour drawings, which included some very noteworthy specimens of the art of Turner and of Peter de Wint. From the comparatively low prices given for some finished works of the last-named artist it may perhaps be conjectured that the popular taste of the day is agreeing with a judgment often expressed in critical circles that the charming art of De Wint is seen to greater advantage in his sketches than in his finished drawings. At all events, a view of Gloucester from St. Catherine's Hill, which had sold under the hammer in 1874 for 640*l*., realised on Saturday only 262*l*. 10*s*. By Copley Fielding, a Scotch lake scene was knocked down for 73*l*. By J. M. W. Turner, however, there were some notable falls of price. Thus, a *Patterdale*, said to have been sold in the Gillott collection for 850*l*., realised on Friday last only 338*l*. Again *Abbeville*, a vignette from the portion of the Novar collection sold last year, realised on Friday but 178*l*. 10*s*., while at last year's auction it had realised 288*l*. *Marly*, from the Novar sale, when regarded as a commercial investment, proved more satisfactory, for last year it realised 367*l*., and this year 400*l*. By F. Walker, A.R.A., the *Harbour of Refuge*—a sketch for his finished picture—fetched 63*l*. A volume containing 100 drawings in pencil and pen, from many hands, among which may be named Gainsborough, Prout, David Roberts, Sir Edwin Landseer, and Richard Doyle, realised 94*l*. 10*s*.

NOTES ON ART AND ARCHAEOLOGY.

MR. JAMES CAMPBELL, one of those painters of the "Liverpool school" who began several years ago exhibiting works on which considerable attention was bestowed both in Liverpool and in London, has lately completed a picture, *The Day before the Race*, which, in the form of a photograph now issued for sale, may prove popular, especially at the present time of year, the thick of the racing season. The scene is a training-stable, in which a veteran trainer is imparting some of the choicer secrets of his craft to a juvenile jockey, whose aptitude as a pupil appears to be such that he scarcely has occasion for any master. Another recent picture by Mr. Campbell is *The First Earnings*, a very well-chosen moment in the home-life of a struggling family. A widow's son has earned his first half-crown; equally to the delight of himself who holds it aloft, of his mother who foresees that the nippings of poverty will be not quite so keen henceforward, and of his child-sister, who gazes with half-wondering intensity at the very cheap doll, the first-fruits of her brother's affluence and goodnature. Mr. Campbell quitted Liverpool some years ago, and is now settled at Reigate.

VISITORS to the Royal Academy of the last couple of years will not have forgotten two pictures of a sort of series painted by Mr. F. W. Lawson, *Children of the Great City*. A third work in the series had been expected to make its appearance this year at Burlington House; but, having slipped out thence by one of those not easily-explicable mischances which attend the doings of Hanging Committees, it is now on view at 70 Pall Mall. This subject is named *Dawn*; and represents, with much truth of sentiment, and attention to a fresh and quiet effect of morning light, the interior of a garret, in which two orphaned sisters and a brother house their penury: Lambeth Palace is seen right opposite, beyond

the river, through the opened window. The eldest sister is now dying, her brother supporting her head, golden-haired, with pallidly-hectic cheeks: the younger sister still alumbers on her patchwork pallet. On the floor are an open book and a common paraffin lamp: pasted on the wall is a large woodcut of the Queen, well known in cheap shops and dingy neighbourhoods. Everything about the room and its habitants indicates degree of poverty which only stops short of the quail because the children are not of naturally coarse fibre.

THE Berlin Museum, after long negotiation, has been fortunate enough to acquire six remarkable works of Art from the Strozzi Palace. Of these, three are paintings of very high value, and three are works of sculpture that have long been known and classed as undoubtedly authentic. To speak first of the paintings. The oldest of these is a portrait by Sandro Botticelli of the unfortunate Giuliano de' Medici, who was murdered at the battle of the Pazzi conspiracy. The portrait, which was probably painted after his death, represents him in profile as a young man of twenty-five. The second in date is a portrait of the young daughter of Roberto Strozzi, who was banished from Florence in 1537, and spent some time in Venice, where this likeness of the fair-haired little girl of at most three or four years old (not ten as Browne and Cavalcaselle affirm) was painted by the master-hand of Titian. It is, at all events, signed *Titianus F.*, and even Titian's severely critical biographers admit its authenticity, though they have mistaken the age of the child. The third is a portrait of Simone Martelli, comparable, it is said, with the best portraits by his master in the Uffizi and the Pitti Palace. The works in sculpture are, if anything, still more noteworthy than the paintings. They consist of the celebrated bust of Marietta Strozzi, engraved in Perkins' *Tuscan Sculptors*, and signed upon the richly-carved pedestal with the name of Desiderio da Settignano, reckoned as one of this master's finest works; a bust, earlier in date, of Niccolò Strozzi, a banker in Rome in the fifteenth century, supposed to be by the early Florentine sculptor Mino da Fiesole; and a small bronze statue of St. John the Baptist, treated with old naturalism. This is said to be by Donatello, who, as we know, frequently chose this subject for his art; but it is difficult to criticise this work, as the bronze casting has not been entirely successful, and much of its delicacy has no doubt been lost. The Berlin Museum has paid the sum of 180,000 lire for these six works to the executors of the late Don Ferdinando Strozzi Majorca Renzi, Prince of Forano, &c., by whom, after remaining for many ages in the Strozzi Palace, they have been sold to fulfil their final destiny of instructing the public in a National Museum.

A FIGURE symbolising the *Genius of the Arts*, the work of M. Mercié, has just been set up on the Pavillon du Louvre, facing the bridge of Saint-Pères, in the place of the statue of Napoleon III. by Barye, which formerly occupied this position. The *Genius of Law*, or *Strength and Prosperity Renascent under the Reign of Law*, has also been treated by M. Crauk in decorative sculpture on the façade of the Pavillon de Marsan. Both works were uncovered at the opening of the Exhibition.

THE splendid altar-piece of the *Last Judgment*, by Rogier van der Weyden, belonging to the Hospital at Beaune, is now for a short time being exhibited in the Louvre, after undergoing a most careful and successful process of cleaning and restoration.

MAKART's picture of the *Entry of Charles V. into Antwerp*, which, as we have before stated, is creating a great sensation at the present time in Vienna, is taken from the well-known passage in Dürer's journal in which the simple-minded Nürnberg artist naively expresses his delight at the sight of "the costly triumph," and particularly at

"the beautiful young maidens whose like I have never seen," who formed part of the procession, and who were exhibited all but naked to the public gaze. Charles V., it appears, offended these young ladies, who all belonged to high patrician families, by casting down his eyes as he passed; but Dürer, as he afterwards explained to Melancthon, regarded them "attentively and closely, and without shame, because he was a painter." This is the incident that Makart has chosen for representation. Charles V. on horseback, it is true, forms the centre point of the composition, but the chief interest, and the real *raison d'être* of the picture, lie with the beautiful maidens and the painter, who is seen observing them with much interest. The whole is a wonderful scene of colour and theatrical display, in which single figures stand forth from the surging crowd with startling vividness. It is, in fact, painted with all Makart's coarse power, and is altogether a noteworthy work, which most people would feel desirous of seeing; but it is asserted that another cause for the crowds it attracts to the Künstlerhaus is the fact that a number of the figures introduced are portraits of persons moving in the highest circles in Vienna. The artist, following the well-known example of Paolo Veronese in his *Marriage at Cana*, has sought to give further interest to his work by depicting the beauties of the day in the dress and character of former times.

THE *Gazette des Beaux-Arts* has not yet suffered itself to be overwhelmed like other journals with the Paris Exhibition. It treats this month of subjects of purely artistic interest, beginning with the frescoes of Veronese at the castle of Masera, near Treviso, upon which we have a first article by Charles Blanc. Strange to say, since Carlo Ridolfi described these frescoes in his *Maraviglie dell'Arte* no competent critic has ever entered upon a full description of them until now. M. Charles Blanc made an excursion to Masera from Treviso in 1873, and his lucid account of the place as well as of the frescoes fully makes up for past neglect, and enables us to form with the help of the numerous illustrations a very clear idea of the artistic riches of this Palladian villa, or, as it is now called, *Castle*, of Masera. Eugène Fromentin is considered as a painter and a writer by M. Louis Gonse, his article being enriched by two capital reproductions from Fromentin's drawings. M. Duranty, whose shrewd criticism we have before noticed, offers some suggestive remarks respecting Daumier in a lively study of that celebrated caricaturist, whom M. Eugène Montrosier has also been studying of late in the pages of *L'Art*. M. Ephrussi treats of "The Italian Influence visible in a Work by Dürer," the work in question being a drawing in the Museum at Hamburg of the *Death of Orpheus*, a subject treated also by Mantegna in a similar manner, as seen in the drawing exhibited by Miss H. de Rothschild at the Grosvenor Gallery, and reproduced in the illustrated catalogue. Dürer's drawing, which was formerly in the possession of Sandrart, is compared with this by Mantegna, and also with a print by an anonymous Italian master, from which the figures in Dürer's work were evidently taken, so that it is needless to talk of "Italian influence" when we can trace direct copying. Dürer's drawing was a very early work, dated 1494. The only other articles of the number are "Un Dossier de Catalogues inédits," by M. E. Bonnaffé; the Laurent-Richard collection; and a review of *Dodone et ses Ruines*, by M. O. Rayet.

THE first two parts of the *Histoire générale de la Tapisserie*, by M. E. Muntz, A. Pinchart, and J. Guiffrey, have just been delivered to subscribers. It is M. E. Muntz, lately appointed Librarian at the Ecole des Beaux-Arts, who is to be credited with the idea of this publication on an interesting subject, the history of which was confused and very obscure on many points. He discovered, three or four years ago, in the archives of Rome, Florence, Siena, Milan, Venice, and

many other Italian cities, documents proving the fact, which had been wholly forgotten, that, from the beginning of the sixteenth century, these cities imported tapestry-weavers from Flanders and Paris, and gave them special opportunities for plying their trade. These discoveries, published in the *Chronique des Arts*, attracted public attention, and the historical exhibition organised two years ago by the Union Centrale in the salles of the Palais de l'Industrie showed an abundance of material. M. Muntz undertakes Italy, and also England (if those interested will send him unpublished documents); M. A. Pinchart undertakes Flanders, and M. J. Guiffrey has already begun the history of French tapestry, which does not date from an earlier period than the beginning of the fourteenth century. Each part is adorned with plates of singular accuracy, obtained direct by photography, with a mixture of colours, by M. Léon Vidal. France has not as yet published any book dealing with the domain of *la haute curiosité* at once so scholarly and so sumptuous. It is the first publication of an anonymous historical book club, having its headquarters on the Quai Voltaire, where M. Léon Vidal's photochromatic studios are established. M. Muntz is now printing a collection of unpublished documents bearing on the history of the arts at Rome during the fifteenth century. He gathered his materials in the archives of the libraries of Rome during the Italian mission with which he was entrusted by the Ministry of Public Instruction.

A COMMUNICATION from Constantinople states that a tomb has been discovered opposite that city, near Kalamisia, not far from the ancient town of Chalcedon (the present Kadiköi), close to the little church of St. John Chrysostom, covered by a marble slab bearing the following inscription, first published by M. Parnanikas, a Professor of the Greek language:—

Εὐτροπίου τάφος εἰμὶ περίφρονος ἡ γὰρ ἀληθὲς ὄνομα τῆς ἀρετῆς ἔλεγε ἀνιδρόμενον.

"Ἀτροπὲ μοῖρα, τὴν τί τὸν εὐτροπὸν ἤπρασας ἄνδρα, ὃς φέρεν ἐξ μονάδας, τρεῖς δ' ἐτέων δεκάδας;

Πέτρος δὲ γνωτὸς σταθερὴν πλάκα τήνδε χαράξας στήσεν ἀποφθιμένῳ τούτῳ γέρας παρέχων.

The somewhat redundant distichs say, with a play upon the proper name which it is not possible to render even approximately, that a friend or relation named Petros has dedicated this sepulchral stone to the memory of amiable Eutropios, swept away by ruthless fate at the age of thirty-six. To this day the place where the discovery was made is named the Harbour of Eutropios, and it is believed that the remains found in the tomb belonged to the eunuch Eutropios, a favourite of the Emperor Arcadius, who in the last years of the fourth century filled the highest offices of State at the Byzantine Court, and whom Chrysostom mentions in his discourse on "The Vanity of all Things human." According to Zosimus, Eutropios was first banished to Cyprus, then sent back to Chalcedon and there beheaded. It is believed that the tomb was excavated in the palace of Eutropios. The form of the letters of the inscription points to the fifth century A.D.

THE STAGE.

MR. SOTHERN's reappearance at the Haymarket Theatre, after an absence from England of two years and a-half, has unfortunately not been attended by the complete success which would have been welcome to the admirers of that popular comedian. Mr. Byron's drama *The Prompter's Box* has not been improved by the American adapter, who has extended it from four to five acts, and has modified some of its original scenes; and Mr. Sothern's performance of the part of Fitzaltamont, the unappreciated tragic actor, strikes an English audience as more eccentric than humorous. Comparisons between this impersonation and that of Mr. Byron, who repre-

sented this character when it was originally produced at the Haymarket some years ago, are inevitable; and there can be no question that in genial humour, in the faculty of giving even to the airs of gloom and melancholy assumed by the disappointed Fitzaltamont a certain suggestion of goodnature, Mr. Byron was more happy. In the United States, where this piece—known in its revived form as *A Crushed Tragedian*—has enjoyed an immense popularity, audiences appear to have been delighted by Mr. Sothern's close parody of a bombastic amateur actor who has lately been a kind of butt of American humourists. A success obtained in this way is almost necessarily of a local character. Mr. Sothern's odd starts and turns and sepulchral utterances do, indeed, awaken laughter, as does the husky falsetto into which his voice frequently lapses; but the part as played does not differ in essentials from the ordinary stage type, of which Sylvester Daggerwood is the best-remembered example. Mr. Sothern's Fitzaltamont is in brief this stage-struck hero, with an exaggerated sense of his own importance, and a deeper grudge against an unappreciating public.

MR. AND MRS. KENDAL contemplate seceding from the company of the Prince of Wales's Theatre at an early date. They will probably take the management of the St. James's, which will, in that case, be redecorated and partly reconstructed.

MR. FRANK MARSHALL's new comedy, entitled *Family Honour*, will be produced at the Aquarium Theatre this afternoon.

A NEW romantic drama, in seven acts, entitled *Les Abandonnés*, has been produced at the Ambigu-Comique with success. The author is M. Louis Davyl.

EMILE ZOLA, the author of *L'Assommoir*, has just completed a play which has been accepted by the Palais-Royal. It is entitled *Bouton de Rose*. M. Zola does not give it to the world under his own name but under that of the favourite character in his romances, Rougon.

MUSIC.

LAST Saturday afternoon the Bach Choir gave, at St. James's Hall, their third concert—the last for this season—on which occasion they performed Bach's great Mass in B minor for the fourth time in London. It was with this work that the choir first appeared in public, with a success which will be well remembered by those who heard them; and amateurs cannot be too grateful for opportunities of renewing their acquaintance with a work not to be fully appreciated at one or two hearings. The choir will do well to give one of their concerts to this great Mass every season. The present performance was one of the finest as yet heard under Mr. Goldschmidt. The solos were admirably sung by Mdme. Lemmens-Sherrington, Mdme. Patey, Mr. W. H. Cummings, and Herr Henschel; while the choir fully sustained its reputation in the difficult choruses which form so important a part of the work. More finished choral singing than that of such numbers as the "Kyrie," "Cum Sancto Spiritu," "Crucifixus," and "Et resurrexit," has seldom been heard. In the air "Qui sedes" an important improvement was made on previous performances by giving the *obbligato* part to the oboe, as intended by Bach, instead of (as hitherto) to the clarinet. On the other hand, in the song "Et in Spiritum" the oboe parts were (for some most inscrutable reason) given to two flutes, with an effect which, in places, was almost ludicrous. A word of special mention is due to M. Stennebrugen, for his extremely fine performance of the very difficult horn *obbligato* to the "Quoniam."

It would be difficult to imagine a finer performance of the instrumental movements of Beethoven's Ninth Symphony than that of Saturday last at

the Crystal Palace. The effect of these sublime movements must be lost unless the players are animated, not only by the spirit of precision, but by the capacity to feel and give expression to the wonderful depth of sentiment contained in almost every bar. These conditions were fulfilled on Saturday, and Mr. Manns may be congratulated on an artistic triumph. Some of the passages for wind instruments were given with ideal purity and charm—notably those for horns in the *Adagio*. The choral portions, as a matter of course, suffered by comparison, but the soloists—Mdle. Friedländer, Mdle. Redeker, Mr. Shakespeare, and Mr. Lucas Williams—were fairly satisfactory. Señor Sarasate's rendering of Mendelssohn's violin concerto deserved the highest encomiums, but the player would do well to avoid granting an encore after a lengthy concerto. The twenty-second series of Saturday concerts, now at an end, has been on the whole less interesting than some of its predecessors, at least in the production of unfamiliar works. Among the unfulfilled pledges we find Sterndale Bennett's music to *Ajar*, Purcell's *Yorkshire Feast Song*, Berlioz's symphony *Harold en Italie*, and Raff's *Waldsinfonie*. On the other hand, the orchestra has fully maintained its reputation, and a distinct improvement has been observed in the vocal selections.

THE concerted pieces performed at the Musical Union, on Tuesday, were Mozart's quartett in D, No. 10, Mendelssohn's Pianoforte quartett in B minor (Op. 3), and Beethoven's string trio in C minor (Op. 9). The *ensemble* was less excellent than usual, the contrast of tone and style between the leader, M. Marsick, and the second violin, Herr Heimendahl, being very marked. The pianist, M. de Beriot, was not wise in selecting Chopin's familiar Polonaise in A flat. The piece requires more freedom of wrist-action than he appears to possess, and some of the *forte* passages were therefore wanting in distinctness of utterance.

HERR HERMANN FRANKKE commenced another series of three concerts of chamber music at the Hall of the Royal Academy of Music, on Tuesday evening. English music was well represented on this occasion, as Sterndale Bennett's sonata *The Maid of Orleans* was played by Mr. Arthur Burnand, and Mr. C. Hubert Parry's trio in E minor was performed by Messrs. Dannreuther, Franke, and Hausmann. This trio is in every sense a masterly work, remarkable for the independent treatment of the three instruments and for the grasp which the composer evinces over the resources of contrapuntal and polyphonic writing. Mr. Parry has also, it is evident, a considerable knowledge of effect, and as a representative English musician his career will be watched with great interest.

At the same hall, on Wednesday evening, the first of a series of classical chamber concerts was given by Mr. Francis Ralph and Mdme. Kate Roberts. Brahms's grand though sombre quintett in F minor, and Beethoven's Rasoumofsky quartett in E minor, were very ably interpreted by the artists named associated with Messrs. Jung, Zerbini, and Ould. Mdme. Roberts selected as her pianoforte solos pieces by Mendelssohn and Schumann; and Mdle. Thekla Friedländer contributed some songs. There was a large audience. The second concert will be given on Friday evening, May 31.

MR. MAPLESON has brought forward one of his new *prime donne* in the person of Mdle. Mathilde Wilde, who has appeared twice as Valentine in *Les Huguenots*. The choice of such a part clearly evinces the desire of Mdle. Wilde to be considered a dramatic soprano, and the possession of a powerful voice and a thorough knowledge of stage business are qualifications in her favour. But her method of singing calls for considerable animadversion, and her acting, though careful, is cold and conventional. A successor to Titiens has yet to be discovered. Mdle. Cummings, who has appeared at concerts as Miss Mary Cummings, has

a fine mezzo-soprano voice, which has received careful training, but as an actress she has everything to acquire. We learn that two orchestral concerts will be given shortly at Her Majesty's Theatre, with M. Pasdeloup as conductor. At one of these Berlioz's *Damnation de Faust* will be performed. Neither of the promised novelties is as yet advertised, but it is understood that *Paul et Virginie* and *Carmen* will be produced at the Covent Garden establishment.

At Mr. Charles Hallé's second Recital at St. James's Hall, yesterday week, the programme consisted of Haydn's trio in D major, No. 21—a charming but almost unknown specimen of the old master, produced by Mr. Hallé on this occasion for the first time—Beethoven's sonata in A, Op. 101, finely played by Mr. Hallé; Bach's sonata in E, for piano and violin; and Rubinstein's piano quintett in G minor, Op. 90. Mr. Hallé was assisted by Mdme. Norman-Néruda, and Messrs. L. Ries, Straus, and Néruda.

MESSRS. LUDWIG AND DAUBERT gave their last Chamber Concert at the Royal Academy Concert Room on the 9th inst., when Haydn's quartett in C, Op. 33, No. 1; Beethoven's quartett in A minor, Op. 132; and Schubert's piano quintett in A, Op. 114, were performed. The quartett party consisted of Messrs. Ludwig, W. H. Eayres, Zerbini, and Daubert; Miss Anna Mehlig was the pianist, and Miss Hélène Arnim the vocalist.

MR. P. S. GILMORE's Military Band has arrived in England from America during the present week, and will perform at the Crystal Palace on Tuesday and Wednesday next. The band consists of sixty-five instrumentalists, and its *répertoire* is not only large, but remarkably ambitious, including such works as Beethoven's symphony in C minor, and his great *Leonora* overture, the overture to *Tannhäuser*, and Liszt's second "Rhapsodie Hongroise." American journals speak of the band in very high terms; and their appearance will be awaited with much interest.

THE second part of Mr. George Grove's *Dictionary of Music and Musicians* (Macmillan and Co.) is, as a whole, fully equal in merit to the first part, previously noticed in these columns. It comprises the portion from "Ballad" to "Boieldieu," and as it carries the work to page 256, we fear the editor will find himself on the horns of a dilemma. Either he must follow the bad example of many previous editors of musical dictionaries (e.g., Ed. Bernsdorf), and make the latter portion of his work far more superficial and less complete than the former, or he must far exceed the limit of two volumes at present proposed. This, however, is a matter with which we have not to deal. The most important, and it may be said the most valuable, article in the present part is that on "Beethoven" from the pen of the editor, which occupies forty-six pages, or more than a third of the whole. The amount of research displayed is only equalled by the evident enthusiasm for his subject which the writer shows in every page: while the whole article is so thoroughly interesting that it may safely be called the best paper on the subject in the English language. Among other interesting articles in this part are those on the "Ballet" by Mr. Sutherland Edwards, "Sterndale Bennett" by Mr. H. H. Statham, "Berlioz" by Mr. Dannreuther, and the various articles on wind instruments by Dr. Stone. It is curious that even with the most careful writers slips of importance will occur; and Dr. Stone's article on "Bassoon" contains an instance in point. After mentioning several characteristic passages for the bassoon, he says that Beethoven's second symphony "opens with a prominent passage in unison with bass strings." Surely he must have been thinking of Haydn's symphony in E flat. Such slips as these are inevitable; it is only justice to Dr. Stone to add that with him they are extremely rare. It is with some surprise that we find the name of Edouard Batiste, one of the most popular French composers of organ music, omitted; while many

SATURDAY, MAY 25, 1878.

No. 316, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

China: a History of the Laws, Manners, and Customs of the People. By John Henry Gray, LL.D., Archdeacon of Hong-Kong. In Two Volumes, with 140 Illustrations. (London: Macmillan & Co., 1878.)

Die chinesische Auswanderung. Ein Beitrag zur Cultur- und Handelsgeographie, von Dr. Friederich Ratzel. (Breslau, 1875.)

DR. JOHN HENRY GRAY is almost as great an institution among the English in China as Confucius is among the natives. Bishops and governors, consuls and commanders-in-chief may come and go, but he remains for ever, giving the aid of his great experience of China to all who are willing to avail themselves of it, and making himself beloved by innumerable acts of goodwill and kindness. Canton is the place with which he is most associated, as he has been chaplain there for very many years, and has constantly been in the habit of mingling with the Chinese, both in the city and in its neighbourhood, and sometimes in circumstances when it required great courage to do so; but all China open to Europeans has seen and known him.

The work which he now presents has been the labour of many years, and is the most important general work on China which has appeared since the publication, over thirty years ago, of *The Middle Kingdom*, by Dr. Wells Williams, the well-known Sinologue and missionary, who was afterwards American Minister at Peking. Since then a few valuable books on special subjects relating to the Chinese empire have appeared, such as Dr. Legge's altogether invaluable edition and translation of the Chinese Classics, the volume of the late Mr. T. T. Meadows on the rebellions of China, and that of the Rev. Dr. Edkins on the religions of the country; but this work of Dr. Gray's is the only elaborate and valuable book we have had for many years treating generally of the people of the Celestial Empire. *The Middle Kingdom* still remains unapproached as the only valuable and complete general survey we have in English of the empire. Its author was greatly indebted to the twenty volumes of the first *Chinese Repository*, to which he contributed largely, of which he was for some time editor, and which form still an unexhausted mine of information on Chinese subjects; but he succeeded in presenting a general view, and he was well able to verify the information which he had collected from previous European enquirers. It may be noted also that some of the writers in the *Chinese Repository*

were not a little indebted to the earlier Roman Catholic missionaries, of whom Duhalde is, to this day, a valuable guide to a country so immutable as China.

Another book with which Dr. Gray's may be compared—chiefly, though not solely, from the number of illustrations which they both have—is *La Chine en Miniature*, par M. Breton, published at Paris in 1811, and containing nearly a hundred very graphic coloured engravings. This book relates almost exclusively to the people of the North of China; but it gives a great deal of information with regard to them, and information much of which holds good for other parts of the country. The Archdeacon goes more into detail as regards the customs of the Chinese, and his engravings are, apparently, all made from Chinese sketches, and thus have a peculiar interest and value of their own; though it is to be regretted that they are all of one simple and artless kind. They will be extremely suggestive to people who are acquainted with the country, but may fail to convey accurate ideas to those who are not. In this latter respect the coloured engravings of *La Chine en Miniature* are much superior, and something may also be said in favour of Father Kircher's *China Illustrata*. Still, we have here a very valuable collection of illustrations of the life of the Chinese as sketched by themselves, and the idea of presenting them was a happy one.

Dr. Gray's book is somewhat wanting in proportion and arrangement for a general view of the laws, manners, and customs of the people; it manifests only moderate descriptive powers, and no great skill of grouping his facts so as either to bring out important results or forcibly to present the vital characteristics of the national life and the vital relations of these characteristics. It is also deficient in giving authority for many of its statements. It would be difficult to discover from Dr. Gray's volumes on what authorities many of these statements rest, and the fact that there are authorities for them. On the other hand, he gives elaborate and very correct details; some subjects he treats in a much fuller manner than Dr. Williams has done, and he gives a great deal of information which he has himself collected, together with interesting accounts of what he has himself witnessed, and of dangerous adventures which he went through. Apart from its general value, this book supplies a great deal of new information with regard to the Flowery Land. One subject on which a good deal of new information is given, chiefly from the author's own experience, is that of the legalised slavery of China—a subject which has been little noticed before, though references to it exist in the *Repository* and elsewhere. Parents in China have a right in certain circumstances to sell their children as slaves, and slaves "are outside the pale of citizenship, and within the reach of the avarice, or hatred, or lust of their masters." The demand for slaves gives rise to a good deal of kidnapping, especially of female children. Our author admits that the slavery of which he writes is of a mild and limited kind, not to be compared with that which once existed in the British West Indies and the United States.

As to the population of China, Dr. Gray notes the statement of Sacharoff that a census taken in 1842 gave a population of 414,686,994; but he does not seem to have made any independent examination of this subject; and he takes no note of the estimates of the Abbé David, Richthofen, and Behm, which give 420,000,000. Sacharoff gave a detailed census of the different provinces taken from the records at Peking. I am informed, however, that when Dr. Legge visited Peking in the spring of 1873 the population of the empire was one of the subjects on which he was most anxious to get information; but all his enquiries were fruitless. No Chinese whom he questioned knew, or at least would admit that he knew, of a census having been openly and professedly made during his lifetime. Still, Dr. Legge is inclined to acquiesce in Sacharoff's estimate of between 414,000,000 and 415,000,000 for 1842, his principal reason for doing so being the results of the census taken in India in 1872; for the population of China must be about double that of India. I myself was in a Chinese town on the great western branch of the Canton river early in 1860, when one night a census was taken of that town and (as I understood) of the whole neighbouring district, each household being required to suspend on a board outside the door the names of those who had slept there that night. Probably rough enumerations of the population of each district are taken occasionally for purposes of taxation and justice, and go up to the governor of the province, but are seldom called for at the capital. Hence Dr. Legge's informants may have been quite accurate in saying that they never knew of a census—a census in our sense of the word, that is to say, ordered from headquarters, taken simultaneously over the empire, and for the special purpose of ascertaining the amount of population—being made openly and professedly. That, however, does not necessarily imply that population statistics are not available in Peking, and were not made use of by Sacharoff. It is easily conceivable that high Chinese officials may be extremely indisposed to communicate such information to foreigners; and I should say that such estimates forwarded to Peking would be more likely to be under than over the truth. Even in some of the agricultural districts of China the air has seemed to me alive with human voices; and I can quite believe in the Middle Kingdom having had 415,000,000 of souls shortly before the Taiping rebellion, and little if at all less now.

We notice as an omission in this work that there is no reference to the Jews of China. A good deal of information, little of which is new, is given with regard to the Mohammedans of the country; but we learn nothing about the "Blue-bonneted Mohammedans" or the descendants of Jews, to be found chiefly in Honan, who have retained certain of the customs and copies of some of the sacred books of their race. They seem to be disappearing, if, indeed, they have not disappeared already; and we looked to the Archdeacon for information on this interesting subject.

Chinese emigration is rapidly becoming a serious matter since we "opened up China,"

and on our advice that empire set aside the laws which forbade its subjects to leave their own land. Already, as Mr. Fisher has borne witness, the Chinese in most parts of California have secured a practical monopoly of such trades as woollen manufacture, boot-making, laundry work, domestic service, cigar-making, fruit-preserving, market gardening, costermongering and "placer" mining, and they are pressing into watch-making, fishing and farm labour; and this they have accomplished in spite of a formidable opposition, which has sometimes taken the form of heavy capitation taxes upon their entry into the State, sometimes of riot, incendiarism and assassination, directed against them when there. In some of the Eastern States of America they are already to be found in considerable numbers, especially as shoemakers; and even in England there is a talk of their being introduced as a counterpoise to strikes and trade-unions. It is not impossible that, unless met by violence or restrictive laws, the Chinese could in course of time work out the labouring population of great part of the civilised world; but do employers of labour perceive that, if this were accomplished, Chinese capitalists would be likely to work them out also very soon after? The difficulty is that the Chinese masses remain unchanged Chinese wherever they settle, are little amenable in their own relations to any laws except their own, play into one another's hands, and so in foreign countries constitute an *imperium in imperio* which would necessarily become *super imperium* wherever they found themselves in sufficient strength.

Hence Dr. Ratzel, a Docent in the Royal Polytechnical School of Munich, has chosen an important subject, and one which has not before had any work devoted exclusively to it or treating it at length. He made personal acquaintance with the Chinese in California, Mexico, and Cuba, but has not had the advantage of knowing them in their own land. Little is contributed from his own experience; and the value of the book lies chiefly in his careful manner of putting together information which has been collected by others, and giving us a general view of the whole subject. The first part of the volume treats of the boundaries and size of China, its fruitfulness and mineral treasures, the amount of population, its various industries, and the circumstances which condition emigration in the country itself. The second part relates to the fields of immigration for the Celestials, beginning with those in their immediate neighbourhood, such as Manchuria and Formosa, and ending with America and Australia. A great deal of the information thus presented is far from new; but it is well put together. His information as to Australia and Polynesia is extremely meagre; there is not much about even California, and his statistics with regard to that part of the world are out of date. Nothing is added to our knowledge of the amount of the population of China. Various alleged censuses are quoted, and Dr. Ratzel accepts that of Sacharoff, but with the qualification that the Tai-ping and Nien-fei rebellions have perhaps brought it down to 360 or 380 millions. But the early Roman Catholic

missionaries have borne personal witness to the extraordinary rapidity with which China recovers from the effects of rebellion and famine, new populations almost appearing to spring out of the ground in the devastated district, while the neighbouring districts appear as thickly populated as ever.

ANDREW WILSON.

Etudes sur l'Industrie et la Classe Industrielle à Paris au XIII^e et au XIV^e siècle.
Par Gustavo Fagniez. (Paris: Vieweg, 1877.)

THE study of municipal institutions, so intimately connected in their earlier history with that of the industrial classes, is now happily receiving more and more attention in France, as well as in Germany, where the labours of Dr. L. Brentano, Dr. G. Schanz, and others are bearing so much fruit. As one among the modern scientific school of French savants, M. Fagniez has worthily set himself to help to redeem his countrymen from the reproach, made a few years back, of neglecting their social and economic history. His position as *Archiviste* naturally gives him full opportunities of going to original documents; and in the volume before us we have the result of careful study and research into the condition of trades—or, more correctly speaking, of crafts and craftsmen—in Paris in the thirteenth and fourteenth centuries. Modestly disclaiming completeness of treatment, either as regards statistics or the historical progress of any industry (for which, probably, the materials do not exist), he looks at his subject from the double point of view of the condition of the workers and of the development of the industry. Accordingly, the first book treats of the civil, religious, and economic organisation of the industrial class, while the second presents us with a monograph on certain industries. Besides these we have, in the form of an Appendix, the text of a large number of original documents gathered from various sources, the value of which to the worker is increased by a short analytical title at the head of each piece—a novel feature in collections of *pièces justificatives*.

Unlike the rich stores of MS. treasure still in the possession of our City companies, the private records of the corporations or craft-guilds of Paris, "les titres de propriété, les procès-verbaux de réunions, les pièces de comptabilité, les brevets d'apprentissage," are lost and gone; while the destruction of the ancient records of the Châtelet—whose jurisdiction stood in many respects in the same relation to the Paris crafts as that of the Lord Mayor to the City companies—leaves an immense blank for the student. Great thanks, therefore, are due to M. Fagniez for the labour and ability with which he has hunted up from the Trésor des Chartes, the Archives Nationales, the Registre du Parlement, and many scattered sources, the evidences upon which to found a picture of the organisation and life of the early Paris artisans and their industries.

Touching but slightly upon their origin—as to which, however, it may be remarked that, with the exception of the ancient "Nautes Parisiens" and the Butchers of the

Grande Boucherie,* "on ne peut retrouver les *collegia opificum* dans les corps de métiers du moyen-âge," a further confirmation of an opinion shared by many scholars—our author takes as his chief starting-point the famous *Livre des métiers* of Etienne Boileau, Provost of Paris in 1258. The great merit of this collection is that in it we see the already existing statutes of about a hundred Paris crafts put on record and affirmed in a declaratory manner, concerning the principal points then held to be of importance to their *status*—viz., "de la franchise ou de la vénalité du métier, du nombre des apprentis et des grades-jurés, des impôts et du guet." Two rolls of subsidies levied at the end of the thirteenth century furnish, among other details, curious information on the street localities, names, and occupations of a great number of industries, of which antiquaries now at work upon our own Subsidy Rolls will be glad to avail themselves.

The craft-guilds of Paris formed no exception to the general rule by which these bodies combined social and religious duties with the principal end of their association. Their statutes for the help of the poor, for mutual assistance in sickness and poverty, on apprenticeship, marriage, burial, &c., for feasting together, and for the support of religious services, all find their parallel in other countries. The toy-makers, who "say that if there die a man or woman of the mystery we will that one shall go from every house with the body, and whoever shall fail shall pay half a pound of wax to the brotherhood" (p. 35), might have drawn their ordinance, even to its very words, from the same source as their fellows in England. But what appears peculiar to these Paris guilds is that the members of one craft would sometimes form within itself several social guilds or *confréries*, while, on the other hand, some of them threw open their social guilds to others outside their own craft. In general, however, "la confrérie, par la façon dont elle était composée, se confondait avec le corps de métier et ne s'en distinguait que par son but et son organisation."

The chapter on the Public Life of the craft-guilds is valuable for the light it throws upon the part played by those bodies in the watch and ward of the city (another interesting illustration may be found in M. Germain's monograph, *De l'organisation administrative de Montpellier*, 1850). The apprentice, the workman, the master, their condition and duties, and the steps by which they arrived at these grades; the position of the heads of trade; the internal jurisdiction of the associations, complete the first book of this valuable contribution to the economic history of the Middle Ages.

The second book, in dealing with the questions which bear upon the professional character of each trade, treats more especially of the trades of millers and bakers, butchers, builders, textile industries and their branches, tailors and the making-up of clothes, goldsmiths and jewellers: subjects which are treated with a fullness of detail and careful illustration most welcome to those engaged in antiquarian and historical studies.

* The question of merchant-guilds, which might be opened here, is not touched upon by our author.

The author has taken warning by failure in other works of the kind, and has provided his readers with a good Glossarial Index.

L. TOULMIN SMITH.

Latter-day Lyrics. Selected and Arranged by W. Davenport Adams. With a Note on some Foreign Forms of Vers by Austin Dobson. (London: Chatto & Windus, 1878.)

THERE is, perhaps, no variety of book so easy to criticise in the merely carping manner as an anthology. The fact that no two people are likely to agree in their principle, much less in their practice, of selection is sufficient to furnish forth a dozen or a hundred unfavourable criticisms, according to the number of the critics, and, as the poems selected must always bear an infinitesimally small relation to those left out, another wide and promising field is opened to the carper. In neither of these fields, however, do our feet particularly care to walk, and, with one exception (to be afterwards referred to), we have no great fault to find with Mr. Adams on the score of his admissions or his exclusions. We do not think that he has been wise in allowing Mr. Tennyson to be almost exclusively represented by the songs scattered through his later works; but, as this is a matter on which others may legitimately differ from us, we shall not insist on it. There are some exceedingly minor writers of whom we could have done with less, and one or two whose absence altogether we could have supported with great equanimity. But of omissions there are few, and of these only two strike us as surprising. The first is the quite unaccountable one of Mr. Horne; the second, that of Mr. Charles Mackay, whose right to admission is, to say no more, superior to that of Mr. W. C. Bennett. On the other hand, Mr. Adams has been well advised in giving a place to the modest and retiring muse of Mr. Ashe. The inclusion of some few American specimens seems to us a mistake, because the selection is not in the least exhaustive, or even representative. But on this head we have nothing more to say.

Much more fault must be found with the notes which Mr. Adams has appended to his selections. The principle which should guide the annotator in such a case is, we think, not disputable. He may legitimately give information where it is required on the context of the pieces, on the other work of the author, or on anything else of this kind. But to attempt, as Mr. Adams attempts, to knock off the poetical merits of his poets in a sentence is, in the first place, futile, and, in the second—Mr. Adams must excuse us—rather impertinent. It can do no mortal any good to know that in Mr. Adams' opinion Mr. Warren and Mr. Simcox "belong to the Swinburnian school," even if the opinion were indisputable. That Mr. Tennyson's sonnets "are not so highly esteemed as they deserve to be" is a very good theme for an extended argument, but utterly out of place in a note of two lines. Mr. Adams seems to have mistaken his commentary for one of the papers of theses which a travelling student used to post up on the gates of the towns he visited. As mere *obiter dicta*,

occurring in such a book as this volume, they are singularly ill-placed. Moreover, in one instance we really must take up Mr. Adams' glove. To represent Mr. Morris he selects in a book of lyrics three of the addresses to the months in the *Earthly Paradise*, which are not lyrics at all. Now, considering that he had all the riches of the *Defence of Guinevere* to draw on, not to mention such later jewels as the "I know a little garden close" of *Jason*, and the "Before our Lady came on earth" of the *Hill of Venus*, this proceeding is inconvenient. The song we have last mentioned is one of the most exquisitely musical songs to be found in any contemporary writer, with its lapping cadence as of the waves that floated the goddess to shore; and Mr. Adams' selections, though very good in their way, are, as we have said, not even lyrical in form. But the note with which the selections are accompanied is the main offence. Mr. Adams is pleased to say that Mr. Morris's muse is "certainly not an inspiring one," but that it has "attractiveness, if not charm." It is not clear to us what is meant by "not an inspiring one." Does Mr. Adams mean that Mr. Morris does not derive inspiration from his own muse, but commits flirtation with the muse of some other body, as a Scotchman would say? If so, we should be very glad to know who the other body is. But it is probably meant that Mr. Morris's muse does not inspire Mr. Davenport Adams; and if that be the case, so much the worse for him. To enter into a discussion here of the comparative merits of any poet would be out of place. But we are bound to say that a poetical critic who refuses to the author of *The Wind*, of *Rapunzel*, of the *Watching of the Falcon*, and of the opening pages of *Sigurd*, inspiration and charm, thereby makes it more than doubtful whether he possesses the right to pronounce any opinion at all on poetry.

Mr. Dobson's "Note on some Foreign Forms of Verse" is a note of a very different kind. It is a most delightful little essay on the charming arrangements of rhyme which we owe to the early poets of France, which Théodore de Banville has revived in our own time with such splendid success, and which within the last few years and months more than one English poet has naturalised. For completeness and grace of style Mr. Dobson's little essay is worthy to rank as a prose tractate beside some of his own verse. Personally we think it is too modest; but this is a good fault. The triolet, the rondeau, and the ballade need not present themselves cap in hand. The sacramental phrase about the sonnet is fully applicable to them; and there are contemporary epics which we would give with joy for Mr. Dobson's triolet "Rose kissed me to-day," or for Mr. Gosse's rondeau "If Love should faint." All we can say is that if the British public does not like these exotic blooms, we are very sorry for the British public. The book contains besides the Note a most interesting collection of examples, including some which are almost unique. Mr. Adams has, by the way, made a mistake in attributing to Mr. Dobson's ballade à double refrain rights of priority, for a similar poem appeared in *London* (a periodical which has contained

large numbers of these verses) last year. But this is a detail. We have already indicated our own preference for the triolet, rondeau, and ballade—in which last class we include the "Chant Royal"—over the others. The ballade in especial is a poetical form of endless capabilities. No one who knows De Banville's splendid "Aux Enfants Perdus," quoted by the present writer in the *ACADEMY* five years ago, can doubt its value for serious poetry; and the same poet's "Pour la Servante du Cabaret," is equally decisive of its merits for lighter themes. As to the Chant Royal, Mr. Gosse's "God of Wine" is, to our mind, a model of stately grace, though we should, after the manner of critics, like to alter one line in it. We cannot speak so highly of Mr. John Payne's similar attempt. This gentleman has fallen into the exaggerated archaism which is the Charybdis of these forms, as their easy adaptation to burlesque is their Scylla. We really must ask Mr. Payne what language

"Lord of liesse, sovran of sorrowing"

is? It is certainly not English, it does not strike us as French, and we do not recognise it as Italian, though there are scraps of each discoverable in it.

Altogether the book has given us pleasure—not unmixed, indeed, owing to Mr. Adams' unfortunate annotations. Wordsworth, and some other brutal persons, would probably have torn away ruthlessly the score or so of pages for which the editor is responsible, and have preserved the rest. We have never been able to find it in our hearts so to mutilate a book; we shall therefore content ourselves with warning readers to stick to the text, and sternly shun the comments—always excepting Mr. Dobson's. They will then have the delight of reading many old favourites and some new ones, in a very pleasant and comely get-up. GEORGE SAINTSBURY.

Scholæ Academicæ: some Account of the Studies at the English Universities in the Eighteenth Century. By Christopher Wordsworth, M.A. (Cambridge: University Press, 1877.)

THIS volume forms a continuation of the author's researches in eighteenth-century university history commenced in his *University Life*, published in 1874 (see *ACADEMY*, May 22, 1875). With respect to the arrangement of the materials—a matter of no small importance where a work is largely composed of minute and multifarious details—it strikes us as an improvement on its predecessor. Only, indeed, those who have engaged in like labours will be able fully to appreciate the sustained industry and conscientious accuracy discernible in every page—an observation all the more due, in that Mr. Wordsworth is content to characterise his investigations by the simple statement that he has "taken some pains to bring to light some of the secrets of university history and of literary lore which have lain dormant in manuscripts, known perhaps to a few, and read, it may be, by fewer."

The plan which he has adopted in setting the results of his researches before the reader is extremely good. First of all, he describes the general apparatus subservient to the studies of the two universities in the

shape of libraries and lectures; then, the successive methods whereby proficiency on the part of the students was tested and stimulated, whether by Acts and Opponencies or the Tripos, in the Sophs' Schools or the Senate House; and, finally, under the several heads of the Mathematics, the Trivial Arts, Humanity, Morals and Casuistry, Law, Modern Studies, Oriental Studies, Physic, Anatomy, Chemistry, Geology and Mineralogy, Botany, Music, and Astronomy, we are presented with such evidence as it is possible to gather, laboriously gleaned from text-books, examinations, lectures, and other less formal sources, of the actual attainments of the students as well as the standard of instruction. Of the whole volume it may be said that it is a genuine service rendered to the study of university history, and that the habits of thought of any writer educated at either seat of learning in the last century will, in many cases, be far better understood after a consideration of the materials here collected.

In some respects, Mr. Wordsworth's book tends materially to qualify the prevalent unfavourable impression as to the state of our universities a century or more ago. Sweeping censure and sarcastic descriptions, like those of Gibbon, Gray, Adam Smith, Payne Knight, and others, have too often been accepted as valid to an extent far beyond what the facts would warrant. Universities, from the nature of their composition, are singularly liable to change, whether in the shape of degeneration or of improvement; and though tenacious of their traditions, they afford no ordinary scope for the exertion of individual influence. The results achieved by Melancthon at Wittenberg, by Conringius at Helmstadt, by Schönborn and Ickstadt at Würzburg, by Spener and Thomasius at Halle, by Boerhave at Leyden, by Linnaeus at Upsala, will suggest themselves to those familiar with the history of letters as illustrating this feature. A very few years suffice to enable a leading mind to rouse at least the student element in such bodies from a state of lethargy to one of lively enthusiasm.

Although admitting not a few "blots and blanks," Mr. Wordsworth, we are glad to find, is able to give it as his opinion that the facts, especially in relation to Cambridge, are more favourable than he had ventured to hope they would prove. It is obvious, however, that in a consideration of the evidence which he places before us, it is necessary to guard against the illusion which a retrospect extending over more than a century is liable to produce. The true test of the university as a school of instruction must always be the encouragement it holds out to the average student, and the kind and degree of knowledge which it enables him to acquire at any given time. With respect to these points, indeed, a lateral section of such history—like that which Prof. J. E. B. Mayor has given us in his edition of the *Life of Ambrose Bonwicke*, and encourages us to look for in his long-promised *Cambridge in the Reign of Queen Anne*—affords the best evidence.

It has been observed by Dr. Döllinger in his able outline, *Die Universitäten sonst und jetzt*, that the spirit of rivalry between Ox-

ford and Cambridge has been their best preservative against supineness such as would have allowed of either university going actually to sleep on its endowments and privileges. In the eighteenth century, however, there is comparatively little evidence of any such rivalry. The breeze that sprang up in connexion with the controversy respecting the *Letters of Phalaris* was followed by a dead calm, in which each university seems to have followed its own traditions without much regard to what might be going on elsewhere. Cambridge was undoubtedly the more efficient instructress; while Oxford, scandalously negligent in this relation, appears to have been far more active in the production of editions of the classics and of scientific works. But even at Cambridge the standard of attainment for a degree in arts was deplorably low. At the end of the century, "two books of Euclid, simple and quadratic equations, and the earlier parts of Paley's *Moral Philosophy* were deemed amply sufficient." In mathematics, the genuine impetus communicated to the study by Newton and his successors had died out before the second half of the century was reached. The manner in which Rohault's *Physics*, as edited by Clarke, continued to hold its ground as a text-book, is evidence of the immobility of the university, even in regard to its leading study. In classics, the acquirement of a pure style was altogether disregarded; students appear to have aimed rather at collecting information than at familiarising themselves with the great masters of thought and expression, and occasionally betook themselves to authors whose very names a modern private tutor would scarcely hear without alarm. In theology, the names of the writers recommended by Waterland in his *Student's Guide* (1730)—Burnet, Sharp, Sprat, Hoadly, South, Tillotson, Norris, Atterbury, and Stillingfleet—afford decisive evidence not simply of the complete expulsion of patristic studies, but also of the declining estimation in which writers of the Anglican school of theology were held, Pearson *On the Creed* being almost the only author of that school whom Waterland recommends. It is really no unfair description when Mr. Wordsworth speaks of the prevailing influences as "overwhelming the field of divinity with a dull and level surface of dead water."

But in order justly to estimate either the Oxford or the Cambridge of the eighteenth century, we must compare them, not with each other, but with Continental seats of learning. Nor is it without something of humiliation that we can mark the efforts of Germany nobly struggling to recover what England seemed careless to preserve. Mr. Wordsworth, in advertent to the circumstances under which the eighteenth century opened, alludes to the "two great shocks" which the country had sustained in the preceding sixty years, but neither the Civil War nor the Revolution of 1688 could compare with the Thirty Years' War in its disastrous effects on learning. Koch, in his *History of the University of Marburg*, has touchingly described the intellectual blight that followed upon that long struggle—a blight so deadly at the universities that Leibnitz, in drawing

up his scheme for the advancement of science, omitted all reference to them, as demoralised beyond reasonable hope of reform. Yet, notwithstanding, in a few years from the time (1710) when Uffenbach visited Cambridge and penned his depressing account of her studies and her libraries (Trinity alone excepted), we find the professors at Erfurt contributing, from their own modest collections, volumes to form a university library; while, before the close of the century, the library at "Georgia Augusta" surpassed, not only that at Cambridge, but the Bodleian itself. Had it not been for the unwise multiplication of new centres and the feuds of theological intolerance, the contrast presented by the German universities would have been yet more unfavourable to our own. "Pennalism" was fast disappearing. What Cambridge required of her graduates before they left may be compared with what Königsberg demanded of her *alumni* before they were admitted. It was necessary, Arnoldt tells us,* that every student should be able to construe a moderately-difficult Latin author at sight, to compose a Latin theme which should be free from grammatical errors, and to understand Latin when addressed in that tongue; he was expected to be familiar with the elements of logic, and to have a knowledge of geography and history; and, finally, it was essential that he should be able to construe and explain two of the Gospels in the original Greek, and the first thirty chapters of Genesis in Hebrew. At Halle, the lectures of Christian Thomasius were awakening his countrymen to the study of their native tongue and of modern literature, half a century before Squire's *Saxon Dictionary* came to an untimely end at Cambridge and Lye's edition of *Cædmon* proved an abortion at Oxford. When Halle declined, Göttingen took the lead, and became as famous for her historical school as Halle had been for theology and jurisprudence. When we note that Spittler's *Geschichte der europäischen Staaten* appeared in the year in which Gibbon died, we cannot but be reminded how justly Göttingen might pride herself on the appearance of that able work, and how little Oxford could claim a share in the production of the *Decline and Fall*. How Kant added to the fame of Königsberg, Fichte and Schelling to that of Jena, it is scarcely necessary to recall.

The share in the work of instruction assigned to the professorial body in the English universities is, of course, but small when compared with that allotted to them in Germany, but their inactivity at Oxford and Cambridge in the last century is one of the "blots" in Mr. Wordsworth's subject, and he evidently finds no pleasure in referring to it—perhaps fails to set it before the reader with all the distinctness which historical fidelity might seem to require. At the close of the century about one-third of the Oxford professors and half of those at Cambridge gave lectures, but not more than six or seven in the year. The rest never lectured at all, and some even failed

* *Historie der Königsbergischen Universität* (1746), i., 234.

altogether to give any indication that they regarded their office as imposing duties of any kind, whether of research or of publication. It is significant that the three professorships founded at Cambridge in the course of the century by the spontaneous action of the university—that of Chemistry (1702), of Anatomy (1707), and of Botany (1724)—were all connected with natural science. The rest originated in royal or private munificence. This may be partly explained by the supposition that the college lecturers were considered, by the resident body, to afford sufficient instruction in the ordinary branches of study. Such an explanation, however, will manifestly not apply to the study of history. It is by no means edifying to find the simple-minded George I. instituting a professorship of Modern History and Languages, “with an appointment so ample” (to quote the address of the university on the occasion) “as well-nigh to equal the stipends of all the other professors put together,” receiving, moreover, profuse thanks for his generosity, coupled with the assurance that “he had wisely observed where their greatest defect lay,” and then to learn that not a single lecture was delivered by successive professors from the foundation in 1724 to the death of Gray, the poet, in 1771.

Much that would have served to illustrate his subject is reserved by Mr. Wordsworth for his third volume, on the *Religious Life*. The present volume, accordingly, appears somewhat defective, from the fact that though it is concerned with the studies of the two great schools for the clergy, divinity is scarcely alluded to in its pages. When, however, the three volumes are before us, Cambridge will be able to point to a collection of facts relating to her history such as no other university in Europe possesses.

J. BASS MULLINGER.

Islam under the Khalifs of Baghdad. By R. D. Osborn, Major Bengal Staff Corps. (London: Seeleys, 1878.)

MAJOR OSBORN told us in his first work, *Islam under the Arabs*, that he proposed to trace the history of the Mohammadan religion in three volumes, of which the present is the second, while the third will deal with *Islam in India*. The first volume left us at the beginning of the 'Abbâsi Khalifs. The second carries on the history to the fall of Baghdad. If *Islam in India* bears out its title, it is clear that the later religious development in Egypt and Syria, Turkey, Persia, and West Africa, not to mention other directions, will be entirely overlooked, and the whole work cannot maintain its original pretension to affording a general history of Islam.

Islam under the Khalifs of Baghdad may be viewed as a story-book, a biographical dictionary, or a history. We should prefer to regard it as a story-book: Major Osborn tells Eastern stories delightfully; and if he had only left out his theological interludes the book would have been an interesting appendix to the *Arabian Nights*. As a biographical dictionary it is not quite so satisfactory. Major Osborn is unable to grasp the notion that an Oriental may by some

strange accident be an excellent man, and he always contrives to select such stories as can only give his characters a ludicrous or a downright disgusting turn. Moreover, he is not at all particular in acknowledging his debts to the various authorities out of which his book is made, nor does he refrain from misquoting them.

But, though his stories are well told and his biographies amusing, Major Osborn insists on a higher ground of criticism: he wishes us to regard his book as a history of Islam. It may be just as well to say at once that it is nothing of the kind. Except a curious capability of throwing himself into the style of the authorities he uses, and thus preserving the same vigorous language throughout his book, Major Osborn has none of the qualities of a historian. He is in possession, so far as we can see, of no original information. He is no Orientalist, as every page of this volume testifies. We do not refer to questions of popular spelling: it would be absurd to be pedantically strict in a book of this kind. But such forms as *Al Mutawakkhil* (frequently repeated and translated), *Hanifite*, *Shafite*, *Sir-man-rai*, and a host more, are not concessions to the public intelligence; they are blunders such as no scholar, no one even who had read through an elementary Arabic grammar, ought to be able to commit. Lastly, instead of taking a broad point of view, Major Osborn writes from that of the narrowest school of Protestant theology.

His history of Islam is, as we have said, incomplete. It is also prejudiced and unjust. So far as we can extract it from the Preface and various rambling pages in several of the early chapters (the latter part of the book being scarcely at all concerned with Islam), his main indictment against the religion of Mohammad is its rigidity: it is final, unchangeable, all-sufficing. A book contains all that the Muslims can know about God; their own minds are powerless in religion. The same rigid rules are laid down about great things and small, about the treatment of other religions and the cut of a man's coat. Triviality reaches its acme in the traditions, and trivial ceremonial regulations are stereotyped for all time. The whole religion is one of forms, not faith; unreasoning, not thinking; fixed, not progressive. Such are Major Osborn's notions about Islam. In some respects they are only too well founded. There is no doubt that the triumph of orthodoxy at the end of the third century of the Flight did reduce Islam for a large proportion of the Muslim world to a mere routine of ritual. The mistake is the assumption that this is the necessary form in which Islam must everywhere continue. Many times since its first promulgation has the religion of Mohammad shown its capabilities of expansion. The varieties of opinion and of practice embraced under the name of Mohammadanism have been even more numerous and conflicting than those of the various Christian sects. Because a certain orthodox sect has long had the upper hand in Muslim countries, it does not follow that so it must ever be. And it is the same with the other causes that keep Islam stationary. There is no reason for their everlastingness.

But Major Osborn is over-severe on Mohammadan ritual. In some cases his charge of triviality arises simply from his own misapprehension of the intention of the ordinance. For example, he ridicules the strict command of putting a staff or drawing a line before one when praying, altogether failing to see that the point of this was to keep the attention from wandering. Does he not know that the dying Jacob prayed towards the top of his staff like any Muslim?

Major Osborn assumes throughout that what is must always be: he paints Islam and its followers in the worst light without any very superlative knowledge of the facts of the case, and says that such *must* be the religion of Mohammad, such *must* be the effects of the creed upon Muslims. Such, we believe, they were not, often are not, and assuredly need not be.

STANLEY LANE POOLE.

NEW NOVELS.

Like Dian's Kiss. In Three Volumes. By Rita. (London: Sampson Low & Co., 1878.)

The History of Margaret Morton. By a Contemporary. In Three Volumes. (London: Chapman & Hall, 1878.)

Forget-Me-Nots. By Julia Kavanagh. In Three Volumes. (London: R. Bentley & Son, 1878.)

Like Dian's Kiss begins with the hackneyed scenes of the gambling-saloons and concert-chamber of the Kursaal at Baden-Baden. Hermann Berger, the hero, has scarcely escaped the deafening applause which greeted his execution of a concerto of Spohr's, before, in a retired corner of the grounds, accident introduces him to a golden-haired and precocious child, who had heard him play, and finished the evening by losing her *bonne* and missing her way back to her grandparents at the Hôtel d'Angleterre. Thither she is escorted by the soon fascinated youth, who introduces him to her grandsire, Mr. Augustus Ragge Delaware, one of the most obnoxious specimens of a vulgar *nouveaux-riche* and incompetent amateur that overcumbered the pages of fiction. In his party is a young cousin of the little heroine, one Bertie Foster, of the Indian Civil Service, who we shortly learn (for Miss Maud tells all the gossip broadcast in her first interview with Hermann in the garden), is “spooney” on “Mlle. Fleurette d'Este,” the loveliest woman in Baden, and at that time its *prima donna*. Strange to say, this charming singer—“a woman lovely enough for Venus, Helen, and Cleopatra, anything that is fair, false, and dangerous”—will have nothing to say to Bertie Foster, but no sooner sets eyes on Hermann Berger, an ill-fed, much neglected son of the drunken wife of a henpecked German baron, hampered by a low-lived and disreputable brother, than she bestows upon him the smiles, sympathy, devotion, and, what is better, sterling patronage, which enable him, eventually, to surmount the drawbacks to his advancement. Among the earlier scenes of *Like Dian's Kiss*, the hours of moonlight with

Fleurette, and the magic of her hotel balcony, ring a curious change upon the miseries of Hermann's half-starved home-life, and the indignities with which he puts up from the vulgar, pompous Mr. Delaware. Anon the scene changes to London. Maud has rejoined her stuck-up grandparents at Lancaster Gate, the better, it is hoped, for four years of education in Brussels. Fleurette, who has married and buried an Italian Marchese, and is drawing crowded houses at Covent Garden as Marguerite, is the mistress of a grand house in Park Lane, and Hermann, in a less successful turn of Fortune's wheel, is one of the violinists in the orchestra, where he is espied by the *prima donna* on the stage, as well as the Bertie-beset Maud in a private box. Of course Fleurette's influence enables him to win success and fame by a series of private concerts under her roof and auspices. When his repute waxes, vulgar Mr. Delaware stakes his large pretensions and scanty talent in cultivating the Italian Marchesa, as well as her dubious and professional musician-adventurer in an "at-home," where the old man's tactics to cover his own incompetency, despite of "good, steady practice"—namely, *pasting over his difficulties and marking them as rests*—would be amusing, if they were not obviously caricaturish, and if they met with their deserts instead of being passed over. Out of this "at-home" spring troubles for Maud, who finds in it the *integratio amoris*, which the suit of Bertie renders peculiarly welcome. The old story of Horace is re-enacted, "*Insignem tenui fronte Lycoridæ Cyri torret amor: Cyrus in asperam Declinat Pholœn*;" and the gist of the tangle displays Fleurette striving to do good to Hermann, openly or by stealth, in the faint hope of winning a love which he has silently pledged to Maud, who is enduring snubs from her grandparents because she will not cast in her lot with an unreasonable and narrow-minded Anglo-Indian cousin, long since cured of his first *penchant* for Fleurette. In the end, and after numerous entanglements, the course of love for the violinist and the wiser and less-precocious Maud is made straight and smooth through her being obliged to fly the home of the Delawares, and find another, after due wedding and wooing, in her Hermann's baronial hall. But the story is improbable and exaggerated. Professional and amateur musicians may fairly resent it as a caricature: few among the former would perhaps climb so successfully to fame as Hermann by the tactics of a "Dian;" and if amateurs, as a class, were half such impostors as Mr. Delaware, they should be exterminated under a heavy penalty.

The *History of Margaret Morton* introduces readers to a Widow Archibald, of cultivated tastes and antecedents, affording a home at Kensington to her niece the heroine, with frequent hospitality to her nephew, Henry Morton, and her husband's nephew, a cousin or connexion of Margaret's, Richard Archibald. Mrs. Archibald's little dinners and whist-parties include likewise an elderly widower, Mr. Wynum, and a fat and fair old maid, Miss Maunsel, occupants of contiguous

apartments in an adjoining lodging-house: and into this habitual circle an element of novel excitement is brought by the visit of Mr. Wynum's son—the adopted heir of his eldest brother, a millionaire mill-owner—just gazetted to a cornetcy in a cavalry regiment. The time of the action of the novel is between the Exhibitions of 1851 and 1862; and Mr. Wynum, whose mistake in life seems to have been selfishness, is stirred by his son's impending departure for India to emulate, by a temporary joining of forces or sitting-rooms with Miss Maunsel, the customary hospitalities of Mrs. Archibald, and to flutter more or less the contiguous dovecots. It seems that Richard Archibald, who is a clever lawyer as well as a member of the Indian house of Morton, Archibald & Co., has always been destined for the husband of "Margaret Morton;" though, as that young lady's education had been superintended by the late Mr. Archibald upon very superior principles, her self-respect has never yet been impaired by the suggestion of any such proposed relation. Not unnaturally, as Miss Morton is clever, good-looking, and agreeable, the amiable Cornet Wynum takes the opportunity of falling in love with her, and much space is consumed in the machinations and counter-machinations of Richard Archibald and his aunt, of Miss Maunsel and Mr. Wynum, until at last the young officer comes to an understanding with his father, proceeds to the East in a state of supposed heart-breaking, and leaves the coast clear for Richard Archibald, who shortly afterwards defeats the plans of his family by marrying one of the ill-bred daughters of a vulgar financier, while his cousin and partner espouses the other. Suppers and whist-parties above stairs, and "something hot" below, between mistresses and maids, eke out the terribly tedious acts of this contemporary drama: but when Wynum *filis* has been shipped to India, and Mrs. Archibald's death, hastened by vexation, has left Margaret without a home and old Wynum on the look-out for new combinations, it occurs to him to prefer proposing to her, in confidence based on their congeniality of literary and philosophical tastes, to proffering hand and heart to Miss Maunsel, who is described in the first volume as resembling "the bust of a Roman matron cut in marble." Margaret weds the widower apparently from admiration of his knowledge of Butler's *Analogy*; soon, however, to find that his philosophy is unpractical, his means far in defect of his wants, and his theory of a wife and a nurse identical. In the course of a few harassed years his restless extravagance so far outruns the constable as to bring her acquainted with unwashed moneylenders and tipstiffs; and, though she clings to him with a devotion out of proportion to his deserts, it is a relief, at any rate to the reader, when he dies and leaves Margaret wellnigh penniless. The time synchronises pretty nearly with the so-called Black Friday, which smashed so many commercial concerns, and finished "Morton & Archibald," whose wives had led them into extravagance, and who only made up to Margaret when they could make her useful. To her the task of clearing the character of a wife who had supplanted

her with Richard falls just in time for a reconciliation with her husband before the death of Mrs. Richard Archibald; and, though with the Indian house in liquidation, and a peck of other troubles in the way, it might have seemed vain to expect a *dénouement* without a fourth volume, the author eventually contrives to bring about a grand issue, by making the Yorkshire mill-owner die intestate, and his heirs-at-law, his brother's widow, and her *quondam* admirer—now her stepson, and an Indian colonel—divide the property. With her share of this it need not be said that Mrs. Margaret Wynum endows the revived house of Morton & Archibald, giving herself withal to her duly-humbled cousin.

It is refreshing to turn from a tangle which the clearest head would find tedious to unravel, from heated rooms and crowded thoroughfares, and from commercial crises on the brain, to the fresh, bright, idyllic sun-pictures which Miss Kavanagh has left us in *Forget-Me-Nots*. The series consists of nigh a score of sketches of country life in a breezy nook of Normandy. Not one of these is a repetition of another; each tells its uncumbered story of a rustic love, or of a maidenly self-devotion, in refined and graceful touches, and amid a setting of ferns and wild flowers, tall red poppies, waving corn, or great green boughs of the old village "oak with the cross." Now it is "Fifine," or Josephine, whose early mishap "At the Well" about which there was a dispute between the Lenuds and Delpierres provokes a pity in the breast of her hereditary foe, the awkward shy young farmer, Pierre, which ripens into love, converts him from a wolf to a lamb, and heals the feud, so that there are no more broken pitchers at the well. Again, "The Story of Monique" introduces us to a rural heiress, humoured in her childish days by an elder less well-to-do cousin, Sévère, who procures for her the magpie which she had fancied, and which the showman would not sell at any price. Sévère has to run for this; but, coming back after Monique is her own mistress, and beset by as wasteful and importunate suitors as Penelope, first becomes her bailiff, and then, after the usual touchiness of would-be wooers, places her on the horns of a dilemma, whether she "cares for him or only wants his work." Her answer is, "It is all the magpie." Annette's "Love Story" is a trifle sadder; but the little touch of Annette confiding Jean's promises and quarrels in the *cavée* to the glossy shoulders of her cows, La Brune and Blanchette, is deliciously pastoral; and the end of her love story—the happiness by deputy, which her savings for the unworthy Jean enable her to effect after forty years of fruitless waiting—is full of a natural sweetness and pathos. This is, indeed, one of the few stories in the book that does not end in direct happiness; for the second story in the first volume, "Sister Anne," while it professes to tell of "a woman compelled to wait for a wooing that came not," is inconsistent in this, that she finds it in pp. 163-4; and so in "My Brother Leonard," an ineffably picturesque tale of the crossed loves and protracted feuds in a *château* looking out on the Mediterranean. When the

expatriated lover would seem to have perished in a burning ship, he comes back alive and all ends happily. Other singularly attractive stories in their respective grades of Norman life are "Phillis and Corydon," the scene of which is the old Castle of St. Brice, and the actors counts and marquises; and "Charlotte Morel," a picture of constancy, love, and faith, in the paths of trade and commerce and in the old-world "sleepy hollow" of Verrières. "The Broken Charm," too, in the third volume, may be mentioned as likely to afford attraction to marvel-seekers and botanists. But it is in vain to express adequately our appreciation of the legacy bequeathed to readers of true taste or fancy-free instincts in this charming bouquet of "Forget-me-nots," one wholesome result of which might well be a lesson of reaction, and recurrence to simplicity and nature, in the works of latter-day novelists. J. DAVIES.

CURRENT LITERATURE.

Bards and Blossoms; or, the Poetry, History, and Associations of Flowers. By F. Edward Hulme, F.L.S., F.S.A. (Marcus Ward.) In spite of its alliterative title (which prejudiced us against it), this is a volume possessing other merits than those which are due to the artist's skill. The illustrations are, indeed, executed with no ordinary taste, and, even if we object to the uniform background of gold, we have no fault to find with the manner in which the flowers themselves are depicted. The delicate shades of the primrose and apple-blossom have been reproduced with marvellous exactness, and in nearly every case the artist has amply justified the selection of subjects for his pencil. With regard to the letterpress, we have little to add to the obvious remark that the writer's range of reading has been a wide one. Perhaps because of its extent it has proved occasionally too heavy a burden for his memory. It is difficult to be at the same time, in Bacon's words, "a full man" and "an exact man;" and to this fact we must attribute the want of accuracy which we find in some of the most familiar quotations. But the archaeological lore displayed by Mr. Hulme is less than might be expected from one who writes himself F.S.A. His account of Candlemas Day, for instance, is neither correct nor complete, and to assign as a reason for its name the custom of celebrating the feast "with many candles" shows considerable simplicity on the part of the author. We are not acquainted with any feast that is not so celebrated. But, after all, there is much to be learnt from this elegant volume, and it would be unjust to subject it to the same rigorous criticism which we should bestow upon a scientific treatise. It will adorn any drawing-room table, suggest pleasant thoughts, and recall many happy associations. Those who are debarred from closer intercourse with flowers will find some compensation from turning over the pages of this pretty book.

The Complete Angler. By Isaac Walton and Charles Cotton. A new Illustrated Edition, with Notes by G. Christopher Davies. (F. Warne and Co.) The May-fly is on the wing, and the soft spring days are tempting anglers back again to their old haunts. This handy edition of old Isaac comes opportunely enough, and should form part of every gentle craftsman's gear. For though the modern art of angling is—we suppose we must admit—in advance of that which was practised by the veteran author, his book is one which will never become obsolete. No doubt many of his notions are absurd, and his natural history is full of quaint errors, but in spite, or perhaps by reason, of these, he is a very delightful companion, so much so that one would even give up a day's salmon-fishing for the pleasure of catching a

basket of "coarse fish" under his kindly direction. In fact, whether he be a fisherman or not, every lover of the English language regards Isaac Walton with affection, and finds delight in his writings. They prove either that Mr. Freeman is wrong in his belief that fishing is a cruel sport, or else that there are some natures upon which its practice exerts no evil influence, but rather "invites them to contemplation and quietness." As such it is certainly to be commended to Churchmen in these troublous times; and, now that trout are again to be found in the Thames, we shall be glad to see Dean Church imitating his learned predecessor, Dean Nowell, as well in his recreation as in his studies. The present edition of *The Complete Angler* is very clearly printed, and well illustrated with the woodcuts from Major's celebrated edition. The historical notes of Hawkins are given, and beside these some capital essays and remarks of a practical kind by Mr. Christopher Davies, who has already achieved some distinction both with rod and pen.

The War in the Peninsula, and Wellington's Campaigns in France and Belgium, by H. R. Clinton, Instructor of Candidates for the Army Examination (Warne and Co.), is written rather from the military than the historical point of view, and will no doubt be serviceable to the students for whom it is intended.

THE second volume of M. Guizot's *History of England*, translated by Mr. Moy Thomas (Sampson Low), extends from the accession of Henry VIII. to the death of Charles II. There is a certain charm in everything which M. Guizot wrote, and to part at least of this period he had paid special attention. But he probably would hardly have placed it himself among the works by which he desired to be known. Some of the illustrations are as absurd as can well be, especially the one in which Sir Thomas More is represented with a forked beard, and the one in which Strafford appears going to execution with the flowing locks of a dandy of the period.

THE Hon. Albert S. G. Canning's *Religious Strife in British History* (Smith, Elder and Co.) is creditable to the writer, so far as it shows that he has read a number of books, including Hooker's *Ecclesiastical Polity* and Cassell's *History of England*, but is not remarkable either for fullness of knowledge or vigour of thought.

HERR OSCAR CANSTATT'S *Brasilien, Land und Leute* (Berlin: Mittler und Sohn), is an excellent and complete popularly-written description of this large region of South America. Though it does not bring new material to add to our knowledge from any scientific point of view, the author's long residence in the country and intimate acquaintance with large portions of it have enabled him to discriminate carefully in compiling from the works of those who have preceded him in this field, and to put together a very trustworthy handbook of Brazil. He begins with a systematic description of the country, its flora, fauna, population, agriculture, mineral resources, trade, communications, colonies and colonial life, and then passes to a brief history of the Empire. The second half of the volume is the narrative of the author's journeys, several chapters being devoted to an account of the German colonies in Southern Brazil. A number of excellent illustrations, chiefly reproduced from photographs, add to the value of the descriptions. Those of the neighbourhood of Rio and its splendid bay are specially noteworthy.

East and West; or, a Tour through Europe and the Holy Land. (Cassell's.) The usual *réchauffé* of the guidebooks, dished up with quotations from Byron and the stereotyped religious phrases and sentiments with which every well-regulated tourist speaks of any place mentioned in the Bible: such is *East and West; or, a Tour through Europe and the Holy Land*. The author signs himself by the eccentric *nom de plume* of

"Rich in Peace," because, as he explains in the Preface, "war clouds hung ominously in the heavens as we entered on our travels," but war did not break out until the trip was over. He says, moreover, "there is no lack of books of travel, and I have felt some hesitation in adding my quota to swell the bulk. My critics may, perhaps, regret that I did not rest satisfied with that attitude." We do for one. These Cook's and Gaze's itineraries are all very tedious, and Mr. "Rich in Peace's" is exceptionally so.

Last Counsels of an Unknown Counsellor, John Dickinson. Edited by Major Evans Bell. (Macmillan.) The "Unknown Counsellor" was a gentleman who devoted nearly all his life, and some part of a considerable fortune, to the cause of the natives of India, and especially of the native chiefs. His "Last Counsels," now edited by Major Evans Bell with an introductory Memoir, consist substantially of an argumentative pamphlet, left incomplete at his death, in which he maintains the loyalty of Holkar, the Mahratta Maharajah of Indore, at the time of the Mutiny of 1857. This vexed question is one of the controversies bequeathed by the publication of the third volume of Sir John Kaye's *Sepoy War*. Mr. Dickinson and Major Evans Bell warmly uphold the view which was adopted by Sir J. Kaye with full knowledge and after much deliberation; and in this country, at least, we do not think that the weight of their conjoint testimony will be affected by the hot-headed pamphleteers on the other side. The subject has been discussed by everyone with the usual prolixity that attaches to a personal controversy, and to an Indian controversy in particular; but considering the position occupied by Holkar, and the importance of the general principles involved, we cannot lay the blame on his English advocates. The point at issue can only be understood by those who have been already initiated into the secret of Indian administration. If we may fairly judge of Mr. Dickinson's style by this fragment, he did not possess the art of so grouping his facts as to carry conviction to the mind of a stranger. Unfortunately, also, Major Evans Bell's intentions are better than his performance. His elaborate criticisms of our Indian Government may contain much that is sound, but they are scarcely destined to be popular. The English public has not yet learned the alphabet of the dialect in which he writes. They take more interest in the vicissitudes of a French Ministry than in the machinery of the Calcutta Secretariat or the career of "a District officer." Nevertheless, we ought not to be ungrateful for this sketch of the life of one who laboriously earned the confidence of Indian princes without ever having set foot in India.

Commentaries on the Punjab Campaign, 1848-49. By Captain J. H. Lawrence-Archer. (Wm. H. Allen and Co.) Captain Lawrence-Archer is one of the few survivors of the gallant army that fought in the second Sikh war. The history of that war has never yet been fully written, perhaps because it covers a page of not unsullied glory in the military annals of our country. On the field of Chillianwalla, within the short space of three hours, we lost eighty-nine officers and 2,357 men, six guns, and the colours of three regiments. After the battle Lord Gough was compelled to retire from the field, entrench his camp, and await reinforcements. At this interval of time it is impossible, even if it were desirable, to describe accurately every incident that occurred during that disastrous afternoon. The contemporary despatches of Lord Gough are well known as models of confused and misleading writing. The author of the book before us relates with creditable pride the part which he himself played, when the Queen's regiment, with which he was doing duty, was almost annihilated by the Sikhs. His notes, jotted down at the time, bring vividly before us the horrors of barbarian warfare, when quarter is neither asked nor given. "In Indian battles," as he significantly

says, "the missing may generally be taken as killed." Is there any reason to suppose that the Sikhs in our own service would behave less savagely than when fighting in the army of the *Khalsa*? It is on record that British officers could not restrain their bloodthirstiness in the Bhootan campaign of 1865.

Miles: a Town Story. By the Author of "Fan." (Samuel Tinsley and Co.) This is a story of factory life in a north-country town. It cannot lay claim to any great originality or vividness of portraiture; but yet the characters are real men and women, and their daily doings are described in a wholesome way. As usual, the villain of the story is the least well drawn, but even in his case the sin of exaggeration is avoided. Altogether the book may be commended for its simplicity of style and soundness of thought.

In Tropic Seas: a Tale of the Spanish Main. By W. Westall. (Samuel Tinsley and Co.) The writer of this story has ventured into a field of romance where others have preceded him, but he deserves credit for rejecting the temptation to introduce those episodes of buccaneering which his subject naturally suggests. His heroes are our own contemporaries of the nineteenth century, mostly master-mariners who know their duty and do it, and prosper accordingly. Their only fault is that they are one and all too virtuous, and are continually meeting one another by the strangest of coincidences. The description of Trinidad and of tropical scenery generally is well done, without any undue straining after effect. A good book to put into the hands of boys.

The Supernatural in Nature. (O. Kegan Paul and Co.) This book displays a great deal of well-directed reading and a certain rather captious acuteness of thought. The writer has a tolerably clear view of the case which may be made against the fitness of students of physical science for the office of spiritual guides to the community, and a view too extensive to be equally clear of the aspects of the ascending order of the universe, which suggest a generalisation of the old argument from design. He has also fed himself with much curiously-gathered information upon all the questions on the present frontier of science, which until we know more will continue to puzzle the imagination; and he reiterates a little too monotonously the undoubted fact that in presence of such puzzles the imagination will commonly find relief in falling back upon the Bible. There are some good points made in the chapter on "The Follies of the Wise" at the expense of eminent men of science who have gone further and fared worse.

WE have received from Messrs. Longmans a uniform reprint of Dr. Arnold's *Sermons*, which will now appear astonishingly orthodox; from Scribner and Co. the collected *Remains of H. B. Smith*, whom Dr. Dorner pronounced the foremost of American theologians. He understood the distinctive theology of New England as well as the apologetic theology of Germany. Perhaps he overvalued the advantage of knowing the latter: it seems to move after the critical theology of Germany like the Prayers after Ate. The truly masterly essay on Emmons makes us wish he had given us a critical history of the little-known movement initiated by Edwards. We have also received two interesting German essays on the prospects of intercommunion between different Christian bodies. Both agree that intercommunion is all that is to be aimed at, and the first step must be to release the two separate communions now bound together in the Prussian State Church. One is by Gottlieb Joss (Leiden: Brill); the other by Karl Lechler (Heilbronn: Henninger). The former received a prize from the Hague Society for the Defence of Christianity; the latter with some fancifulness (St. James's doctrine of faith working by love is made a sign of a feminine theology) shows real spiritual insight. F. Bassermann, of Heidelberg, has sent us a con-

venient little *précis* of Schopenhauer, by Arthur Busch, prettily got-up. *Minds and Moods*, by Mortimer Granville, M.D. (Renshaw), contains some shrewd observations and useful hints. *Morality*, by James Platt (Simpkin, Marshall and Co.), contains some amusing information about the tricks of trade, and a round assertion that most people who make large fortunes out of nothing do so by robbing those they buy from, or those they sell to, or those they employ, or all three. In spite of this, the author maintains that honesty is the best policy, believing, in the teeth of facts, that the order we live under would, if understood, be one of unmixed beneficence.

NOTES AND NEWS.

WE understand that Sir James Stephen is preparing a second edition of his *General View of the Criminal Law of England*, which will form substantially a new work, and will include notices of the Criminal Law of India and the Colonies. It will be published in the course of the year, by Messrs. Macmillan and Co. The question of Evidence will be separately and fully dealt with in a future volume.

MESSRS. MACMILLAN AND Co. will shortly publish in a volume the lectures on *Saintly Workers*, delivered in Lent at St. Andrew's, Holborn, by the Rev. Canon Farrar.

EARLY in the autumn Messrs. Longmans and Co. will publish a work by Mr. William Digby, of Madras, entitled *The Famine Campaign in Southern India (Madras, Bombay, and Mysore) in 1876-78*. It will be in two volumes, the first consisting of (1) a narrative of the famine campaign in Madras, giving a popular account of the disaster in all its phases, and the measures taken to grapple with it; (2) narrative of the Bombay famine; (3) of the Mysore famine; and (4) the threatening famine in Northern India, August-November, 1877. As the principles adopted in the different presidencies and Mysore were unlike, each narrative will include an entirely diverse collection of facts, and the same ground will not be traversed in each. Volume II. will be devoted to sections of interest to specialists:—(1) Private Charity, describing in chapters i. to v. the charity displayed before the appeal to England on August 4, 1877, then the history of the Famine Relief Fund, with particulars of the good done by the money subscribed in the British dominions generally; (2) Relief Camps and Village Relief; (3) The One lb. Ration: evidence *pro* and *con*; (4) How the Railways saved Millions; (5) Results of the District Census; (6) Village Relief and Village Agency; and (7) Miscellaneous: (a) emigration as a panacea; (b) the weavers; (c) seed grain for destitute cultivators; and (d) prickly-pear as food for cattle. There will be an appendix containing important State and other papers.

THE June number of the *Nautical Magazine* will contain an article by Sir Travers Twiss on "Privateers," in connexion with the Declaration of Paris of 1856, as to the abolition of *la course*, and the reported fitting-out of Russian privateers in American ports.

MR. ROBERT ROBERTS, of Boston, Lincolnshire, has nearly ready for publication a handsome reprint, with choice headlines, borders, and ornaments, of Raphe Robynson's 1561 translation of Sir Thomas More's *Utopia*, "with copious Notes and a Biographical and Literary Introduction by the late Rev. T. F. Dibdin, F.S.A." Mr. Roberts prints from the late Sir Henry Ellis's copy of the book, which has additional notes and corrections. He also gives an Appendix of interesting and racy extracts from Sir Thomas More's Works. "A merry tale," said More, "commith neuer amysse to me"; and Mr. Roberts's selection justifies the Chancellor's saying.

MESSRS. PUTTICK AND SIMPSON have announced for sale, on May 27 and 28, "the library of a well-

known collector," comprising a number of first editions—Coleridge, Blake, Godwin, Mary Wollstonecraft, and others coming down to a very recent period; especially "first editions of various pieces and works by or relating to Lord Byron, upwards of 300 volumes, probably one of the most interesting collections ever formed." The "Shelleyana" are thus described:—"Books and manuscripts, autograph letters, transcripts of original letters of P. B. and Mary Shelley (made before 1824), journals, &c., the major part of which are doubtless unpublished, some first editions of Shelley's works, &c., from the collection of Mr. and Mrs. Gisborne." This section of the materials comprises minutely accurate transcripts, made by Mr. Gisborne, of the letters addressed to himself and his wife by Shelley; both those which have been published in the *Essays and Letters*, and others as yet unpublished. The transcripts from published letters contain various passages which have not appeared in print. There are also a transcript of Shelley's burlesque drama, *Swellfoot the Tyrant*; a mass of journals and letters written by Mr. Gisborne and Mr. Jefferson Hogg; and a letter written by Godwin in 1820, reflecting severely upon Shelley's line of conduct in connexion with the writer's money-difficulties: persons who are conversant with the importunities of Godwin, and the exertions and self-sacrifices of Shelley to appease them, will, however, be apt to take this letter *cum grano salis*. The last owner of the Shelley items proper to the Gisborne family was, we believe, a lady connected with that family, Miss Rumley.

MR. THOMAS HUGHES, Q.C., has in the press, and nearly ready for publication, a volume directed against the movement for the disestablishment of the Church of England. It will be issued immediately by Messrs. Macmillan and Co., under the title *Our Old Church: What shall we do with it?*

MR. JOAQUIN MILLER, the American poet, arrived in London two or three weeks ago. He is not likely to remain long.

THE letters from William Blake, a series of great interest to his admirers, which were sold on May 20 amid the Hayley correspondence by Messrs. Sotheby and Co., fetched good prices, ranging between 2*l.* and 7*l.*

THE Court of the Stationers' Company of London have presented an honorarium of twenty-five guineas to Mr. Edward Arber, F.S.A., as a mark of their appreciation of the great energy displayed by him in the *Transcript* of their *Registers* between 1554 and 1640 A.D., produced by him in four large volumes.

MESSRS. MACMILLAN AND Co. will publish in the course of the next few weeks vol. ii. of Lord Rayleigh's *Theory of Sound*; *Elements of Descriptive Geometry, with Illustrations*, by J. B. Millar, C.E., Lecturer at Owens College, Manchester; and two new volumes of the "Nature" Series—viz: *Light: a Series of Simple, Entertaining, and Inexpensive Experiments in the Phenomena of Light, for the Use of Students of every Age*, by Alfred M. Mayer and Charles Barnard; and *Metals, and their Chief Industrial Applications*; being, with some additions, the substance of a course of lectures delivered at the Royal Institution by Charles Alder Wright, D.Sc., Lecturer on Chemistry in St. Mary's Hospital Medical School.

WE are sorry to hear that the College for Men and Women will probably have to be given up this season on the expiration of the lease of its house, as the required guarantee fund of 300*l.* a year for future operations cannot be raised. The college has for so many years done so much good, and been such a success in every way except the pecuniary one, that its stoppage is seriously to be regretted.

THE Cambridge Extension Scheme of Lectures and Classes at Bedford has also to be given up.

The committee has just announced its bankruptcy, or rather its wind-up after having discharged its liabilities. The town and neighbourhood are not large enough to yield a sufficient percentage of intelligent students.

A GOETHE SOCIETY has been founded at Vienna, after the pattern of the English Shakspeare societies. Its object is to found a Goethe library, and to issue editions of Goethe's chief works at a price sufficiently low to place them within the reach of all classes.

THE Municipality of Turin have bought the original MS. of Silvio Pellico's *Le mie prigioni* for the sum of 8000 francs.

MESSRS. OVERALL, of the Guildhall Library and the Town Clerk's Office, have nearly ready the concluding volume of their Calendar of the *Remembrancia*, one of the series of records belonging to the Corporation of the City of London.

THE Guildhall Library is filling so fast, and is used so much, that already there is talk of the need of doubling it in size and making it still more worthy of the City which owns it. The removal of the Law Courts to the new building in the Strand will, when it takes place, afford at least an opportunity for the full discussion of the matter.

THE appointment of Mr. Reginald Sharpe as Records Clerk of the Corporation is bringing forth good results. Mr. Sharpe is calendaring the Rolls of Deeds and Wills in the Hustings Court, and has got down to the poet Chaucer's time, 1340 A.D. The particulars of each deed are entered in six columns. Thus the conveyance in 1339 to the poet's grandfather by one of the Herouns, with whom the Chaucers were so bound up, is:—“(Roll) 66 | (Document) 41 | 13 Edw. III. | 1339 | Thomas Heroun, vintner, to Richard Chaucer, vintner | tenement in the parish of St. Michael, Paternoster Church.” (See “Further Additions to Mr. Furnivall's *Trial-Forwards*,” p. 134. Document 42, the same to the same, is a quitclaim of the same premises.) The only thing to be desired is that the Corporation should allow Mr. Sharpe three clerks or assistants to work under his superintendence, so that the calendaring might go on faster, and the many sets of records of the Mayor's Court, &c., &c., be made available for literary and antiquarian enquirers.

DR. GROSART has now in the press Chester's *Love's Martyr*, containing the original text of Shakspeare's *Phoenix and Turtle*.

THE Rev. H. R. Haweis's sermon on “Shakspeare and the Stage” has been reprinted, with some slight revision, from the shorthand writer's report in the *Era* of May 5. Mr. Haweis's sermon on War to the Volunteers, in St. James's Hall, on the Sunday before last, has also been reprinted.

THE Rev. Charles Hargrove, the former Cambridge Lecturer on English Literature in the Northern District, will read a paper on “The Religion of Shakspeare,” at the *soirée* of the Liberal Social Union, at St. George's Hall, Langham Place, on Thursday evening, May 30. The Chair will be taken at 7.45 P.M., by Mr. Furnivall.

Summer Snow, by Sarah Tytler, illustrated by Frank Dadd, will be the second of the “Bluebell” series of novels. It will be published on June 1.

THE first part of the Didot collection of books and MSS. will be sold from June 6-15. Mr. Quaritch has had the MSS. entrusted to him for exhibition in London during a couple of days this week.

THE Council of the Folk-lore Society have decided to compile a Bibliography of Works relating to English Folk-lore, which will be prepared from (1) special works on the subject; (2) articles in magazines or in Transactions of societies. In order to secure uniformity in the arrangement of the particulars to be thus obtained, forms have

been prepared for the use of those who wish to aid in the compilation, which may be obtained of the honorary secretary, Mr. G. L. Gomme, Castelnau, Barnes, S.W.

IN a few days will be published *The Annals of Tennia*, an exhaustive history of the game, by Mr. Julian Marshall. The work appeared weekly in the *Field*, and is now issued in volume form by that journal.

A WRITER in the *Deutsches Montagsblatt* devotes an article to Bayard Taylor and the question of American reprint. It appears that Bayard Taylor, before entering on his new post, expressed the hope that he might be the means of concluding an accord between America and Germany on the question of copyright. The writer of the article in question pleads in favour of the present system of piracy, at least for newspapers, on the score that the papers are too poor to pay for original contributions, and that if reprints were forbidden a very large colony of Germans would be cut off from all spiritual communion with their fatherland.

THE English Dialect Society will issue in a week or two the first instalment of their publications for 1878—a *Glossary of the Words and Phrases of Cumberland*, by Mr. William Dickinson, F.L.S.; and a reprint of Thomas Tusser's *Five Hundred Pointes of Husbandrie*, edited with an Introduction, Notes, and Glossary by Mr. William Payne and Mr. Sidney J. Herrtage, B.A. The last-named work is the edition of 1580, collated with those of 1573 and 1577; and contains in addition a reprint of the unique copy in the British Museum of *A Hundreth Good Pointes of Husbandrie*, 1557. The notes are very elaborate, and in their preparation Mr. Herrtage has had the assistance of Prof. Skeat and Mr. James Britten, F.L.S.

KARL BLIND will contribute an essay to the June number of the *University Magazine* on “Vjera Sassulitch and Constitutional Aspirations in Russia,” which will contain many details of the trial hitherto unknown in England.

THE *Deutsche Rundschau* for May has a lively and appreciative article on Sainte-Beuve, by Herr Hillebrand, who, in spite of his efforts to reach the French method of criticism, is somewhat deficient in lightness of touch, a defect which the thought of his subject brings constantly before us. Prof. Hübner gives a lucid and interesting account of the Roman conquest of Britain, under the title “Eine römische Annexion.” In tracing the gradual occupation of the island we have the rare advantage of the guidance of a great and almost contemporary historian, and of a number of subsidiary helps in inscriptions and other antiquities which have been in some respects more carefully and jealously preserved than those of other countries. From his thorough command of the latter sources of information Prof. Hübner is able to sketch the course and method of Roman advance with remarkable distinctness. Starting from the south coast in A.D. 43, the invading army, numbering, perhaps, 70,000 men, at the end of six years occupied a triangle, the three points of which were Chichester, Bath, and London, with Colchester thrown forward as an outwork. The western boundary included the mining district of the Mendip Hills, to which the Romans seem to have attached great importance. The next important advance was to Gloucester, which formed the great military station for the western coast, as Colchester did on the east. After Camulodunum Glevum seems to have been the first colony founded in Britain. Suetonius Paullinus (A.D. 59-61) extended the province northwards as far as Chester and Carnarvon, and into Anglesea, and held the former notwithstanding the dangerous outbreak in the south-east under Boudicca, more familiarly known to us as Boadicea. The first *legatus* of Vespasian, Cerialis (A.D. 71-74), occupied Lincoln; and

his successor, Frontinus, the well-known military writer, subjugated the Welsh mountains, so that the whole southern half of the island was now annexed. Then followed the long and brilliant rule of Agricola (A.D. 78-85), who pushed on as far as the two Firths of Clyde and Forth, having doubtless first secured a basis behind him at York, of which he may be presumed the founder. In this expedition he won a hard-fought battle over Calgacus on the Graupian mountain—the locality of which has not been determined. It is, perhaps, not so well known as it should be that the name Grampian (from a mis-reading of Tacitus) was only conjecturally given to the chain which now bears it, by the scholars of the seventeenth century, apparently with no previous tradition in its favour (see Burton's *History of Scotland*, vol. i.). This was the furthest point of Roman invasion, and was not permanently held till a later date. This is a very brief summary of the first part of Prof. Hübner's paper. The remainder describes the two great lines of fortification from sea to sea—viz. Hadrian's (not Severus') from Carlisle to Newcastle, and that of Antoninus Pius from Glasgow to Edinburgh. An adaptation of this essay, with further illustrations, would make a valuable course of lectures, either at the universities or before some of our archaeological or historical societies. It would make clear, what antiquaries do not always understand, that every inscription is a piece of historical evidence, intelligible almost at once to the mind that has a general knowledge of the circumstances of the country where it is found. To realise this imparts a new zest to archaeology, just as the modern theories of the distribution of plants and animals give a novel interest to the naturalist. Herr Brandes begins a study of the Swedish poet Esaias Tegnér; and Herr Ferdinand Müller contributes some interesting reminiscences of Bellini.

IN the *Nuova Antologia* for May Signor Boglietti gives a sketch of the life of Byron, which, we learn, forms a chapter of a forthcoming work on Byron which is to contain a complete examination of his writings.

NEW TESTAMENT critics and philosophers, as well as Hebraists, will find something to their purpose in the *Monatschrift für Geschichte und Wissenschaft des Judenthums*. The last seven numbers contain articles by Dr. Grätz on Bezetha, the suburb of Jerusalem (this bears directly on the interpretation of the Gospels), on the contents of Pa. cix., on the pseudo-Aristobulus, and on the motive which dictated the selection of the daily Temple-psalms; and historical articles by Dr. Kohn on the life and works of Mardocheai ben Hillel, and by Dr. Guttman on the Philosophy of Religion of Abraham ibn Daūd of Toledo, &c. The latter, and not Maimonides, appears to be the real founder of that Aristotelianism, derived from the Arabs, and modified by neo-Platonic elements, which prevailed for centuries among Jewish thinkers. It is a striking evidence, however, of the power of educational prejudice, that even a great philosopher like Abraham ibn Daūd thought it necessary to support every thesis of his philosophy by proof-texts from Scripture. Hence even such a highly poetical work as the 139th Psalm is converted by him into a summary of the Aristotelian doctrine of categories.

The Law Magazine and Review (Stevens and Haynes) in its quarterly number for May contains articles of various degrees of merit. Mr. Justice Markby, of the Calcutta High Court, has the first place with an article on “Codification and Legal Education.” The writer is one among our few practical lawyers who possess both the knowledge and the earnestness requisite to advance the work of legal reform. He recognises the almost insuperable difficulties which lie in the way, and on this occasion contents himself chiefly with a criticism of certain published opinions of Sir James Stephen and Sir Henry Thring. It is

to be deplored that three such eminent men, from whose conjoint action much might be expected, should still differ on not a few points of fundamental importance. The editor, Mr. Taswell-Langmead, contributes an article on "Parish Registers," a subject which, by laborious investigations, he has made his own; and Mr. Alexander Robertson proposes several comprehensive changes in the administration of criminal law, suggested by his knowledge of the corresponding department of practice in the Scotch courts. A valuable feature in this magazine is the "Quarterly Notes," compiled by a competent hand, giving information about events of legal interest in foreign countries. As compared with the weekly journals of the profession, which are all immersed in details of practice, the *Law Magazine and Review* deserves support as the only periodical devoted to scientific jurisprudence.

NOTES OF TRAVEL.

IN No. 3 of the *Mittheilungen* of the Royal Geographical Society of Vienna for the present year, we find the first part of an account of the Turkish archipelago (the Vilayet of the islands of the White Sea, with Samos and Cyprus) written from a statistical and military point of view, by A. Ritter zur Helle von Samo, formerly military *attaché* of the Austrian Legation in Constantinople. The descriptions of the military strength of the islands seem to be drawn from the fullest local knowledge, and cannot fail to be of interest at the present time.

THE first and second parts of the *Bulletin* of the Belgian Geographical Society contain a very complete historical summary of discovery in the basin of the river Zambesi, from the time of the earliest Portuguese explorers onward to the present day, by M. A. L. Wauters.

WE learn that the promoters of the Scottish missions on Lake Nyassa are about to place a steamer on the lower Zambesi, to maintain communications as far as the cataracts of the Shire.

THOSE to whom the beaten tracks of Continental travel have become familiar, and who are in search of new holiday scenes, will be grateful to Captain Clark Kennedy for his interesting account of a tour *To the Arctic Regions and Back in Six Weeks* (Sampson Low). Few indeed can be aware how easily and inexpensively the glorious scenery of the Norwegian snowfields and fiords can be reached from this country, else a much larger branch of the annual tourist stream would turn in that direction. Captain Kennedy takes us with him most pleasantly from Christiania by cariole over the Dovrefjeld to Trondhjem, and thence, coasting along by steamer northward, to Tromsø, to visit the ugly little Lapps at home in their tents, and to enjoy the strange beauty of the scenery lit up by the "midnight" sun, adding interest everywhere to his descriptions by noting the habits of the sea-birds and fishes with which these coasts abound. An exact list of all expenses incurred on the tour, appended to the volume, is convincing proof that one may go to the Arctic regions and back for a very moderate sum.

AFTER nearly a year's delay, caused in a great measure by the time occupied in the reduction of his large-scale route charts, the Foreign Office have just published a Report by Mr. E. Colborne Baber, of H. M.'s Consular Service, "on the route followed by Mr. Grosvenor's Mission between Tali-fu and Momein." This Report is even more important than its title would at first sight appear to indicate, and is rendered additionally interesting by the fact that Mr. Baber has compared Marco Polo's relation with his own experiences, and verifies in many respects the accuracy of the Venetian's information upon a country almost entirely unknown to Europeans; indeed, the principal discrepancy which he finds between Marco Polo and actuality is the fact that the Yunnan people, instead of speaking an unintelligible *patois*,

are now found to use a remarkably pure form of Chinese, which, it may be added, was forcibly instilled into them under the first emperors of the present Manchu dynasty. It would be impossible within the limits of a brief note to advert to the various matters of interest dealt with in Mr. Baber's Report, but one portion is worthy of special notice as indicating considerable commercial activity in the distant province of Yunnan:—"About a mile outside the west gate the quarterly fair (*Yüeh kai*) was being held, presenting a very animated scene. Some 5,000 people, many of them non-Chinese, were present, and good order is evidently maintained, as valuable wares are exposed with security. . . . Lolos were rubbing elbows with people from the Shan districts, and Tibetans, the dirtiest race we had ever seen in this land of dirt, where most of the matter is in the wrong place, were chaffering with sleek Cantonese. A Fakir with a praying-machine, which he twirled for the salvation of the pious at the price of a few *cash*, was at once recognised by us; he was our old acquaintance, the Bakhshi, whose portrait is given in Colonel Yule's *Marco Polo*. . . . The lower part of the fair was occupied by lodging-booths and restaurants bordered by stalls, on one of which it was interesting to find a copper knife and a stone celt. The knife is undoubtedly genuine; the celt, called locally, and indeed all the world over, 'thunder-stone' (*lei-ta-shih*), bears traces of sharpening on the axe-edge, and is well adapted for use; but as these objects are now employed as charms on account of their supposed supernatural origin and properties, and as there is a brisk demand for them, it is difficult to satisfy oneself of their authenticity."

It may be mentioned that in another part Mr. Baber gives an account of a strange disease which haunts some of the valleys of Yunnan, and bears, in some respects, a resemblance to the plague of London. The value of Mr. Baber's Report is enhanced by an elaborate itinerary and tables of latitudes and altitudes; but most important is his careful route-survey from Yunnan-fu to Têng-yüeh, given in four large sheets. This survey is the more valuable as the route followed by the mission is, for the most part, almost unknown to Europeans. Mr. Baber has also prepared, but has not yet forwarded to England, a running survey of the country from Hankow to Yunnan-fu, as well as a chart of the Yang-tze Kiang, somewhat beyond the farthest point reached by Captain Blakiston, chiefly with the object of establishing accurately the names of places—a matter in which our maps of China are lamentably deficient.

WITH reference to a note on New Guinea in the *ACADEMY* of April 27, in which allusion was made to the hostility suddenly displayed by the natives at Stacey Island, South Cape, we are glad to learn that the Rev. W. G. Lawes has received tidings from Mr. Chalmers of the safety of the newly-established mission station at that place, respecting which grave fears were entertained.

MESSRS. DAY AND SON have just executed for the Church Missionary Society a series of coloured lithographs from sketches of Central African scenes sent home by the late Mr. Thomas O'Neill and others of the Victoria Nyanza Expedition. The scenes represented include the rapids on the River Wami; Dr. Smith's tomb; dhow-building at Ukerewe Island; Nouru, the capital of Usukuma; Mpwapa; and views in western Ugogo, Usugara, &c. We understand that the society contemplate publishing at an early date this interesting collection, accompanied by some brief descriptive letterpress.

THE BRITISH MUSEUM.

II.

PASSING over the Departments of Oriental, Greek and Roman, and British and Mediaeval Antiquities, the most important additions to which we have recorded from time to time, we come to the Zoological Collections. As the time is now ap-

proaching for the removal of these into the new Natural History Museum, the work of this Department has been principally directed with a view to their satisfactory arrangement in the new galleries. The series intended for scientific study is kept strictly distinct from that intended for exhibition, which series is being selected on the principle that it should only contain such specimens as are instructive to the general public. In order to lessen, for a time, the labour of registering and incorporating new acquisitions, the purchase of very extensive and unnamed collections of vertebrate animals has been avoided as much as possible, preference having been given to individual objects of great intrinsic value. Two large collections only were acquired during the year: these were the entire collection of sponges formed by the late Dr. Bowerbank, and estimated to contain at least 7,000 specimens; and the type-collection of St. Helena Coleoptera, formed in 1875 by the late T. V. Wollaston during the expedition to that island, containing about 1,550 specimens, some of which are the most anomalous forms that any country has yet produced.

One of the most valuable specimens in the Mineral Collection has been added to it during the past year in the form of a mass of pure Proustite (tribasic sulpharsenate of silver) in large and bright transparent ruby-coloured crystals, from Chañarillo, Copiapo, Chili. Like the topazes from the Uralga river, this beautiful specimen is only occasionally exposed to view, in order that the light may not destroy its transparency. It was presented by Mr. Henry Ludlam.

Two extensive Herbaria are the most notable acquisitions by the Department of Botany: one, that of the late R. J. Shuttleworth, of Berne, containing more than 150,000 labelled specimens of Phanerogams and 20,000 of Cryptogams, from all parts of the world; the other, the Herbarium of *Hepaticae* formed by Dr. Hampe, consisting of upwards of 6,000 labelled specimens.

Mr. G. W. Reid, of the Print Department, announces the publication in 1876 of two more Catalogues, viz., the third volume of Mr. Stephens' *Catalogue of Satirical Prints and Drawings*, and Dr. Willshire's *Descriptive Catalogue of Playing and other Cards*. The latest donations to this Department include a collection of 1,417 drawings, illustrating the manners and customs of the Chinese at the present day, executed by native artists; some being highly-finished in water-colours, the rest drawn with the pen in outline. Also eight small Chinese sketch-books; four views in China by G. P. Reinagle and W. Skinner, in lithography; and a series of twenty-two plates representing conquests of the Emperor of China, engraved by Helman; a catalogue of *The Works of Raphael Santi da Urbino, as represented in the Raphael Collection in the Royal Library at Windsor Castle, formed by H.R.H. the Prince Consort, 1853-1861, and Completed by Her Majesty Queen Victoria* (1876, 4to.); eleven small leaves, executed by William Blake, containing *theses* of his favourite dogma, "There is no Natural Religion," and illustrated with slight coloured designs; a satirical design, representing monks and nuns feasting, drawn by F. Boitard, in pen and Indian ink, on vellum; five manuscript volumes, viz.:—a descriptive catalogue of the etchings by Dutch and Flemish masters, in two volumes; a list of niello plates and prints, by early Italian engravers; commencement of a catalogue of prints of the early German School, not described by Bartsch; and a list of the works of Pierre Drevet, the engraver; an ornamental device, enclosing the names of "Mr. Elisha and Mrs. Elizabeth Kirkall," with the date, "August the 31st, 1707:" executed on wood, probably by Kirkall, the engraver; a complete collection of the portraits, six hundred in number, executed in lithography by Charles Bagniet, consisting of noblemen, clergymen, military officers, ladies, and various literary and artistic celebrities of the present day, principally English, the whole bound in twelve volumes.

Chief among the purchases may be named:—

Of the Italian School—a set of the three rare *anneaux avec Enlacements*, engraved from designs attributed to Leonardo da Vinci; King David kneeling, with a deer beside him, by Benedetto Fontagna; also an undescribed woodcut of *St. John and the Lamb*, by the same master; a triumphal arch, with bas-relief representing Romulus and Remus suckled by a wolf, by an early anonymous engraver; two extremely rare prints by Marcantonio—namely, *Christ Giving the Benediction* and *Angelica and Medoro*.

Of the German School is Wenzel Hollar's Great View of Cologne, engraved on four plates and printed on eight sheets. It shows the whole extent of Cologne and Deutz, with their fortifications. Only two other copies of this impression are known to exist, one at Vienna, the other at Cologne.

Of the French School we have—a *Group of Fowls*, by Jean Baptiste Huet, in crayons; *A Man Threshing Corn*, by Jean Francois Millet, in black chalk, on grey paper; a complete set of the works of Balthazar Jean Baron; a large collection of the works of Jean Louis Demarne; *Le Stryge*, by Charles Méryon; Portrait of Gabriel de Presigny, Archbishop of Besançon, by Jean Dominique Ingres; a large collection of plates executed by Frederick Hillemaacher, including a set of 168 vignette illustrations to the *Théâtre de Molière*, proofs on a Japanese paper; a set of 169 small plates by J. Chauvet, illustrating the works of Horace.

Finally, of the English School, we have—view of a waterfall, a fine example in tempera, by W. Nesfield; a sketch-book which belonged to William Hunt, containing pencil drawings by him, chiefly portraits of members of the Sol Club; Queen Charlotte's Flower Garden, Buckingham House, by John Paul Fischer, in water-colours; a fine collection of prints after Richard Cosway, R.A.; Head of a Negro with an iron collar round his neck, engraved in mezzotint by Sir Christopher Wren; there is only one other perfect impression from the plate known to exist. *Modern Italy*, after J. M. W. Turner, R.A., by William Miller, an unfinished proof, touched by Turner himself, and having his autograph directions to the engraver in the margin; a choice engraver's proof of the *Rent Day*, after David Wilkie, R.A., by Abraham Raimbach; a curious collection of prints after John Henry Ramberg, R.A., together with a large number of drawings and etchings executed by himself.

THE BUSHMAN ROCK-PAINTINGS.

THE following extracts are from a letter written by Mr. Stow, of the South African Geological Survey, to Miss Lloyd, on the subject of the Bushman rock-paintings and etchings, of which he has formed a large collection. A portion of the collection was lent in 1875 to the late Dr. Bleek, and has already been of great assistance in the Bushman researches. The interest which attaches to these paintings need hardly be pointed out, since the Bushmen are among the most primitive and degraded of mankind, and their language, with its clicks and reduplicated plurals, seems a survival of one of the earliest forms of speech. As the Bushmen have been driven south, it is possible that they, and not the Eskimaux, may have been related to the prehistoric cave-dwellers of the neolithic age who have left so many specimens of high artistic skill in France, Belgium, Switzerland, and (as we now know) in England. Mr. Stow's letter is dated Rouxville District, Orange Free State, June 4, 1877, and was written by him in the course of a geological survey upon which he was engaged on behalf of the Free State Government. After expressing the hope that his recent labours might "bear good fruit, not only geologically but ethnologically," Mr. Stow continues as follows:—

"Before proceeding, I will tell you the arrangements I am trying to carry out, that I may secure as

many additions as I possibly can whilst engaged in my survey, without trenching upon the time that has to be spent in other objects. I have an active young Bushman whose special work it is (whilst I am engaged on any mountain side, &c., making geological sections) to hunt for any Bushman paintings that may be found in that particular neighbourhood and mark them down, so that when my work proper of the day is done, he can guide me to the several spots without loss of time, and in half-an-hour the copies are secured, and I can return to my encampment rejoicing at the additional spoils I have rescued from destruction. He takes great interest in the work, and has been very successful, and I have had some stiff rugged climbs in consequence. I have also spoken to Mr. Hamilton Hope—the magistrate in Morosi's territory, and an old friend—to secure the services of two of the old Bushmen still living there, to travel with me for the same purpose, as well as to give an opportunity of learning any amount of Bushman history they may be in possession of, or of other traditions that may be of interest in illustrating the work.

"As I had heard so much of the splendid caves of the Kraai River, the Wittebergen, New England, &c., I took a month for myself before commencing my duties in the Free State, hoping thus to fill a portfolio with fresh captures. There were a number of caves of magnificent proportions, some nearly sixty feet from the floor to the domed and arching rocks overhead—caves that were palace-caves from their positive grandeur: one, flat-roofed, stretching inwards some sixty to seventy yards, solemn and dismal, like some great mystic rock-temple.

"In some of these, many parts of the walls had been covered with hundreds, aye thousands, of groups and figures; many must have originally displayed extraordinary talent. From ten to twenty years ago they might have been preserved in all their primitive excellence; but alas! the heart of any earnest student of nature must sink down to zero, to behold the wanton, ruthless destruction, that had taken place; almost standing aghast as the hopeless conclusion of 'Too late!' forces itself upon him. Smudged colours, and a few lines here and there of considerable beauty and excellence, are all that are left to tell the tale of how effectually the huddled sheep and cattle have done the work—or where the paintings have been positively scrubbed out in sheer wantonness by some miserable lump of humanity in all probability calling itself civilised!

"Thus, instead of securing as large a number as I had hoped, I only obtained some five cartoons (double size); but, small in number as they are, they will form no insignificant addition to the previous collection, as in one or two the artist has attempted to represent objects and actions I have not seen attempted before: for instance, a bird of prey swooping upon a dead or dying eland, &c.

"The same destruction has been carried on in the Free State, in every sheltered cave where a few sheep or goats could be forced. But this must have been a kind of Bushman's paradise; and a number of paintings are partially preserved in the more inaccessible positions. With the help of my Bushman painting-hunter, I have already secured some thirty extra cartoons, and before I left the Fields, I obtained about eight others of chipped emblems and other figures; thus altogether nearly doubling the collection in your charge. You will doubtless be pleased to hear of even this progress; but I trust ere long to add very considerably to the present number, as I hear of numerous caves, &c., among the mountains that I shall have to visit, if all be well, during the course of my geological survey, and I can get my Bushman-pointers well on the trail.

"I make my young Bushman paint the sheets of paper the proper stone-colour, ready for the copies. This he manages very well. He has arrived at that stage that he has begged of me to furnish him with a lead-pencil, that he may learn to copy some himself! It would be an advance if, instead of copies, some of my collection became original Bushman-paintings!

"One thing is certain, if I am spared—I shall use every effort to secure all the paintings in the State that I possibly can, that some record may be kept (imperfect as it must necessarily be, in spite of one's best exertions) of the wonderful artistic talents of one of the most primitive and most interesting races on the face of the earth. For upwards of ten years I have striven

(with regard to the Bushman artists) to place myself in a position to fulfil the same kind of mission as 'Old Mortality' in another sphere, and have never lost an opportunity during that time of rescuing from total obliteration the memory of their wonderful artistic labours; at the same time buoying myself up with the hope that by so doing a foundation might be laid to a work that might ultimately prove to be of considerable importance and value to the student of the earlier races of mankind." . . .

REPORT OF THE SUB-COMMITTEE OF CONVOCATION OF THE UNIVERSITY OF LONDON.

At the annual meeting of Convocation of the University of London, which took place last week, the most important event in the eyes of the general public was the acceptance of the supplemental charter, empowering the university to admit women to degrees in all faculties. On the same occasion a series of resolutions was passed, at the recommendation of a sub-committee, which marks an epoch of no less importance in the history of the university. Dr. Pye-Smith was the chairman of the sub-committee appointed some time ago "to consider by what measures the connexion of the affiliated colleges with the university may be strengthened, and generally how the objects of the university in the promotion of sound learning and liberal education may be more efficiently attained." The Report has been printed in the form of a small pamphlet, the general spirit of which throws much light upon the formal resolutions which have now been adopted by Convocation and submitted for the final approval of the Senate.

The recommendations of the sub-committee arrange themselves in two classes: (1) a scheme for establishing more intimate relations between the university as an examining body and the teaching staffs of the several affiliated colleges; (2) the development of the university itself as a centre of advanced study and original research. These two objects, though to some extent independent of each other, are treated throughout as aspects of the same change in the character, and perhaps also in the constitution, of the university, by which its corporate life may be stimulated and its members may be induced to take a more active interest in its well-being. The key-note is sounded in the opening pages of the Report, which contain a reasoned protest against the common definition of London University as "a Government examining board." Such a definition, we are told, has never been acquiesced in by most of those members of Convocation who take a prominent part in university affairs. At the same time, it is admitted that the theory which regards examinations as the supreme goal of academical life has been fundamentally modified since the university was incorporated forty years ago. It has now come to be generally recognised that the main end for which every university exists is to promote education, in the highest sense of the term and in its most advanced form; that examinations, however efficient, are merely one of the means by which study is tested, and not an end in themselves; and that the process of examination loses half its value when detached from the curriculum of instruction. The tendency, therefore, of the first class of the recommendations of the sub-committee is to establish a permanent channel of intercourse, suggested rather than defined, between two bodies now isolated—the Senate which controls the examinations, and the colleges which prepare the majority of the candidates. By this means, it is hoped, the present system of affiliation will become a reality, and the colleges, by receiving some degree of recognition, will ultimately group themselves round the central body, not as nurseries of supply, but as members of a common organisation.

The second class of recommendations carry one stage further the conception of the university as a corporate body, with duties to be discharged towards the higher education, not comprised in the

sole function of examining. They are embodied in the two following resolutions, of which one at least was not passed at the meeting of Convocation without some opposition:—

"That it is desirable that the university should take advantage of such opportunities as may present themselves of promoting, by the institution of university chairs or otherwise, the cultivation of such higher or less usual branches of study as can be more conveniently or more efficiently taught by a central body.

"That it is desirable for the Senate to consider the importance of recognising independent research in the examinations for the higher degrees in such way as the Senate may approve."

The latter of these two resolutions needs only to be stated to be approved. It is obvious that the former is open to several ready criticisms. At present London University has neither the organisation nor the funds to establish professorial chairs or laboratories for research; and it may be argued that to accept either State aid or private endowments for such purposes would be a wide departure from the principles of its original foundation. Objections of this kind were, of course, deliberately considered and over-ruled before Convocation adopted the resolution as its own. For London University the change is little short of a revolution: to Oxford and Cambridge it would be merely the restoration of an old type, half forgotten. It is pleasant to find that one at least of our great universities is advancing on the true course of academical reform, unhampered by the dead weight of old-world prejudice and the mischievous influence of vested interests.

CORRESPONDENCE.

AN OLD ENGLISH TREATISE ON LOGIC.

Lincoln College, Oxford: May 11, 1878.

Mr. Garnett, of the British Museum, has kindly drawn my attention to a very curious little work on Logic, bearing the title of *Witcraft*, which, from having been classified by Watts under the head of works on "Witchcraft," has hitherto, I believe, escaped the notice of logicians. As the book may have some interest, not only for the

small number of persons who care for the History of Logic, but also for the much larger class of students of Old English, I venture to trouble you with a brief account of it.

The work, which is in black-letter, was printed at London by Bynneman, Anno 1573. It is dedicated to the Earl of Essex (father of the more celebrated earl). The author is one Ralph Leuer, or Lever, who held a prebend at Durham.

The main object of the book seems to be to substitute English for the Greek and Latin terms of the Scholastic Logic. With respect to the matter, it does not seem to differ substantially from other Nominalist treatises of the time.

The "Forespeache" is written from "Duresme, the 24 of November, 1572." In this the author says:—

"To prove that the arte of Reasoning may be taught in englishe, I reason thus: First, we Englishmen have wits as well as men of other nations have: Whereby we conceive what standeth with reason, and is well done, and what seemeth to be so, and is not. We have also framed unto ourselves a language, whereby we do expresse by voyce or writing, all devises that we conceive in our mynde: and do by this means let men looke into our heartes, and see what wee thinke. Then, as Englishmen men can compasse this Arte by wit: so can they also declare and sette it forth by sprache."

The word "Logic" is throughout replaced by "Witcraft," which is defined as "a cunning to frame and to answer a reason." "A reason standeth of certayn sayings" (that is, sentences), "and a saying of wordes." A "saying" may be either a "shewsaye," a "bidsaye," or a "wishsaye." A "shewsaye" (proposition) "is a perfect saying, standing of a nowne and a shewing verbe."

The subject and predicate of a proposition are called respectively the "foreset" and the "backset."

"The tounring of a shewsay" (that is, conversion) "is the removing of the backset into the rone of the foreset."

"Gaynsaying shewsayes" (that is, opposed propositions) "are two shewsayes, the one a yeasaye, and the other a naysay, chaunging neyther foreset, backset, nor verbe."

Subject, as distinguished from Accident, is an "Inholder," while Accident is an "Inbeer." Category is replaced by "Storehouse" (though Substance, Quantity, and Quality are retained), Singulars by "Selfethings," Species by "Kinreds," Genera by "Kyndes," Definition by "Say what" (Division being retained).

The following account of syllogism and induction is, perhaps, curious enough to be worth transcription.

"There are but two wayes to prove a doubtful matter.

"For either we rise by examples of selfethings and specialls to the knowledge of the generall: or els contrary-wise we fall by the rule of the generall to the knowledge of speciall and selfethings.

"The first may be called a reason by example" [that is, Induction]: "the seconde a reason by rule" [that is, Syllogism].

"A reason by example pertaineth to common sense and experience.

"A reason by rule belongeth to arte.

"A reason by example serveth to prove the principles of arts, by certayne particular examples: A reason by rule proveth particular cases by principles and generall rules.

"So that a reason by example ascendeth to the generall: a reason by rule descendeth to the particular.

"A reason by example allureth the ignorant: a reason by rule forceth the learned.

"The number of shewsayes in a reason by example are uncertaine, sometimes many, and sometimes fewe: but the number of shewsayes in a reason by rule is ever certaine, and so that they are never more nor less but three.

"The two first shewsayes that are placed in a reason by rule are called foresayes" [premisses], "the

third may be termed an endsay" [conclusion]. "The major, minor, and middle terme of a syllogism are called respectively the generall terme, the speciall terme and the proving terme.

"The backset of the endsay is alwayes the general terme.

"And the foreset of the endsay is ever the special terme.

"The proving terme is that terme, which is placed in both the foresayes: and is the meane whereby the other two termes agree, or disagree, among themselves in the endsaye."

It may be noticed that throughout the book an animal is called a "wight."

This is not the oldest English treatise on Logic, nor does it expressly claim to be, though it makes no mention, I believe, of its predecessor, *The Rule of Reason, containing the Arte of Logike*, by Sir Thomas Wilson. The latter work was frequently reprinted. Watts enumerates editions of 1551, 1552, 1553, 1563, 1567, and 1580. It is dedicated to Edward VI., and appears to be designed at least as much to attack the doctrines of the Church of Rome, and defend those of the Reformation, as to promote the study of Logic. Though very curious in its way ("the fruite," as the author says, "being of a strange kind, such as no English ground hath before this tyme and in this sorte by any Tillage brought forth"), this work has not the special interest attaching to Lever's *Witcraft*, inasmuch as there is no attempt to replace the technical terms of the Scholastic Logic by English equivalents. T. FOWLER.

THE CONFERENCE OF LIBRARIANS.

British Museum: May 18, 1878.

If my paper at the Conference of Librarians has amused Mr. Thomas, his comments upon it have amused me: and I hope to be allowed space for a few lines of good-humoured rejoinder.

I can assure Mr. Thomas that I was perfectly serious throughout the whole of my paper; and, moreover, that I flattered myself I had disposed of his principal objection by anticipation. Foreseeing that it might be urged, I had taken care to remark that the principles of arrangement applicable to a collection of books on one particular subject are inapplicable to a library comprising books on all subjects. In the former case the subject in question may be treated exclusively on its own merits; in the latter, respect must also be had to what precedes and follows. This seems to me such obvious common-sense that I am astonished it should be necessary to repeat it. In the Museum, at all events, we have always supposed ourselves to be arranging, not ten libraries, but one library.

Mr. Thomas's criticisms on points of detail convince me that he has given little attention to the subject. He scruples at Mineral Waters being "made a co-ordinate head" with Therapeutics. That is, they are neither excluded from the library nor merged in the general mass of therapeutical literature. Which of these alternatives would Mr. Thomas prefer? and why should he prefer either? He thinks that Photography should have been placed with the Fine Arts. What! treatises on chemicals? and instructions for photographing the moon? He confounds the essential nature of the thing with one of its applications.

Mr. Thomas's further remarks raise a mere question of words:—

"Thou callest nether garments pants, whereas I call them trousers; therefore thou art in hell, and may the Lord pity thee!"

What he calls Science I have called Natural History and Physics. If these terms had not been employed, other censors might just as reasonably have complained that the subjects denoted by them had been omitted. Hegel may very naturally have thought that the term "philosophy" should be restricted to speculative re-

search; but the countrymen of Bacon may be excused for differing from him.

RICHARD GARNETT.

Temple: May 20, 1878.

The ACADEMY has on various occasions noticed so very favourably the paper and proposals for the extension of the Oxford University Library system read by me at the Librarians' meeting in London last October that I am most reluctant even to seem to question anything admitted into its columns. But in your late number, in a review of the *Transactions* of that meeting, Mr. Thomas appears to have somewhat confused familiarity with these proposals with such publicity as they may have acquired since the delivery of the very address which he is reviewing. I hope, therefore, you will allow me to state that the proposals have been published by me but three times—firstly, in February, 1876, in an article in *Macmillan*; secondly, in a letter to the *Times* of March 30 of last year; and, lastly, in the address above referred to.

My letter, of a later date, to the Vice-Chancellor of the University, as Chairman of the Bodleian Curators, was neither printed nor published by me, but by the University, at the order of the Vice-Chancellor, for the information of members of Convocation.

C. H. ROBERTS.

THE BODLEIAN MS. OF CATULLUS.

Oxford: May 18, 1878.

A word in reply to Mr. Nettleship's statement.

1. Mr. Nettleship says that in my Prolegomena (p. xvi.), when distinguishing between two classes of MSS., one of which includes O, I make no special mention of it. For a very good reason. Conciseness led me to select one MS. as the type of each of the two classes. "Alterum (genus) G et eius similia, quae maxima turba est, alterum D et eius similia Riccardiani et nostri codicis a." G is the best type of the former and much the larger class; D, of the latter, which includes only two others.

2. I cannot think that anyone who started with the fact that a MS. is as a rule better in proportion to its antiquity, then read my description of O immediately after G (p. xxxv.), then examined its readings, could be under any doubt as to its importance. My words are these:—

"O. Canonicius 30, nunc in Bibliotheca Bodleiana apud Oxonienses, exsunt saec. xiv. assignatus ab Henrico O. Coxe, viro peritissimo codicum. Membranaceus est, scriptus 74 paginis 31 versuum, nisi quod pagina uicesima octava 26 tantum habet, relicto spatio quinque versuum, ante *Collis o belliconiei*. Vltimae paginae in calce scriptum est *Finito libro referamus gratia Christo*. Plerumque mire consentit cum Sangermanensi, e.g. *Littus ut xi. 3. Verum istius populi* lxvii. 12, in utroque legitur, ubi ceteri codices habent *Littus ubi, Verum isti uel istis*. Habet haec sibi propria. Omittit xxvi. 2, lxiv. 330, 379-382, lxvi. 21 *Languidior tenera cui pendens sicula beta*, lxviii. 16 *Iocundum cum aetas florida uer ageret*, qui duo uersus in ceteris codicibus bis leguntur, prior in loco suo et post lxiv. 386, alter in loco suo et post lxviii. 40, in O semel tantum et in sede quam dixi aliena. Habet uersus 3, 4 carminis xcii. *Quo signo! quia sunt totidem mea. Deprecor illam Assidue, uerum dispeream nisi amo*, qui absunt etiam a G, Lachmanno autem ab Italis ex Gellio in Catullum inducti videntur."

Then, after some details not necessary here:—

"Hunc codicem aut antiquissimum habeo omnium qui nunc supersunt aut uno Germanensi inferiorem."

This description, short as it is, contains in substance the main points of Baehrens' argument: the actual antiquity of the MS., its singular agreement with G, the peculiarities which stamp it as unique. It would hardly be too much to say that Baehrens evolved his theory mainly from its suggestion. That theory I believe to be absolutely impossible, as I try to prove in the Prolegomena

to my forthcoming new edition. But it has this merit: it brings into prominence the two earliest MSS., and not O only, but G. It has also this serious defect: that in the attempt to prove G the parent of all the other MSS., it violates every probability of rational criticism. If to discover the value of a MS. means to ascribe to it an exaggerated importance, then, and only then, can Baehrens be said to have discovered the value of the Oxford MS. Mr. Nettleship might as well say that Baehrens had discovered the value of G, because he exhibited it for the first time in isolated combination with O.

3. Would Mr. Nettleship expect me to mention G or O, or G with O, apart, where they shared a reading with a dozen other MSS.? I should then have aimed a death-blow at my own design: and should not have made so clear as I have to Baehrens that the agreement of readings in the MSS. of Catullus is such as to make even his improbable theory possible. But there are not a few other cases where O and G coincide against the other MSS., and where my edition marks the coincidence by red ink. Again, there are many cases where the readings of O are distinct from those of any other MS., and are given separately. Suppose a student intent on solving the relation of the MSS. to each other, and I think I am not saying more than I am warranted when I deny to Baehrens any extraordinary sagacity in assigning to O the value he has given it.

4. That G was actually copied from the rediscovered original is an inference which has been drawn from the subscription at the end: an inference which I myself accept in my edition of 1867. I do not any longer think this likely, as the lapse of more than half a century between the rediscovery of Catullus' poems and the copying of G in 1375 makes it almost impossible that the scribe could know whether any copies had been made in the interim. It is, of course, even less likely that O, which was probably later, was a direct copy of the original. This *a priori* improbability is much increased by the peculiar differences of the two MSS. For, if on the one hand, they often exhibit a marked and singular agreement, they are, on the other, so different as to make it nearly impossible that they are direct copies of the same original. It would seem that O represents the nearer approach to this original, but with at least one copy intervening: that between G and the original not less than two copies intervened. Only on some such hypothesis can I explain the phenomena presented by the two MSS. In fact, the only part of Baehrens' theory which I can accept is that these two MSS. are a nearer approach to the rediscovered codex than any others; and this, so far as it is true (and the Datanus seems to show that it is liable to many modifications), is no discovery of his, but a direct inference from the fact that they, and they alone, belong to the fourteenth century.

R. ELLIS.

Oxford: May 20, 1878.

My concern at Mr. Ellis's misinterpretation of my words in the *Fortnightly Review* is much diminished when I find how badly he can treat his own statements. He now not only abandons one of the best founded opinions expressed in his Prolegomena of 1867, that G is a direct copy of the lost original (V), but contradicts himself more than once in the two letters which he has addressed to the ACADEMY. Between G and V, he now says, not less than two copies intervened; between O and V only one copy intervened; and O is the nearer approach to the original. Yet in the same letter he speaks of G as the best type of the class which it represents (the class derived from V), and O as probably later than G, and less likely to be a direct copy of V. Last week he said that O has changed the position of Catullian criticism. Baehrens himself has not (in general terms) said more than this: yet Mr. Ellis says this week that Baehrens exaggerates the value of O.

In Baehrens' theory of the relation of G and O to V, I understood Mr. Ellis to distinguish a true and a false element: part of it he accepts, part he rejects. The part which he accepts is "that these two MSS. are a nearer approach to the rediscovered codex than any other." The mistaken statement is that G and O are directly copied from V. This latter theory was last week "improbable": this week it is "absolutely impossible." But both the true and the false parts of Baehrens' theory, Mr. Ellis maintains, are easily deducible from his own Prolegomena and Apparatus of 1867. If this be the case, one would suppose that the Prolegomena and Apparatus cannot lay claim to much distinctness of utterance on the subject of O. The patent fact is, however, as all readers of Baehrens' Catullus know, that Baehrens supports his theory on arguments quite independent of anything which he learned from Mr. Ellis's Prolegomena. I think that I showed conclusively in my last letter that Mr. Ellis in 1867 did not perceive the value of O as he now does, and that his speaking of it as his oldest MS. did not carry with it a recognition of its importance. Mr. Ellis now merely reasserts the argument which I have refuted. I need not go over this ground again. I will only say, with regard to the passages marked with red ink in Mr. Ellis's Apparatus, that they were, according to his own statement, not intended to bring out the readings of G and O, but to indicate those of the lost archetype or archetypes supposed to be the foundation of all MSS. except the Thuanæus. If they occasionally bring out the readings of G and O, this is only by accident. I am much puzzled by Mr. Ellis's statement that it was for the sake of conciseness that he omitted all mention of O on page xvi. Why should he hesitate to add a few words to a preface of sixty pages, if he thought that his MS. had changed the position of Catullian criticism?

Baehrens' theory of the relation of G and O to V is clear, intelligible, and to my mind at present convincing. Until I am better instructed, I shall continue to prefer it to a theory which has so far only landed Mr. Ellis in confusion and self-contradiction.

H. NETTLESHIP.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, May 27.—1 P.M. Geographical: Anniversary.
8 P.M. Society of Arts (Cantor Lecture): "Some Researches on Putrefactive Changes," by Dr. B. W. Richardson.
TUESDAY, May 28.—8 P.M. Royal Institution: "On some Points in Vegetable Morphology," by W. T. Thiselton Dyer.
8 P.M. Civil Engineers: Discussion on "Long-Span Railway Bridges."
8 P.M. Anthropological Institute.
WEDNESDAY, May 29.—8 P.M. Society of Arts.
THURSDAY, May 30.—3 P.M. Royal Institution: "On Molecular Physics: Gases," by Prof. Guthrie.
FRIDAY, May 31.—8 P.M. Victoria Institute: Annual Address, by the Rev. Dr. Rigg.
9 P.M. Royal Institution: "The Native Races of the Pacific Ocean," by Prof. Flower.
SATURDAY, June 1.—3 P.M. Royal Institution: "On Richard Steele," by Prof. H. Morley.

SCIENCE.

History of Materialism, and Criticism of its present Importance. By Frederick Albert Lange. Authorised Translation. By Ernest Chester Thomas, late Scholar of Trinity College, Oxford. In Three Volumes. Vol. I. (London: Trübner & Co., 1877.)

Die Forschung nach der Materie. Von Johannes Huber. (München: Ackermann, 1877.)

A TRANSLATION of Lange's well-known *History of Materialism* is so valuable an addition to English literature that criticism suspends itself a moment to offer a hearty welcome to the newcomer. A book more fitted to inaugurate the "Philosophical Library" it would have been difficult to find. The

historical spirit, the general impartiality, the sober criticism which distinguish Lange's work promise well for the future volumes of the series. The many readers interested in science and philosophy to whom German still remains an unknown tongue will find in Mr. Thomas's translation a convenient substitute for the original. More than this, however, cannot be said. The directness and simplicity of Lange's sentences are frequently obscured in the English version. We meet too often with such a sentence as:—"Aristotle thinks that not this, but through choice and reflection the soul moves man." Nor is the work free from actual errors. Thus on page 133 we read:—"Anyone who imagines that anything can arise out of nothing can find his prejudice *refuted* every instant," where the original bears *bestätigt*, a word meaning quite the opposite of the sense which Mr. Thomas gives it. To say, again, that "religious traditions are easily *polluted* with the material sentiments of the masses" (p. 47) goes much beyond the meaning of *verflechten*; and "confident insistence" can hardly be regarded as the equivalent of *dreiste Uebertreibung*. It must seem ungrateful to call attention to these misrenderings in a work which will confer a great benefit on many students. Happily, the present volume seems to bear traces of improvement in its later as contrasted with its earlier portions. There appears, therefore, good reason to hope that the second and third volumes of Mr. Thomas's translation will be free from several of the inaccuracies which we have noticed in the first instalment. To the translation Mr. Thomas has prefixed a short Life of Lange, in the course of which we learn that "at Oxford, philosophy begins with Plato and ends with Aristotle."

The real value of Lange's work is contained in the second title which the author gave his labours. It is not so much the "history of Materialism" as the "criticism of its present significance" (*Bedeutung*) which occupies the writer. To Lange the interest of the systems of Democritus and Epicurus centres in the fact that the difficulties of present materialistic systems are already to be found within the fragments of their doctrines. "Atomism," he maintains, "is still to-day what it was in the time of Democritus." So strongly, in fact, did this critical interest predominate in Lange over the historical that when he reached the second volume of his work he discussed the different aspects of materialistic progress without regard to mere chronology. Throughout, however, this criticism remains historical in spirit. "History and criticism," the writer has himself remarked, "are oftentimes the same;" and his work may be regarded as a standing protest against that unhistorical attitude from which, as we are reminded, few materialists, with the brilliant exception of Gas-sendi, have been altogether free. The student of early Greek philosophy might, indeed, object that Democritus was credited with a more developed system than could be expected at that early age; and the Aristotelian scholar might maintain that his master was treated, not as a thinker of the fourth century B.C., but as a mediæval schoolman occupied with the controversies of Nomi-

nalists and Realists. But such anachronisms do not interfere with the value of Lange's general criticism, however much they may render him unfair to individual thinkers. Unbiased judgment, sound common-sense, and laudable sobriety in argument display themselves throughout the work; and so far as these characteristics predominate in Lange's History, so far it goes a long way towards answering the question: What is the place of Materialism in human knowledge? What is its real meaning and significance as a form of philosophical explanation?

Materialism is one of those words with which the world has grown so familiar that it seldom pauses to consider what the term really means. "The expression," if we may universalise a remark which Lange makes with reference to Büchner, "stands sometimes in its correct historical meaning; sometimes it is equivalent to 'realism,' at another time to 'empiricism;' there are even instances in which this the most positive of all philosophical conceptions is used as a simple negative, and almost corresponds to 'scepticism.'" It is undoubtedly one of the defects of Lange's History that the author has done little to correct this vagueness in the connotation of the term. Materialism, we seem frequently to gather, is the opposite of superstition. But few require to be reminded that there is no necessary incompatibility between the two. Nor is Materialism necessarily opposed to the recognition of established forms of religion, though Lange pauses to remark, in reference to Boyle and Newton, "that peculiar combination of a thoroughly materialistic philosophy with a great respect for the dogmas and customs of religious tradition," and reminds us that Strauss's *Leben Jesu* appeared contemporaneously with the first railway made in Germany.

Amid this indefiniteness in the meaning of the term, there are, however, two characteristics which stand prominently forward in the different forms Materialism has assumed in history. On the one hand there is the mechanical interpretation of nature, the tendency to confine causation to immediate sequence, and deny the action of guiding ideas or final causes in the universe; on the other hand stands the reduction of phenomena to certain ultimate constituent particles—the doctrine that the world is composed of atoms and empty space. Mechanism and Atomism constitute in fact respectively the form and content of Materialism. The first of these aspects of materialistic systems is often emphasised in Lange's work. The "abolition of all teleology" is noted as the only one of "the great principles underlying the Materialism of our time" which is wanting in Democritus. "The unpromising denial of the idea of design" is, we are told elsewhere, "the peculiar keystone of the whole edifice of materialistic philosophy." This conception of the absence of teleology from materialistic science is one widely spread at present. Hæckel has given special currency to the belief by the distinction he has drawn between a mechanical or monistic and a teleological or dualistic explanation of phenomena. But it may be doubted whether every monistic

system, rightly so called, must not be also essentially teleological—whether, that is to say, a system can really present things in unity unless it recognise the action of a regulative and unifying idea. Darwinism, at least, implies throughout a teleological conception of the processes of nature. Nor is it sufficient to distinguish with Lange between a false and true teleology, of which the one "is not only compatible with Darwinism, but almost identical with it." The essential point is that here, within the very camp of the "Materialists," the world is found to be interpreted, not through a mere accidental sequence of phenomena, but through the recognition of an inner meaning, an ultimate end, which the processes of nature are unconsciously realising. And the fact seems to show that, just as the facts of human history are only rightly understood when they are viewed as gradually leading up to the development of certain ideas, and thus contributing to social progress, so, in like manner, the truths of natural "history" are only read aright when we discover that the apparently arbitrary phenomena of nature are working out some rational design. The history of Materialism is at least full of instances which show that the belief in the order and purpose of the world is possessed of that regulative heuristic function Kant assigned it. Lange himself notes that "scarcely a single one of the great discoveries in antiquity" belongs to the materialistic schools; and few require to be reminded that the chief opponents of final causes in modern Europe have done little or nothing for the development of science. It is difficult, in the face of this, to understand why Lange ventures to assert that the "radical extermination" of teleology "is the indispensable condition of all scientific progress." He seems nearer to the truth when he maintains that "the ideal element with the conquerors of the sciences stands in the closest connexion with their inventions and discoveries."

If the insufficiency of the materialistic method be exhibited only indirectly in Prof. Lange's work, the defectiveness of Materialism in relation to its contents is repeatedly and clearly pointed out. "Atomism," remarks the author at the very outset of his History, "is as little able to-day as in the time of Democritus to explain even the simplest sensation of sound, light, heat, taste, &c." The chief interest, in fact, of the history of Materialism lies in the attempts it makes to fill up this gap within its system. Of course, with Lotze, we may deny the difficulty. We may maintain that the problem of explaining *how* the movement of matter can become sensation is not really different from that of explaining *how* the movement of one wheel is communicated to another. But Materialism has generally thought itself bound to go further. Sometimes the knot has been simply cut. Hobbes directly identified a certain form of movement with the processes of thought. Robinet, making that "radical change" in the notion of matter which Prof. Tyndall still desiderates, attempted to bridge the gulf by regarding sensation as a property of the smallest particles of matter. But the difficulty, as Du Bois-Reymond first clearly

which, really resolves itself into a question of the limits of cognition; in other words, we are thrown back upon the results of Kant's *Critique*. It is by reference to Kant that Lange judges of the validity of materialistic systems. Into the meaning and permanent importance of the *Critique of Reason* Lange shows considerable insight. But he does not see, as Professor Caird has seen, at the *Critique* is an essentially regressive work, of which the earlier portions have to be interpreted by the fuller vision of the later sections. Lange has no eye for the "ideas" of the *Dialectic* or the necessities of practical reason. And, although he sees at Kant demolished the ordinary empirical count of ideas which themselves render experience possible, he finds the main issue Kant's teaching in a Phenomenalism scarcely different from that of Protagoras.

This neo-Kantianism, as Von Hartmann has named it, is no doubt sufficient to demonstrate the futility of pure Materialism. It is impossible, it would seem to follow, to derive sensation from movement, because sensation is itself, as knowing, the prior of the two. Matter and force can be at best merely convenient abbreviations. Materialists, in fact, Lange himself says, "are essentially sceptics; they have ceased to believe that matter, as it appears to our senses, contains the last solution of every stigma of nature; but their procedure assumes fundamentally that it does, and they wait till the positive sciences themselves force them to adopt other hypotheses." To Lange, therefore, the significance of Materialism must be very inconceivable. Its truth, he says, lies in its exclusion of the miraculous and arbitrary from nature; its error lies in "raising matter into the principle of all existence." There is surely room to doubt how far this answer exhausts the problem. All philosophy is an attempt to explain the wonderful; and thus far Materialism has no immediate advantage over an ideal system. On the other hand, its error be an unconditional trust in matter, it would seem to follow that Materialism on its most distinctive side is altogether false. Lange, of course, would reply that Idealism can claim little validity for its conceptions; and he entertains us with much interesting talk about the subjective worth and objective validity of the ideal constructions of the imagination and the poetry of metaphysics. But the question does not stop here. Lange is done good service in opening the eyes of any materialists among us to the limited nature of their explanations, and he notes with satisfaction, in the Preface which he wrote before his death, the agreement between his views and those which Tyndall and Mill had just announced respecting the ideal element in life. But logic requires his remission to be carried out to their legitimate conclusion. If matter, we ask, be the creation of our mind, must not the explanation of existence be sought in the creator rather than in its product?

Prof. Huber's brochure helps us to an answer to this question. Within the compass of one hundred pages it subjects Materialism to a most patient and impartial scrutiny, which lands us in more definite

results than those of Lange's subjective Idealism. It is, in fact, the most vigorous and suggestive treatment of a rather hackneyed subject that we have seen for some time. Huber sees, as Lange does, that matter is a mere phenomenon of our consciousness; and he points out that the very qualities thought to be characteristic of matter cannot without an implicit contradiction be assigned to atoms. But his examination does not stop half-way. Materialism, he holds, will, if systematically pursued, find that, instead of constructing mind out of matter, it must beforehand establish the reality of matter upon mind. The very atoms, he adds, must, according to the conception of chemical affinity, be conceived as mutually supplementing one another, and must thus be regarded as members prepared beforehand by some original unity to serve as parts within a system. This unity, he seeks to show, can be nothing but the equivalent of that thought which in us at once combines and separates, and yet throughout all changes remains itself. Thus, he concludes:—

"Our thought, to which in the course of its investigations the universe displayed itself originally as the mechanism of dead atoms, next as the action and reaction of internally-connected elements, and then as the organism of animated members or monads, finally, at the close of its journey, finds thought once more the principle of mechanism, chemism, and animate organism. But it is a thought which, as *primaeva*, is not, like human thought, conditioned: it does not, Epimetheus-like, merely think after or reflect upon something already given and systematised: it is a thought which, as absolutely determining itself, must be grasped as creative, Prometheus-like, and therefore as exercising thought prior to its objects (*vordenkend*). While shell after shell falls away from the inmost kernel of the universe, the phantom of matter presents itself as only the veil of Isis, behind which the absolute mind stands displayed as the all-conditioning and all-present." This conception of absolute thought will appear to many a "hard saying." It would seem to be, none the less, the necessary verdict of epistemology upon Materialism.

EDWIN WALLACE.

PROFESSOR HENRY.

PROF. JOSEPH HENRY, who has recently died at the ripe age of eighty-one, furnishes one of those examples, not unfrequent in a free country, of a man rising by his own efforts from a comparatively obscure position to one of eminence, at least among his fellow-citizens. Not that he was unknown to science in Europe, for his name was seen from time to time in company with those who were discussing the scientific topics of the day; but, in common with many other members of the great army of science, he was a useful subaltern, well fitted to obey orders, but not capable of originating the plan of a campaign.

He was born at Albany, in the State of New York, on December 17, 1797. He received the usual rudimentary education of boys of his station, served his time to a watchmaker, and afterwards established himself in that business in his native city. It is highly creditable to him that his spare time was devoted to the study of physical science on a mathematical basis, and with such success that before he was thirty he was already Professor of Mathematics in the Albany Academy. About 1827 he began a series of experiments on electricity which occupied him during many years, and furnished materials for numerous papers in the American scientific journals and in the *London Philoso-*

phical Magazine, and also for a quarto volume entitled *Contributions to Electricity and Magnetism*. Some of his countrymen claim for him discoveries which are usually assigned to European philosophers; but no one, we think, can admit the justice of such a claim, any more than the character of an original mind for Prof. Henry in that most difficult of all intellectual employments—original research, where a man, though travelling in the dark, must have the sagacity to know the true path and to keep in it without going astray or stumbling. When one of those master-minds has done this, and by his superior sagacity has thrown light upon an unknown and hitherto unsuspected path into the wide domain of nature, it is no disrespect to say that men of inferior capacity may easily enter thereon, and assist the original discoverer in matters of detail. This is precisely what Prof. Henry did. For example, when Faraday made his splendid discovery of secondary currents, which formed an entirely new branch of electrical science, Henry showed that by a similar method of induction tertiary currents, and currents even up to the seventh order, could be produced by means of coils formed of ribbons of sheet copper. This result, and similar results in various branches of physical science, are meritorious, but do not display any great originality of mind, or raise their author above the respectable and useful workers who may be reckoned by hundreds, while the Franklins and the Faradays can only be estimated as single units.

Henry was Professor of Natural Philosophy in the College of Princeton, New Jersey; and in 1846 became Secretary, and afterwards Director, of the Smithsonian Institution at Washington, a post which his great scientific knowledge and administrative skill enabled him to fill with credit to himself and profit to the Institution.

Prof. Henry was as agreeable as a companion as he was useful and valuable as a public servant. During one of his visits to England we had the honour of spending an evening in his company, when he gave a minute account of the various improvements he had introduced into the light-houses of the United States' coasts, the result of which was an improved light with a considerable saving in the cost.

C. TOMLINSON.

SCIENCE NOTES.

PHILOLOGY.

ALL those who are interested in the study of Comparative Syntax will find an excellent synopsis of what has been doing lately in that important and much-neglected branch of Comparative Grammar in an excellent article in the *Zeitschrift für österreichische Gymnasien* (No. 2, 1878), by W. Scherer, the well-known German philologist. It contains a marvellously complete enumeration of all recent labours on the subject, and detailed and judicious criticisms on some of the most important of those which concern the syntax of the Germanic languages in particular.

PROF. MIKLOSICH has just published in the *Transactions of the Vienna Academy* two treatises, which may be considered as a sort of supplement to the Phonology in his great work, the *Comparative Grammar of the Slavonic Languages*. Both of these labours have a bearing, beyond their immediate object, on the Comparative Grammar of the Indo-European languages generally, especially the second paper, on "Steigerung und Dehnung der Vocale" in the Slavonic languages.

UNCOMMON activity has been displayed within the last twelve months in the promising field of Zend Philology. The following is a list of the more important writings on the subject, in which smaller articles in French and German periodicals are not included. M. Darmesteter has given to the world his excellent work on *Ormuzd et Ahriman*, of which we shall publish a detailed notice hereafter. Prof. Spiegel has published the third volume of his *Iranische Alterthumskunde*.

Geldner's *Ueber die Metrik des jüngeren Avesta* treats of the metres used in the more recent parts of the Zendavesta, and the help which they afford in restoring the original reading of the passages where the text has been corrupted. M. Ch. de Harlez, in his *Etudes Avestiques*, has discussed some of the main controversial points in Zend Philology. W. Geiger has published an instalment of a German translation, with notes, of the Pehlevi version of the Vendidad, and C. Bartholomae an instalment of a work on the Verb in the Zend Language, which is to form a counterpart of Delbrück's work on the Verb in the Veda. We may also mention here, as relating to Iranian Antiquities, Dr. Keiper's book on the *Persae* of Aeschylus, viewed as a source for Ancient Persian History. Several other works which promise to be important are in preparation. Thus M. Darmesteter is engaged on an English translation of the whole Zendavesta for Prof. Max Müller's series, and M. Ch. de Harlez is about to publish the third and last volume of his French translation of that book. Dr. West will translate for Prof. Max Müller's series several of the most important Pehlevi works. Prof. Hübschmann has announced, for the collection of *Indogermanische Grammatiken*, a Grammar of the Iranian Languages.

THE hundredth anniversary of the Batavian Society of Arts and Sciences, the oldest Oriental Society, which was celebrated on April 24, 1878, has given Dr. Burnell an opportunity of publishing a new text or recension of the *Arshaya-brāhmaṇa* belonging to the *Sāmaveda*. This new text is ascribed to the *Gaiminiya-sākhā*, whereas the original text, published in 1876, was that of the *Kauthuma-sākhā*. The differences between these *sākhās* or schools are not very considerable, but on that very account they are of the greatest interest, as showing us what trifles were considered important by the ancient founders of these schools. Dr. Burnell considers the text of the *Gaiminiya* school more simple, and therefore perhaps more ancient, than that of the *Kauthuma* school, yet he is inclined to place the origin of their differences so late as to ascribe them to the carelessness of scribes. He suggests that the *Talavakāra sākhā*, which claims to have handed down our text of the *Kenopanishad*, may be the same as the *Gaiminiya-sākhā*; anyhow it would seem to have been a school closely connected with that of the *Gaiminiyas*. Its name, *Talava-kāra*, might through *ṭadava* and *tandava* be connected with *Tāndava*, an old *Sāmavedic* title, unless we prefer the etymology given by *Dhāranalakshana* (Introduction, p. vii.).

Les Plaidoyers politiques de Démosthène. Par Henri Weil. Première Série. (Paris: Hachette.) M. Weil's edition of the *Plaidoyers politiques* is a valuable contribution to the study of Demosthenes. This first series contains the orations *In Meidiam*, *In Leptinem*, *De falsa legatione*, *De corona*. Each oration is preceded by an introduction, and accompanied by notes critical and exegetical. The introductions and exegetical notes, though brief, are excellent, and always to the point: the critical notes bring the reader abreast of the latest and best that has been done for the text of Demosthenes. M. Weil is far from following some modern scholars in their proposed alterations of the text. In an introduction he discusses a good many of Cobet's alterations, and many "emblemata" have the good fortune to be retained. Nevertheless we sometimes find a new text in the place of what is old and familiar. For instance, in the *De corona* (p. 249), the old text of the MSS. gives *καὶ μὴν τὴν ἐλπίην γ' ἐκείνος ἔλυσεν τὰ πλοῖα λαβὼν, οὐχ ἡ πόλις, Αἰσχίνης*. *Φέρε δ' αὐτὰ τὰ ψηφίσματα . . . φανερόν*. This text M. Weil inverts, placing the sentence *φέρει δ' . . . φανερόν* before *καὶ μὴν . . . Αἰσχίνης*, and reading *καίτοι for καὶ μὴν*. The reason given is that the old arrangement "faisait croire (et l'auteur des faux documents est tombé dans cette erreur) que Démosthène alléguerait de pièces prouvant que

Philippe avait rompu la paix. Mais, par le fait, il s'agit ici de toute autre chose, et la capture des bateaux ne peut être mentionnée qu'incidemment." But Demosthenes has already asked the question whether Philip has not by various actions transgressed the conditions of peace; and in the old text the capture of the boats introduced by *καὶ μὴν* gives an additional and more crucial instance of his wrong-doing—the actual fact which led to a rupture. M. Weil's inversion gives a new and very ingenious turn to the passage; but can we admit such a change without the strongest necessity? The text may have been altered to admit the forged documents, or it may not; and if editors alter the text of authors according to their view of the meaning required, very little will be left unchanged.

Homeri Ilias, Scholia. Vols. iii. and iv. Ed. G. Dindorf. (Clarendon Press.) The third and fourth volumes of the *Scholia* on the *Iliad*, published by the Clarendon Press, contain the *Scholia* of Codex Venetus B. They are brought out with the same care and accuracy as the preceding volumes. Dindorf is the editor; Messrs. Cobet and Monro have done the work of collation. The editor claims to have corrected a good many errors in the edition of Bekker (1825), which arose from the confidence which Bekker placed in the work of Villosion; he has also corrected the *Scholia* as found in Ven. B. by the comparison of five other MSS. (the Townley in the British Museum, a manuscript in the Escorial, the Vossian MS. at Leyden, the Harleian in the British Museum, and the Leipzig manuscript). The chief value of the work will be to enable scholars to ascertain more about the work of Porphyrius on Homer than has been possible hitherto. In Codex Ven. B. the excerpts from the Alexandrian grammarians, which make Ven. A. so valuable, are few and far between; and in their place we have considerable extracts from the *Σημειώματα Ὀμηρικὰ* of Porphyrius, who seems to have gathered up in his work a large number of the questions asked about Homer, and the solutions given. The intrinsic value of his work cannot be placed very high, but it is interesting as giving a picture of Homeric studies down to the fourth century A.D., omitting the severer work of the great scholars, and the *διωρθώσεις* of the text. A good instance of the kind of difficulty raised and the mode of solution will be found at *Il. x., 271*. As to the *Scholia* which are not from Porphyrius, the editor tells us that they contain "plurima ad interpretationem poetarum verba utilia generis grammatici et historici et mythologici." And this is true; but there is also a good deal of another kind, of which the following are examples:—*θεοῖς αὐτῶν καὶ αἰγῶν ἡδεῖται ὁ Ἀπόλλων ὕλη γὰρ τοῖς τόξοις τὰ κέρατα αὐτῶν. — ποδαρκὴς] ἐν τῷ τοῖς ποσὶν ἐπαρκῶν καὶ τοῖς ἀλλοῖς*.

DR. KIELHORN has published a brochure (Trübner) on *Katyāyana and Patanjali; their Relation to each other, and to Pāṇini*, in which he maintains that the lost *Vārttikas* or comments of Katyāyana on Pāṇini's grammar can be recovered from Patanjali's *Mahābhāṣya*. That work, in treating of each of Pāṇini's rules, throws its remarks sometimes into a series of short epigrammatic sentences accompanied with a paraphrase and a running commentary; sometimes into longer periods, the gist of which is not collected into shorter ones. Where these short sentences occur, they afford, even if taken by themselves, a complete argument. The running commentary, on the other hand, often maintains a different view; while there are several peculiarities of style and language making a marked distinction between the paraphrased sentences and the rest of the work. Further, in one passage, Patanjali refers to one of these paraphrased sentences as "the *Vārttika Kāra's*"; and in another passage even informs us that one of them is Katyāyana's. The simple hypothesis that the thus paraphrased sentences are throughout Katyāyana's would afford the only rational explanation of all the facts. But, if so,

the opinion of Prof. Weber and Dr. Burnell that Katyāyana wrote to attack, while Patanjali answered in defence of, Pāṇini, can no longer be maintained; for both the later grammarians are found to be writing sentences sometimes in support of, and sometimes against, the views of the famous predecessor. Finally, it is probable that the whole of Katyāyana's *Vārttikas* are quoted in the *Mahābhāṣya*, and that the latter was chiefly intended as a commentary upon them rather than directly on Pāṇini; though it doubtless also imitated them, not only in commenting upon those rules of Pāṇini not dealt with by them, but also in adding new comments upon some of the rules already considered by Katyāyana. Dr. Kielhorn supports his able and closely-conducted argument by numerous proofs drawn from the *Mahābhāṣya*; and the essay is an important addition to the history of Indian grammar.

MEETINGS OF SOCIETIES.

ZOOLOGICAL SOCIETY.—(Tuesday, May 7.)

F. D. GODMAN, Esq., F.Z.S., in the Chair. The Secretary read a Report on the additions that had been made to the Society's Menagerie during the month of April.—Mr. T. J. Parker read some notes on the stridulating organ of *Palinurus vulgaris*, which had first been described by Dr. K. Möbius.—A communication was read from Dr. F. Buchanan White, entitled "Contributions to a Knowledge of the Hemipterous Fauna of St. Helena, and Speculations on its Origin." In the first part of his paper the author, after briefly noticing what was known with regard to the fauna and flora of that remote and interesting oceanic island, and mentioning the various theories that had been brought forward to account for their origin, discussed the difficulties of the animals, and argued that they had evidently been derived at a remote period from the Palaearctic region by way of Madeira, the Canaries, and the Cape de Verde Archipelago. In the second part of his communication, Dr. F. B. White described the Hemiptera collected in St. Helena by the late Mr. T. V. Wollaston, during the recent visit of that lamented naturalist to the island. The collection included thirty species, of which five were probably introduced; one appeared to be indigenous, but seemed identical with a European species, and the remaining twenty-four were regarded by the author as new and peculiar to the island. Seven new genera and one new sub-genus were created for the reception of ten of the species, the rest, with one exception, being referred to European genera.—Mr. P. L. Sclater read some further remarks on *Fuligula Nationi*, a species of duck from Western Peru, of which he had lately received a nearly adult male from Prof. Nation, the discoverer of the species.—Mr. A. G. Butler read the descriptions of a small collection of Lepidoptera made at Kingston, Jamaica, by Mr. James J. Bowry.—Mr. Edgar A. Smith read a paper containing the description of three new land shells from Jamaica and Borneo.—A communication was read from Mr. D. G. Elliot, containing a memoir on the fruit pigeons of the genus *Ptilopus*. Mr. Elliot recognised seventy-one species of this genus.

ROYAL ASTRONOMICAL SOCIETY.—(Friday, May 10.)

LORD LINDSAY, M.P., President, in the Chair. Before the communications referring to the late Transit of Mercury were read, the Astronomer Royal expressed his opinion that the observations of a bright spot upon the disc of the planet and of rings around it ought to be received with very great caution, as under the circumstances under which the observations were made there was much occasion for reflections from the surfaces of the lenses and from the inner sides of the eye-tubes. He mentioned several cases of very deceptive appearances, which when properly examined were found to be caused by such reflections. Mr. Christie, who on the day of the transit had observed Mercury, during a break of the clouds, with the great Greenwich equatorial, stated that he had seen a minute bright spot near the centre of the planet's disc. It was slightly diffused, but with a brilliant, star-like nucleus. It was only seen when the eye-pieces, of which he used several, were carefully adjusted, and when the definition was good. A bright

alo of somewhat irregular outline was seen round the planet with an inner and much brighter ring about "in breadth. The halo appeared much brighter than the ordinary surface of the sun; but it might have been only an effect of contrast. Capt. Tupman, observing likewise at Greenwich, had, on the contrary, not been able to detect the slightest trace of a permanent white spot within the disc, nor of any ring, luminous or shadowy, surrounding the planet. Mr. Dunkin said that he saw distinctly a very minute point of light near the centre, a little towards the following limb of the planet, and during the few available minutes of superb definition a ring or corona of light around the planet was clearly visible. This corona was evidently fainter than the sun, and appeared with radiating arms as in the solar corona. The halo of light seemed to be of a half-tint, and his impression was that being of subdued light was probably produced only by contrast. Mr. Proctor, observing at Clapham with a silver on glass reflector, saw on the disc of Mercury a white spot of sensible magnitude, and brightest in the middle. It seemed very nearly as bright there as the general surface of the sun. The spot was quite as distinct when the solar image faded in lustre as when brightened. But when the scudding clouds left the face of Mercury uncovered while they darkened the rest of the solar disc, the spot grew perceptibly fainter. He had no doubt whatever that the spot was a merely optical phenomenon. Around Mercury were seemed to be a ring brighter than the sun's surface; but he was inclined to suspect that the apparent completeness of this ring was an optical illusion. Mr. Chambers, Mr. Brett, Capt. Noble, Mr. Penrose, and other Fellows, mentioned what they had seen. Mr. Ranyard stated that, observing at Lord Lindsay's Observatory, Dun Echt, Aberdeen, he saw no spot on the disc, and no ring round it, before external contact he had swept the slit of a spectroscopic slowly across the path of Mercury, but saw no trace of the planet. When Mercury was about two-thirds upon the sun's disc he observed it carefully with the great refractor, the aperture being reduced to ten inches, but no trace of a ring of light round the part of the planet's limb outside the sun's disc, or any indication of the limb, could be detected. Lord Lindsay observed external contact with a large prism in front of the object-glass of a six-inch refractor and a direct-vision prism behind the slit, so as to give a coloured image of the sun's limb according to Secchi's device. The limb of the planet was seen encroaching upon the C line of the chromosphere thirteen seconds before external contact with the photosphere, as observed with the same instrument. Lord Lindsay promised to give a full account of the Dun Echt observations at the next meeting.—Mr. Rutherford, of New York, one of the Foreign Associates of the Society, who was present at the meeting, showed two photographs of parts of the sun's disc taken by him in 1871, which gave evidence of markings and appearances on the sun's surface similar to that furnished by the photographs which have recently been taken by M. Janssen. Mr. Rutherford also exhibited a photograph of the solar spectrum on a very large scale. The spectrum for the several sections of the photograph had been produced by means of a diffraction grating, stated to have more than 17,000 lines to the inch.

PHYSICAL SOCIETY.—(Saturday, May 11.)

PROF. W. G. ADAMS, President, in the Chair. Mr. J. Norman Lockyer, F.R.S., read a paper "On Some Recent Researches in Solar Chemistry."—Sir William Thomson, LL.D., F.R.S., described and exhibited the apparatus he has employed in recent researches on the influence of Stress on Magnetisation, a detailed account of which he has just submitted to the Royal Society; he also, in part, described them at the Royal Institution on the 10th inst., but attention was not then directed to the experimental details now brought before the society. The rod or wire under examination was surrounded by two co-axial wire helices, the outer of which was connected with the battery, and the inner with a ballistic galvanometer—that is, one that acts with regard to electric impulses just as Robins' ballistic pendulum. It was some years ago discovered by Villari that a longitudinal pull augments the temporary induced magnetism of soft iron bars or wires when the magnetising force is less than a certain critical value, and diminishes it when the magnetising force exceeds that value; in either case the residual magnetism is augmented when the force is applied,

and diminished when it is removed. Sir W. Thomson has found the critical value for soft iron to be about twenty-four times the vertical component of the earth's magnetic force, or 10 C. G. S. units. In the case of some bars of nickel and cobalt specially prepared for him by Mr. Wharton, of Philadelphia, he finds opposite effects, so that beyond the critical value pull *increases* the magnetisation. The next branch of the enquiry had reference to transverse stress obtained by water-pressure within a gun-barrel, and it was ascertained to have an opposite effect to that found by Villari in the case of longitudinal pull. The critical point in soft iron for transverse pull is at about 25 C. G. S. units. Sir W. Thomson has been examining the effect of torsion on a wire that is at the same time exposed to longitudinal pull, confining himself in his first set of experiments to magnetisation under the sole influence of the vertical component of terrestrial magnetism. His results showed, with every amount of longitudinal pull, a diminution of magnetisation produced by torsion in either direction, thus extending a conclusion arrived at by Matteucci, Wertheim and Wiedemann regarding the effect of torsion unaccompanied by longitudinal stress. But it now appears that this effect of torsion is very remarkably diminished by a large pulling force nearly reaching the limits of elasticity. In conclusion, Sir W. Thomson called attention to a very different and extremely interesting effect of torsion discovered by Wiedemann—the development of longitudinal magnetisation in an iron wire by twisting it while a current of electricity is flowing along it. This is a subject of great interest, and requires further investigation.

ROYAL SOCIETY.—(Thursday, May 16.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"Experimental Researches on the Electric Discharge with the Chloride of Silver Battery. Part II. The Discharge in Exhausted Tubes," by Warren De La Rue and Hugo Müller; "Note on Legendre's Coefficients," by I. Todhunter; "On the Spectrum of Metalloids, Spectrum of Oxygen," by Dr. Schuster; "On the Variations of the Diurnal Range of Magnetic Declination, as recorded at the Prague Observatory," by Prof. Balfour Stewart.

SOCIETY OF ANTIQUARIES.—(Thursday, May 16.)

LORD CARNARVON, President, in the Chair. The Rev. F. E. Warren, Vice-President of St. John's College, Oxford, exhibited an Irish missal belonging to Corpus Christi College, concerning which there has already been some correspondence in the ACADEMY. Three other Irish missals only are known, those at Drummond Castle, and in the Advocates' Library, Edinburgh, and one in the possession of Lord Ashburnham. For palaeographic and other reasons, this MS. is ascribed to the twelfth century, and the king of the Irish who is mentioned therein is supposed to be Tordelbach O'Connor, king of Connaught, who died in 1156.—Mr. Franks exhibited some rubbings of brasses from Gloucestershire, which he has presented to the society. The county possesses in all 107 brasses, of which Mr. Franks has rubbings of 104. Six only are of the fourteenth century. The earliest is that of Blanche Bradstone, at Winterbourne, wearing a wimple and plain straight gown. The brass of Thomas, fourth Lord Berkeley, in the church of Wootton under Edge, was made in 1392, the year of his wife's death, although he did not die till 1417. His figure has a collar of mermaids. There is also a brass of a civilian in the Temple Church, Bristol, of the same century. The figure of Sir John Cassy, at Deerhurst, represents him, as Baron of the Exchequer, attired in coat and mantle, lined with fur. At his lady's feet lies a dog, whose name, "Terri," is engraved at his side. Another specimen of official costume is afforded by the brass of Sir John Juyn, Recorder of Bristol, and Chief Justice of the King's Bench, in the Church of St. Mary Redcliffe. Among the military effigies is one from Newland of a bearded man whose head rests on a helmet of which the visor is open; over his head is his coat of arms, having for a crest a miner with pick-axe in hand, a bag on his back, and a candle in his mouth. At Fairford there is a brass of John Tame and his wife, who, it is said, founded the church to receive the celebrated windows, which were taken on board a foreign ship. The county possesses several specimens of ecclesiastical brasses,

of which the earliest are a palimpsest brass of a priest at the Temple Church, Bristol, having on the other side a lady; and that of Robert Lord, chaplain, holding a chalice and host, at St. Peter's, in the same town. The dates of these are 1460 and 1461. At North Leech and Lechlade there are brasses of woolmerchants, the principal trade of the county in the Middle Ages.—Mr. C. E. Davies exhibited a curious mask, found at Bath in a broken Roman drain. It is composed of tin, and stones or other substance had been inserted for the eyes, but the sockets are now empty. Its position in the Roman drain was doubtless accidental, and it probably came from a nursery which formerly existed on the spot where it was found.

METEOROLOGICAL SOCIETY.—(Wednesday, May 17.)

C. GREAVES, Esq., F.G.S., in the Chair. The following papers were read:—"On the Daily Inequality of the Barometer," by W. W. Rundell; "Meteorology of Mozufferpore, Tirhoot, for the Year 1877," by C. N. Pearson; "Note on the great Rainfall of April 10-11, as recorded at the Royal Observatory, Greenwich," by William Ellis; "Observations of Sea Temperature at Slight Depths," by Captain W. F. Caborne.

ROYAL ASIATIC SOCIETY.—(Anniversary Meeting, Monday, May 20.)

SIR EDWARD COLEBROOKE, Bart., M.P., President, in the Chair. The following members were elected as the officers and council for 1878-9:—President and Director: Major-General Sir H. C. Rawlinson, K.C.B., F.R.S.; Vice-Presidents: Sir Edward Colebrooke, Bart., M.P., James Fergusson, Esq., F.R.S., Brian H. Hodgson, Esq., F.R.S., and Colonel Yule, C.B.; Council: Sir E. Clive Bayley, K.C.S.I., E. L. Brandreth, Esq., Oliver Codrington, Esq., M.D., the Rev. John Davies, M.A., M. P. Edgeworth, Esq., Sir Barrow Ellis, K.C.S.I., Sir Douglas Forsyth, K.C.S.I., J. F. Fleet, Esq., Major-General Sir Frederic J. Goldsmid, K.C.S.I., Arthur Grote, Esq., W. W. Hunter, Esq., LL.D., Colonel Nassau Lees, LL.D., Sir W. Muir, K.C.S.I., Colonel Sir Lewis Pelly, K.C.S.I., Lord Stanley of Alderley; Treasurer: Edward Thomas, Esq., F.R.S.; Secretary: W. S. W. Vaux, Esq., M.A., F.R.S.; Honorary Secretary: Thomas Chenery, Esq., M.A.; Honorary Librarian: R. N. Cust, Esq.—The Report of the Council stated that forty-one new members had been elected during the year 1877-8.

FINE ART.

THE ROYAL ACADEMY EXHIBITION.

(Second Notice.)

Domestic and Miscellaneous Figure-Subjects. The critic feels a little dismayed in entering upon this enormously large and competently-filled section of the exhibition: there are so many works to speak of, and so little space within which to discuss them. I find about eighty artists down in my list of notes—not to speak of those who have remained unnoticed. Let us take eleven to begin with—Messrs. Leslie, Orchardson, Goodall, Hughes, Herkomer, Pettie, Long, Alma-Tadema, Frith, Walker, and Holl.

For some years past we have failed to feel much interest in Mr. Leslie: he has got so smooth and marketable in painting, so well-behaved and demure in sentiment. A Greek nymph or an English schoolgirl count as nearly the same to him. A model nursery-governess with an inkling of Lempriere would paint, supposing her to be endowed with very considerable proficiency in pictorial handiwork, very much such pictures as Mr. Leslie's. His example of the present year follows on in this same order of ideas and of work, but it is certainly a very pleasing specimen—"Home, Sweet Home." The lovely old air is being played and sung by an exemplary girl of seventeen, "as good as she is pretty," as the attached domestic of fiction is apt to phrase it: a rather junior sister kneels by the music-stand, and four younger girls join in. The scene is the schoolroom in a house of affluent comfort: the costumes belong to a long half-century ago, and are agreeably varied in detail.—Mr. Orchardson's subject is named A

Social Eddy, left by the Tide; another theme of about the same period of costume, so greatly run upon of late in our exhibitions. The scene is the drawing-room adjacent to a ball-room; the guests are trooping in to the dance, the last couple being a lady and gentleman who seem to have some idea of becoming partners for life as well as for the next waltz or quadrille. They leave behind them in the drawing-room, along with an aged gentleman and lady to whom tea and fan suffice, a young lady whose wistful glance suggests that she would gladly have received the departing gallant's invitation to the ball-room. This simple story is very clearly told, and the creamy tone of colour, bright without tawdriness or parade, is more than commonly pleasant to the eye, and consistently carried out. We cannot, however, well account for the lighting, which appears to be full ordinary daylight, with no candles burning or anything of the kind, whereas a late hour of the evening would have seemed the right time for a ball.—*Palm Sunday*, by Mr. Goodall, is a life-sized group of a beautiful young mother and her infant daughter, both in mourning; the child, with her steady stare of wondering or inquisitive pleasure, holds a sprig of the gleaming yellow blossom which serves English people instead of palm branches. A green lawnny meadow is outside the window. In largeness of manner, and a refined as well as elevated style of beauty, Mr. Goodall had hardly yet equalled the figure of the lady here; it is far indeed ahead of anything of which he appeared capable in the days of his earlier popularity.—From Mr. Arthur Hughes again we get (as so often before) another female figure perfect in sweetness and maidenhood. *Uncertainty* is his title; and his subject, the damsel in question blushing modest and expectant while her suitor is "asking papa" in another room with its door conveniently but tantalisingly open. The lover's fine-grown greyhound, left behind during the colloquy, looks with confident affection at the young lady, as if to reassure her that she shall certainly be his mistress at an early date. Her salmon-pink dress is the chief colour-item in the picture: close to this comes a yellow chair-cushion a little too saliently bright—the only interruption to a quietly-graceful harmony of tint. Few pictures of our school could be more covetable than this for daily companionship and contemplation. We like it better than Mr. Hughes's second work, *Vanity*, a composition of several figures in which a very aged dame, a child, and a peacock, are prominent, the costume being of the Elizabethan date. Here the best thing is the old lady—touchingly wan and feeble, without anything of what is mean or repulsive in decrepitude: the executive touch, though it possesses Mr. Hughes's wonted delicacy, is somewhat blunt and husky, wanting sprightliness and contrast.—Mr. Herkomer's *Eventide, a Scene in the Westminster Union*, is one of the few pictures by which this exhibition will be remembered: we have already said something about it. To make a picture—which shall be not merely a sermon or tract—out of a London workhouse filled with old women was a difficult problem: it has been solved by Mr. Herkomer. He neither embellishes nor degrades, but shows us old age feeble, suffering, not wholly sunk into the blankness of non-employment, nor quite without separate and individual relish for the scanty comforts which remain to it. Needlework is the chief occupation, tea the staple of solace, and a few flowers, and prints on the wall, are added. There is a black cat near one group, and we are rather surprised that he is left uncared for by any of the inmates. Several of these have that collapsed contour of face which arises from loss of teeth: a point of life-likeness which Mr. Herkomer could hardly omit, but on which he has not insisted to such a degree as to make his work artistically an eyesore. A large space towards the left centre is occupied by the boarded floor: the perspective of the room is powerful in recession

and in light and shade. There is a large amount of character in various heads, considered severally; but this properly merges into the singleness of perception and feeling apposite to the whole scene. The present is certainly the finest subject-picture which its very able author has produced since his celebrated *Chelsea Pensioners* of two or three years ago.—Mr. Pettie has a very telling work in *Rob Roy*, and a natural and agreeable one in *The Laird*, strolling through his harvest-fields. More important than either of these is *The Hour*, which shows a Spanish lady of high degree, with a black mask dangling from her left hand, descending the lordly staircase to keep an assignation as the sun sinks low in the west, and strikes full upon her face—a face of rather sinister handsomeness. The pitch of execution in this picture is high throughout, and most specially so in the red dress associated with the black mantilla. Mr. Pettie has adhered to the trying rule, "Be bold, be bold;" nor do we think he has in this instance laid himself open to the censure implied in the final caveat, "Be not too bold."—Mr. Long pursues his vein of picturesque and peculiar incident in ancient life, with a spice of the ludicrous. *The Gods and their Makers*—Egyptian women modelling and painting idols—is his present subject: the canvas of ample dimensions; the painting not particularly strenuous (and, indeed, the theme does not demand this), but easy, natural, and on the whole fairly successful. Here we have a negress holding a white cat, suspiciously unrestful, to be the original of a moulded divinity; the two white kittens are breaking and playing with a blue image: there, other women chat and laugh over the finishing touches of pigment bestowed upon a deity of the nether world; a Pasht, an Apis, a lizard, and a great miscellany of other effigies, throng the apartment.—Of Mr. Tadema's two works we had already spoken. *A Sculptor's Model (Venus Esquilina)* is the picture which he sent not long ago to Berlin, where it earned merited applause. All requisite accessories are duly introduced; but essentially this is a strong direct study of nude female form—well-developed and sufficiently fine for guiding the sculptor in his clay model, visible behind, but not in itself of an ideal type, either in limb or in visage: it will be the sculptor's business to turn what he sees into what he conceives—woman into goddess. The smaller work, *A Love Missile*, is exceedingly choice in colour and light, the sun shining bright outside the marble shutter of the room in which the flord damsel stands in delicate gradations of half-shadow and reflected gleams. The face and throat, however, appear to us weighty for the rest of the figure; and, though lively, the countenance cannot be called engaging either in contour or in expression.—After some years of comparative eclipse, Mr. Frith is again in the ascendant with the British public: his *Road to Ruin*, a series of five pictures, is the great popular attraction of the gallery, and has needed a policeman to make its scrutinisers and admirers "move on." *College, Ascot, Arrest, Struggles, The End*, are the titles of the successive subjects: card-playing opens the sequence, and suicide closes it. Even persons who have not seen the works can understand pretty well what Mr. Frith must have made of them. A prosaic but natural and straightforward invention of incident and *ensemble*; nothing far-fetched, nothing terrific, nothing aristocratic; propriety of grouping and painting, without strong effects from either source; a story that one reads like a book, and from which one derives the trite self-consistent moral of a narrative for the schoolroom: these are the characteristics of Mr. Frith's series. It is not to be disliked or disapproved; but to be liked with lukewarmth, and approved with mental reservation. To damn with faint praise, or to praise with faint damnation, is the critic's or the cynic's most obvious alternative. In the first subject, *College*, we observe a foreground figure—an undergraduate rather than "graduate" of

Oxford—who almost looks like a caricature of Mr. Ruskin: can this have been intentional on Mr. Frith's part?—Mr. F. S. Walker, who has been a rising man these two or three years, may now count as a risen man: *The Convent-Garden* places him in that position: a vigorous piece of brush-work, with blossoming trees forming a large central mass, camellia-bushes in front, speckled sunshine not frittered away out of breadth, two cats on the parapet, several nuns, and three young ladies their pupils at a discreet distance. We do not observe here any marked signs of a mastery over character or sentiment: but force of hand and faculty of portrayal are abundantly proved.—Mr. Holl paints on a larger scale, and with more of dramatic combination, than we remember from him heretofore. *Newgate, Committed for Trial*, has for its principal subject-matter the visit of his wife to a young beardless man who advances towards the grated partition with a wild and sudden look, as if the shock of this meeting had roused in him a depth of feeling which had as yet been kept under, merged in sullen dejection and apathetic hopelessness. The wife's profile is indefinite, and adds nothing to the emotional value of the picture. Two girls are close by: one of them belonging perhaps to the second group—a prisoner of hyena-like savagery who browbeats his wife, an ill-used, slovenly, half-brutalised woman, seated with her baby. To the right three ladies are entering: one of them, handsome and bold-looking, clenches her hand in a significant action which indicates a bribe, and looks with very meaning eyes at the warder; this elderly and experienced person certainly understands what is implied, but gives no symptom of response. Here are much energy of conception and of handling, telling expression, capacity for conveying the salient and essential elements of the subject without much pains spent upon what is secondary. Mr. Holl's principle seems to be realism without insistency—and a very good principle it is when free from the blemishes of offhandedness and unloveliness. From these blemishes he is certainly not altogether free; yet, making due allowance for what pertains to his dreary theme in the present instance, he is entitled to ungrudging praise.

With other exhibitors in this department we must be summary: more so than the very considerable merits of several of them suggest.

Boughton, *Green Leaves among the Sere*: a family group, not including any old or elderly person as the title might seem to imply, with a little girl holding out a verdant sprig to the baby; the feeling graceful, the painting firm, the mannerism definite but piquant. *The Waning of the Honeymoon* is a less pleasant but still a clever specimen of Mr. Boughton's art. *Rivière, Symmetry*: a small girl, dressed in blue, is seated on the staircase, perhaps sent out of the room for some childish misdemeanour; a white terrier brings his black nose close to her face: the story capitally told, with great proficiency of work. Less solidly painted, but not less telling in its way, is the *Victims*: two girls inexorably bent upon subjecting two appealing dogs to a sea-bath. Staniland, *Goodbye*: an emigrant ship about to depart; the canvas crowded with the multiplied and varied incidents of farewell, judiciously chosen and painted, but wanting that harmonic touch of artistic fusion which is the making of a picture. Frederick Morgan, *After the Reaper's Work is done*: human figures and a donkey amid an orange-and-primrose-tinted glow of sunset, rich and effective. The like praise is due to *Jealousy*, a Frenchwoman with four kittens and a dog. Cope, *Lieutenant Cameron's Welcome Home from his Explorations in Africa*. A long description is given in the catalogue, showing that the scene is Shoreham, Kent; and the cleric who figures conspicuously, the gallant traveller's father, vicar of this place. There are a great number of figures in this large picture, and some genuine interest both in its main subject

nd in the particular points of incident; but, after preceding all that can be properly claimed, we must allow that it is a poor piece of pictorial work, with neatly-posed *marionnettes* for human agents. Thomas Graham, *The Philosopher's Breakfast*: a grim and unkempt old gentleman, his chin-pan seething with protoplasm or the differential calculus, has opened his street-door to a matutinal milk-girl, and brought down his op-basin for the needed dole of milk: a capital piece of humour, pairing with Mr. Graham's appiest essays. Viney, "Why, then, let a Soldier think!" a military group of the seventeenth century in a wine-cellar, the revelry fast lapsing into drunkenness: exceedingly clever, and dexterous in such—see especially the crinkled eyes of the 'alstaffian old sinner in a large red cloak: the colours and costumes rather too flaunting and few, in the manner of Fortuny's followers. Lamont, *The Prince's Choice*: a large painting with numerous figures, showing how the young sovereign has selected his bride from among a levy of expectant and now disconcerted beauties: standard-bearer, stalwart and prominent, occupies the foreground. The key of colour is bright, active, lightsome, and in its totality too unsubstantial; for style Mr. Lamont may be partly indebted to Mr. Leighton, yet not in a servile way. Hodgson, *Lost*. The scene is a stable; the personages, an old Algerine marauding captain, and his lieutenant; the incident, the subordinate howling to his chief, from amid a quantity of miscellaneous plunder, a locket with a portrait of a pretty boy, which recalls to the battered and avid veteran some loved and lost child of his own. The expression is sufficiently rue to enable us to read this story in it with confidence, and on the whole this ranks among Mr. Hodgson's successful works. *A Pasha*, black bearded, self-confident in prosperity, is another excellent example. Mr. Chevalier goes to a remote Orient for his subject—*An Eastern Puzzle*, *Chinese Lama-Priests at Home*. This looks true in essentials, and the faces indicate the sort of character intended, yet not in a very characteristic way. The priests, young and old, and two of them extremely fat, are all robed in bright yellow, with faultlessly shaven heads; an elderly spectacled gentleman prepares to light his pipe. *La Première Communion*, *Dieppe*, by Mr. P. R. Morris, is as predominantly a white picture as that of Mr. Chevalier is a yellow one. It is big beyond all proportion to the value of the subject-matter or pictorial material, and the white dresses, as usual with Mr. Morris, are too bluish and thus too cold in tint for pleasing optical effect; on the whole, however, the theme is treated sensibly, and with variety and natural disposition of the figures; the technical ability also is noticeable.—Mr. W. M. Wyllie paints *The House, Session 1877*, with a considerable amount of general propriety, and fair realisation of likeness, the whole being treated easily, and with some tendency towards sketchiness. Sir Stafford Northcote is speaking, and Mr. Fawcett is walking to his seat; Messrs. Lowe, Bright, Gladstone, Goschen, Forster, and Whalley, Lords Hartington and Cranbrook, Sir W. Vernon Harcourt, and Dr. Kenealy, with some others, are readily recognised—the Liberal members being given in much greater number than the Conservative. Mr. W. L. Wyllie's subject is of a different class—*Summer Clouds*: orange sands, blue river and sky, short noontide shadows, and no general tempering of shade; the colour extremely bright, and the whole a vigorous effort at realisation of strong unmodified sunlight-tints. *Sedge-Cutting in Wicken Fen, Cambridgeshire, Early Morning*, is a well-sized picture by Mr. R. W. Macbeth, who has more than once shown a predilection for representing country-employments with some peculiarity of combination or of costume: sickle and scythe, and the singular dress of the scytheman, play a large part in this painting. The execution is easy and decided, not elaborate; the faces of men and

women too uniform in type; the general result that of unacknowledged actuality.

Other pictures which the visitor should not fail to remark, and would in many instances enjoy, are—Stone, *The Post-Bag*; Armitage, *After an Entomological Sale*, a good bit of character, with portraits of Mr. Armitage himself, and other artists; R. B. Browning, *A Worker in Brass, Antwerp*—of this very interesting first appearance we have already spoken; Charles Gregory, *Folklore*; Kate Perugini, *In for a Scrape*; A. Dixon, "It may be for years," railway-passengers waiting for the train at a country station; Lancaster, *Convalescents in the Chapel, Children's Hospital, Great Ormond Street*, promising, with a certain look of combining elements of style from Mr. Alfred Hughes and Mr. Legros; Gade, *Happy Old Age*; Clarke, *Wandering Minstrels*; J. Charles, *Our Poor*, the subject partially resembling that of Mr. Herkomer; Mrs. Anderson, "Guess Again;" F. E. Cox, *A Tiff*; Prinsep, *Study of a Kashmiri Nautch-Girl*, and *Martaba, a Kashmiri Nautch-Girl*; Barclay, *Women Moulding Water-Jars, Algeria*; Louise Jopling, *The Village-Maid*; Elmore, "Such tricks hath strong imagination"—a curious subject of a lady fancying that she sees her absent husband in her toilet-glass; Mrs. Ward, *One of the last Lays of Robert Burns*; Waterhouse, *The Tibia*; Cauty, *Castaways*, the famine-wrung survivors of a shipwreck, a work in which painfulness is combined with a considerable degree of force; W. V. Herbert, *Unwelcomed Visitors from the Highway to the Landlord's Best*, German mediaeval free-booters; Burgess, *Childhood in Eastern Life*; Conti, "A Health to Bright Eyes;" Waller, *The King's Banner*; Bateman, "As it fell upon a day;" Albert Moore, *Garnets*; Frederick Leighton, *A Study*, a lady's head brilliant in flesh-tint, far more satisfactory in this respect than the author's ideal pictures usually are; Hook, *The Coral-fisher, Amalfi*; Walter C. Horsley, *Shopping in Constantinople*; Colin Hunter, *Store for the Cabin*; Pott, *Fallen amongst Thieves*, a gambling scene; Naish, *Devonshire Trawlers*; Nettleship, *A Wounded Messenger*, a carrier-pigeon caressed by its young mistress, a graceful piece of work; Edwin Hughes, *Distinguished Visitors*, of some seventy years ago, inspecting a mansion of historic or artistic interest; Wünnenberg, *After the Confession*; Bridgman, *Having a Good Time*, naked infants rolling in sea-sand; W. Bright Morris, *At the Fair of Seville*; Alice Havers, *June and September*; E. Blair Leighton, *A Flaw in the Title*; Hopkins, *The Apple-loft*; Scheurenberg, *Fête Champêtre*; Lionel P. Smythe, *Waiting*, a number of French fisherwomen, much in the same style as Mr. W. L. Wyllie's picture previously mentioned; C. W. Wyllie, *Étaples*, with laundry-work in the open air—the same remark will apply here; Scholderer, *Wondering*, a seated figure of a countrywoman; Barwell, *A False Scent*, a well-told incident in the Cavalier and Roundhead contest; Maria Brooks, "I wonder if it's true," a girl with a story-book, in the mode of a fancy-portrait; Lockhart, *The Parish Kirk*, noticeable in its management of reflected light, and in other respects also; Topham, *Drawing for Military Service, Modern Italy*.

ART SALES.

MESSRS. SOTHEY, WILKINSON AND HODGE sold last week a considerable collection of etchings, mostly by living artists, formed by the late M. de Masson, of Louviers. The prices fetched do not require us to record them.

THE same firm sold on Friday and Saturday last the books and prints left by George Cruikshank, or rather the whole of his books, as we understand, and a great part of his prints—enough remaining to make a second sale next winter, or next year. George Cruikshank had been the fortunate recipient of many presentation copies from Charles Dickens, and these fetched high prices on Friday and Saturday. Thus 7*l.* 2*s.* 6*d.* was ob-

tained under the hammer for a copy of *The Cricket on the Hearth*; and 13*l.* 13*s.* for a copy even of the third edition of *American Notes*. The *Sketches by Boz*, with illustrations by George Cruikshank, realised 12*l.* Among the various works of George Cruikshank—choice and especially selected impressions mostly from his own private collection—we note a very fine series of the *Omnibus*, 1842, extremely rare, 18*l.*; Maxwell's *Irish Rebellion*, 11*l.* 15*s.*; *Rookwood*, 6*l.* 6*s.*; the *Tower of London*, forty plates, fine proofs on India paper, 13*l.* 13*s.*; the *Miser's Daughter*, "the story suggested to Harrison Ainsworth by George Cruikshank," 13*l.* 10*s.*; a complete set of the *Punch and Judy* etchings, in rare state, curious and extremely rare, 17*l.*; the *Life of Sir John Falstaff*, one of the later works of Cruikshank, which recent criticism has claimed as among his best, 17*l.* 10*s.* Only six years ago, as we are informed, similar impressions of the *Life of Falstaff* sold for 3*l.* Afterwards were sold certain plates and blocks, the highest of which went for 41*l.* It remains to be seen what they will yield to their purchasers.

ON Wednesday in last week Messrs. Christie, Manson and Woods sold the first portion of the pictures, drawings and sketches by George Cruikshank. The second portion will be sold in the winter, and it is hoped may contain the original illustrations to *Oliver Twist*, some of which are believed to be of exceptional beauty. The present portion was remarkable as comprising the original illustrations to the *Falstaff* and to *Windsor Castle*. The oil pictures were nearly all of them sketchy, and laboured besides under all the disadvantages common to the painted work of the artist. One of the best was considered to be a picture of Ariel, founded on the line "On the bat's back I do fly;" this was knocked down for so low a sum as 8*½* *gs.* In some respects the most important, though certainly not the most attractive, of the drawings was the large drawing for the *Worship of Bacchus*—the picture now in the National Collection. This design was knocked down for the obviously inadequate sum of 32*l.* 11*s.* The *Falstaff* drawings excited the greatest interest. They are in water-colour, and are quite small: only about six and three-quarter inches by four and a-half. A wonderful little bit of colour was the portrait of Falstaff, which realised 30 *gs.* Cruikshank is now recognised to have been an exquisite draughtsman of simple or picturesque architecture, and one of the Falstaff drawings—the one of Sir John inducing Mrs. Quickly to withdraw her action and to lend him more money—contained admirable examples of Cruikshank's skill in this particular. The design fell under the hammer for 32*l.* 11*s.* The sum of 15*l.* 15*s.* was realised for the drawing of Falstaff driving Pistol from his presence. The exquisite death-scene, the drawing in which the long-prosperous knight lies on his bed with wandering face and lips a-babbling "of green fields," also realised 15*l.* 15*s.* The day's sale realised more than 1,000*l.*

NOTES ON ART AND ARCHAEOLOGY.

It is true, we believe, that the admirable picture of Old London Bridge which was sold at Mr. Heugh's sale for about seven hundred guineas—the precise sum was mentioned in our last Saturday's issue—was one of the many offered to the nation by the munificent generosity of the late Mr. Wynn Ellis. The authorities with whom the choice rested did not see fit to include it in those of Mr. Wynn Ellis's possessions selected for the National Gallery, though it can hardly be doubtful that its representation of a precious and characteristic portion of old London, long ago vanished, is both interesting historically and of great artistic value. Mr. Heugh, it seems, became possessed of the picture for the substantial sum of about 500*l.*, shortly after it had been rejected by the public authorities on whom the duty of selection rested; and after keeping it a year or two

Mr. Heugh appears to have parted with it at a price which allows him about thirty per cent. profit on his purchase. But the nation does not now have the chance of possessing it.

A "SPECIAL LOAN EXHIBITION OF FURNITURE, CABINET-WORK, AND ORNAMENTAL WOODWORK" was opened at the Bethnal Green Museum on May 9, and has continued since then to excite and repay a large amount of public interest. This Museum is now notified to contain pictures, Oriental porcelain, and other works of art, lent by the Queen, Messrs. Boulton, Franks, Galton, Soden Smith, and Valpy, the Trustees of the late Mr. Cosier, the Hon. Massey Mainwaring, the late Mr. Danby Seymour, and Miss Yates; the Japanese collection of Mr. Alt; the anthropological collection of General Lane Fox; the Doubleday collection of insects; collections of animal manufactures; and illustrations of food and economic entomology. We hope to notice this exhibition in more detail hereafter.

MESSRS. GREENE AND SON, of 155 Cannon Street, have got together a collection of Barbotinés and Bourg-la-Reine pottery, from the factories near Paris.

Two remarkable articles, the first of a series entitled "Physical Science for Artists," have been contributed by Mr. Norman Lockyer to the last two numbers of *Nature*. In these articles scientific criticism is brought to bear upon matters of art, and especially upon the painting of the sky in landscapes. The test is, of course, only meant to apply to certain phenomena coming within the province of the artist, and affords no measurement for that mysterious something added by the mind of the painter which gives the real value to his work, for it is certain that a painting may be wholly true to nature, and quite unassailable from a scientific point of view, and yet may be utterly commonplace; whereas another, in which the artist has made even such bad mistakes as Mr. Lockyer enumerates, may notwithstanding be a great work of art. But it must be admitted that for the most part it is the artists who have infused the greatest amount of mind into their works who have followed nature most observantly. This is seen in the two lists of pictures from this year's Academy selected by Mr. Lockyer to test his "working hypothesis" with regard to sky colour. Those which he finds correct from a scientific point of view are those which have also received most praise from purely artistic criticism, while those which he condemns as inaccurate are for the most part rather poor works. The value of such teaching as this to the artist can scarcely be exaggerated. If art be, as Charles Blanc defines it, "the interpretation of Nature," the interpreter surely ought to be acquainted with the laws which underlie the phenomena whose meaning he seeks to expound. Art criticism also may here find a secure basis to work from instead of the shifting and arbitrary tests which it now too often employs. "It is only those," as Mr. Lockyer says, "who are ignorant of the development of art who will look with suspicion upon these new tests of truth with which artists can supply themselves" by scientific training.

DURING the continuance of the Paris Exhibition the national manufactures of Sèvres and Gobelins will be thrown open to the public, without any restriction, every day in the week, from noon to 5 P.M. On Sundays and *fêtes des ateliers* will be closed, but even then the Museum and galleries may be seen without cards or orders of admission.

A FINE landscape by Hobbema has lately been added to the Museum at Nancy. The *Chronique des Arts* gives the following account as to how it came there:—M. A—, a gentleman who came to settle in Nancy in 1871, finding himself encumbered with this large picture in a small dwelling, gave it to an upholsterer in the place, evidently imagining it to be of no value. The upholsterer, in his turn, not knowing what to do

with it, presented it to the Museum, where the director soon after saw it. He had it cleaned—for it was in a dreadful state of dirt and varnish—and carefully restored, and it now turns out to be an important work by Hobbema, a real treasure-trove for the Nancy Gallery.

A LOAN exhibition of paintings and other works of art was opened last week at Manchester. It is said to be the richest display that that town has seen since its celebrated exhibition of art treasures in 1857. The profits of the exhibition are to go towards a new building for the Manchester School of Art, an institution which has increased so remarkably of late years that its present accommodation is not sufficient for its purposes. It is proposed that the new building shall include, besides the school premises, a town museum and a large public gallery, after the model of that at Liverpool. Of course a large sum is required to accomplish such an undertaking, but 15,000*l.* has already been subscribed, and it is hoped that the present exhibition may bring in something more.

THE Germans seem to be making up for their first ungracious refusal to participate in the Paris Exhibition by now sending a large number of works of art. It is stated that as many as ninety pictures and works of sculpture were sent from Berlin just before the opening. Among these were two striking paintings by Louis Knaus, of which German critics speak very highly, and another by Gussow, called *In the Atelier*, representing an old woman cleaning a picture. Two groups of sculpture also, by Reinhold Begas, are exciting admiration.

THE fiftieth number of Dohme's *Kunst und Künstler* contains biographies of Sebastian del Piombo and Giulio Romano, by Dr. J. P. Richter. Dr. Anton Springer's double biography of Raphael and Michelangelo is still going on in this publication, although it has already appeared in a separate form. When completed in *Kunst und Künstler*, it will form one complete volume of this vast work.

M. CLÉSINGER's colossal statue of the French Republic is now finished, and was approved of the other day by the Fine Art Commission. It is to be set up on the lawn of the Champ de Mars, facing M. Bartholdi's grand statue of Liberty. The Republic is represented as a female figure wearing a helmet and cuirass; but her right hand rests on the tables of the law, while in her left she holds an olive-branch. Although a sitting figure, this statue reaches the height of eighteen feet.

A PROPOSITION for restoring the central pavilion of the Tuileries, and using it as a museum for modern art, has again been brought before the French Chamber.

AN instructive little work on the manufacture and decoration of pottery, entitled *Pottery: How it is Made, &c.*, has lately been published by an American author, Mr. Geo. Ward Nichols. The primary object of the book is stated to be "to show that the manufacture of pottery may become one of the great art industries in the United States;" but this object is in no way obtruded, and the practical instructions are so clear and simple that they will probably be found valuable, not so much to the potter or manufacturer, who, it may be presumed, knows all about these things, as to the large number of amateurs who are at present trying their skill in pottery decoration, either for amusement or with the hope of making it a profitable occupation. The directions given for painting on china and earthenware are especially useful, for the colours are grouped according as they can bear *ordinary heat* and *greatest heat*, and palettes of various kinds are described suitable for painting on either fine china or coarse earthenware. Valuable hints are also given as to the kind of decoration best fitted for china, the colours to be used in painting flowers, stems, grasses, and other natural objects. With regard to figure-

painting on china, the writer gives the sensible advice that it should be strictly avoided. "Don't paint heads or any part of the human figure as decoration of pottery. Even when it is well done it is inappropriate, and when it is not excellent it is horrid." For those, however, who will rush upon this dangerous ground, certain safeguards as to colour and treatment are afforded. Many of the designs with which this elegant little book is illustrated are quite charming in their way, and especially the quaint device on the cover; indeed, though meant as a text-book and strictly fulfilling its purpose, it is so prettily got-up that it may well claim a place in a lady's boudoir as well as in the potter's workshop.

WITH reference to the subject of gold masks found on the face of the dead in ancient tombs, the new number of the *Archäologische Zeitung* (p. 25) gives a series of extracts from *Selections from the Records of the Bombay Government*, No. xliii. (New Series, Bombay, 1857), and other sources, showing that in 1848, when Commander Jones was employed on the Upper Euphrates, a mummied body was found in an elaborately-painted coffin near the old fortress of Halebi, a site which is identified as that of the town of Zenobia. On the face of this mummy was a mask of gold, on which were impressed the features of the deceased. This mask is afterwards referred to as being in the India House, and doubtless now is in the India Museum here. From another instance of a mummy found in the district Commander Jones supposed it to have been the seat of an Egyptian colony. At all events it was clearly a place where Egyptian forms of sepulture were followed, in which case the use of the gold mask is not so singular as when it occurs at Mycenae.

THE new number of the *Bullettino di Corrispondenza Archeologica* shows with what activity the exploration of ancient sites is being carried on in Italy—outside of Rome—as, for instance, at Cagli, Ceretolo, Chiusi, Corneto, and Pompei. At Corneto (Tarquinii) the latest discovery is a tomb, which, though it had been opened and sacked before, still contained several objects of interest, in particular (1) a scarab of green jasper, with an Egyptian design, resembling in all respects the scarabs found in Sardinia, and traced to the Carthaginian occupation of that island; (2) another scarab, but of chalcedony, also with a Carthaginian design. With these scarabs were found two painted Greek vases of the fifth century B.C., which thus determine the period at which these productions of the Carthaginian gem-engraver found their way into Etruria. In another tomb in the same neighbourhood has been found a bronze mirror incised with a figure of Adonis (*Atunis*) standing between two seated female figures inscribed *Mean* and *Evan*.

CASTELLANI (Alessandro) has issued a catalogue of his collection of majolica, which is to be sold in Paris next week, May 27–29.

MR. HORMUZD RASSAM has been excavating at Nimrud and Kouyunjik, where he has found a good many tablets, as well as at Kalah Sherghat, the site of Assur, the ancient capital of Assyria. At Nimrud numerous remains of Assur-natsir-pal have been discovered. He will probably return to England next month.

THE city of Basel has lost another of its venerable historical edifices. The old "Judeneshule" in the Grünpfahl-Gässlein has just been demolished in the course of the widening of the Gerter-Gasse. Fechter in his *Basel im 14. Jahrhundert* gives two notices of this old house. After the banishment of the Jews, in consequence of the great mortality of 1348–49, which was to have lasted 200 years, they began by degrees to creep again into the city; as early as 1361, one Jew settled in the "hus das gelegen ist in der Gassen," and which from this time was spoken of as "des Juden frien hus." Before the banishment the Jews had a

ave been at pains to estimate the artistic
the illustrations to the quarto edition of
alogue of the Grosvenor Gallery Winter
ion, which has very lately been issued
and Windus); and, so far as we
le to judge, the combined method of
aphy and engraving used by Mr. Dawson
aring them has, in this case, answered
as well as would any other process of
ction that was available. The results
us at least equal to any obtained in
nthly art magazines by the most recent
st belauded systems of reproduction. But
well for the amateur and student to recog-
nly that reproduction in the strictest and
curate sense there can hardly be: transla-
the thing most wisely aimed at. No etch-
Rembrandt's or of Claude's, whose lines
een coarsened by the process popularly
f "reproduction," is ever seen in the copy
een in the original. Original drawings are
es better served, and few of these have
ter served than some now included in the
e of the Grosvenor collection. We happen
been able to compare the Grosvenor repro-
of Botticelli's allegorical drawing of a
figure representing Abundance with a
y-executed photograph of the same draw-
he result is in favour of the Grosvenor re-
ion, which, preserving more of the fineness
preserves more of the spirit of the original.
not say that in any single case the repro-
is faultless; but the amateur must be
ngly simple if, in consequence of what
assured in certain quarters, he really
to find for some few shillings the
s artistic effect which the wise readily give
and at need scores of pounds, to be able
re in the original drawing or the original
Turning to Mr. Comyns Carr's essay on the
gs of the Italian Masters, we may say that
deniably the most finished piece of critical
that has come from his hand. We do not
means agree with all his assertions, though
es none that he has not carefully weighed.
ld, for instance, that his admiration of
do carries him further than the truth about
eat master when it leads him to consider
onardo's penetration into human character,
n in the countenance, has never been ex-

Even with the added knowledge of
do's design and field of practice which many
ow have, thanks in part to the Queen's loan
Grosvenor Gallery, we should most of us
nsider Leonardo limited in his range over
character. We are not sure that Mr.
view that vital differences in schemes of
constitute the great barrier to the appreci-
by one age of the art of another will be
to hold invariably good. The form does
t as much as the colour to repel us, for ex-
from the earlier art of Italy. But there is
ertainly truth in Mr. Carr's remarks about
mmon ground discovered by most artists
g with the pen, the silver-point, or the
y-needle; and where we do not agree with
rr he is sure to interest. At a time when,
the one hand, art journalism is occasionally
flippant through the contributions of writers

boasting little capacity, on the other hand art-
writing is either oppressed or underrated by the
dogmas of those who have no appreciation of any
other than its scientific side, it was well that a
writer of generally balanced gifts should enter his
protest against the pedantic and pernicious
tradition that would "weight" every exquisite
thing "with inappropriate learning." We com-
mend Mr. Carr's essay to the thoughtful considera-
tion of readers who are intelligent enough to know
that Literature, when dealing with Art as with
any other subject, cannot be permanently equipped
with knowledge alone. "That which remains
after all"—as Lord Houghton recalled to us the
other night at the Academy dinner—"that which
remains is Style."

THE STAGE.

A PERFORMANCE partly in honour of Shakspeare,
and partly, as it seemed, in aid of the fame of an
American gentleman who claims to have invented
a "Telephone-harp," was given at the Gaiety
Theatre on Wednesday afternoon under the patron-
age and direction of Miss Kate Field, the American
authoress. The dramatic entertainment consisted
chiefly of fragments of Shakspeare's plays, in which
many popular actors and actresses took part. The
performances on the telephone-harp, however, and
a brief lecture on that subject by its inventor,
were scarcely less prominent features in the pro-
gramme, though the only apparent justification
for this association was the circumstance that
certain melodies, which were made audible in
rather uncouth and barbarous fashion, were stated
to proceed from a harp then playing at Stratford-
on-Avon. Of the conditions of the experiment—if
experiment it could be called—the audience of course
could know nothing. Altogether, the American
gentleman's ingenious contrivances seemed to have
but slight connexion with Shakspeare, notwith-
standing Miss Field's curious observation, "When
Shakspeare put a girdle round the earth in forty
minutes, did he not anticipate this performance on
the telephone-harp?" In the course of her
address Miss Field also took occasion to observe
that the performance of Wednesday was "the
result of a dream," in which "her ancestor,
Nathaniel Field, the dramatist and friend of
Shakspeare," had appeared to her and reminded her
that we owe to America the preservation of
Shakspeare's birthplace, "for not until that
greatest showman on earth, P. T. Barnum, was
about to pack up the crumbling house and carry it
away did we awake to a sense of its value." The
Gaiety Theatre being lent for the occasion by
Mr. Hollingshead, and the services of the per-
formers also given gratuitously, while the prices
of admission were exceptionally high, the perform-
ances are, we are informed, expected to result in a
substantial addition to the funds of the Shakspeare
memorial.

A BRILLIANT Oriental ballet, entitled *The
Golden Wreath*, has been produced at the
Alhambra. The story which is supposed to be
conveyed by the graceful proceedings of Mdlls.
Pertoldi, Mdlls. David, and other performers, has
been written out by Mr. James Albery in the form
of a brief argument printed in the programme.

THE management of the Aquarium Theatre,
who have hitherto confined themselves to revivals
of standard English plays, ventured on Saturday
last to produce a new comedy from the pen of
Mr. F. A. Marshall, which bears the title of
Family Honour. Mr. Marshall—the merits of
whose comedy, *False Shame*, brought out at the
Globe some years ago, are well remembered—has
on this occasion chosen to rely more upon story
than upon the portrayal of character; but his
method of unfolding his plot is unfortunately not
always dramatic. He has a tale of family history
to tell, showing how a worthy young lady, married
to a proud but generous and high-minded English
baronet, suffers from the misdeeds of a dead

mother; but, as much of the circumstances of the
case is supposed to have elapsed long before the rise
of the curtain, the author is compelled to depend
in great measure upon rather tedious narratives
of a retrospective kind put into the mouths of the
leading characters. This, however, is unhappily
not the only reason why the performance of
Family Honour excited but a languid interest, in
spite of neatly written dialogue and one ex-
cellent sketch of character. A graver fault
lies in the manifestly fictitious nature of
the embarrassments and the sorrows in which
the heroine is involved. The poor lady is
a meek, inoffensive, and tender-hearted person,
who has never been guilty of any worse offence
than a tendency to extravagant displays of affec-
tion towards a husband old enough to be her
father. Yet she is charged with maintaining
secret relations with a lover of disreputable charac-
ter, banished from her husband's presence, and
driven to obtain admission to her own home by
engaging herself as a domestic servant. A word
from her would at any moment have explained the
matter satisfactorily and restored her and her hus-
band to peace and happiness; but this obvious
step is not taken for four years; and the only rea-
son assigned is the circumstance that the true
nature of the relations between the lady and her
supposed lover—who is a half-brother—cannot be
revealed without breaking a pledge of secrecy and
making known to the jealous husband that his
wife is the illegitimate offspring of a profligate
mother. In circumstances of this kind it has been
the custom of novelists and playwrights to bind
the heroine by an oath; or to represent the
promise as having been solemnly extorted by
some person whose death renders it impossible
to obtain a release from the obligation. In the
present case, however, the engagement is simply
between the heroine and a living lady whose
temptations to be silent are incomparably weaker
than the motives which ought to have induced
her at once to divulge the facts. The piece is sup-
ported by the talents of Mrs. Hermann Vezin, Mr.
Farren, Miss Litton, Mr. Kyrle, and Mr. Fawn,
and is placed upon the stage with due care.

A NEW romantic drama, entitled *Populus*, from
the pen of MM. Ulric de Fonvielle, Charles
Hubert, and Christian de Trogo, has been pro-
duced at the Château d'Eau. The new play,
which is in eight tableaux, is described as once
more presenting that eternal theme of comedies
and dramas in France, a humble hero beloved by
a noble young lady, whom he finally wins in
spite of the opposition of her family.

SPIELHAGEN is converting his latest work, *Das
Skelett im Hause*, into a play, for which the very
slight story is better suited than for a book.

MUSIC.

MR. MANNS's benefit concert, which always follows
at the close of the winter series of Saturday con-
certs at the Crystal Palace, took place on Satur-
day last. The programme was of unusual length,
even for a Crystal Palace concert, lasting nearly
three hours, and was equally remarkable for the
variety of the selections it included. The orches-
tral pieces given were the overture to *Oberon*,
Mendelssohn's Scotch Symphony, and a clever and
interesting serenade in canon for stringed orches-
tra, composed and conducted by Herr Henschel,
who is not only one of our best baritone singers,
but an excellent and thoroughly-trained musician.
Contrary to the custom at Sydenham, two de-
tached movements from larger works were intro-
duced into the programme. These were the first
Allegro of Grieg's piano concerto in A minor,
finely played by M. Charles de Beriot, whose re-
cent appearance at the Musical Union has been
already mentioned in these columns, and the
variations from Beethoven's Kreutzer Sonata, in
which M. de Beriot was joined by Señor Sarasate.
The great Spanish violinist also created a *furor*

by his performance of his own fantasia for violin and orchestra on melodies from *Faust*. The vocalists were Miss Robertson, Miss Catherine Penna, Mdle. Fides Keller, Mr. Barton McGuckin, and Herr Henschel. That the audience fully appreciated the services which Mr. Manns has for so many years rendered to music in this country, was proved by the warmth of his reception on Saturday. The list of works produced during the past season, printed, as usual, at the end of the programme, shows the energy and enterprise of the conductor and the directors of these concerts to have been no less than in previous years. Thirty-eight works have been performed for the first time at the Palace, while thirteen English works have been brought forward, six of which had not been previously heard. The concerts will be resumed on October 5.

MR. CHARLES HALLÉ at his third Recital at St. James's Hall, yesterday week, brought forward Mozart's trio in G major, Brahms's thoughtful and interesting, though somewhat diffuse, sonata for piano solo in F minor, Op. 5; Goldmark's suite in E major, Op. 11, for piano and violin, which has been more than once heard in London during the past season; Beethoven's romance for violin, in G major, and Schumann's charming Phantasiestücke, Op. 88, for piano, violin, and violoncello.

THE harmonium is probably the best-abused musical instrument in existence, simply because, of the large number of persons who imagine they can play it, very few have ever made it the subject of special study, or have the least idea how to use it properly. That it possesses real charm under the hands of a *virtuoso* was proved last Thursday week by Herr Louis Engel at Messrs. Metzler's show-rooms in Great Marlborough Street. Herr Engel has long been known in the profession as one of the first living performers on the harmonium, and in his recital on one of Alexandre's finest instruments he showed not merely the variety of tone but the peculiar power of expression of which, when skilfully managed, the harmonium is capable. Herr Engel was assisted by Mdme. Antoinette Sterling as vocalist. A second recital was announced for Thursday last; and we understand that a third will be given next Thursday. Those who wish to know what can really be done with the instrument by a fine player are advised not to lose the opportunity of hearing Herr Engel.

THE programme of Herr Franke's second chamber concert at the Royal Academy of Music last Tuesday evening comprised Schumann's Phantasiestücke, Op. 88, for piano, violin, and violoncello; Chopin's Polonaise in E flat, Op. 22, played by Herr Frantzen; Handel's violin sonata in A major (Herr Peiniger); Schumann's "Stücke im Volkston," Op. 102, for violoncello (Herr Hausmann); Mozart's quartett in C major; and songs by Herr Henschel.

MR. CHARLES GARDNER gave his annual morning concert at Willis's Rooms last Tuesday, when the chief items in the programme were Beethoven's trio in D, Op. 70, No. 1; Schumann's Andante and variations for two pianos; and a sonata in A for piano, from the pen of the concert-giver. The artists announced to assist Mr. Gardner were Mdle. Redeker, Mr. W. Shakespeare, Herr Ludwig, Herr Daubert, Mr. W. G. Cusins, and Mr. Fountain Meen.

THE special feature of the sixth Philharmonic Concert, given on Wednesday evening at St. James's Hall, was the first appearance in Europe of the American singer, Miss Emma C. Thursby. Readers of American musical papers will not need to be informed that Miss Thursby has been for some time one of the established favourites of our cousins across the Atlantic; and the success achieved here during the last few years by two other American vocalists—Mdle. Albani and Mrs. Osgood—

naturally caused Miss Thursby's appearance to be awaited with interest. It may be said at once that the lady more than satisfied all reasonable expectations. She has a high soprano voice, of considerable power and sympathetic quality, extending to the E flat in alt.; she sings with genuine feeling, and with an unaffected style, which at once commended her to all lovers of pure music. She chose for her *début* Mozart's concert-aria "Mia speranza adorata" and the well-known "Jours de mon enfance," from Hérold's *Pré aux Clercs*. Her success was unmistakable, and we gladly welcome in her a valuable addition to the ranks of our soprano singers. Madame Patey sang at the same concert the "Agnus Dei" from Bach's Mass in B minor, which is hardly suited for a miscellaneous concert, and a song by Beethoven. Signor Papini gave a not altogether satisfactory reading of Spohr's Dramatic Concerto; and the orchestral pieces of the evening were Schubert's great symphony in C and the overtures to the *Naiades*, *Leonora* (No. 3), and *Oberon*. The playing of the band was on the whole very good, in Bennett's overture and in the slow movement of the symphony especially so. The *Leonora* overture (for which Mr. Cusins, we think most unwisely, considering the length of the programme, accepted an encore) was less satisfactory, being in places wanting in refinement. The next concert is announced for June 12.

REFERENCE has frequently been made in these columns to the excellent service rendered to the cause of music by the Cambridge University Musical Society. The annual orchestral concert, given in Easter term, took place last Tuesday, when the works presented were Sterndale Bennett's symphony in G minor; Beethoven's rarely-performed cantata, *Meeresstille und glückliche Fahrt*, Op. 112; and Kiel's *Requiem*—the latter for the first time in England. Friedrich Kiel is a Professor at the High School of Music in Berlin. His *Requiem* is a work precisely adapted to the needs of an Academic musical body, as it displays the soundest musicianship without any leaning towards pedantry, and considerable modern feeling unallied to extravagance. A strict analysis would occupy too much space, and would probably prove uninteresting. The most effective movements in performance are the dignified and impressive opening, "Requiem aeternam," for quartett and chorus; an elaborate though not strictly-worked fugue, to the words "Quam olim Abraham," the subject of which is afterwards introduced with excellent effect in the "Hostias;" and the "Benedictus," a graceful flowing movement in triple time. There are no solos in the work, the single voices being only employed in the concerted music, and never for any length of time. The performance, under the *baton* of Mr. C. Villiers Stanford, was exceedingly commendable; and the same remark will apply to the Bennett and Beethoven selections. Miss Mary Davies, Miss Annie Butterworth, the Rev. L. Borissov, and Mr. Wadmore did the little that was required of them with the most satisfactory results.

MDLE. ETELKA GERSTER, the Hungarian *prima donna*, who at once leaped into fame last season at Her Majesty's Theatre, appeared in five parts, of which four were interesting only in a vocal sense. But the fifth—Gilda, in *Rigoletto*—was her best performance; and much interest was excited in operatic circles by the announcement that she would appear on Wednesday morning as Marguerite, in *Faust*, a character which is a crucial test of dramatic as well as vocal ability. As might have been anticipated, Mdle. Gerster's conception of Goethe's heroine was for the most part unconventional. Very subdued in the garden scene, she gradually manifested more and more force in her acting, the details of the tragic portion of the opera being rendered with excellent taste and with some display of real power. Her voice is small in volume, but its quality is remarkably sympathetic, and her command of the *mezza*

voce complete throughout a compass of two and a half octaves. Add to this a singularly sweet manner, and it is easy to comprehend the success of Mdle. Gerster's performances, even to those who care but little for displays of mere agility.

THIS afternoon a new "Oratorio for Children" entitled *Christ and His Soldiers*, written by John Farmer, is to be produced at Exeter Hall with a chorus and orchestra of 400 persons under the direction of the composer. The performance is to be given in aid of the Cornhill Home, King's College Hospital.

AN Opera-Cantata, *Horne the Hunter*, libretto by Mr. Edward Oxenford, the music composed by Mr. John Old, of Reading, is shortly to be published by subscription. The work is in the prospectus to be "adapted to the concert room, or for dramatic representation."

MESSRS. PUTTICK AND SIMPSON will sell by auction next Thursday, in their rooms at Essex Square, the whole of the unpublished manuscript compositions of Rossini. The catalogue of the sale contains 121 lots: of these forty-two are one or more voices, with piano; seventy-five for piano solo; and the remaining six are miscellaneous. The old composer's well-known manuscript shows itself very characteristically in the titles of some of the pianoforte pieces. They are: Lot 48, "Spécimen de mon temps;" Lot 49, "Valse anti-dansante;" Lot 60, "Petite Valse;" Lot 61, "L'Huile de Ricin;" Lot 74, "Prélude Corral;" Lot 76, "Ouf, les petits pois;" Lot 81, "Memento homo;" Lot 82, "Asses de Mame-Dansons;" and many others equally curious. The manuscripts are now on view at the auctioneers' sale-rooms.

MESSRS. NOVELLO, EWER AND CO. are continuing with energy the publication of their valuable series of "Music Primers," the first number of which have been already noticed in THE ACADEMY. Among the more recent additions to the volumes already issued have been Mr. A. Ellis's *Speech in Song* (Singer's Pronouncing Primer); *The Scientific Basis of Music*, by Dr. H. Stone; *Harmony*, by Dr. Stainer; and *Counterpoint*, by Dr. Bridge. Of the first-named we confess to having made only a cursory examination, because the constant use of "glossic," of which readers of this journal are familiar, requires a larger expenditure of time to master it than was possible for us to devote to it. Even a superficial acquaintance with Mr. Ellis's book has been quite sufficient to convince us that the work has gone most thoroughly into his subject, and we believe that vocalists will find themselves well repaid for the labour of mastering its contents. Dr. Stone's little treatise can hardly be too much commended. The subjects with which the book is concerned are of a nature which it must have been by no means easy to render interesting—Tonometry, Harmonics, Consonance, Resultant Tones, the Semibreve and Temperament, and several kindred themes. But Dr. Stone has succeeded in writing in a manner equally clear and interesting. In seventy pages he conveys a large amount of valuable information, and we consider this book one of the very best of the series that has yet appeared. The works of Drs. Stainer and Bridge are also excellent. Though the former is known to hold pronounced views on the points of musical theory, he has very wisely placed them in the background, and written a work which may be adopted even by teachers who would dissent altogether from Dr. Stainer's opinions, as explained in his larger work on Harmony. While Dr. Bridge has written what is, in our opinion, the best and clearest treatise in our language on a necessarily somewhat dry and abstract branch of musical composition.

DR. WILLIAM H. STONE writes:—"Will the writer of a courteous notice of my 'Bassoon,' in Grove's Dictionary of Music, kindly

SATURDAY, JUNE 1, 1878.

No. 317, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Narrative of a Voyage to the Polar Sea during 1875-76 in H.M.S. "Alert" and "Discovery." By Captain Sir G. S. Nares, R.N., K.C.B., F.R.S., Commander of the Expedition. With Notes on the Natural History, edited by H. W. Feilden, F.R.G.S., Naturalist of the Expedition. 2 Vols. (London: Sampson Low & Co., 1878.)

THE renewal of Arctic exploration by the Government of this country was a wise and enlightened measure, and the objects to be secured by it fully justified the expenditure and the risk. Those objects were stated by the Prime Minister, in his memorable letter dated November 17, 1874, to be the advancement of science and the "encouragement of that spirit of maritime enterprise which has ever distinguished the English people." To bring Her Majesty's Government to this conclusion was a work of many years; and that work was performed by the late Admiral Sherard Osborn. To him, and to him alone, belongs the credit of having by his admirable tact, his great power of exposition and persuasion, and his untiring perseverance obtained the despatch of the Arctic Expedition of 1875-76. He it was who set forth the scientific objects to be secured by such an expedition; the true method of exploring as established by the experience of all previous expeditions; the great advantages to the navy that Arctic service provided; and the route that should be taken in order to secure the desired results. Under his continuous advocacy the enthusiasm of the nation was aroused, the support of all the leading organs of public opinion was secured, and the navy especially heartily entered into a project which was certain to advance its best interests.

Sir George Nares has prefixed to his work an Introduction, by Admiral Sir George Richards, which is calculated to give a totally different impression, and against the error of which we feel bound to protest in the interests of future Arctic enterprise. Admiral Richards omits the part taken by Sherard Osborn altogether. He does not even mention his name. He asserts that the leading journals were either opposed to Arctic exploration or kept silence; that science held aloof and was converted against its will; and that the naval service could scarcely view the project with favour, because comparatively few could be employed, and Arctic rewards would tend to check the ordinary flow of promotion. Now, we are in a position, with full knowledge, to deny the correctness of every one of these

statements. With three exceptions, all the leading daily and weekly organs of public opinion cordially supported Sherard Osborn when he commenced his efforts in 1865; all but one supported him when he renewed those efforts in 1872; and finally the support he obtained was unanimous. The scientific bodies did not hold aloof, but, whenever they were appealed to, they did all in their power to second the measures adopted by Admiral Osborn, both in 1865, in 1872, and subsequently. As for the naval profession, it showed the most cordial sympathy for the endeavours to secure the renewal of Arctic research in every way that was possible, and it is most unjust to accuse naval officers, as Sir George Richards does, of taking such a selfish and narrow view, and of feeling no interest in a naval enterprise because only a selected few could take part in it. Such, we are very certain, was not the feeling of the great body of naval officers; and it is equally incorrect to say that Arctic rewards checked the ordinary flow of promotion. They did nothing of the kind, for Arctic promotions were in addition to the usual service promotions.

We dispute the correctness of the account which Admiral Richards has given of the origin of renewed Arctic exploration, and still more strongly do we deprecate his views with reference to the objects of the late expedition and the best methods of future research. He tells us that the first object was to reach the Pole; that the Smith Sound route was selected because there was reason to believe that land still trended away north from latitude $81^{\circ} 38'$; and he apologetically ventures to hint that the explorers of 1876 were "not less successful than any of their predecessors." In reality the object of those who advocated Polar research, and at length secured the despatch of an expedition, never was to get to the Pole. The advance of knowledge had proved that there could be no useful results in reaching the North Pole. It is an utterly useless quest. The object of Admiral Sherard Osborn, and of the learned societies which supported him, was to secure useful scientific results by exploring an unknown region; while the clause in the Admiralty Instructions about reaching the Pole if possible, was in direct opposition to the representations and wishes of the scientific bodies. There is no allusion to such an object in the letter of the Prime Minister stating the reasons which led Her Majesty's Government to despatch the expedition. Admiral Richards himself said, on April 22, 1872, "I do not attach much importance to finding the North Pole; if it is found incidentally, well and good." And, on February 8, 1875, he said:—"I am very far from thinking that the success of the Expedition depends on reaching the Pole, or even a very high northern latitude." In fact the insertion of the clause about the North Pole in the Instructions was pure mischief, tending to divert attention from the true aims of the expedition, which were to explore as large an area of the unknown region as possible.

Still more erroneous is the reason given by Admiral Richards for selecting the Smith Sound route—namely, that the land was

believed to trend northwards from 82° . The land was so shown upon an American chart; but it was perfectly well known, from information supplied by Dr. Bessels, of the *Polaris*, long before the English expedition sailed, that this delineation was incorrect, and that the land did not trend northwards. The true reason for selecting the Smith Sound route was very different. That route was selected by Sherard Osborn in 1865, and was eventually adopted by all competent authorities, because it offered the best chance of reaching such a position within the unknown region in the ships as would enable the explorers to examine a satisfactory extent of the undiscovered area by means of sledges in whatever direction the coasts might trend. This was the object of the expedition, and the results have no need to be stated with bated breath and whispering humbleness. "Not less successful than any of their predecessors" indeed! We ask Admiral Richards to point out a single English scientific expedition that ever crossed the Arctic circle which has been so successful, as regards the value and extent of its scientific and geographical results. The work of Sir George Nares, and especially that of Captain Feilden, furnish a complete answer to the Introduction.

Lastly, we deprecate the endeavour of Admiral Richards to discourage future Arctic research by the only means which can secure any satisfactory result—namely, sledge travelling. He says that the Pole must be sought in ships alone; and that it is a question whether it would be justifiable to equip another essentially sledging expedition. He asserts that geography has little to gain by it, science perhaps less; and that whatever science has gained by such voyages has been by exploration near the ships, and not through the efforts of extended travelling parties.

Truly this is a nice Introduction to the narrative of an essentially sledging expedition! Fortunately, the work itself forms a complete and triumphant refutation of the Introduction. The results of the late expedition furnish abundant proofs that it is not only justifiable, but most desirable from every point of view, to persevere in the despatch of such essentially sledging expeditions until the work of exploring the vast unknown area round the Pole has been completed. That work will never be done in any other way. We gain by experience; each new expedition teaches new lessons, and all experience confirms the correctness of the views of Admiral Sherard Osborn, in accordance with which the late expedition was equipped and despatched. Geography has gained much by sledging expeditions; other branches of science still more, and chiefly through the efforts of extended travelling parties. Why Admiral Richards supposes that observers cannot collect and observe as well at a distance of a hundred miles from a ship as at a distance of one mile he does not explain. But here, again, the Introduction is refuted by the facts recorded in the work itself. At the furthest point reached by the northern division of sledges, in the last expedition, astronomical and magnetic observations were

taken, soundings were obtained, collections were made, and all phenomena were carefully noted. Similar observations were taken at the furthest points reached by the eastern and western divisions of sledges. The most valuable scientific work that has been done in the Arctic regions is due to extended travelling parties.

This strange Introduction will act as a wet blanket on the work of Sir George Nares, and it is very unfortunate that it should have been inserted. For Admiral Richards was not one of those Arctic officers who assisted Sherard Osborn throughout in his patriotic efforts to obtain a renewal of Arctic exploration. When those efforts were commenced, on January 23, 1865, Osborn was warmly supported by General Sabine, by Sir George Back, by Admiral Collinson, by Captain Vesey Hamilton, and by many other old Arctic officers. But Admiral Richards then publicly announced that he was opposed to the despatch of an expedition. And his opposition was very effectual. He adopted Dr. Petermann's now exploded theory about sailing direct to the Pole by way of Spitzbergen; he caused a division in the camp, and thus delayed and thwarted the work for several years. He was against the Smith Sound route, he was against exploration by sledges, and he always depreciated the value of the scientific results of Arctic work. On April 22, 1872, he changed front to some extent, and even expressed a hope that an expedition might be sent. But it is unfortunate that an officer who long opposed the endeavours to obtain a renewal of Arctic exploration, who has always depreciated the scientific results to be obtained, and who objects to exploration by sledge travelling, should have been selected to write an Introduction to a narrative of Arctic exploration by means of sledge travelling, the chief object of which was to secure scientific results.

The work of Sir George Nares, as we have already intimated, forms a complete refutation of the views put forward in the introduction by Sir George Richards. It is the narrative of a very successful expedition equipped for exploring unknown coasts by sledge travelling, and it details the numerous and valuable scientific results of such exploration. Sir George Nares has written his book mainly in the form of a diary, the greater portion consisting of extracts from his journal, and from the official journals of the officers in command of the various sledge parties. He has written, he tells us, for the information of future Arctic explorers, and for this purpose the method he has adopted is suitable, especially as the enquirer is assisted by a good and copious Index. In these interesting pages we are enabled to follow the expedition through the unprecedented difficulties of ice navigation until, thanks to the consummate seamanship and unceasing watchfulness of its commander, the advanced ship crossed the threshold of the unknown region and entered upon its work. We are then introduced to the perils and discomforts of autumn travelling, and to the routine of an Arctic winter in a well-organised expedition. But the main interest of this memorable enterprise lies around the spring travellers, whose heroic de-

votion to duty will ever form a bright page in the annals of our navy. Captain Nares sent extended travelling parties to the north, to the south, to the west, and to the east, and all returned, after enduring incredible sufferings and hardships, with a rich harvest of useful results. The plans for completing this exploring work were admirably conceived and most efficiently executed. The object of the expedition was to explore that portion of the unknown area which was accessible by the Smith Sound route, and this object was, in the face of great difficulties, most fully secured. The expedition was consequently successful; and the pages of Sir George Nares's volumes record the means by which success was obtained, and the noble deeds of those who served under him.

But the work is not only a record of the labours and sufferings of the explorers: it also chronicles the results of those labours. It not only tells us how the battle was fought, and the victory won: it also enumerates the spoils, and demonstrates their value. We are told by Admiral Richards, in the Introduction, that the results of a sledging expedition hardly justify its despatch. We are convinced by Captain Feilden, in the Appendix, that the numerous results, and their great scientific value, most fully justified all the expense and all the hardships that were entailed in obtaining them.

The extremely interesting sections of the Appendix on the ethnology, the mammalia, and the birds, are by Captain Feilden himself, the indefatigable naturalist of the *Alert*; and the fishes have been reported upon by Dr. Günther of the British Museum. The *Mollusca* and *Insecta* of the expedition were worked out by Mr. Edgar Smith and Mr. McLachlan, and the *Crustacea* by Mr. Miers and others. Prof. Martin Duncan reports that the collection of *Echinodermata* is so interesting, and the specimens are so variable, that they will be described fully in a separate monograph. The *Polyzoa*, *Hydrozoa*, *Spongiida*, *Foraminifera*, and *Polycystina*, have also been described by competent authorities. The very excellent collections of flowering plants and ferns brought home by Captain Feilden were examined and named by Prof. Oliver, and the Appendix contains a most interesting Report upon them by Sir Joseph Hooker. The geological results of the expedition, including the discovery of a miocene coal-bed near Discovery Harbour, are most important, and have been very ably discussed by Captain Feilden; and the fossil flora has been examined by Prof. Heer, of Zürich. Complete sets of meteorological, tidal, and magnetic observations were made at two different stations during a whole year; while the geographical discoveries were of the utmost importance.

The Arctic Expedition of 1875-76 was completely successful. It has proved that such enterprises are not only useful as supplying very noble occupation for the navy in time of peace, but that the valuable scientific results are worth all, and more than all, that is expended in obtaining them. It has also confirmed the opinion based on all former experience, that the ship must be looked upon merely as the base of operations, and that all useful exploration must be achieved

by extended sledge travelling parties. Finally, its results have proved that Arctic research is of sufficient importance to justify the continued support of our Government, and that other expeditions should follow until the greatest geographical problem of our age is fully solved.

CLEMENTS R. MARKHAM.

La Saisiaz: The Two Poets of Croisic. By Robert Browning. (London: Smith, Elder & Co., 1878.)

In Mr. Browning's latest volume we are reminded in many ways of *Fifine*. There is the same delicate problem whether one love is enough for a man, which was already foreshadowed in the exquisite *Any Wife to any Husband*. There we had the wife's half-reproachful generosity: in *Fifine* we had the husband's half-humorous, half-abashed apology for adding the lower love to the higher. In the present volume we have the stage where the memory of the highest love is enough, and there is no present need for anything but companionship—if loving, youthful companionship, so much the better. This is the moral of the pretty story of the Greek poet whose string snapped when he was playing and singing for a prize, which he won because the chirping of a cricket supplies the missing note, and is immortalised by his gratitude. The lady who quotes the story to a poet who told it her while his shoulder propped her head asks if he will be as grateful and own

“‘as Victory was nighest,
While I sang and played,—
With my lyre lowest, highest,
Right alike,—one string that made
“Love” sound soft was snapt in twain,
Never to be heard again,—

Had not a kind cricket fluttered,
Perched upon the place
Vacant left, and duly uttered
“Love, Love, Love,” whence’er the bass
Asked the treble to atone
For its somewhat sombre drone.”

But you don’t know music! Wherefore
Keep on casting pearls
To a—poet? All I care for
Is—to tell him that a girl’s
“Love” comes aptly in when gruff
Grows his singing. (There, enough!)”

In *La Saisiaz* the same poet or another philosophises on the death of a companion dear and true, who died suddenly after ascending Salève in his company by sunset, as a preparation for another ascent to see the sunrise. In one of their last walks together they had discussed lightly enough

“What seemed hits and what seemed misses in a
certain fence-play,—strife
Sundry minds of mark engaged in ‘On the Soul and
Future Life.’”

As he looks at Mont Blanc from her grave at Salève, he wonders how much is left of one better loved than she knew:—

“You supposed that few or none had known and loved
you in the world:
May be! flower that’s full-blown tempts the butterfly,
not flower that’s furled.
But more learned sense unlocked you, loosed the
sheath and let expand
Bad to bell and outspread flower-shape at the least
warm touch of hand

—May be, throb of heart, beneath which,—quicken-
ing farther than it knew,—
Treasure oft was disembosomed, scent all strange
and unguessed hue.
Disembosomed, re-embosomed,—must one memory
suffice,
Prove I knew an Alpine-rose which all beside named
Edelweiss ? ”

and then comes the question, what is left of
er beside a memory: he has to face the
uestion of the Symposium seriously and
bide his own answer. The answer is worked
ut by a dialogue between Reason and Fancy
omewhat after the manner of Tennyson's
Two Voices. In that marvellous early work
here is a far wider range of suggestion and
agenuity than in *La Saisiaz*, but the work of
he maturer poet has more point and decisiv-
ess. The younger seems to come round to
he comfortable view of the subject without
nowing why. Mr. Browning imagines a
oet who will resolutely though regretfully
verturn the cup of comfort and wait to be
onvinced by his own dialectics. Like
Descartes, Mr. Browning establishes the two
ltimate facts of God and the soul by a sim-
le appeal to consciousness: having had the
dvantage of studying Descartes' critics, he is
ware that the consciousness which establishes
his primitive synthesis is purely personal;
ut his poet does not refuse his personal con-
idence on that account. The poet is also
ware that what is given in consciousness is
t most the present relation of the soul and
od, and that the eternity of God and the
urpose of creation in general, and of the
reation of the soul in particular, are mat-
ers of inference. Subject to these provisos
ve get one of the most forcible statements
n the English language of the unsatisfactory
ature of the conditions we live under, and
f the illusory nature of all the palliations
suggested by those who wish to discredit
he old one, that there is a better life to come.
The writer states very soberly, and there-
fore very impressively, that if this life is all,
it is upon the whole a vale of tears, and such
slow progress as is observable in the life of
the race is fairly enough made a presumption
that the progress in the life of the individual
will at last reach its due term, which on
earth it obviously does not. No reply is at-
tempted to the obvious observation that in
the simpler processes of nature, such as cry-
stallisation and vegetation, the early stages, so
far as they can be watched, are just as satis-
factory, so far as they go, to an idealist as the
later; and that Cowper's weaver, who only
saw the wrong side of the pattern in his
loom, could always see the right side if he
thought it worth while to stop the loom and
turn it up, which we cannot. The writer
puts all his strength into the thesis that,
assuming this life to be a state of probation
or education, we have just as much ground
to surmise a better as would serve to bring
out the full extent of our ethical appreciation
of it. Having brought the argument so far,
Mr. Browning's poet asserts himself invested
“for the nonce” with all the eloquence of
Rousseau and the poetical power of Byron
and the learning of Gibbon and the wit of
Voltaire—all of whom had lived near *La*
Saisiaz—in order that he might enunciate
with the maximum of extrinsic authority his
confession of faith, which he rightly regards
as more comfortable and edifying than

those of Rousseau and Byron, of which
we have very fair parodies. The con-
fession is summed up in a line,
“Well? why he at least believed in Soul, was very
sure of God.”

Most persons who regard the questions at
issue as matter for argument, if they con-
sider the arguments of Mr. Browning's poet
at all, will consider that he has made out a
stronger case for what he believes in than
for what he is sure of; although it is a pre-
sumption in favour of his view that the races
which have embraced Buddhism and are con-
siderably more sure of soul than of God stand
upon a distinctly lower level than the Aryan
and Semitic races, which, whenever they
have been in a condition to put the question
to themselves, have been much more sure of
God than of soul. This is a consideration
which would commend itself to a writer who
at the close of the *Two Poets of Croisic* de-
cides that among real poets the question of
relative rank is to be settled by the question
“which one led a happy life?”

“If one did, over his antagonist
That yelled or shrieked or sobbed or wept or
wailed
Or simply had the dumps,—dispute who list,—
I count him victor. Where his fellow failed,
Mastered by his own means of might,—acquist
Of necessary sorrows,—he prevailed,
A strong since joyful man who stood distinct
Above slave-sorrows to his chariot linked.

Who knows most, doubts most; entertaining hope,
Means recognising fear; the keener sense
Of all comprised within our actual scope
Recoils from aught beyond earth's dim and dense.
Who, grown familiar with the sky, will grope
Henceforward among groundlings? That's offence
Just as indubitably: stars abound
O'erhead, but then—what flowers make glad the
ground!

So, force is sorrow, and each sorrow, force:
What then? since Swift's gives the charioteer
The palm, his hope be in the vivid horse
Whose neck God clothed with thunder, not the
steer
Sluggish and safe! Yoke Hatred, Crime, R-morse,
Despair: but ever mid the whirling fear,
Let, through the tumult, break the poet's face
Radiant, assured his wild slaves win the race!”

Mr. Browning has seldom written any-
thing nobler or more musical than the two
last stanzas of our quotation: and no doubt
Shakspeare or Milton lived a happier life
than Byron; but, so far as our knowledge
goes, Scott and Wordsworth, till his
tearful old age, lived happier lives than
either, and the happiness of Scott and of
Wordsworth, so far as he was happy, was
due to their success in yoking the safe steer
and the fiery horse together.

The main problem of the poem, however,
is not the comparative worth of true distinc-
tion, but the tragedy of abortive endeavour
complicated with the comedy of momentary
success. The poem begins with a descrip-
tion of the weird, uncomfortable little town
of Croisic, with its bleak scenery and
Druidical survivals. We are reminded again
of *Fifine* in the way in which the poet lingers
over the veneration still paid to the Menhir
which has kept its place, and the scenery in
general reminds us of the powerful landscape-
painting of “Childe Roland to the Dark
Tower came.” And then we come to the
two poets, each of whom, in spite of un-
favourable surroundings, had his own mo-
ment of celebrity, though the first is now

only remembered by the second's unsuccess-
ful curiosity about him; and the second is
only remembered by his good fortune in
duping Voltaire, which made him the hero
of Piron's *Métromanie*. These two forgotten
celebrities are identified with two sparks from
a Yule log by a rather elaborate adaptation of
the children's game of Parson and Clerk,
which some readers may be able to accept
as humorous. More will be able to admire
the sobriety with which the author exhibits
the early poetaster, a page at the Court
of Condé when it seemed certain that
Louis XIII. would die childless, whose great
experience came in the shape of a thunder-
storm that shattered the ducal crown on
the terrace (which all the Court soon ex-
pected to see turned into a royal one), and
seemed to the Croisic poet, interrupted in
the composition of an ode to his mistress,
like a plain revelation from heaven that the
true king would yet have a son and heir. He
immediately embodied his prophecy in a
poem which he handed to his patron, and
then took fright at his own boldness. The
boldness was justified in the course of a
year: the poet published his poems, especially
the prophecy, with due attestations and any
number of complimentary verses, his con-
temporaries' congratulations on his foresight;
after which he had the admirable discretion
to let nothing more be heard of him.

“No doubt his soul became at once aware
That, after prophecy, the rhyming-trick
Is poor employment: human phrases scarce
Rather than soothe ears all a-tingle yet
With tones few hear and live, but none forget.”

In fact, his experience is a sort of concrete
repetition of the experience of Lazarus as
conceived by Karshook, only the presenta-
tion is a little more ironical; Karshook
believes less in the story he tells than the
poet who created him, and according to the
story Lazarus's whole life was coloured by a
brief experience of transcendental realities.
The poet, who—for as long as it took to get
his works printed with his own portrait
engraved as a frontispiece—imagined himself
a prophet, never came into contact, as the
story is told, with anything higher than
disciplinary illusions which it would do us
harm to see through:—

“No, we must play the pageant out, observe
The tourney-regulations, and regard
Success—to meet the blunted spear nor swerve,
Failure—to break no bones yet fall on sword;
Must prove we have—not courage? well then—
nerve!
And, at the day's end, boast the crown's award—
Be warranted as promising to wield
Weapons, no sham, in a true battle-field.

Meantime, our stimulated thunderclaps
Which tell us counterfeited truths—these same
Are—sound, when music storms the soul, perhaps?
—Sight, beauty, every dart of every aim
That touches just, then seems, by strange relapse,
To fall effectless from the soul it came
As if to fix its own, but simply smote
And startled to vague beauty more remote?”

When so many writers from the author of
the *Psalm of Life* upwards and downwards
are engaged in well-meant endeavours to
give a factitious seriousness and dignity to
this transitory and perishable life, there is
reason to be grateful to Mr. Browning for
the renewal of his weighty and penetrating
protest.

The same protest is repeated in a lighter

form in the history of Paul Desforges Mailard, who sent an unsuccessful prize-poem to the editor of the *Paris Mercury*, and afterwards—by the suggestion, at all events by the help, of his sister, who copied his poems, beginning with the worst, in her own writing—duped both the editor and Voltaire, who fell in love with Mdlle. Malcrais de la Vigne, his sister's *nom de plume*, on the strength of the verse she signed. Paul, when he thought fit to claim in his own person the reputation he had won under the name of a lady, had the amusement of humiliating two celebrities, and was afterwards misguided enough to challenge the world by printing a collected edition of the verse praised under false pretences, thinking that nobody would take back his homage.

“Oh Paul, Oh piteously deluded! Pace
Thy sad sterility of Croisic flats,
Watch, from their southern edge, the foamy race
Of high-tide as it heaves the drowning mats
Of yellow-berried web-growth from their place,
The rock-ridge, when, rolling as far as Batz,
One broadside crashes on it, and the crags,
That needle under, stream with weedy rags!”

It is rather an abrupt descent from poetry like this to reflections on the distinction between fame which is mere fashion and fame which is more, the latter being illustrated by the rather hazardous instance of Beddoes, whose reputation is not yet secure against slipping back among the *dilettanti*.

G. A. SIMCOX.

The Conflicts of Labour and Capital; being a History and Review of the Trade Unions of Great Britain. By George Howell. (London: Chatto & Windus, 1878.)

At the time of the great strikes in the London building trades, in 1859–60, this author, then quite a young man, was a bricklayer, and a member of the Council of his Union. He came to the front in the course of that long and bitter struggle, and after it was over had to seek work out of London. Not long afterwards he was sought out as secretary to the Reform League, which post he filled till that body was dissolved. So far as we are aware, he has had no education, beyond what a National School could give, which he has not picked up for himself. No one who bears these facts in mind while reading this book will, we think, be inclined to deny that it is a really noteworthy work. In this branch of literature no such book has hitherto been produced by an English working man; nor, so far as we are aware, with the single exception of M. Nadaud, by any foreigner. And in the present phase of the labour question it should bear a high value, representing as it does with unquestionable authority the views of that great and hitherto almost inarticulate section of our people which must now be reckoned with, and for good or evil will have more and more to say every year in the conduct of the affairs, and government of the life, of this nation. Those who are familiar with the writings of Dr. Brentano, Mr. Thornton, Mr. Ludlow, Prof. Fawcett, Mr. F. Harrison, and Mr. Crompton, will not come upon anything new or original in Mr. Howell's pages; at least we have not found any position defended by him which had not previously been occu-

pied by one or other of these gentlemen. But though he keeps within the old lines he shows himself quite competent to hold them, and well aware of the weak places and points of vantage; and, if he avails himself freely of weapons which other men have used before him, he has clearly mastered their use, and is not going into action with armour which he has not proved for himself.

Were it otherwise we should have little hope that the book would do the good service which we expect from it. A mere compilation, however carefully done, would carry little weight, even with readers whose interest in the subject might survive through the 500 pages. But Mr. Howell is an able and temperate advocate, as well as a diligent compiler, contrasting in this respect very favourably with such opponents as Sir E. Beckett, who can see nothing in the Unions but mischievous and insane attempts to recast society in defiance of some law of the universe which they seem to think has provided that English workpeople are, and must remain, a sort of gutta-percha figures, to be squeezed into such shapes as shall please their employers, and whose wisdom would be to learn to work quietly for such hours as shall be fixed for them, and to strive for higher wages by the simple process of underselling their fellow-workmen.

The book opens with a short history of the old guilds—the Trade Unions of the Middle Ages—which those who are not familiar with Dr. Brentano's book on *Workmen's Guilds* will find a very readable summary of that important work. After tracing their history from its commencement to the present time, Mr. Howell parts in sorrow, not unmixed with scorn, from

“all that remains of the ancient guilds in the Livery Companies of to-day—the feasting and drinking, the processions and regalia, which point to their mediæval origin, and their immense revenues chiefly derived from monopolies granted in a bygone age, and which up to the present have managed to resist legislative investigation and to evade Governmental control” (p. 78).

The City companies are acting wisely in these days in taking up the subject of technical training in their respective handicrafts, before the time when those who look upon themselves as the lawful heirs of the good things they are usurping have become powerful enough to challenge their title to that goodly heritage. Two careful and able chapters follow on the “History and Development” and the “Objects and Government of Trade Unions.” Those who wish to get, without trouble, a bird's-eye view of the present position of these organisations will find the facts summed up on the table given at page 172, and in the next three or four pages. The benefits conferred by the Unions are given under six heads at pages 193–194, to only one of which we should demur. This is the fifth, which claims for Unions that “they encourage emulation among their members both as to methods of work and skill.” There is no evidence of this known to us in the rules of the Unions, or in their public action, and much that leads to the opposite conclusion. Mr. Howell has supported several of his other positions by very valuable evidence; as, for instance,

when he asserts that the governing bodies of the Unions are on the side of law, and cites the cases of the Bristol Union taking the employers' side and stopping the strike-pay of men who were breaking the law, and of the London Trades' Council refusing to defend Unionists (p. 319). He should have followed the same course in support of his fifth proposition, which stands, we fear, at present on the simple assertion of those whose wish is father to the thought.

Chapter IV., on “Political Economy and Trades Unions,” is, to our mind, the weakest in the book, and to a certain extent justifies Mr. Goschen's assertion, to which Mr. Howell takes such keen exception, “that political economy is the bugbear of the working class, and philanthropy its idol” (p. 195). The moderation and good taste which characterise the book generally are here, too, somewhat at fault, as when he proposes to substitute his own nickname of the “Grab-all Science” for Mr. Carlyle's “Dismal Science.” We should have expected it to occur to so able and fair-minded a writer, that all those champions whom he sets in array against Mr. Malthus, and those of that great man's disciples whom he dislikes, are themselves all professed economists; and that the science which is concerned (as its name declares) with the Law of the State's Household must remain a noble and philanthropic study even in the Millennium. His own book is a treatise on the hated science, and a valuable one, though we can by no means admit his claim to have been the first to point out the fallacy of the limitation of “the wage fund” in a speech in St. Martin's Hall in 1860.

The following chapters on *Piece-work*, *Hours of Labour and Overtime*, and on *Apprentices*, are perhaps the most valuable in the book, because these are the questions round which the battle has raged most fiercely for the last quarter of a century, since the first great lock-out of the Amalgamated Engineers, in 1851–2. Here Mr. Howell is again at his best (the red rag of Political Economy being no longer in sight), and his discussion of the “butty” system and the “sub-contract” system (p. 281, &c.), his statement of the men's case for short hours (pp. 300–1) and his explanation of the deterioration of workmanship of late years, are worth the careful study of all who care to look at these subjects from the standpoint of the most intelligent of our handicraftsmen. Mr. Howell himself, though he does not avow it, is obviously a believer in the adage, “eight hours' work, eight hours' play, eight hours' sleep, and eight shillings a day,” for which he claims Alfred's famous threefold division of his time as the parent. We may add that he is as earnest in his denunciations of all that class of offences known as “rattening” as any employer could wish. “Call it what you will,” he writes (p. 322), “it is robbery: it is an offence against the law, violates the rights of property, and is repugnant to all sense of duty, right, and freedom.”

We must pass over the chapters on the Federation of Unions, Strikes, Conciliation and Arbitration—all temperate statements of the Unionist case—to the twelfth, which deals with Co-operation and Industrial Partnerships. We do not see that it was necessary

to Mr. Howell's purpose to touch this subject at all, but having done so he should have given it more space, and examined, and thought it out, more carefully. Whether our working classes will "not be prepared for generations to come" (p. 467) for Co-operation, as he holds, is a matter of opinion; but when he asserts that "the chief thing aimed at is large dividends;" that "Co-operative Associations differ from ordinary firms in nothing except the numbers who share profits;" and that "it is admitted that Co-operation has failed to produce any lasting effects on the burning questions which agitate the minds of those engaged in labour" (p. 473), we cannot let the statements pass unchallenged. They are true of the large middle-class associations, which have taken the name and adopted parts of the machinery of the working-class co-operators, but not true of the 1,200 societies in federation, which are represented by the Central Board elected yearly at the Co-operative Congress.

Our space will not allow us to do more than enter a protest; but when Mr. Howell has time to reconsider this matter, we would ask him to take his own views of the work which Trade Unions have to do in the future, and ascertain how far what he hopes of them has already been actually done for some three millions of people by Co-operative Association. He complains that the Unions are "living from year to year on their capital" (p. 474); he thinks that, "if judiciously managed, the Union funds may be used to purchase dwellings for their members, and to procure them the best goods at the lowest prices" (p. 496). Most desirable objects, no doubt, about which the Unions have been talking for more than a generation, but which they will never even begin to realise until they adopt those principles and methods of the co-operators which, as Unions, they still look upon with so much distrust.

It is no doubt a long step for Unionists to take, but we have no doubt that they will take it before long, and that Mr. Howell will be one of the first converts; for it is becoming clearer every day that the "conflicts of Labour and Capital" will never come to an end except in this way, and that it is through Co-operation, and not Trade-Unionism, that—

"Surely that wiser time shall come
When this fine overplus of might,
No longer sullen, slow, and dumb,
Shall leap to music and to light.
In that new childhood of the earth
Life of itself shall dance and play,
New blood through Time's shrunk veins make
mirth,
And Labour meet Delight half-way."

T. HUGHES.

Les Epopées françaises : étude sur les origines et l'histoire de la littérature nationale. Par Léon Gautier. Tome I. Seconde édition, entièrement refondue. (Paris: Palmé, 1878.)

THE time is gone by when a critic could write, without being charged with ignorance, that "les Français n'ont pas la tête épique." Even the general public are beginning to be aware that the epic arose in France earlier than among the other Latin races; that the

French epic attained abroad a greater expansion than the Germanic epic; and, in short, that it was for centuries adopted and imitated by the whole of Europe. If it did not enjoy the good fortune which fell to the lot of the Greek epic, if it did not find a genius to ensure immortality to its traditions and protect them against the forgetfulness of the literary classes, it is well qualified to excite the interest of a critical school which is on the watch not only for individual genius but also for the spirit of a nation, which studies them from the historical rather than from the æsthetic point of view, which finds more scope for its energies in the examination of spontaneous and popular works than of those which are the result of reflection and individual effort. So the number of those who are tempted by the study of our epic poetry is increasing, editions of our Early-French poems are multiplying, and the curiosity of educated persons who are yet strangers to science is beginning to take this direction.

Among the scholars who have most largely contributed to draw attention to our *chansons de gestes* must be reckoned the author of the book above named. In the group of those who are engaged on mediæval French literature, M. Léon Gautier has made himself a place apart. Some of his rivals may bring to the same studies a more delicate literary tact, a more profound knowledge of the literatures which have imitated our own; some may be distinguished by a more unflinching critical sense. M. Gautier's special characteristic is the subjective way in which he treats a question, the personal impress which he gives it, and, as in the present case, the enthusiasm with which it inspires him, the gift of making his subject comprehensible and attractive. Hence the dogmatic manner, the tone at once oratorical and familiar, which we notice in his book. There are few delicate shades of thought; but we have very clear and sharply-defined ideas which pass and repass repeatedly before the reader, and are engraved on his mind. To all this must be added a profound knowledge of his subject, and above all of the texts themselves, as well as great sincerity in quest of truth.

It is, in fact, to a scrupulous feeling of the imperfections of his earlier work, to the exigences of a conscience which is hard to satisfy, that we are indebted for this second edition. M. Léon Gautier has taken account of the criticisms on the first. Thus he no longer explains the formation of the earliest *chansons de gestes* by the juxtaposition of ballads, but admits oral tradition as an alternative source. It is on this question of origin, the most obscure and the most attractive raised by the history of our epic literature, that M. Gautier has derived most profit from the works which have appeared since the first edition of his book. To characterise the *chansons de gestes*, he has adopted the formula of M. Gaston Paris—"l'esprit germanique sous la forme romane." Is not this formula open to the charge of attributing to a race what belongs rather to a social régime in which there was a confusion of races? And does not M. Gautier fall into an anachronism when he recognises in the *chansons de gestes* the institutions of the reign of Charlemagne?

The Emperor's boundless popularity, absorbing that of his ancestors and of his Merovingian predecessors, imposed itself on our first epic poets, but they adapted, as it were, that glorious name to a state of society and to institutions differing widely from those organised by the restorer of the Western Empire.

In Book I. of his present work M. Gautier has followed the chronological order: in fact, he could scarcely adopt any other in explaining the origin and formation of the epic. The same order was not equally necessary when he came to deal with the study of the epic during its period of splendour, which is the subject of Book II. For instance, we can very well imagine such a study divided into as many parts as there are *gestes*: the *geste* of Charlemagne, of Guillaume d'Orange, of the House of Lorraine, &c. Had this plan been adopted, each *geste* might have been studied with regard to its sources, its fabulous relations, its propagation, its legendary and historical elements: in a word, the author of *Les Epopées* might have done for each of these *gestes* what M. Gaston Paris has done for the *geste du roi*. This is what M. Gautier intends to do in the following volumes, but he decided first to study the *chansons de gestes* as a whole, and, in order to deal with the general questions suggested by them, he has traced a plan which consists in following our poems from their first conception to their propagation by the *jongleurs* in France and abroad.

This plan is based on sound principles, but unfortunately the author has sometimes swerved from it. Thus he deals with language and dialects (chap. vi.), and then with versification (chaps. vii. and viii.), before attending to the matter of the poems (chap. ix.). Then, having treated of form before treating of subject-matter, the author returns to form in his sixteenth chapter, which is devoted to style. Nor do the chapters on the manuscripts of the *chansons de gestes*, and on the mode of publishing them, seem to us to occupy their proper place. If this want of method strikes the reader, it will naturally escape the notice of those who use the work for purposes of reference, and who will be guided, till the appearance of the alphabetical index promised us by the author, by the very complete analytical table of contents. We must not, therefore, exaggerate the defect which we have just pointed out.

We have called it a book of reference. It is, in fact, as such that M. Gautier's work will render special service to those who are already familiar with our ancient epics. As to those who know them only by name, they cannot find a more earnest and more sympathetic interpreter of their beauties. The author's sincere and contagious enthusiasm, the simplicity and dogmatism of his ideas, the rhetorical character of his style, will have special attractions for youthful readers, and will awaken in many a taste for this class of studies. We may say, in fact, without forgetting the honourable part taken by the author in their development, that he is specially distinguished in our eyes by the qualities of the populariser; but let us hasten to add, to deprecate the disfavour into which this word has been brought by too many crude and unconscientious works,

that he is a populariser with an admirable knowledge of the questions with which he deals, who forms his own ideas, and is continually checking them by keeping himself *au courant* with the progress of science.

G. FAGNIEZ.

ROMAN LAW.

A Systematic and Historical Exposition of Roman Law in the Order of a Code. By William A. Hunter, Professor of Roman Law, University College, London; embodying the Institutes of Gaius and the Institutes of Justinian, translated by J. Ashton Cross. (London: William Maxwell & Son.)

Studies in Roman Law, with Comparative Views of the Laws of France, England, and Scotland. By Lord Mackenzie. Fourth Edition. Edited by John Kirkpatrick. (Edinburgh and London: William Blackwood & Sons.)

An Analysis of M. Ortolan's Institutes of Justinian, including the History and Generalisation of Roman Law. By T. Lambert Mears. (London: Stevens & Son.)

THE study of Roman law is steadily progressing in this country. The stimulus applied by the law examinations of the several Universities and also of the Inns of Court has already borne fruit. Both as an example of abstract jurisprudence, and as a subject by itself, the *Institutes* of Justinian have taken a recognised place in the curriculum of legal education, and there are now several good editions available to the student. But it must be admitted that until recently our standard treatises on Roman law bore too evident traces that they had been produced to satisfy the demand of the examination system. It is satisfactory, no doubt, that elementary works reproducing the substance of German or French originals should find a market among English law-students; but apart from the incidental contributions of Austin and Maine, our own country has hitherto been backward in the task of elucidating that great system of law upon which all modern jurisprudence is based. We have had writers of text-books, and we have had commentators, but no names comparable with those of Savigny and Ortolan in the domain of comprehensive analysis and original research.

Prof. Hunter's *Exposition of Roman Law* goes far towards removing the burthen of this reproach. It undertakes to re-arrange the whole subject from the point of view occupied by the most recent writers on jurisprudence. The author is not afraid to criticise the results of his predecessors, or to suggest certain novel theories upon points of considerable importance. Perhaps his chief characteristic is that he regards Roman law not as an antiquated specimen of jurisprudence whose value is chiefly historical, but as a systematic body of principles, capable of being re-arranged so as to correspond in its order with the ideal code of the present day. At first acquaintance, the reader already familiar with the *Institutes* will be disturbed to find that the old division of the Law of Persons and the Law of Things has been deliberately aban-

doned. But to the pupil who has learned the scientific classification of Austin before entering upon the study of Roman law, all will at once be intelligible, and he will be saved the task of modifying what he has been taught in accordance with an arbitrary principle that possesses only an historical significance. Prof. Hunter begins by classifying his subject under four books, which are respectively entitled *Rights in Rem*, *Rights in Personam*, *Inheritance and Legacy*, and *Civil Procedure*. A uniform order of exposition is then adopted for each group of rights and duties that make up the larger classes. For example, the *potestas* exercised by fathers over their children is treated under the following headings:—(1) Definition; (2) Rights and Duties; (3) Investitive Facts; (4) Divestitive Facts; (5) Transvestitive Facts, a term conveniently coined for the purpose; (6) Remedies. The same elaborate method of division and subdivision runs through every chapter of the book; and unless the reader carefully masters the principles upon which the classes are arranged, he will become hopelessly confused by the numerical and alphabetical progressions and the constant changes of type. Our first feeling on turning over some of the pages was similar to that produced by the contemplation of an ill-arranged genealogical tree. However, from the point of view of the student, we have no doubt that Prof. Hunter has acted wisely in availing himself of all the devices that the printer's art can supply in order to arrest attention.

But Prof. Hunter is something more than a systematic expositor of the common inheritance of all students of jurisprudence. On two or three points he has been bold enough to advance original views of his own which are deserving of much consideration. The place occupied by the theory of Possession in Roman law has always presented difficulties which were not completely removed by the well-known explanation of Savigny. That learned and ingenious writer, availing himself of the reconstruction of early Roman history effected by Niebuhr, explained the importance of the right to possession by referring it to the irregular occupation by the patricians of the *publicus ager*, in which the full right of property was not possible. Prof. Hunter, while not denying the plausibility of this hypothesis, takes up what is substantially a different position. According to his theory, possession represents the only right of property in Roman soil which the strict principles of early jurisprudence allowed to foreigners. In other words, "possession is equitable ownership of land," following in its main incidents the legal ownership or *dominium*, and protected by the special agency of praetorian interdicts which were moulded after the fashion of the older remedies of the *jus civile*. In discussing the historical origin of the various forms of contract recognised by Roman law, and in tracing the connexion between Contract and Conveyance, Prof. Hunter is again led to express views which differ from those maintained by several distinguished jurists. He has also been bold enough to assign a new definition to the much-vexed term *status* which we have not space to criticise.

Lord Mackenzie's *Studies in Roman Law* afford an interesting example of the different position which the subject occupies in Scotland. This work, which was first published in 1862, and has now reached a fourth edition, enjoys, we believe, the reputation of a classic for educational purposes. It is written with sufficient learning and great clearness, and while its bulk is small its subject-matter covers a very large field. There is a full historical sketch, a general analysis of the conception of law, and a rapid summary of the chief points of Roman jurisprudence, as compared with the corresponding rules of law in France, England, and Scotland. The whole is presented in an eminently readable form, with a copious array of original authorities. But with all these merits, Lord Mackenzie's book possesses one grave defect. It does not supply any new contribution to the treatment of a well-worn subject. It may be described as the careless outpourings of a full mind, rather than the supreme result of scientific study. Considering the extent to which Scotch jurisprudence is penetrated by principles borrowed from the civilians, and also the obligation imposed upon Scotch advocates and upon Scotch judges (by an express article of the Treaty of Union) of undergoing an examination in the civil law, it is curious to observe how little its study has been advanced in Scotland. It is true that the *Institutions* of Stair, the *Institute* of Erskine, and the *Commentaries* of Bell furnish admirable illustrations of the manner in which rules borrowed from Rome can be applied to modern circumstances, and exhibit "familiar acquaintance with the writings of the continental jurists." But they do not profess to be more than expositions of the municipal law. To these standard authors, as to Scotch lawyers at the present day, Roman law is merely the historical introduction to the law of their own country. It is studied more commonly than in England, and very likely it is studied better; but it is nowhere regarded as a proper subject for scientific research, apart from its manifest value to the practitioner. The modern revival, which originated in Germany and has spread to France and England, appears to have borne no fruit in the congenial soil north of the Tweed. The present edition of Lord Mackenzie's *Studies* is edited by Mr. John Kirkpatrick, who has been careful to add references to the most recent authorities, and to make the corrections rendered necessary by the lapse of time. It is not the editor's fault if the comparative views of the laws of France, England, and Scotland look somewhat meagre, and if the corrections in certain cases are more important than the original text. Lord Neaves, whose lamented death has taken place since we received the book for review, has added an Appendix which chiefly consists of Greek epigrams paraphrased with characteristic humour.

The name of the late M. Ortolan undoubtedly ranks in the first place in France among expositors of Roman law, and to him all English commentators on the *Institutes* of Justinian are deeply indebted. No one, even in Germany, has thrown so much light upon the subject by the intelligent ap-

plication of the historical method. M. Ortolan died in 1873; and the eighth and last edition of his great work was published in three volumes in 1870. In the following year (1871) there appeared an authorised translation of the two introductory chapters, entitled *l'Histoire de la Législation Romaine et une Généralisation du Droit Romain*, from the competent hands of Messrs. Prichard and Nasmith. We were, therefore, a little surprised to receive the volume standing third on our list, which also announces that it is "published with the late M. Ortolan's permission." Our surprise was removed when we noticed that the editor is an LL.D. of the University of London, which makes "the study of M. Ortolan's entire work compulsory on all candidates for its law degrees." Mr. Mears, in fact, has set himself the too common task of compiling an analysis which shall be useful for students preparing for examination; and his chief merit is to have compressed into 140 pages that which occupies just five times as much in the original. We cannot further congratulate him on the success of his labours. We suspected something wrong when we found that he had entitled his second part "Generalisation of Roman Law," which ought to have been rendered "General View." Throughout the text the marvellous perspicuity of the French professor has suffered grievously in the process of condensation. The reader must be especially warned against giving more than a provisional assent to the summaries of the contents of the four books of the *Institutes*, which have been compressed out of all recognition. In some cases, also, such as in his novel derivation of *clientes* on page 3, Mr. Mears has unwisely attempted to improve upon his original. JAS. S. COTTON.

NEW NOVELS.

- An Open Verdict.* By the Author of "Lady Audley's Secret." In Three Volumes. (London: J. Maxwell & Co., 1878.)
Madge. By Lady Duffus Hardy. In Three Volumes. (London: Hurst & Blackett, 1878.)
A Knight of To-Day. By L. T. Meade. (London: J. F. Shaw & Co., 1878.)
The Little Alpine Fox-Dog. By Cecil Clarke. (London: Samuel Tinsley & Co., 1878.)
A Lost Battle. In Two Volumes. (Edinburgh: David Douglas & Co., 1878.)

THE subject of *An Open Verdict* is one which is suggestive of recent trials and police-reports, but the author of *Lady Audley's Secret* has very wisely made the interest of her story turn upon the character and not upon the outward circumstances of her heroine. The sketch of Beatrix Harefield is perhaps one of the most successful which Miss Braddon has ever drawn; and the contrast of the brave unfortunate heiress and the scheming small-minded Bella Scratchell is successfully carried out to the end. On these two women the interest of the story depends—the men are not true studies of life, with the exception of the scholarly vicar and the vulgar millionaire. Cyril Culverhouse, the hero, may be a model curate, but is anything but a model gentleman; and

a love which could survive his desertion at such a time of need as that in which Beatrix is accused of the murder of her father was a passion which he was not likely to understand or appreciate throughout his life, in spite of the strong asseverations which the author puts into his mouth. Nevertheless, he has some fine qualities; and the scene in which he saves the life of the young shoemaker, by insisting on the transfusion of his own healthy blood into the cholera-stricken frame of the dying man, seems an original and striking incident. Curate-worship is a new element in Miss Braddon's novels, and it is too great a concession to a large number of her readers, however estimable the curate may be. But as a whole the tone of this novel is distinctly higher in many ways than any that we have seen of Miss Braddon's, and the plot is not less interesting.

Madge is a tragedy of fashionable life in spite of the happy marriage of the heroine to an earl at the end. The story is a pitiful one. A young girl, the daughter of a wealthy mine-owner, is suddenly plunged into the highest London society in a curious way. A lady of rank advertises for the charge of a young lady wishing to go into good society; the mine-owner, who is eminently "a self-made man," goes up to London for the day, makes friends with the lady of rank, and at once commits to her the charge of his one daughter, who, of course, is very beautiful. *Madge* has none of the difficulties which might be supposed to afflict a young *débutante* who has never seen any society but that of a blind friend and a young workman who has lost his heart to her; but she makes no mistakes, except liking an early run in Kensington Gardens, and going to spend the day with her brother and her chaperon's son in their lodgings, which is considered a heinous crime. Of course the chaperon's son is the hero, who is said to be "the god" of *Madge*, and enters the room where she is sitting "clothed in broadcloth and fine linen, even wearing on his head the proverbial chimney-pot." But the secondary hero, Colonel Dunstable, is far more interesting than Cecil Slade, who is nothing but a fairly good type of the young London man who has learnt to calculate even the strength of his affections. The tragedy concerns Colonel Dunstable, and it would be wrong to reveal it; but we think it strange that so little pity should be given to the unfortunate man who has been such a good friend to *Madge*. The story is very easily and smoothly written, and we are at the end almost before we are aware of it.

A Knight of To-Day hardly lays claim to being a novel, but it is an exceptionally good story, and this not so much from the strength of the plot, which is in some respects faulty, as from the interest which the characters create in their own histories, and the high-toned and large-minded way in which the book is written. Its hero is a man who gives himself up to work for the London poor; and he works not only for them but with them, raising those with whom he comes into contact by the power of personal sympathy, the depth of their need being the only measure of their claim upon

him. The plot breaks down in the account of the money-transactions concerning which the hero gets thrown into prison; but we would rather accept the mistakes made as to the forgery than lose the scene in which Archer hears that one of the working-men whom he has been trying to help out of evil ways is reclaimed by the thought of his wrongful suffering. The character of the heroine, Helen, is well drawn, and there is a great deal of close observation in that of her uncle, the old miser, who is morally poisoned by the love of gold. The minor characters are more conventional, but as a whole the story is a beautiful one, and told with strength and pathos.

It is a novelty to have a story told by a dog, and it is one which *The Little Alpine Fox-Dog* does not make us wish to see repeated. The dog commences his history in Switzerland, and at the outset we find it rather incongruous to read of "its mother murmuring a few words of jargon in its ear, these words conveying a mother's blessing on her child, and a heartfelt prayer for its welfare in its new life." The dog records the unhappy love-story of its young mistress, and is then transported to a meat-shop in London, from which it is afterwards stolen. Another curious episode in the story is that the dog is able to relate the conversation between two dog-stealers which took place when it was not present. The story is not a strong one, and does not gain by being told in this foolish way.

A Lost Battle is a pleasantly-written book which tells how failure may develop good in a character when success fails. The hero, Will Thorpe, is a philanthropist, and breaks down in his Utopian schemes of benefiting his uncle's tenantry, only succeeding in getting himself disinherited. But when everything seems most against him, he finds himself in possession of the prize which he has coveted above all others, the love of his friend Lisa Dalbiac, who from her own artistic career in Paris has been watching the life of the man to whom she had given the first impulse for good. F. M. OWEN.

CURRENT THEOLOGY.

De Foederis Notione Jeremiana; Commentatio Theologica. Scriptis Hermannus Guthe. (Lipsiæ: J. C. Hinrichs.) One conspicuous defect of most English commentators on the Scriptures probably is that they omit to interpret the ideas of the sacred writers: they explain the words and the constructions, and then, by a *salto mortale*, impose on the Biblical phrases the meaning attached to them in the theological standards with which they are most familiar. This excellent little tractate of Dr. Guthe does not offend in this way. No one who reads it carefully can fail to have a more real conception of what "covenant" meant to Jeremiah. Jeremiah, says Dr. Guthe, was the first of the prophets to use the idea of "covenant" religiously (one can hardly as yet say theologically) on a large scale. By so doing, he placed the growing spiritual religion on a firmer basis. For the idea that God was in covenant with Israel annulled the fancy of the divine capriciousness (at least, so far as the Israelites were concerned), and prevented excessive despondency in the worst times. It is possible that Dr. Guthe exaggerates the importance of the idea of "covenant" in the teaching of Jeremiah; but the fullness with which Dr. Guthe has discussed the question prevents us from ex-

pressing, in the scanty space at our disposal, a positive opinion on this subject. He has, at any rate, supplied an answer to the assertion of Dr. Kleinert (on the question as to the date of Deuteronomy) that the age of Josiah was incapable of original religious views.

Joel ben-Pethuel Propheta. Commentatus est Josephus Antonius Karle. (Lipsiae: J. C. Hinrichs.) A melancholy interest attaches to this small treatise, which has received high testimony from Drs. Delitzsch and Schrader. The author, a student of Biblical and Oriental literature of great promise, died before he could publish his work. We gather that it was primarily intended for Roman Catholic theologians; certainly it is far above the standard ordinarily attained by Roman Catholic exegesis.

Beiträge zur Erklärung des Buches Job. Von Dr. J. Barth. (Leipzig: J. C. Hinrichs.) A valuable re-examination of the critical problems of Job from the side of its literary relations to other Old Testament books. The author appears to us somewhat hasty in his judgments, but he has given a larger apparatus of cognate passages than any previous writer. At the end of the tractate are some original notes on difficult passages.

Beiträge zur Kritik des Buches Hiob. Von Lic. Carl Budde. (Bonn: Marcus.) This is a more complete investigation of the position of the critical question, mainly called forth by Studer's attack on the integrity of the book. Here, again, the value of the critical apparatus is far superior to that of the conclusions. Dr. Budde even ventures to maintain the genuineness of the speeches of Elihu; but he only succeeds in showing that it is, on linguistic grounds, barely possible, but not that, even from this limited point of view, it is at all probable.

Neutestamentliche Theologie. Von Dr. A. Immer. (Bern: J. Dalp.) A new work on New Testament theology, which deserves attention even after the great work of B. Weiss, especially as the subject has been rather neglected by English Biblical critics. The arrangement is similar to that of Weiss, but the author's presuppositions include the subordination of "metaphysical and mythical forms" to the religious essence of the doctrines—a hazardous enterprise, as it would seem. He also shows a tendency to bolder solutions of critical problems than Weiss. Prefixed to the work is an historical sketch of "the Hebrew and Jewish religion"—i.e., of the two principal phases of Israelitish religion.

The Prophecy of Jacob. Notes Critical and Exegetical on Genesis xlix. By Aug. N. Obbard, M.A. (Cambridge: Deighton, Bell and Co.) A Cambridge prize-essay, showing diligent study, especially of the Jewish commentators. It was hardly worth while for so youthful a writer to attack the accuracy of collective German scholarship, of which Rosenmüller, Gesenius, and Maurer are quoted indiscriminately as the representatives.

The Fore-Gleams of Christianity. An Essay on the Religious History of Antiquity. By Charles Newton Scott. (Smith, Elder and Co.) The "ambition" of the author is to supplement the "no less captivating than profound work of the late Mr. Maurice on the religions of the world, and their relations to Christianity. His conclusion is that Christianity is the true harmony of the earlier religions and philosophies, and that the hand of God is manifest in the preparation for the Gospel. The debateable character of the materials makes it difficult to criticise what is really a suggestive, well-written, and useful work. Some of its facts strike us as penultimate, if we may use the phrase, and not drawn from the latest sources. Yet English and French literature has been largely, and on the whole judiciously, drawn upon. We would suggest that the classification of races in Gen. x. is not, according to the best authorities, ethnological, but geographical and historical.

The Natural History of Atheism. By John Stuart Blackie, Professor of Greek at the University of Edinburgh. (Daldy, Isbister and Co.) Less full of facts than Mr. Scott's book, but perhaps more adapted to drawing-room readers. Originality, indeed, does not appear to be aimed at. That Atheism is naturally produced in persons of a certain type of mind, that there are "Atheistic incapables" and "Atheistic monsters," Atheists from self-assertion, Atheists from reaction against pedantic orthodoxy, &c., it hardly needed Prof. Blackie's vigorous pen to make evident. That there were moral elements in Greek polytheism, and that Buddhism has a good and a bad side, is equally familiar to most readers; and that religions can only be even approximately understood by studying their primary standards is also admitted by all sane persons. Whether it was worth while to print these rather conversational lectures may perhaps be doubted. The author's account of Nirvana seems to us the best part of the book; his view of justification by faith hardly coincides with that of the great Apostle.

Creed and Deed. A Series of Discourses. By Felix Adler, Ph.D. (New York: G. P. Putnam's Sons.) A work full of tender idealism and practical earnestness, combined with unreserved devotion to the principles of modern science. The author has been in the habit for many months of delivering addresses to a quasi-religious society in New York, some of which are here printed. The contents are no new doctrine to hearers of Mr. Conway, and some passages in the book will recall favourite sayings of George Eliot. The chastened rhetoric of the style is very enjoyable (though we do object to "basic," "perdure," and one or two other new words). It is true, we must be already at the standpoint of the author fully to appreciate his counsels and to recognise the justness of his criticisms on the creeds. There is, however, not an unkindly or ungraceful word in the whole volume. In the last address, "The First Anniversary Discourse," the author explains the course which he has taken, and the steps by which he has guided his hearers to make the experiment of a permanent quasi-religious organisation, the motto of which is "Divinity in the Creed, Unanimity in the Deed." The subjects of the addresses are "Immortality," "Religion," "The New Ideal," "The Priests of the Ideal," "The Form of the New Ideal," "Religious Conservatism of Women," "Our Consolations," "Spinoza," "The Founder of Christianity." The Appendix deals with the evolution and present circumstances of Jewish religion; it shows deep study. On one small point (the significance of the popular usages on the Day of Atonement, p. 205) the author seems to us led astray by his fine poetical instinct. Noteworthy is the remark on the last page, that "the present condition of liberal Judaism is strongly akin to that of liberal Christianity. The old is dead, the new has not been born." And elsewhere he says, "The propaganda of liberalism in the past has been weak and barren of great results. . . . What we need is institutions of which persons shall be merely the exponents;" but he does not tell us how these institutions are to be founded. We forbear to criticise what is, after all, a work mainly of edification. The author, who has studied the history of religions, is not likely to be unaware of the obvious objections to his well-meant enterprise. One of the choicest passages in the volume is the thoughtful interpretation of a Buddhistic parable in the sermon called "Our Consolations."

A Lexicon of New Testament Greek on a New Plan, by which the Greek New Testament may be translated into English with demonstrable Accuracy, by the simplest Method. (Elliot Stock.) A Companion to the *Lexicon of New Testament Greek*, &c. (Elliot Stock.) There can be no doubt that with the aid of these two books, any person, knowing nothing of Greek beyond the letters, might fight his way through the Greek Testa-

ment, learning the grammar as he went along; but whether he would not do this at a greater expense of time and trouble than by beginning in the usual way is a question on which much might be said. On the whole we are not prepared to recommend the adoption of the plan. Still those who have only an imperfect acquaintance with the Greek grammar may find much help in these books.

A Critical Lexicon and Concordance to the English and Greek New Testament. By the Rev. Ethelbert W. Bullinger. (Longmans.) The design of this work may be best stated in the words of its author. It is "to give every English word"—occurring, that is to say, in the authorised version of the New Testament—

"in alphabetical order, and under each the Greek word or words so translated, with a list of the passages in which the English word occurs, showing by a reference figure which is the Greek word used in each particular passage. Thus, at one view, the Greek word, with its literal and derivative meanings, may be found for every word in the English New Testament."

Its advantage is that it thus places the English reader almost on an equality with the Greek scholar, and enables him to ascertain the precise meaning, or shade of meaning, among many possible ones, belonging to any word in which he is interested. To say that the author has accomplished his design in the most perfect manner is, perhaps, to say all that is needful. In one or two instances, indeed, he has been led astray, in our judgment, by his too rigid views of inspiration, and by his refusal to make use of the Rabbinical mythology for the exegesis of Scripture; but generally speaking his scholarship is sound, and one or two of the longer articles—for example, that on the word "God"—are deserving of special praise. In a work of which a large part is composed of figures and references obviously only the minutest care could have secured accuracy, and for this end it is clear that no pains have been spared. It would be pleasant to think there were many merely English readers of the New Testament who would value and make use of such a work; but such as there are will do well to have it beside them. Perhaps it will be most appreciated by those whose studies in the Greek Testament are commencing.

The Four Gospels in Greek, with a Lexicon. By the Rev. John T. White, D.D., Oxon. (Longmans.) In giving a reprint of the *Four Gospels* for those "who wish to retain, amid the avocations of life, an acquaintance with the Evangelists in the original language," Dr. White has apparently adopted the text of Griesbach, but without marking the doubtful passages, Mark xvi., 9-20 and John vii., 53-viii., 11. In the short Introductions prefixed to each Gospel he could scarcely have been expected to do more than touch on questions of dates and authorship; but since he has noticed, for the purpose of refuting, the opinion that the Fourth Gospel could not have been written by a man of John's antecedents, he should hardly have passed over in silent contempt any opinion which places Matthew, for example, later than 60 A.D. The Lexicon seems all that could be desired.

The Gospels harmonised and arranged in Short Readings. By the Rev. Edmund Fowle. (George Bell and Sons.) It is always useful to have the parallel passages in the Gospels printed side by side; and this Harmony, which is divided into short lessons and intended for the use of schools, has been very carefully arranged. The work is conveniently divided into two parts—one embracing the incidents in the life of the Saviour; the other, his parables and longer discourses—and inasmuch as St. John's Gospel does not harmonise with the others, many parts of that Gospel are omitted altogether.

Bible Studies. By M. M. Kalisch, Ph.D., M.A. Part II.—The Book of Jonah. Preceded by a Treatise on the Hebrew and the Stranger. (Long-

) This is perhaps a more generally interesting work than the book on Balaam which we read some time ago. The subject of the relation of Jews and heathen is treated in a masterly way, but the problem of the origin of the story itself receives no fresh light. No notice is made of the latest form of the mythical hypothesis (*Logical Review*, April 1877). The tendency of the book is to promote a refined Theism. Dr. Schenck is a most honourable combatant; yet he is not secure against making misquotations (see the passage from Augustine on page 10).

Enquiries concerning the Structure of the Semitic Languages. Part II. By Sir W. Martin, D.C.L. (Liams and Norgate.) Readers of the *Life of John Patterson* will remember a striking passage in which the views of the bishop and his father, Sir W. Martin, as to the Hebrew tenses were briefly mentioned. That these so-called tenses are properly nothing to do with time is a proposition which requires no apology, but which can only be said to have been proved by Sir W. Martin. A little acquaintance with the current modern Semitic philology, especially in Germany, would have modified the author's confidence in his results, and have saved him from such a blunder as Joel ii., 17, as the following:—"Ben the porch and the altar were the priests, ministers of the Lord, weeping." Why does it rather impart to us some of that Polynesian feeling of which he must be a master?

NOTES AND NEWS.

AND up with a volume of pamphlets of 1670-which he recently obtained, Prof. Dowden has found a manuscript of about the same date, containing a collection of miscellaneous poems. Many of these have been already printed, but yet ascertained. The manuscript includes several well-known pieces by Andrew Marvell, Sir John Denham, and the Earl of Rochester; the text varies in many and interesting particulars from the printed texts: in some instances it adds several lines to the poems as printed; in others, the variations certainly present the true readings for the first time. The poems are in the shape of satires upon the morals and politics of the reign of Charles II., and these copies were probably made while the verses still circulated in manuscript.

MESSRS. MACMILLAN AND CO. have in the press a treatise on *Coal: its Nature, Origin, and the extent of our Supplies*, by the Professors of the Yorkshire College, Leeds, edited by Prof. Thorpe, F.R.S. The subject will be treated from three different standpoints. Firstly, the writers will look into the past, to sketch out the state of the country when coal was coming into being, and the processes by which it was formed; then, dealing with the present, they will give an account of the methods of working coal, and some of the questions to which it is now being put; lastly, an attempt will be made to forecast the future, and speak of the probable duration of our coal supply.

WE are glad to be able to inform our readers that the Cambridge University Press is about to issue very shortly the first part of the new edition of *Natural Philosophy*, by Sir William Thomson and Prof. Tait, a book which has been so long anxiously looked for.

WE also learn that the same Press is preparing an early publication, uniformly with the Cambridge Bible for Schools, a Greek Testament, in parts, with a revised text based on the most recent critical authorities, and English notes, under the general superintendence of the Rev. J. J. S. Rowne, D.D., Hulsean Professor of Divinity.

A VOLUME comprising all the collected Miscellaneous Poems of Mr. Nicholas Michell, with numerous full-page illustrations from original drawings, will shortly be published by Messrs. Frederick Warne and Co.

MR. J. M. WILSON, of Rugby, is preparing a treatise on geometry, to correspond with the *Syllabus* drawn up by the Geometrical Association. It will thus form a simplified Euclid. The book will be published in the autumn by Messrs. Macmillan and Co.

PROF. VOGEL, in an article in the last number of the *Deutsche Rundschau*, reckons the annual consumption of silver for photographic purposes as amounting to nine million marks (450,000*l.*). One of the mines of the Nevada, such as the Big Bonanza, would more than suffice to supply this new drain of silver.

MESSRS. RIVINGTON will shortly issue a new and revised edition of *Arnold's Henry's First Latin Book*, by O. G. Gepp, M.A., late Junior Student of Christ Church, Oxford, and formerly Assistant-Master at Tonbridge School. The new edition differs from the original mainly in its arrangement, and in the fuller treatment of the cases and the infinitive mood. The exercises, with the exception of a few on the participles, are entirely new; and they have been supplemented by fifty "Test Exercises," which may be used at various stages. References are made throughout to the *Public School Latin Primer*.

THE same publishers have also in the press a new and revised edition of *Arnold's Latin Prose Composition*, by George G. Bradley, M.A., Master of University College, Oxford. The general arrangement and plan of the work has been in the main preserved; but great changes have been introduced, every article and exercise has been more or less rewritten, greater prominence has been given to the more important, and less to the minor, differences between the two languages. The order of the exercises on the cases has been altered, and a more systematic account of the Latin cases has been inserted. The vocabularies have been separated from the exercises, and arranged in order at the end of the book. An Introduction has been prefixed, containing an analysis of the Latin sentence, and a chapter on the arrangement of words in Latin. Specimens also of continuous exercises have been added, and also of exercises for translation into Latin based upon chapters selected from a Latin author.

WE understand that Prof. Fawcett's work on Free Trade, just published by Messrs. Macmillan and Co., is already being translated into German.

AT the last meeting of the Royal Irish Academy, on the 27th inst., Cunningham Gold Medals were presented, to Dr. Aquila Smith, for his enquiries into Irish numismatics; to Dr. Casey, for his mathematical discoveries; to Prof. E. Dowden, for his literary works, especially in the field of Shakespearian criticism; and to Dr. G. J. Allman, for his researches into the natural history of the Hydrozoa.

Cicero de Amicitia, edited by Arthur Sidgwick, M.A., Assistant-Master at Rugby School, and formerly Fellow of Trinity College, Cambridge, will be issued by Messrs. Rivington on August 1.

A SHORT sketch of the life of the late Mr. Dudley Baxter has just been written by his widow, and printed for private circulation among his relatives and friends. Mr. Baxter's first publications appeared in 1860, but his pamphlets and letters in the *Times* on Mr. Gladstone's Reform Bill of 1866 first brought him prominently before the public. From the latter date until 1874 he was consistently employed in furthering the interests of the Conservative party by newspaper correspondence and by separate treatises: during these years his views on political and social subjects exercised considerable influence on public affairs. The facts in all his publications were carefully collected, and his statistics were marshalled with great skill. The gratitude of his political chiefs for his assistance is shown in the many letters from Conservative statesmen printed in the pages of this memoir.

THE second volume of *Beeton's Dictionary of Universal Information: Geography, History, and Biography* (Ward, Lock and Co.), contains a large mass of useful material, and a number of very inferior illustrations.

MR. JOSEPH S. NICHOLSON'S *Essay on the Effects of Machinery on Wages*, to which the Cambridge "Cobden Prize," founded by the Cobden Club, was lately awarded, will be published early this month by Messrs. Deighton, Bell and Co. Mr. Nicholson holds a Scholarship in Moral Science in Trinity College, Cambridge, and last year obtained the lately-founded "Gerstenberg Prize" in Political Economy at the M.A. examination of the University of London. The adjudicators of the Cobden Prize were Mr. Fawcett, M.P., Sir John Phear (now Chief Justice of the Supreme Court, Ceylon), and Mr. Cliffe Leslie.

I Tipografi Ebrei di Soncino, da Federico Sacchi (Cremona), is a careful monograph on the Jewish family of printers who, in the early days of printing, devoted their energies to the production of editions of the books of the Old Testament and of the Talmudic writers. Driven from Speier by religious persecution, a Jewish family settled in Soncino in the middle of the fifteenth century, and laboured to adapt the new art of printing to Hebrew writings. Signor Sacchi has gathered together all the notices he could find of the lives of these Jewish printers, especially of Gerson, the most famous of them, who was diligent in gathering and printing Hebrew MSS., and who disputes with Aldus Manutius the invention of the cursive type. We have before us only the first instalment of Signor Sacchi's work, which gives biographical notices of the printers and a list of their editions between 1483 and 1547.

ANGLO-NORWEGIAN sportsmen will be glad to hear that an English translation of Prof. Friis's celebrated work *Tilfjelds* will shortly be published. The translator, Mr. W. G. Lock, will add chapters on the rental of shootings, salmon-fishing, &c., and a synopsis of the Norwegian game-laws down to the latest date.

A NEW edition of Mr. John Morley's two works on Voltaire and Rousseau (Chapman and Hall), both of whom died in 1778, may be taken as a quiet contribution to the better knowledge of two men over whose tombs strife is not yet silent in France. It may be left to Frenchmen to decide whether Voltaire shall have a statue or not.

AT a meeting of the Cambridge Antiquarian Society, on May 13, Mr. Magnusson read a paper on a Norwegian clog almanac, the property of R. E. Smith, Esq., in which he showed that in Norwegian almanacs, as in those in use in Staffordshire, the Sunday letters were marked by straight lines or notches, but never by runes, which were only employed for almanacs in Denmark and Sweden. This tends to disprove Dr. Plot's theory that the Staffordshire clogs were derived from Danish rune staves, and rather suggests the idea that this method of marking time was introduced into Norway by English missionaries. It is curious that this calendar begins the year on St. Calixtus' Day, October 14, while some Danish calendars commence on August 11, the day of St. Tiburtius.

AN Examination of Canon Farrar's *Eternal Hope* is in the press, and will shortly be issued by Messrs. Kerby and Endean.

MR. HERBERT SPENCER, who has been spending a few days in Paris, was entertained at a banquet given in his honour by M. Germer-Baillières on Saturday last. Among those present were MM. Ribot and Maspero.

THE *Rassegna Settimanale* announces that Messrs. Barbera, of Florence, will publish in the course of the coming summer, an *Appendice all' Epistolario ed agli scritti giovanili di Giacomo Leopardi*. Pros-

pero Viani is likewise preparing for publication the correspondence between the members of the last generation of the Leopardi family, entrusted to him for the purpose by the Countess Leopardi.

In the Appendix to Sir T. Duffus Hardy's last Report is an entry which suggests the finding of another link between Shakspeare and Essex: "No. 1350. Inventory of goods and chattels, books, &c., at Essex House." Surely "the general of our gracious empress" (*Hen. V.*, Prol. v.), so happily alluded to by Shakspeare, might have had in his library copies of at least *Venus and Adonis*, and *Lucrece*, the books dedicated to that Southampton who risked his life with the rash Earl. So, at any rate, thought Mr. Furnivall, and asked expectantly for the document; but alas! only to learn that it had pleased the Queen to take her old beheaded favourite's books to herself, without having a money-price set on them, or a list made of them by the commissioners, who say of Essex:—

"In quodam armariolo suo vocato 'his Studdy,' in predicta domo manciali vocata 'Essex House,' habuit diversos libros impressos vocatos 'printed bookes' diuersorum generum et linguarum, Anglice 'languages,' & eosdem libros prefata Serenissima Domina nostra Elizabeth Regina placet habere sibimetipsi absque aliqua appreciatione."

The whole Inventory of the goods is interesting, specially the descriptions of Essex's grand bed, his jewels, and his armour. We can only give the furniture of his study:—

"In the late Earle of Essex his study

Item one little Table	iiij s. iiij d.
Item one redd velvett Carpett & one turkye Carpett.	xl s.
Item one payre of Andiorins, one fier shovell & tongis	viiij s.
Item one Skreene	viiij d."

A LETTER from Bucharest in the *Bund* of Bern records the death of the Roumanian poet Petrino.

THE Council of the Old French Text Society mean to print a thousand copies of the *Chronique normande de la fin du XIV^e siècle*, to be edited by M. Siméon Luce, on account of its great historical interest. The new number of the Society's *Bulletin* continues Prof. Paul Meyer's notices of rare French MSS., and gives an account of the uncatalogued thirteenth-century MS. F. 149 of the National Library in Madrid, which contains seven inedited French poems, two of which are unique.

OBITUARY.

EARL RUSSELL died at Pembroke Lodge on the 28th ult., in his eighty-sixth year. His education in the University of Edinburgh, under the care of Dugald Stewart, deepened the traditional Whig politics of his family, and qualified him for representing in Parliament the family borough of Tavistock. Although he soon made his mark in Parliament, the darkened prospects of political life after the suspension of the Habeas Corpus Act in 1817 almost induced him to forsake politics and devote himself entirely to literature. Two years later he published *The Life of Lord William Russell*, with some account of the disastrous days in which he lived; it was well received, and has since passed through six editions. His *Essays and Sketches of Life and Character* (1820), and his *Letters Written for the Post and not for the Press* neither received nor deserved so favourable a reception, as their author possessed few of the qualities which form the popular essayist. Lord Russell's next venture in literature (*Essay on the History of the English Government and Constitution*) was reprinted so recently as 1873; it has also been translated into French (1865), and German (1872). His tragedy of *Don Carlos* was chiefly remarkable for Mr. Croker's severe condemnation in the *Quarterly Review* of 1823. The *Memoirs of the Affairs of Europe from the Peace of Utrecht* (1824-29) should have been brought down in four volumes to the death of Louis XVI., but only two volumes

have been published, the last appearing in 1829. Two years earlier he published an historical discourse on that vexed question, the *Establishment of the Turks in Europe*; and in the year of the Reform Bill appeared before the public with an essay on the *Causes of the French Revolution*. The three volumes of selections from the *Correspondence of the Fourth Duke of Bedford* (1842-46) formed a valuable addition to the historical literature of the last century. The four volumes of the *Memorials and Correspondence of C. J. Fox* (1853-57)—the materials of which were in great measure collected by Lord Holland—and the three volumes of *The Life and Times of C. J. Fox* (1859-66) were intended to portray the political and personal merits of the great statesman whose opinions were ever in the recollection of Lord Russell. The *Memoirs of Thomas Moore*, in eight volumes (1853-56), were much more diffuse than the poet's career justified; some passages of the poet's diary, it may be added, led to a warm correspondence between Mr. Croker and Lord Russell. An abridged edition of this memoir was published in 1860. After his retirement from active political life Lord Russell amused himself with the publication of a volume, in 1871, on the *Foreign Policy of England* for the previous three centuries, and in 1875 with his *Recollections and Suggestions* from 1813 to that year. It is impossible to enumerate here the speeches in Parliament and on the hustings, the letters to prominent politicians and country constituencies, or the addresses to literary societies which the late peer published during the course of his long life: neither can we mention the numerous replies which these publications (and notably his famous "Durham Letter" on the Roman Catholic aggression) drew from his political and religious opponents. We may, however, add that two volumes of selections from his speeches and despatches were given to the world in 1870.

DR. ROBERT CARRUTHERS, the well-known editor of the *Inverness Courier*, died on the night of May 26, in his seventy-ninth year. He was born at Dumfries in 1799, and in early life apprenticed to a bookseller and bookbinder. While resident at Huntingdon, as master of the National School, he published a history of the town and an anonymous selection from the prose works of Milton. In 1828 he was called to Scotland as editor of the *Inverness Courier*; three years later it became his property. His edition of the poetical works of Pope, with extracts from his correspondence and memoir, was published in 1853; a new edition of the poetical works was issued in 1858 in Bohn's Illustrated Library, and the second edition of the *Life of Pope*, "revised and considerably enlarged," appeared in 1857 in the same collection. Mr. Carruthers edited and revised the several editions of Chambers's *Cyclopaedia of English Literature*, and superintended the publication of the same publisher's *Household Edition of Shakespeare's Dramatic Works*. To Chambers's *Life of Sir Walter Scott* (1871) he added an interesting collection of "Abbotsford Notanda," and annotated a reprint of Boswell's *Tour to the Hebrides*, which has since passed through many editions. The student of Pope will only be able to dispense with the edition of Mr. Carruthers on the completion of the more laborious and critical volumes of Mr. Elwin. Few journalists have obtained greater or better-deserved popularity than Mr. Carruthers: his merits were in 1871 recognised by the Senatus of the University of Edinburgh with the degree of LL.D.

NOTES OF TRAVEL.

M. L'ABBÉ DEBAIZE, for whose scientific mission to Central Africa the French Government has apportioned a sum of 100,000 francs, left Marseilles for Suez on April 21, and expected to reach Zanzibar on May 30, where he must delay for some time in preparation for his intended journey

across equatorial Africa. Michel Alexandre Debaize was born at Glazais in Département Deux Sèvres in 1845, studied at the theological seminary of Séez, and was ordained in 1872, but had carried on in the meantime a course of Oriental studies under the Egyptologist Prof. de Rougé, in Paris, so that he has a good knowledge of Arabic, Coptic, and of some East African languages. His further education for travel was carried out under the superintendence of Captain Mouchez for astronomical observation, and under Milne-Edwards for natural history.

WITH the same steamer a number of missionaries set out for Zanzibar, to add to the existing French missions in East Africa two new stations, one on the Victoria Nyanza, the other on Lake Tanganyika. This new missionary undertaking, to which we have previously referred, was planned by Cardinal Franchi, and has been entrusted to a congregation which was founded about ten years ago by M. Lavigerie in Algeria. These missionaries have been practised in the use of scientific instruments, and their observations will doubtless be of great value in extending the knowledge of Central Africa.

To the surprise of all, Herr Marno has resigned his appointment in connexion with the Belgian East African Expedition, and left Zanzibar on April 5 on his return journey to Europe. M. Cambier, however, writes on April 5 that his preparations were all but completed, and that he only waited the arrival of MM. Wauthier and Dutrieux to set out for the Tanganyika at the end of May. M. de Semellé, the French explorer, to whose projected journey across Africa from the West Coast we have previously referred, left Bordeaux on April 5 for West Africa. It is expected that M. Savorgnan de Brazza has by this time reached the Gaboon from his journey on the Ogowé.

THE latest *Bulletin* of the Geographical Society of Marseilles brings a useful addition to West African geography in a description and an original sketch-map of one of the delta branches of the Ogowé river, by M. Emile Fourast, made during an expedition against the Pahouins from Libreville on the Gaboon to Rambou; as well as an account of the route from Aden to Shoa, south of Abyssinia, by the late M. Louis Pottier.

WE learn from Dr. Behm's *Monatsbericht* that M. N. Miclucho-Maclay reached Singapore on January 18 after a two-years' cruise among the islands of the Western Pacific and a residence of seventeen months on the Maclay coast of New Guinea. He was then awaiting the return of a Russian war vessel to Kronstadt to come back with it to Europe for a time.

THE treaty between Japan and Corea of February 26, 1876, gave the Japanese the right to settle and trade on certain points of the Korean coasts. The first of these settlements was formed in Fusan, not far from Torai, and a correspondent thence to the Japanese journal *Sakigake Shinbun* says:—

"It was very cold in January at Fusan: the thermometer stood between -2° and -22° F. (-19° and -30° C.). Our settlement numbers about a hundred houses, with about eight hundred Japanese inhabitants of both sexes. A school for teaching the Korean language was lately opened in the newly-built temple of Honganji. The populous city of Torai, which is about three ri (seven miles) from our settlement, is frequently infested by tigers, and on that account every door is closed early in the evening, after which no one ventures into the streets. An animal called 'Tonpi' by the Koreans, and which resembles a cat, attacks the tiger, which seems to fear it greatly. Noticing this, the Koreans, when they go into the hills, put on a cap of tonpi-skin. Very few of the lower class of Koreans sleep in beds; most of them have only a sheet of Korean paper for a couch, and keep up a fire beside them for warmth. The articles of import are chiefly muslin, silk, dyes, tin, copper, and various small wares. The Koreans, on the other hand, bring golden and

other valuable manufactured goods for export. No customs are paid in trading."

On Monday last the Earl of Dufferin, Governor-General of Canada, was elected President of the Royal Geographical Society, in succession to Sir Rutherford Alcock, the latter becoming a Vice-President. Among the new members of Council elected at the same time were Sir Henry Barkly, Mr. Douglas W. Freshfield, General Sir J. H. Lefroy, R.A., and Sir W. L. Merewether.

At the April meeting of the Russian Geographical Society M. Potanine gave a brief account of a journey which he has just made in Mongolia. In the course of his explorations he found that the Altai chain was well-watered in the north-west, but that the other portions were arid. On the southern slopes of the chain forests are found in the western valleys, and along the streams which are tributary to the Bulugun; in the east, however, there are no trees. On the northern slopes forests were only met with at three points. The trees found were chiefly species of pine, but the natives say that cedars grow on the slopes to the north of Hanghoi. In concluding his address M. Potanine enumerated the various races inhabiting the Altai Mountains.

FROM the Report of the Council of the Royal Geographical Society we learn that they have frequently considered the practicability of preparing a MS. map on a large scale of Equatorial Africa, on which the routes of travellers shall be represented in much greater detail than hitherto, and which shall be accompanied by a memoir containing a list of authorities and references, and such further information as cannot be included in the map. The preparation of a trial sheet of the section—five degrees of latitude and of longitude in height and width—in which Kilimanjaro is situated has been entrusted by the Council to Mr. E. G. Ravenstein, and is nearly completed.

JUDGING from his Report, Signor D'Albertis appears to have carried out his recent expedition in the *Neva* up the Fly River, New Guinea, under very great difficulties. He experienced constant hostility on the part of the natives, and was much troubled by the conduct of part of his crew. In many parts the natives were found to be very numerous, and on one day he estimates that he saw 2,000 on the banks. On that occasion he passed a large village, where there were more than 500 people on the bank, whom he describes as "beautifully dressed with white feathers, and their bodies painted in many colours." They wore white shells for purposes of ornament and protection, and had "head-dresses of white feathers of cactus and red and yellow Paradise bird." Signor D'Albertis discovered a large tributary entering the Fly River from the north-east; but, owing to the various troubles he met with, he was not so successful as he expected with his natural-history collections, but he obtained 800 skins of birds, comprising probably 200 species, of which he hopes that 20 or 25 may prove to be new.

M. SARDOU'S DISCOURSE.

THERE is always an interest, for those who take any interest at all in letters, in the discourses and replies which signalise the introduction of a new member to the French Academy. The pleasant tradition which demands that the novice shall extol his predecessor to the skies, and that the respondent shall greet the novice with an ingenious compound of flattery and gibes, gives scope for some agreeable literary effects. In the present instance, too, the triad was very happily composed and contrasted. The defunct member was M. Joseph Autran; his successor was M. Victorien Sardou; the respondent was M. Charles Blanc. M. Sardou is a dramatist of whom everybody knows something; M. Autran was a poet of whom, without breaking the tradition as to

the treatment of the dead, we may fairly say that very few people knew anything; and M. Blanc is a capital art-critic, to whom criticism of pure literature, dramatic or poetical, is somewhat of a novelty. The two speakers had, therefore—as very frequently happens on these occasions—tasks of charming incongruity set them. M. Autran's reputation is indeed due to a play, *La Fille d'Eschyle*, and this gives him one slight point of contact with M. Sardou. M. Sardou is known to be very particular about his *mises-en-scène*, and this puts him in relation with M. Blanc, who is one of the greatest living authorities on costume. The orators made the most of these scanty points of solid ground. Otherwise their two discourses may be characterised as admirable examples of the faculty of Academies for gracefully beating the air. M. Sardou's discourse was really a clever criticism from the outside of the performances of his predecessor, a poet who may perhaps be allowed somewhat the same place in the literary hierarchy of France as Rogers or Crabbe holds in the literary hierarchy of England. Whether Autran, had not his first success brought him fortune as well as fame, would have done better than he actually did is rather an idle question. It is sufficient to say that his actual performances are likely, to borrow a famous phrase, to be read when Hugo and Gautier are forgotten. The sonnet, however, to the last-named poet, which M. Blanc quoted, will give readers who are not disposed to investigate the works of the immortals *minorum gentium* a pleasant idea of his amiable talent, and nothing more need be said about him.

M. Blanc probably knows something more about drama than M. Sardou does about poetry, and his criticism of the popular dramatist's works was very interesting if it was not exactly final. It is amusing to find that the proportion of blame which in such cases is obligatory was in part allotted to *Rabagas*. It is possible that other persons will not be quite so convinced as M. Charles Blanc of the ill-luck of that dramatic excursion into the fields of politics. However this may be, the criticism of M. Sardou possesses certainly a wider interest than the criticism of Autran. Even Academicians cannot make the attraction of their comments entirely independent of the attraction of their text. *La Famille Benoiton*, *Nos Intimes*, and *Dora*, are realities to thousands to whom *La Vie Rurale* and *Les Poèmes de la Mer* are not even names. It does not always follow in such a case that because it is so it ought to be; but in this case the two truths are fortunately coincident.

GEORGE SAINTSBURY.

THE WILL OF PETER THE GREAT.

IN the April number of the *Deutsche Revue* Prof. Harry Bresslau discusses the question of the authenticity of the so-called Will of Peter the Great. The existence of a document corresponding more or less with the current texts of this enigmatical programme of Russian policy was asserted in the last century. Nothing can be more precise than this extract of a report from Podewils to the great Friedrich, lately discovered in the Berlin archives, in which the Prussian Minister speaks of a conversation with the Russian envoy:—"Kaiserlingk told me that he remembered to have seen an autograph manuscript of the deceased Czar Peter on the fundamental maxims of his house, in which his successors were recommended to maintain friendship with Prussia." The Berlin archives also contain a report of a Baron Leutrum's conversation with Friedrich in 1754, when the king reminded him of the Will of Peter "of glorious memory." Further, in 1798 Friedrich Wilhelm gave his Ministers a memorandum which he said had been laid before the French Government by one Sokolniczy, who professed official connexions with Poland. This paper included an approximate text of Peter's Will written from memory by the Pole after a perusal

of the original, which he said was in the secret Russian archives.

These facts, or shadows of facts, were Cabinet secrets till the year 1812, when M. Lesur, a clerk in the French Foreign Office, published a large book, written from the Urquhartite or Rawlinsonian point of view, on the progress of Russia, which gave—without any other explanation as to authenticity than a mere "we are assured"—not a Will, but a "résumé of a plan" sketched by Peter. Whether or not Lesur really wrote, as is said, by order of his chief, the Duc de Bassano, the circumstances of the publication, coinciding as it did in date with Napoleon's invasion of Russia, seem suggestive of a "tendentious" stroke of official French authorship. This point was argued by Berkholtz, of Riga, whose *Napoléon I. auteur du testament de Pierre le Grand* was an ingenious attempt to show, by the light of the "higher criticism," that the supposed Will was written, not by a member of the Orthodox Church, but by a Roman Catholic, who was no other than the French Emperor. A new phase in the history of the text, or rather description of the text, of this subjective document, was reached when Gaillardet published his romantic Life of the famous epicene diplomatist, the Chevalier d'Eon, who, according to the veracious biographer, had found in the Peterhof archives (which never existed) a true copy of Peter's Will. Gaillardet professed to have worked in the French archives, and Bresslau maintains that his text of fourteen articles was concocted either from Lesur or from the papers on which Lesur worked.

If our confidence in the penetrating power of the critical microscope were up to the German level, we should attach decisive importance to the elements indicated in the evolution of Peter's Will. The internal evidence against the authenticity of the document is strong. The phantasmagorical character of its recommendations and historical visions strikes us as hardly compatible with the cool reasoning character of Peter, while it lies suspiciously open to the charge of containing *vaticinia post eventum* in such articles as those advising Russian marriages with German princesses, and the maintenance of anarchy in Poland in order to the eventual partition of that republic. Article 5, suggesting the union of Russia and Austria for the expulsion of the Turks from Europe, seems to be an allusion to the alliance of Catherine and Joseph. Article 14 is the rhapsody of a diplomatic maniac, especially where the imaginary successor of Peter devours all Europe by letting loose "a swarm of his Oriental hordes and greedy nomads" on Italy, France, the Rhine, &c., so as to deport the inhabitants of those parts in the most correct Accadian or Ninevite style to the depths of Siberia.

Professor Bresslau thinks, on the whole, that some Urtext of the will was made up by anti-Russian Poles about 1790, that this got into the hands of the French Government, and was afterwards touched up by Napoleon. The hypothesis is simple and likely: but the probable has not always happened; and this explanation does not sufficiently connect our canonical document with the statement of Podewils. We must add that Prof. Bresslau has not exhausted the last-century evidence on the subject, and that Fourmestraux (*Etude sur Alexandre II.*) gives a text differing again from those named above. A recent French pamphlet, *Les auteurs du testament de Pierre le Grand*, has been attributed to M. Thiers.

BOSTON LETTER.

Boston: April 23, 1878.

On the first of the month there took place here an event of some importance as bearing on the possible development of dramatic literature in this country—the production of *A Counterfeit Presentment*, a comedy by W. D. Howells, at the Boston Museum, a theatre which, like Wallack's

at one time in New York, stands alone among its competitors in an effort to keep alive English comedy and to maintain a certain tradition of refined and even acting. The *Counterfeit Presentment*, with Mr. Lawrence Barrett in the hero's part and Miss Annie Clarke in that of the heroine, was witnessed on the first night by an audience comprising persons of wide celebrity in literature, both as creators and critics (among the former Mr. Longfellow and Dr. Holmes), and the success of the piece was unquestionable. This comedy was published last year in the *Atlantic Monthly*, but has been changed in various minor points, and extended by the insertion of a new act, since taking its place on the stage. It is really the first notable attempt that has been made here to give in the theatre an uncaricatured picture of manners in the better class of society, with, at the same time, a plot of some interest and a careful study of character in the leading personages. Though not without weaknesses, it is a charming light piece, the dialogue of which is interpenetrated with an agreeable flavour of wit. Above all it is honest, and does not depend on factitious interests of scenery, mere sensation, or the passing vogue for phases of frontier crudity. It is a beginning, we hope, of something better. Our stage is hardly worse off than the English in some respects. There have been resolute, though only half-successful, endeavours to retain the poetic drama and the higher comedy in this country; and a strong current of thought and opinion is at present setting in the direction of new dramatic literature and the more systematic cultivation of the art of acting. We have heard something about a "New England Theatre Reform Association" this winter, which has thus far succeeded only in exciting hostility by accepting the use of the Globe Theatre gratis, and bringing out on its boards a close imitation of Mr. Jefferson's *Rip Van Winkle* by amateurs, to the supposed detriment of professional actors, and with no discernible influence on the forming or reforming of the theatre. But the time is probably not far distant when the present groping for improvement will result in the establishment of a histrionic academy and a properly endowed theatre—probably in New York.

You have seen in the papers reports of the public dinner to the Hon. Bayard Taylor, in New York, on the 4th. It was the largest and most brilliant affair of this sort undertaken in compliment to an author since the Dickens dinner ten years ago. These things are of importance with us, by giving an opportunity for the literary men to assert themselves as a body, which they do not seem able to do in any other way. It is surprising that in a country where everything, from social science down to cheese-making, is forwarded by "conventions," authors do not combine to protect their interests and organise their influence by annual meetings and discussions. At the Taylor dinner there was much warrantable enthusiasm over the fact that, with Mr. Lowell at Madrid and Mr. Taylor at Berlin, the administration commits itself to a due recognition of the literary element in affairs of State. But the inertia of our chief followers of literature in not forming an effective solidarity certainly gives fair occasion for the sneers of politicians, one of whom, Senator Angus Cameron, indulges his scorn in the forthcoming number of the *North American Review* (for May-June). "Until literary men, as a class," says Mr. Cameron, "show as much capacity for the protection of their own interests as the less pretentious but more practical business men of all classes, their voice will have little weight in moulding national legislation;" and he goes on to sneer at the inability of Mr. Longfellow or Mr. Emerson to protect their productions one mile beyond the limits of this country, while inventors of the smallest mechanical contrivances secure patents from many other nations. In this connexion let me bring to your notice five essays on *The Nature of Intellectual Property*, by Prof. N. S. Shaler (Harvard College), pub-

lished by J. R. Osgood and Co. in a thin volume. These sketch the theory and the effects of patent laws in a lucid way, and argue in favour of international copyright. At present there is much talk of revising our whole patent system, and some communistic clamour has been heard about sweeping away all such protected rights. It is a good moment to press the copyright cause; but nothing will be done here, because our authors make no exertion.

A *Memoir* of (Gen.) William Francis Bartlett, by General F. W. Palfrey (son of the Hon. J. G. Palfrey, the historian of New England) has just been issued by Houghton, Osgood and Co. It is a book without much literary *façon*, but it presents a vigorous and simple sketch of the gallant man whose career began and ended so abruptly. Entering the army in 1861, at the age of twenty-one, and while still an undergraduate of Harvard, he rose rapidly from the rank of captain, and in less than five years, at the close of the war, had become a major-general by brevet. He became a great favourite in his native state, Massachusetts, was offered the collectorship of Boston—the second commercial office in the country—and before his death, in 1876, was nominated for Lieutenant-Governor by the Democrats, and urged by the Republicans to be their candidate for Governor, with a prospect in either case of being run for the Vice-Presidency of the Union in the following campaign. Circumstances prevented all these schemes, but the facts show clearly enough the ease with which a man of the highest principle may become a leader in our politics. Bartlett was entirely independent of parties, yet courted by both; he died at thirty-five with a national reputation for the greatest bravery, purity, and generosity, and for his efforts to restore harmony between North and South.

Charlotte Cushman: *Her Life, Letters, and Memories*, by Emma Stebbins, is another interesting biography, in press with the same house. The promise of letters is not very well fulfilled, and there is a good deal of superfluous writing in the book on matters which throw little or no light on the subject of it. But the story of the great actress's small beginnings, her struggles and her success, cannot fail to offer something of value. We have to thank England for the recognition which secured Miss Cushman a career.

G. P. Putnam's Sons, of New York, are preparing a translation of *Constantinople*, by Edmondo de Amicis, and have completed the first volume of a series entitled "Current Discussion," edited by Edward L. Burlingame. This is to bring together in permanent form, for reference, some of the valuable essays constantly appearing in English periodicals. The first volume takes up *International Politics*, and includes Archibald Forbes's essay on "The Russians, Turks, and Bulgarians," Mr. Gladstone's "Montenegro," &c. The second, on *Questions of Belief*, will embrace the *Nineteenth Century* Symposia, Mallock's "Is Life worth Living?" and many other contributions.

Mr. Emerson, who lectured in March on "The Fortune of the Republic" in the Old South Church, last night delivered there a discourse on "Temperance," which as you may imagine covered a larger ground than that usually assigned to the word by our total-abstinence advocates who have misappropriated it. Mr. Emerson's lecture treated of moderation in all forms; and in the course of it he said that though the man with the greatest power of expression—Shakspeare—has by common consent been awarded the highest place in renown, if the opinion of the poets were asked, their verdict would be different from this general judgment.

A large collection of paintings by artists of the Munich school has lately been opened here, an interest in this direction having been aroused by the effect which Munich teaching has had on the work of young American artists in the last five years. There are now some ninety Americans studying painting in that city, and though the

influence is, perhaps, not the best, we owe to it an element of academic thoroughness much needed among us, and productive of vigorous results in men like Durvenc, Shirlaw, and Chase, who are doing much to advance their art in this country. Do you use the heliotype in England? It is, I know, an English invention. Prof. Charles Eliot Norton, of Cambridge, has sent out a circular announcing that he is superintending the publication of a series of heliotypes from plates in Turner's *Liber Studiorum*, which promise to be very useful to students and to those who cannot see the originals.

I ought not to leave unmentioned the subscription concerts given this winter in the Sanders Theatre of the Harvard Memorial at Cambridge, under the direction of Prof. J. K. Paine, some of whose shorter compositions have been performed there. Every year we make some advance in the cultivation of music. Palestrina's Mass for the Dead was recently given, for the first time in this country, I believe, by the Boylston Club, a recent and flourishing musical organisation of Boston; and at the Cambridge concerts pieces are produced which one cannot hear elsewhere. It may be worth noting that a duet for harp and violin by Spohr was there heard this winter for the first time in the United States. Spohr's *Nonette*, which was also performed, has been given only once before on this side of the water.

CORRESPONDENCE.

THE INTERNATIONAL LITERARY CONGRESS.

Reform Club: May 29, 1878.

Having undertaken to address a general invitation to English men and women of letters (on the

part of the Société des Gens de Lettres de France) to the forthcoming Congress, of which I enclose you the amended and final programme, will you allow me to address those with whom I have not been able to communicate personally, through your columns; and to intimate to them that I shall be happy to receive the names and addresses of any ladies or gentlemen who may desire to have an invitation—before June 5?

I have undertaken to draw up a full Report of the proceedings of the Congress, for the future guidance of English authors in their relations with the permanent International Literary Committee, which the Congress is to appoint; and, at the same time, to present any papers which English authors, not being able to attend in person, may desire to submit for discussion. I shall be glad to hear from those who have anything to communicate before the close of next week.

BLANCHARD JERROLD.

THE BODLEIAN MS. OF CATULLUS.

Oxford: May 26, 1878.

The contradictions which Mr. Nettleship ascribes to me exist in his fancy, not in fact.

1. That O is, as I believe, later in date than G is perfectly consistent with its being, as I also believe, a nearer approach than G in its general character to the rediscovered original. This is a fact of MSS. universally known and acknowledged: and yet it is true, as a rule, that MSS. are better in proportion to their antiquity.

2. In my Prolegomena of 1867 I made G the type of one large class of MSS. (those not of the same family as the Datanus), and I did so because it was and is still the best representative of that class. I fail to see how this is inconsistent with O's being a nearer approach to the rediscovered original from which both were copied. Mr. Nettleship here either misunderstands or misrepresents my words.

3. O marked a new era in the criticism of Catullus, and is, therefore, an important discovery. But when Baehrens discards all fifteenth-century MSS. in favour of O and G, I believe him to exaggerate the value both of O and G.

R. ELLIS.

LEVER'S "WITCRAFT."

University College, London: May 28, 1878.

Lever's quaint logical treatise, introduced to your readers by Prof. Fowler in the last number of the ACADEMY, has not wholly escaped the notice of previous writers. A short account is given of it in Rémusat's *Histoire de la Philosophie en Angleterre depuis Bacon jusqu'à Locke* (1875), vol. i., p. 187, founded, as the author states, upon an earlier notice in Sir E. Brydges' *Censura Literaria*, vol. v. (1815). As Rémusat's book has itself been very little noticed, perhaps I may be allowed to add that, although not remarkable as a piece of philosophical criticism, it contains other evidence of research, generally at first hand, among the less-known thinkers of English name.

G. CROOK ROBERTSON.

THE COLLEGE FOR MEN AND WOMEN.

London: May 28, 1878.

The paragraph in your last number in reference to the College for Men and Women, 20 Queen Square, W.C., requires an explanation, which I trust you will allow me to give your readers.

It is true that a guarantee fund of 800*l.* a year for three years is needed for the support of the College. Part of this sum has, however, been raised, and the Council do not doubt that an institution which, without appealing to the public, has for sixteen years carried on its work with doors open to all needing instruction, without distinction of class or creed, will not fail to be supported through the present crisis by the many friends of liberal education.

REGINALD STUART POOLE.

THE DATE OF THE "COURT OF LOVE."

Oxford: May 24, 1878.

I have not yet seen Prof. Skeat's revised issue of Bell's Chaucer, but Mr. Furnivall's letter to you, printed in the ACADEMY of April 27, induces me to protest against the summary decision, condemnatory of *The Court of Love* and *The Romaunt of the Rose*, in which he invites all the world to acquiesce. The matter is by no means so clear. With regard to *The Court of Love*, which Mr. Skeat appears disposed to assign to the age of Henry VIII., "or even later," I confess that such an opinion seems to me simply amazing. What indication, however faint, can be found in the poem of its having been written after the revival of learning? Is it conceivable that Philogenet, who tells us that he was "lettred," should, if the author wrote in the sixteenth century, have made no allusion to those "good letters," on the study of which the writers of that age so piqued themselves?—that he should have known nothing more of Greek literature and life than is implied in the crude mythology, just as familiar to Chaucer and Gower as to him, of which the poem is full?—that in this respect *The Court of Love* should be not one step advanced beyond compositions of the early fifteenth or late fourteenth century? Surely the whole spirit of the poem, with its court for deciding amatory problems, its "statutes" of Love, its "Admete" and "Alceste," and "ladyes gode ninetene," is mediæval, not classical; yet it could not have failed to partake largely of the latter spirit, if composed at the late date which Mr. Skeat would assign to it.

With regard to the language of *The Court of Love*, Mr. Skeat (as quoted by Mr. Furnivall) says:—"The language can scarcely be said to belong even to the fifteenth century, but belongs rather to the reign of Henry VIII., or even later."

On such a point Mr. Skeat is a high authority; and yet, according to my own feeling, the language, even as printed in Kyngston's Chaucer of 1561 (in which *The Court of Love* first appeared), is essentially of a fifteenth-century character. But all doubt on this head ought to be removed now that we can read the poem as edited by Mr. Morris (in the Aldine edition of Chaucer) from the MS. at Trinity, Cambridge. Wherever, in the edition of 1561, "them" or "their" appears, we now find that we should substitute "hem" or "here" as the reading of the MS. This one fact, as I believe, throws back the composition of the poem beyond the time of Caxton (say 1475); for *hem* and *here* (*hir*, *her*, *hire*), if they do not absolutely disappear, yet become exceedingly rare in English writing after that period. The ascription of *The Court of Love* to a writer of the sixteenth century is thus disposed of. A minute examination of the language of the poem would, at least in my judgment, show that there exists no reason why it should not be assigned to the age of Chaucer and Gower; but for such an examination I cannot ask you to allow me space in your columns.

Mr. Skeat thinks *The Court of Love* "utterly unlike" Chaucer. I do not think so. But this is a question of taste, and it would be interesting to have the opinion of the Poet Laureate upon it, or that of Prof. Shairp. Of course it is impossible to pronounce with confidence that the poem is by Chaucer. That it was believed to be so by Stowe, and on that ground added to the edition of 1561, is a fact of scarcely any importance, for among Stowe's additions is *The Craft of Lovers*, of which no one can read three stanzas and believe it to be Chaucer's; and also several *Ballades*, the genuineness of which is more than doubtful.

I ought to have mentioned, when speaking of the Trinity MS., that I am informed by my friend Mr. Aldis Wright that it is apparently in a hand of the sixteenth century. From the mere age of the MS., therefore, nothing can be inferred. In my view it is a transcript of a MS. of earlier date now lost.

The author of the *Court of Love* seems to me to have been a man of poetical power far superior to Lydgate, Gower, Occleve, Hawes, or any known English writer between the time of Chaucer and the reign of Henry VIII. Scotland produced within that period men capable of writing it, but there is not a particle of evidence to connect it with Scotland. Chaucer has nowhere told us that he wrote a work so called, nor is it mentioned by his contemporaries. Still no one can be certain (apart from considerations of language, style, &c., which considerations we have not found to be conclusive) that Chaucer did not mentally include it among the "many other bokes" of which he speaks so penitently at the end of the *Persones Tale*. All that I mean to say, however, is this: if the *Court of Love* is not by Chaucer, it is the work of an unknown contemporary poet of very remarkable and highly cultivated powers, of whom no other trace or memorial has descended to posterity.

I will, with your permission, reserve till next week what I have to say on the *Romaunt of the Rose*.
T. ARNOLD.

THE BRITISH MUSEUM SYSTEM OF CLASSIFICATION.

May 28, 1878.

It appears that after all Mr. Garnett was in earnest, and I must reluctantly give up the kindlier view I was anxious to take. But is not a serious defence of the Museum System even more cruel than an ironical eulogy?

Mr. Garnett in his paper claims that the system is "logical and philosophical:" in his letter he asserts as "obvious common-sense" that it could be nothing of the kind; that in a general library it is impossible to treat subjects exclusively on their own merits; in short, that the way to make the whole library "logical" is to make each part illogical. But why should a thousand books on medicine, for instance, be arranged in one way where they form a special library, and in quite another way where they form the medical section of the Museum library? Why should law-books be classified on one principle at Lincoln's Inn, and on another and an ingeniously perverse principle, in Great Russell Street? But no! says Mr. Garnett, books in a general library must be arranged with respect "to what precedes and follows," and "to the harmonious connexion of the parts." In Zoology accordingly, the Museum classification begins with Mammalia followed by Ornithology and Herpetology, and then inserts "Domestic Animals (with Veterinary Surgery)" between Ichthyology and Entomology. No doubt, on Mr. Garnett's association principle, because we make pets of gold-fish and because too many insects have an inconvenient tendency to become domesticated! Seriously, on Mr. Garnett's own showing, what they have been doing at the Museum is to disarrange ten libraries and to call this arranging one.

Where a classification is objected to as radically bad, it is scarcely worth while to dwell on details; and I professed, therefore, to give only a few of the more striking curiosities of the Museum arrangement. I certainly objected to sub-classes being co-ordinated at random with their classes; and I am still unable to see why "Mineral Waters" alone of the whole *Materia Medica* should be taken out and made a separate class "co-ordinate with Therapeutics and Surgery." Why then is there not a separate head for Plaisters? Have Mustard Plaisters been excluded from the library, or merged in the general mass of therapeutical literature? Which of these alternatives has Mr. Garnett preferred, and why has he preferred either? And again, he still insists that Photography is a branch of Philosophy: why then does he not put Engraving and Etching with Philosophy, and not under the Arts? What! metals and acids? treatsises on chemicals? Surely he confounds the essential nature of the thing with the apparatus for its production!

What may properly be classed under Philosophy is, in Mr. Garnett's opinion, a mere question of words. It is strange that such a view should still survive; and stranger still in any modern classification to find no place for Science. Mr. Garnett says, indeed, that what I call Science he calls Natural History and Physics; but under neither of these heads are to be found, *e.g.*, Astronomy, Mechanics, or Chemistry, which are placed together with "Military Art," "Spiritualism," "Peace, Duelling, and Cruelty to Animals," &c., &c., under Philosophy. This is what Mr. Garnett seems to consider a Baconian use of the term. "A countryman of Bacon" may well be excused for misunderstanding the Hegelian view of the relation of Science to Philosophy; but why should he also misunderstand Bacon's own classification of the Sciences? It would surely puzzle even Mr. Garnett to justify the inclusion in Philosophy of such subjects as "Navigation," "Astronomy," and "Railway Administration." It is an idea as old as Plato that kings should become philosophers. The British Museum may claim the credit of discovering that our sea-captains and station-masters are philosophers already. Has long familiarity with the mysteries of the Museum terminology blinded Mr. Garnett to the fact that outside the Museum, at least, the word "Philosophy" has come to have a perfectly clear and definite meaning?

Mr. Garnett may find amusement in my comments upon the Museum system. But the "System" itself is more amusing than any comments that can be made upon it.

ERNEST C. THOMAS.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, June 3.—3 P.M. Royal Institution: General Monthly Meeting.
 5 P.M. Musical Association: "On the present Cultivation of Sacred Music in England," by C. Mackeson.
 8 P.M. British Architects.
 8 P.M. Victoria Institute: "Succession of Life upon our Globe," by Prof. Nicholson.
 8.30 P.M. Geographical.
 TUESDAY, June 4.—8 P.M. Royal Institution: "Minute and low Forms of Life," by the Rev. W. H. Dallinger.
 8 P.M. Colonial Institute: "The Angora Goat, and its Naturalisation in British Colonies," by G. Gatherall; "A Ship Canal between India and Ceylon," by S. McBean.
 8.30 P.M. Zoological: "Additions to the Menagerie in May 1878," by the Secretary; "On the Taxonomy and Distribution of Cray-fishes," by Prof. Huxley; "On the Skull of a Rhinoceros from India," by Prof. W. H. Flower; "Butterflies collected in Eastern New Guinea, &c., by Dr. Comrie," by Messrs. Godman and Salvin.
 8 P.M. Biblical Archaeology: "On the Hieroglyphic or Picture Origin of the Characters of the Assyrian Syllabary," by the Rev. W. Houghton.
 WEDNESDAY, June 5.—7 P.M. Entomological.
 8 P.M. Geological.
 8 P.M. Microscopical: "On *Meliceria ringens*," by F. A. Bedwell; "On the Measurement of the Diameter of the Flagella of *Bacterium termo*," by the Rev. W. H. Dallinger.
 8 P.M. Archaeological Association: "On an early Ercollet Roll in the British Museum," by E. M. Thompson; "On the Measurements of Ptolemy and Antoninus applied to the South of England," by G. M. Hills.
 THURSDAY, June 6.—3 P.M. Royal Institution: "Molecular Physics," by Prof. Guthrie.
 4 P.M. Royal Society: Election of Fellows.
 8 P.M. Linnean.
 8 P.M. Chemical.
 8.30 P.M. Antiquaries.
 FRIDAY, June 7.—4 P.M. Archaeological Institute.
 8 P.M. Geologists' Association.
 8 P.M. Philological: "Non-Italian Dialects of Modern Italy," by Prince L.-L. Bonaparte; "On the Quichua Language," by E. Boock.
 9 P.M. Royal Institution: "Romanticism," by W. H. Pollock.
 SATURDAY, June 8.—3 P.M. Physical.
 3 P.M. Royal Institution: "Joseph Addison," by Prof. H. Morley.
 8.45 P.M. Botanic.

SCIENCE.

Inductive Metrology; or, the Recovery of Ancient Measures from the Monuments. By W. M. Flinders Petrie. (London: Harrogate Saunders, 1877.)

THIS is an interesting book. The author's object is to deduce the true measures of the civilised nations of antiquity from accurate

measurements of the remains they have left behind them. By comparing together a number of measurements he hopes to eliminate all chances of error in ascertaining the ancient units of length, and determining the mean to which the monuments testify. A series of short lengths obtained from the monuments of a given area furnish him with the unit he is in search of; the assumption being, of course, that uneven or prime numbers, except the lowest, are not likely to have been used as multiples. Mr. Petrie, however, admits fractions among his results, and holds that "a compound length may not be a round number at all, but may consist of such numbers as $15 + 2 + 7\frac{1}{2} + 2 + 15 = 41\frac{1}{2}$ units."

The conclusions at which he arrives are conveniently given at the end of his book. He claims to have ascertained "the exact values of the Sacred Hebrew or Royal Persian cubit, the Royal Egyptian cubit, the Egyptian digit, the Assyrian *hu* or *U* [more correctly the *ammal*], the ancient Greek foot, the Olympic foot, the Drusian foot, the Plinian foot, and the Pythic foot," along with the probable errors of these determinations. He believes, too, that he has shown that the Sacred Hebrew or Royal Persian cubit was used in Greece, Mohammedan Persia, and "apparently by the North American mound-builders;" that the Pythic foot was "an Egyptian measure used also in Assyria, Persia, Asia Minor, Africa, and Sardinia;" that the Assyrian *suklu rabtu* was employed in Syria, Asia Minor, Sardinia, and Roman Britain, "and is very probably the base of mediæval English units, including the British inch;" that the digit was independent of the Royal Egyptian cubit, which was used in Asia Minor (as Herodotus states), Assyria, Persia, Syria, and Roman Gaul; while "the Babylonian foot, derived from the regular decimal division of the Egypto-Babylonian cubit," was the principal unit of Greece, and was used in Mohammedan Persia as well as by the Romans and the English. The Assyrian cubit, "identical with the early Christian Irish unit, the commonest unit of prehistoric remains, and the unit of Mexico," is held to be of Egyptian origin, like the Drusian foot, the Plinian foot, and the Philetairian foot. Mr. Petrie further thinks he has brought to light other units, "the knowledge of which had dropped out of the ancient literature on the subject;" has partly shown the average error of workmanship among different nations; and has proved all the marks on the Egyptian cubit-rods "to mark cubits and units, which are recovered by inductive examination from the monuments, and which are probably the prototypes of the greater part of the units used by the ancient Mediterranean nations." The ethnological and historical suggestions to which he believes his researches tend are certainly very bold. It is plain what inference he is inclined to draw from "the exact identity of the American mound-builders' unit with the Hebraeo-Persian cubit," "the close similarity of the Mexican unit with the widespread 21.4 unit of the Old World," or "the close similarity of the Phœnician unit to a principal unit of prehistoric British remains, and also to the Polynesian unit." But it must be remem-

bered that, even if Mr. Petrie's conclusions were as certain as he supposes them to be, we could draw no inference from a fact like the identity of two units of length in different parts of the world unless it were supported by other facts of a similar kind.

But can Mr. Petrie's conclusions be regarded as certain? When we see the careful and exact manner in which he has gone to work; when we read his chapter on the doctrine of probabilities as applied to his own researches; or when we look at the arrays of figures which cover his pages, it is difficult to remain sceptical. Nevertheless, I must confess that he has not convinced me. There are three reasons which make me doubt the soundness of his method and premisses.

First of all, his primary assumption that ancient buildings were erected according to rule seems to be a sort of *petitio principii*. It is true that he claims to deduce this result from his tables of measurements; but, as a matter of fact, he draws up these tables on the implied assumption that definite units of length can be extracted from them. Now, I altogether doubt this assumption. The architects and builders of antiquity, perhaps even in Egypt, seem to me to have worked rather according to the rule of thumb than according to any scale of measures which may have existed among them. Accuracy and exactness in measuring distances is quite modern. The ancient builder was satisfied if his constructions displayed the proportion required by his eye, or roughly approximated to a current measure of length. The reference in the Egyptian Book of the Dead to the "shortening of the cubit" is really a general reference to scamped work. On the assumption that ancient buildings were constructed with the same accurate relation to a definite unit of measure as those of the present day, it is possible to extract a definite unit of measure from them by grouping several of them together; but it is clear that the result so obtained is a fallacious one. Considering the number of ruins in the world; considering, too, that each of them must present a certain proportion and bear a certain relation to such general measures of length as the hand or the arm; it would be wonderful if units of measure could not be found by arbitrarily grouping certain portions of them together.

In the second place, we all know the ease with which figures allow themselves to assume the forms we wish. As in statistics, so in metrology, contradictory inferences may be drawn from the same set of numerals. The Great Pyramid religion is an instructive warning of the danger of applying mathematics to the history of the past and the monuments in which it is enshrined.

Then, thirdly, Mr. Petrie's data are at once too few and too arbitrary. He says, indeed, that "probably over 10,000 measurements in all have been examined," out of which more than 4,000 measurements have been selected for use. But the selected lists ought to have been confined to the measurements of single buildings or single groups of buildings, and to have been fairly exhaustive in each case. Thus, instead of

comparing together the lengths of the ruins at Abu Shahrein and Mugheir in Babylonia, of a "basalt monolith" in the British Museum, and of remains from Kalah Sherghat, the ancient capital of Assyria, an exhaustive list of measurements should have been made, for the purpose of comparison of only one of these monuments, such as, for instance, the temple at Mugheir or Ur.

But it must be remembered that Mr. Petrie himself is fully conscious of the 'certainty of a portion' of his units "being fictitious, and having no relation to the original unit employed (if there were any such in these cases)," so that the only question which can arise between him and his critics is as to the proportion borne by such fictitious units to the real ones. He believes that the real units greatly outnumber the fictitious ones; the reasons given above make me think that the contrary is more likely to be the case.

In conclusion, I would refer Mr. Petrie to some very able and (to my mind) convincing articles published by Prof. Lepsius last year in his *Zeitschrift für Egyptische Sprache*, and in the *Transactions of the Royal Berlin Academy* on the Babylonian measures. The article read before the Berlin Academy has been printed in a separate form,* as have also Dr. Oppert's attempts to controvert it, and Prof. Lepsius' replies.

A. H. SAYCE.

SCIENCE NOTES.

GEOLOGY.

Presidential Address to the Geological Society.—In recently vacating the Presidential chair of the Geological Society of London, Prof. Duncan delivered a masterly address, which has just been published in the Society's *Quarterly Journal*. This journal always ranks high among the publications of our learned societies, but the May number is especially noteworthy for its thickness, and speaks well for the care bestowed upon it by its accomplished editor, Mr. W. S. Dallas. More than thirty pages are devoted to Prof. Duncan's address. After referring to the application of the Huttonian philosophy to palaeontology, he enlarges on the geological value of exact investigations in zoology. Thus Prof. Busk's careful study of the fauna of the Gibraltar bone-caves, and his comparison of those remains with existing types, have thrown much light on the former distribution of animal life in the Mediterranean region, and on the ancient physical geography of this area. From the character of these fossils it is inferred that the surrounding country must have been well wooded in Quaternary times, and that the straits were certainly not then in existence. Malta also affords, in the character of the mammalian and chelonian fauna of its caves, evidence of the former extension of land in the Mediterranean area. The fauna of Malta in Quaternary times, including gigantic tortoises associated with elephants of various sizes, could not have subsisted upon the stunted vegetation, and in the restricted area, of the present island. Dr. Günther has brought his wide knowledge of existing reptiles to bear upon the study of these huge tortoises, and some of his unpublished writings are quoted by Prof. Duncan. Giant tortoises are still living in the Galapagos Archipelago, off the west coast of South America, and in the island of Aldabra, to the north-west of Madagascar, while extinct forms have been found in the Mauritius and in Rodriguez. Nor must we forget the huge fossil tortoises of the Sivalik

fauna in India. The isolation of these creatures on widely-separated lands is a fact full of suggestion to the student of distribution. If we assume a common origin for allied species, we must further assume a former continuity of land, extending over 150 degrees of longitude, between the Mascarenes and Africa, then between Africa and South America, and, further, between America and the Galapagos. Land-connexion between Africa, north of Madagascar, and India was long ago suggested. It may be assumed that over this wide area the gigantic tortoises spread themselves, and on the appearance of primeval man were hunted down until they were exterminated, save on those points of land which, by submergence of the lower districts, became separated from the mainland before man had followed them to these retreats. Prof. Duncan brings forward arguments in favour of this subsidence; but on this point, as on so many other subjects of interest discussed in this able address, we are prevented by space from following him, and must be content to refer the reader to the *Journal* in which the address is printed.

The Age of the World.—Mr. T. Mellard Reade, of Liverpool, has contributed to a recent number of the *Geological Magazine* a paper of much interest on this subject. It resolves itself into a criticism of Sir William Thomson's famous estimate of the world's antiquity. Starting on the assumption that the earth was at one moment in a state of uniform incandescence estimated at 7000° F. above our present surface-temperature, it was estimated that probably not more than 100 millions of years have passed since the surface became habitable. In the present essay Mr. Reade seeks to show "on what an insecure basis this tremendous superstructure of inference has been built." In the first place there are insuperable difficulties in the way of determining the average thermal conductivity of the materials of which the earth is composed; and this determination is an indispensable element in the problem. The crust is largely made up of strata varying in thickness and in conductivity, and the laminations would probably favour the retention of heat. On the whole, Mr. Reade believes that the coefficient of thermal conductivity used in the solution is too high. The result is further vitiated by our ignorance of the rate at which temperature increases downwards. Sir W. Thomson assumed as a rough mean $\frac{1}{50}$ of a degree Fahrenheit for every foot of descent, but this is an assumption to which the writer decidedly objects. If these data are incorrect, the calculations based upon them will of course need modification. The data at our disposal are, in fact, so meagre that it is well-nigh hopeless to look at present for any trustworthy results from these calculations. Interesting and ingenious as such speculations unquestionably are, they are not to be received by the geologist without suspicion. Mr. Reade has, therefore, done well to throw himself between the geologist and the mathematician, and show the one how far in this matter he may lean upon the other.

A New Fossil Bird.—It is interesting to learn from the last *Bulletin* of the United States Survey of the Territories that the remains of a bird of high organisation have been discovered in certain insect-bearing shales at Florissant, in Colorado. The relics comprise the greater part of the skeleton, and, though deficient in portions of the head, include nearly all the bones of the anterior and posterior extremities; the wings and tail are so well imprinted on the rock as to indicate even the shafts and barbs of the feathers. The fossil represents a bird of arboreal habits, with well-developed powers of flight. It belongs evidently to a high ornithic type, and is probably referable to the group of *Passeres*, or perching birds. Although the absence of bill renders it impossible to assign the species to any particular family, there are reasons for believing that it is allied to the finches. *Palaeospiza bella* is the name under

which Mr. J. A. Allen describes this new bird. Both generic and specific names are new. This specimen represents the first fossil passerine bird which has been discovered in North America.

New Extinct Vertebrata.—In the same number of the *Bulletin* which contains Mr. Allen's paper on the new bird, Prof. Cope describes a number of extinct vertebrata from the Upper Tertiary and Dakota Formations of the West. Several new genera of reptiles are established, and many new species are described. The Pliocene beds of Oregon have yielded the remains of several birds, including a fossil cormorant, described as *Graculus macropus*; a single bone indicating a new species of goose named *Anser hysibatus*; and an extinct swan on which the name of *Cygnus Paloregonus* is bestowed. The remainder of this number of the *Survey Bulletin* is devoted to descriptions of recent forms of life.

Mont Blanc: a Treatise on its Geodesical and Geological Constitution; its Transformations; and the Ancient and Recent State of its Glaciers. By Eugène Viollet-le-Duc. Translated by B. Bucknall. (Sampson Low and Co.) Now that tourists are beginning to prepare for their summer excursions, many of which will be extended to Switzerland, it seems a fit time for calling attention to this interesting volume. Its author is known as an architect rather than as a geologist, but he has been in the habit of devoting much of his vacations for years past to the study of Mont Blanc. After the annexation of part of Mont Blanc to France he conceived the idea of preparing an elaborate map of the district. With a keen eye for seizing upon the salient features in a mountain scene, and with a facile pencil for depicting what he sees, he has been able to sketch and map the mountain with great accuracy and with equal effect. Three separate views of each peak have been combined into one, and the resulting map is the product of about 500 drawings and sketches. By a peculiar method of shading he obtains the effect of the sun on the mountain at about eleven o'clock in the morning during the months of July and August. The reader must not expect, however, to find M. Viollet-le-Duc's great map of Mont Blanc appended to this octavo volume. The map is, indeed, an independent publication, and the book is the result of notes made while the mapping and sketching were in progress. Mr. Bucknall, himself an architect, had translated the other works of M. Viollet-le-Duc, and he has certainly not done wrong in offering the present translation to the English reader. It is true that a good deal of the scientific matter may be found elsewhere, but still there is a freshness blowing through much of the book which shows that the writer has been holding communion with nature in her Alpine solitudes, and has written down exactly what he saw. The author's vivacity of style is peculiarly French; and his descriptive writing is assisted by 120 sketches, generally very slight, sometimes merely diagrammatic, but always expressive. To the geologist and the physicist the book will prove far from unprofitable, but still it is to the general reader rather than to the man of science that the author has throughout addressed himself. The Alpine tourist who is anxious to learn something about the structure of the rock-masses which build up Mont Blanc, and about the origin and motion of its glaciers, will find in M. Viollet-le-Duc a pleasant and profitable guide.

METEOROLOGY.

Storm Tracks in Northern Europe.—Prof. Wild has issued, as a supplement to his Meteorological Bulletin, two sets of charts showing the monthly paths of cyclones over Northern and Western Europe during the six years 1872-7. The tracks for the first half of the period have been drawn by Baron Maydell, and for the second by Lieut. Spindler, who has also prepared the analysis of the whole. It is a great pity that a paper of such

* Die Babylonisch-Assyrischen Längenmasse nach der Tafel von Senkereh (1877).

a character is not regularly published. In the first place, M. Spindler finds that the ratio which the number of depressions coming from the Atlantic and Arctic Oceans bears to the number generated near the Mediterranean or over Southern Russia is 5:2, but of the former class hardly 50 per cent. really enter on the Continent, sweeping outside the coasts instead. Accordingly, of the storms which travel over Russia about half come from the sea and half from the land side, most of the latter being secondaries. As regards the region most frequently visited by storms from the ocean, it is found that of the five strips of five degrees each comprised between the parallels of 45° and 70° N. lat., that between 55° and 60° —i.e., that embracing Denmark and Southern Norway—is that by which the great majority of the storms, about one-third of the entire number, enter on the Continent. This proportion, however, does not hold in winter, the predominance indicated being chiefly brought out by the figures for summer and autumn. As regards the power of forecasting the direction of motion of each storm, the probability that any given storm will maintain its course unchanged for twenty-four hours is only 0.24, while it is 0.35 that the path will not swerve more than 20° on either side from its previous direction. However, only 3 per cent. of all the storms examined changed their course by 90° . If, however, two successive depressions have followed the same track, the probability is 38 per cent. that the next that comes will take the same line. The oceanic depressions arrive chiefly in November and December, and are rarest in May and June, in which latter months they never penetrate far into the country. The Continental depressions are generally of slight intensity, and only gain in force when they approach the sea. They are most frequent in spring and summer. On the average of the six years a depression appears every fourth day, but the sequence is more rapid in winter, less so in summer.

The Motion of Storms over the Atlantic.—M. Hébert, who during the recent illness of M. Harold Tarry took up the Monthly Weather Review which that gentleman had started in *Les Mondes*, and has since kept up the publication, has given in the *Bulletin* of the Association Scientifique a summary of a recent paper of his own on the "General Movements of the Atmosphere." In this he differs materially from Mr. Collins, of the *New York Herald*, and from Captain Jinman, both of whom appear to believe that storms circulate round and round the globe. M. Hébert suggests that most of the storms of Western Europe originate in the Rocky Mountains, while others, again, start from Central America and the Northern Andes!

Storm Warnings for South-west Europe.—Dr. G. Hellmann in the *Austrian Journal* for April 1 discusses the importance of an independent telegraphic organisation for the requirements of the western parts of the Mediterranean seaboard. He shows how reports from the Azores would be of the first importance to the districts in question, although they have been proved to be of slight value to our own islands and Northern Europe. The cable, however, has not yet been laid. Among other uses of the proposed intelligence system Dr. Hellmann suggests the possibility of locust warnings! The advance of these plagues over Algeria is at a regular rate, and it is quite possible to adopt precautionary measures for killing them if one knows they are approaching.

The Weather of last Winter in Iceland.—Captain Hoffmeyer has given in the *Austrian Journal* for May 15 a brief notice of the climate of Iceland during last winter. As we all remember, the period in question was singularly mild, dry, and calm, at least for Southern England, from the middle of December. In Iceland the period was remarkably stormy, changeable, and wet from the middle of October up to the end of February.

A Memorial Station to Padre Secchi.—Padre Denza, of Moncalieri, has announced by a circular the intention of the Italian meteorologists to establish a station on the Stelvio, and to name it after Secchi, who was the first originator of the mountain-stations at Monte Cavo and Grotta Ferrata.

The Mean Pressure in Europe.—In the *Austrian Journal* for April 1 Prof. Buys Ballot gives a summary of the annual march of pressure at all the stations in Europe, for which he gives regularly the deviations from the normal heights in his *Jaarboek*. The number of stations is 108, and they are classified in ten groups. The Professor promises a further discussion of the question in Part II. of the *Jaarboek* for 1872, which is not yet published.

The Mean Pressure of Vienna.—In the *ACADEMY* for May 4 we noticed Dr. Hann's paper "On the Mean Temperature of Vienna, from 100 Years' Observations," and now we have another paper on the "Mean Pressure." Both papers appear in the *Sitzungsberichte* of the Vienna Academy. The demand for these papers has arisen from the necessity of carefully determining the constants of the new Meteorological Observatory, the Hohe Warte. It is needless to say that the discussion has been carried out with the greatest care. The mean pressure is 743.7 mm., with a maximum of 745.7 in January, and a minimum of 741.7 in April. The epochs for diurnal range, on the mean of the year, are, for the maxima, 9h. 6m. A.M., and 10h. 8m. P.M.; and for the minima, 4h. 4m. P.M., and 4h. 5m. A.M. The amplitude of the day oscillation is 1 mm., and of the night oscillation 0.4 mm. Of course a considerable change takes place in the several months.

The Daily Range of Temperature.—In our columns for February 2 we noticed Prof. Wild's great paper on the temperature of the Russian Empire. Those of our readers who may not have access to the original memoir may be glad to learn that Dr. Hann gives a concise summary of the results as to diurnal range in the *Journal* of the Austrian Society for May 1.

The Distribution of Heat in a Vertical Direction in the Atmosphere.—In former numbers of the *ACADEMY* we have noticed the appearance of successive instalments of the abstract of the paper by MM. Mohn and Guldberg, "Etudes sur les mouvements de l'atmosphère." In the *Austrian Journal* for April 15 they take up a new subject, the change of temperature as we ascend in the atmosphere, a question frequently attacked previously, especially by Peslin in the *Bulletin* of the Association Scientifique for 1878. The authors deal with the question under its three aspects: (1) Air at rest; (2) An ascending current as in a cyclone; (3) A descending current as in the Föhn.

MEETINGS OF SOCIETIES.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, May 14.)

JOHN EVANS, Esq., D.C.L., F.R.S., President, in the Chair. Captain Dillon exhibited a series of flint implements, collected in the neighbourhood of Ditchley, Oxon; and a number of others from the drift gravel of the Lea Valley, near Clapton, were exhibited by Mr. Worthington G. Smith.—The following papers were read by the author, Prof. Rolleston:—"Description of a Male Skeleton found at Cissbury by Mr. J. Park Harrison." The paper was illustrated by a semidiagrammatic of the pit whence the skeleton had come; the principal part of the skeleton itself, some bones of ox, goat, pig, and red deer, and, finally, a large quantity of worked flints and some lumps of iron pyrites were on the table. Much help had been received as to the preservation of the skeleton from Dr. Kelly, the Medical Officer of Health for the district. There was no doubt the skeleton had belonged to a man with a markedly dolichocephalic skull, the length-breadth index being seventy-one, but not brachycephalic, the length-height index being seventy-six; his stature had been something under

five feet, either as calculated from the long bones, or by simple measurement of the skeleton as laid out and increased by the addition of one inch for calvarial and cranial integuments. The age had been something between twenty-five and thirty, the absence of wear on the wisdom-teeth being deceptive, owing to the non-development of one of these teeth, and the small size of another. The owner of the skeleton had suffered from infantile cerebral hemiplegia, the right humerus being a half-inch longer, and the right radius $8\frac{1}{2}$ " longer than the corresponding bone on the left side, while the femora were equal in length, and the right tibia only $2\frac{1}{2}$ " longer than the left. This pathological condition, however, did not account for some very striking characters of the limb-bones, which were equally prominent on both sides of the body; these being the platycnemy of the tibiae, the anterior convexity and from side-to-side flattening of the humeri, &c. Altogether the osteological peculiarities of the skeleton were distinct evidences for its antiquity and its mode of burial.—"On the Excavation of Three Round Barrows at Sigwell near South Cadbury, in the Parish of Compton, Somerset." These three round barrows belonged to the Bronze Age; no trace of iron, except such as had been accidentally (and demonstrably so) introduced, being found in any of them; the interments in them had been in the way of cremation, and in one case the ashes had been gathered into a bark coffin, and a bronze dagger placed with them. In one barrow no interment was found, in another the ashes occupied an area of only 1' in diameter, and in both cases the bones had been carefully picked out of the embers of the funeral pile and interred apart, though in neither case in an urn. Fragmentary pieces of coarse pottery, however, were found here and there throughout the mass of the barrows, and though there were no flints to be found in the immediate neighbourhood, great abundance of chipped flints and some scrapers were found; and notably one very beautiful one by the Rev. J. A. Bennett, to whose association very much of the success of the exploration was due.

CHEMICAL SOCIETY.—(Thursday, May 16.)

DR. GLADSTONE, F.R.S., President, in the Chair. The following papers were read:—"On the Detection and Estimation of free Mineral Acids in various commercial products," by Peter Spence and A. Esilmann. The method is based on the fact that peracetate of iron even in dilute solutions has a distinct yellow colour, not perceptibly altered by acetic acid or solutions of persulphates, but instantly bleached by free sulphuric, hydrochloric, and nitric acids. The solution is made by dissolving ten parts of iron alum and eight parts of crystallised acetate of soda in 1,000 parts of 8 per cent. solution of acetic acid (25 per cent.).—"The action of Hypochlorites on Urea," by H. G. H. Fenton. The author has found that when urea is acted on by a hypochlorite in the cold, in the presence of a caustic alkali, only half the nitrogen is evolved. From various experiments it was proved that the nitrogen remains behind as a cyanate.—"On the behaviour of Metallic Solutions with Filter Paper, and on the Detection of Cadmium," by T. Bayley. The author has investigated the action which takes place when drops of metallic solutions are placed on filter paper, the extent to which the solutions spread being tested by sulphuretted hydrogen. In some cases the solution seemed to concentrate itself in the middle, in others round the edge of the spot. Dilution, temperature, and the kind of filter paper have an important influence on this phenomenon. The salts of silver, lead, &c., when moderately concentrated, give a wide water-ring containing no metal, while the salts of copper, nickel, cobalt, and especially cadmium, must be much more dilute to present the same appearance. This property of cadmium to spread itself over the whole drop is so marked that it affords an elegant means of detecting it in the presence of metals whose sulphides are black.—"On Essential Oil of Sage," by S. Siguira and M. M. P. Muir. The oil consists mainly of two terpenes—one boiling at $152-156^{\circ}$, the other at $162-167^{\circ}$ —an oxidised liquid, and a camphor. A small quantity of absolutely pure sage oil has been examined, and consists mainly of a terpene of a dark emerald green colour, boiling at $264-270^{\circ}$.—"On the Action of Bromine upon Sulphur," by J. B. Hannay. The author has investigated the evidence as to the existence of any compounds of these two elements by boiling-points, the spectrum of the vapour, specific

ravity, and vapour tension. He concludes that the action of any quantity of bromine on any quantity of sulphur is an action on the whole mass, and not in multiple proportion, but that, if at low temperatures he compound containing one atom of sulphur to two of bromine meets a body with which it can form a molecular combination—e.g., arsenic—it assumes the crystalline form in conjunction with such a body.—“On the Determination of High Boiling-Points,” by J. Carnelly and W. C. Williams. The authors have determined the boiling-points of various substances by observing whether or not certain salts fuse when exposed to the vapour of the boiling substance. The melting-points of the salts have been determined by Carnelly. The salts are contained in capillary tubes.—“On High Melting-Points,” Part IV., by T. Carnelly, D.Sc. The author has perfected his (specific) method of determining melting-points, and eliminated two sources of error. In the present paper he gives the melting-points of over one hundred substances. He promises a paper embodying theoretical results deduced from the above observations.

ZOOLOGICAL SOCIETY OF LONDON.—(Tuesday, May 21.)

J. D. GODMAN, Esq., F.Z.S., in the Chair. A communication was read from Lieut.-Col. R. H. Beddome, containing the description of a new genus and species of snakes, of the family of Calamariidae from Southern India, proposed to be called *Xylophis indicus*.—Mr. L. Selater read the tenth of a series of Reports on the collection of birds made during the voyage of I.M.S. *Challenger*, containing an account of the birds of the Atlantic islands and Kerguelen's Land, and of the miscellaneous collections made by the expedition.—Mr. J. Wood Mason described several new or little-known Mantidae from India, Australia, and other localities.—Mr. H. W. Bates read a paper containing the description of new genera and species of Geodephagous Coleoptera from Central America, belonging to the families Cicindelidae and Carabidae.—Mr. G. French Angas read the description of a new species of *Tudicula*, which he proposed to name *T. inermis*.—A communication was read from the Marquis of Tweeddale, being the ninth of his contributions to the ornithology of the Philippines. The present paper gave an account of the collection made by Mr. A. H. Everett in the island of Palawan, and contained the descriptions of nine new species, beside three examples of the remarkable *Polyplectron emphanes*, of which the locality was previously unknown and specimens were excessively rare.—Prof. A. H. Garrod read a paper in which he gave a description of the tracheae of *Tantalus loculator* and of *Vamellus cayennensis*, and some notes on the anatomy of the Great-headed Maleo (*Megacephalon maleo*).

SOCIETY OF ANTIQUARIES.—(Thursday, May 23.)

JOHN CARNARVON in the Chair. The Rev. J. Baron read a paper upon a hoard of gold nobles found on a farm at Westbury, Wilts. The coins, thirty-two in number, were mostly of the reign of Edward III., bearing the device of a king in a ship, which was adopted after the battle of Sluys, with the legend, “Jesus autem transiens per medium illorum ibat.” Three specimens belonged to the succeeding reign, but were similar to the earlier coins, except the name of the king. Four bear the arms and name of Philip the Bold, Duke of Burgundy, being coined in Flanders for circulation in England, in accordance with a treaty made between the Duke and Edward III. The diameter of the coins is $1\frac{1}{2}$ inches, and the weight 20 gr. When coined they were equal in value to 6s. 8d.; but the gold in each is now worth nearly a sovereign.—Mr. Octavius Morgan exhibited a silver model of the first Eddystone lighthouse built by Winstanley, which was probably made in 1698.—Mr. Baldry exhibited a bronze statuette of an Egyptian functionary of the nineteenth or twentieth dynasty. The lower part of the trunk is lost, and there are traces of a gilded collar. The casting was made on a sand core, and an iron rod was placed inside to give the statuette, which measures twenty-six inches, greater strength. This object was found near the pyramid of Gizeh.

PHYSICAL SOCIETY.—(Saturday, May 25.)

PROF. W. G. ADAMS, President, in the Chair. Mr. D. Blaikley read a paper on “Brass Wind Instruments and Resonators,” describing an attempt he has made to

carry into some detail certain acoustical investigations of the late Sir C. Wheatstone. A method by which the positions of the nodal points in a cone and in a bugle had been fixed, was explained; and it was shown that a complete cone cannot be used by the lips as a wind instrument; that conic frustra cannot give resonance to the same series of notes as complete cones, and that, therefore, the conical form must be modified; and, as this modification of form makes the position of a node for every note required more or less coincide with that of the lips, so will the instrument be more or less perfectly in tune. Experiments were shown to illustrate the effect of varieties of form in producing different qualities of tone, and evidence was given of the existence of very high harmonic or partial tones in the low notes of wind instruments. In the trombone the ninth partial tone (three octaves and a tone above its prime) was thus proved to be sounding, and partial tones up to the sixteenth have been heard. Sir W. Thomson pointed out the connexion between the range of a musical instrument and the phenomena observed in a trumpet-shaped bay between high and low water; he also considered that an investigation of the overtones due to the cavity of the mouth would well repay research in explaining the influence its shape has on the vowel sounds.—Dr. Guthrie placed on the table a communication on salt solutions and attached water, and on the separation of water from crystalline solids in currents of dry air, in continuation of his researches which have already been published. He also showed the effect of a steam jet in boring through a block, mainly with a view of obtaining suggestions as to the use of such a method in the commercial preparation of ice.—Mr. Rutherford then showed a photograph of the solar spectrum from the line E to H taken by means of a grating. By means of a heliostat he concentrated the rays on a lens within a collimator, which in relation to the observing telescope was of considerable length in order to admit as much light as possible, and the grating was moveable. The enlargement was effected by inserting a lens near the focal point of the observing telescope, and he used a sensitive collodion which gave the greatest sharpness of definition about the line G.—Sir W. Thomson, in continuation of the communication made to the society at its last meeting, described the effect of torsion on the electric conductivity of a tube of brass. He showed that the effects of pull and thrust were different, and that in the case of a tube, as in the case of a plate, there is a diminution in conductivity in the direction of pull; in the case of the tube, however, the components of the forces result in a sort of echelon arrangement as regards conductivity.

FINE ART.

THE INTERNATIONAL EXHIBITION, PARIS, 1878.

(First Notice.)

THE interest of an exhibition of this nature lies, not in the novelty of the works placed before us, but in the opportunity which they afford for comparison on a vast scale of, what can be called only by courtesy, the schools of the different nations. Of schools, indeed, there are but two—the French and the English. In this enormous crowd the little group of English artists alone show a character and quality of sentiment wholly distinct from the character and sentiment of the French school. All other nations are not only deeply imbued with traditions of old derived from France, but are linked to her at present by closely approximating tendencies and aims.

Immeasurably inferior to the French, both in point of numbers and in all that relates to matters of practice and knowledge, the English school has, however, pursued its own path, while the rest of Europe has followed the lead of France. The French school is, in fact, the school of the Continent. Ever since the days when the theories of Winckelmann and Lessing found a practical exponent at Paris in Louis David, the North and South, Germany and Italy alike, have followed the direction and obeyed the impulses of France. The line taken by Kaulbach in obedience to the warlike and religious enthusiasm which laid hold on Germany in 1814 may at first seem to be an exception. It will, however, be found on examina-

tion that it was but an adaptation of the principles laid down by David—an adaptation of the principles and practice of the Classicists to another order of subjects. The direction was substantially the same, although the point of departure seemed different. Since the beginning of the present century the rule of the Classicists has only been seriously disputed by the Romantists, and the Romantists, like the Classicists, were the children of France. The Romantic movement, inaugurated in literature by Mme. de Staël, was inaugurated in art by the group of which Eugène Delacroix was the chief. It not only modified choice of subject, and the nature of the ideas which it was the object to express, but it revolutionised to a considerable extent the forms of expression, and profoundly affected both theoretical principles and actual practice. In matters of practice, the methods and style of the English school, which, unlike the rest of Europe, had remained almost a stranger to the teaching of David, acquired, as represented by the works of Reynolds and Lawrence, an enormous influence with the leaders of the Romantic movement. To the qualities of sentiment and colour which distinguished our great portrait-painters they attached a cardinal importance. There were those who, with the passion of deep conviction, formulated as a principle the expression of the subject by colour rather than by form—a doctrine the very reverse of that held by the Classicists, and which led when applied by the extreme members of the party, not only to neglect of construction and composition, but to neglect of outline of mass and general arrangement.

The generation which witnessed the heated contests of 1820, which witnessed the days when the opening of the Salon was a signal for battle between groups of eager partisans, has almost passed away, but the present exhibition shows us on all sides how wide has been the action of the movement with which the name of Delacroix is indissolubly connected, and how deeply it has leavened modern art. Take, for instance, the works of some of the most celebrated painters of the day, the works of men so diverse as Henri Lévy in France, and Makart in Austria, and we see that both alike derive from the days of 1820. The *Salomé* of M. Lévy, and his decorations for the chapel of St. Merry, exhibited in the section of the *Ville de Paris*, show the same lavish use of all means of picturesque effect, the same devices for occupying and amusing the mind by variety of line and play of light, the same vivacious desire to please the eye by a gay assemblage of variegated hues, as distinguish the vast and entertaining canvas on which Herr Makart has depicted the *Entry of the young Emperor Charles V. into the City of Ghent*. Even the tendency to give to historical subjects an anecdotic turn is also common to M. Lévy, and to his weaker brother Herr Makart. It has, indeed, always been a reproach to the greater part of the Romantic school that they were ready to satisfy the demand for amusement even at the expense of themes which require serious study as well as intelligent treatment. M. Lévy, when he has to show us St. Denis preaching the Gospel, scatters around the saint in picturesque groups a lively audience of gipsies, and, instead of constructing his landscape background sculpturally, as is invariably done by those who have the instinct of mural decoration, who possess that art which “respects the wall,” M. Lévy gives us interlacing boughs of trees and waving masses of foliage, and white clouds fleeting across the blue sky. Mural decoration is, indeed, always treated more or less pictorially by the class in which M. Lévy must be reckoned, and the works of this order executed by Herr Makart at Vienna show the same tendency to conceive of the subject, not in relation to the building of which it should form a part, but as an independent whole, as a “picture” one of the legitimate objects of which is to lead the eye into space, to create illusion, to

cause us, in short, to *forget* the wall. In like manner, too, just as M. Lévy sees in the solemn preaching of the destined martyr an opportunity for amusing the spectator with the variety of types to be found in an assemblage of wildly picturesque Bohemians, even so Herr Makart in the *Entry of Charles V. into Ghent* selects, not the terrible drama of Spanish and Catholic oppression, full of historical importance and local colour, but the prettiness of a gay pageant which might have been the pride of any great city, spiced by the light comedy which raises a smile at the expense of the austere boy-pupil of Cardinal Granvelle gravely rebuking the *déshabille* of a troop of little dancing-girls who form part of the show.

This tendency to elude the more serious aspect of a subject, to seek refuge from the severe exigencies of the heroic in the picturesque; to be satisfied with ingenious and graceful arrangements rather than encounter the heavy toil of slowly-elaborated compositions; to seek in the first place for all means of pleasurably irritating the eye by the sensuous seductions of colour rather than to address the mind through the eye with the results of ripened study of form—these are the weaknesses of the Romantists, but they have their strong side also. It must not be forgotten that during the present century they have enlarged the borders within which men had hitherto moved, by directing their attention to an aspect of the real world which had been previously to a great extent ignored. Art is based upon the real; it is based upon that which exists, and all honest interrogation of nature must furnish valuable results. Not only have strong men, such as M. Meissonier, come out of the ranks of the Romantists—Meissonier, whom the author of the *Massacre de Scio* proclaimed to be “le maître le plus incontestable de notre époque”—but the leading preoccupations of the younger painters of the present day may be traced to that impulse to seek out aspects of life admitting of close approach and intimacy which derives from the Romantic movement. The all-absorbing desire to be true to nature—to *faire vrai*—and to be “modern” at any cost, which distinguishes the band of which M. Gervex is perhaps the strongest representative—this desire was born, in truth, of that liberty of choice which was claimed by the leaders of the Romantists. The Moderns, like the Romantists, have indeed their left wing. Just as among the men of 1820 there were those who could be justly reproached with sheltering their indolence and incapacity for serious study under exalted pretensions to “colour,” even so do the Impressionists, the left wing of the Moderns, of to-day attempt to evade all criticism of the insufficiency of their knowledge and acquirements by appealing to the force of their “impressions.” But a school so great as that of France can afford room for follies and exaggerations. The extravagance of those who proclaimed Delacroix their leader (those who placed one single attribute of form—the attribute of colour—above all others) awakened at least the attention of the Classicists by whom it had previously been neglected; and in their turn the Moderns, who, in their eagerness for faithful reproduction of no matter what, often forget the first principles of art, are amassing for us a vast experience, which may afford materials for the renewal of types and subjects which have now become conventional.

Like the Romantic movement, the Modern movement has now caught hold upon the other nations of Europe, and when we see this further proof of the enormous influence of the French school; when we see its numbers, its discipline, and its strength; it is impossible not to ask to what is this weight and superiority due. I cannot but think that it is due in great measure, not only to national aptitude, not only to the logical force with which the French always pursue any given idea and work it out to its ultimate conclusion, but to that very system of Administration against which a strong opinion is now in course of formation in the studios of Paris.

What does the Administration do for the Fine Arts in France? In the first place, it supports great schools, the schools of Paris and of Rome; and, in the second, by the commissions which it bestows it directs the training given in those schools, it fosters the production of works which could only find a place in edifices of vast size, such as palaces and public buildings. The action of the Government schools must in one respect be allowed to be in the highest degree beneficial. The *penonnaires de Rome* have a sense of the dignity of their profession which is scarcely to be found, even among the most distinguished men, outside their ranks. If they do not come back from Italy with the fire of genius, they come back having received a training which directs their aims towards a high ideal, and are ready to suffer for the honour of their art. You do not find the canvases of Cabanel the common property of knots of picture-dealers, and Delaunay will prefer never to have sold a painting to seeking fortune by taking his cue from the tastes and fashion of the moment. It is, however, urged that the set routine of the schools stifles originality; but the mere existence of a talent such as that of Delaunay or of a man like Gustave Moreau is a proof to the contrary. The mere fact of regular training in a certain set of formulas will not take away or give powers of conception and invention, but it will and does give, according to the capacity of those trained, powers of execution and command of the tools with which to work; and the certain prospect which is ever before the student of being able sooner or later to put himself to the proof on work of a monumental character sustains him through the long years of necessary preliminary labour and study.

But there is another side to the picture, the side which makes all endowment a dubious benefit. Until a machinery can be devised which shall prevent places from being jobbed, which shall prevent the rule of incompetent officials, those who desire to set the Fine Arts free from State control can always make out a strong case.

E. F. S. PATTISON.

THE GROSVENOR GALLERY.

(Second Notice.)

MR. CECIL LAWSON'S large picture, *In the Minister's Garden*, leads off the landscape art of this exhibition. It is a potent work, and has made on all sorts of spectators that impression which is the natural outcome of power. Certainly few British landscapes of recent years could be matched with it in this respect; it reminds us more—but not of course with any taint of imitation—of the vivid courageous manner which used to distinguish the earlier works of Mr. Anthony—a painter, by the way, whom we regret not to find represented in the Grosvenor Gallery. Mr. Lawson gives us a very wide space of varied English country, laying great stress on his foreground, which sends everything else back, strong though the manipulation is all over the canvas. A fir-tree rises in front over a luxuriantly free growth of hollyhocks, cabbages, nasturtiums, peas, marigolds, and further to the right, roses, poppies, &c.; beehives are there also; then fields, cottages, various small scattered figures, trees, fields again, and a hilly ridge rising towards the white-clouded blue sky, speckled with a few drifting birds. Natural abundance, open space, strength of tint, all united with a general simplicity in the point of view and atmospheric conditions, are dominant qualities in this excellent picture, in which, while all is strong, nothing appears strained. Much as we value the *Minister's Garden*, we prefer to it Mr. Lawson's second and rather less large picture, *In the Valley, a Pastoral*, which we remember enjoying some years ago at the Royal Academy. This is pre-eminently graceful, and poetic in its grace; it affects one like a snatch of delicate descriptive lyrical verse. Blue is the keynote of the colour: blue in the river, the distance, the sky, the shep-

herdess with her straggling flock. A third work by the same painter is named *Strayed, a Moon-light Pastoral*; nor would it be fair to speak of this with any less praise than of the other two. A few sheep are on high ground overlooking the Tyne and its miscellany of buildings, seen with luminous dimness by the light of the moon, whose blurry edges accord with the generally moist atmosphere. Even had we never before seen any productions by Mr. Lawson, what he now shows in the Grosvenor Gallery would prove to us indisputably his possession of the three precious qualities—strength, sweetness, and sentiment. We hardly know that he requires to be on his guard against any particular misdirection of faculty, and can only hope that he will continue to paint his best, without laxity on the one hand, or over-demonstration on the other. Facility, of which no doubt he already has abundance, and will from year to year acquire still more, is a serious danger, as well as a great opportunity. Mr. Whistler contributes to the landscape section three “Nocturnes” and a “Harmony.” The nocturnes are respectively in blue and silver, in blue and gold, and in grey and gold; the first two being river scenes, and the third a street scene. All these are of Mr. Whistler's finest quality; or in other words, according to their own special standard, unsurpassable. Perhaps of the three we should prefer the blue and gold; but it is difficult to choose. The *Harmony in Blue and Yellow*—a quiet sea meeting the sandy beach—is also excellent. Mr. Armstrong gives a landscape treatment of *Ariadne Abandoned by Theseus*: a dreary scene, streaked with the beauty of flowers—a hard line of dark sea below a yellow sky—and to the right the reaching hands of the forlorn princess. Other principal landscapes are *A Pastoral*, by Mr. Mark Fisher; *The Coming Storm*, by Mr. Legros, with two stark tree-trunks, a pond, and the collision of vapours in the sky; *March Weather*, by Mr. Boughton, with a woman trudging on a country path, and a windmill beyond the sloping ground; *Twilight by the River-mouth, Oneglia*, by Mr. George Howard; *The Rocks Assembling*, by Mr. Stuart Wortley; and *Vesuvius from above Pompeii*, by Mr. Barclay.

We must now revert to the figure-pieces, which our opening review did not by any means exhaust.

Mr. Strudwick's *Passing Days* seems to be a general favourite: the symbolism is moderately easy to decipher, but any difficulty which may at first have existed has been cleared up by the artist himself, who supplies, in Mr. Blackburn's handy illustrated catalogue, an abstract of his theme. Man, attended by Time and Love, is watching the past and passing days: those of childhood have already gone down into the mist; behind come the future days, ending with decrepitude, and the final apparition of Death. The period of advanced middle age hardly finds a representative. Mr. Strudwick, who evidently inspires himself out of the rich oracular fumes of Mr. Burne Jones to a large extent, has produced here a picture with an ample sufficiency of appropriate and well worked-out thought. His manner runs into two extremes: that of the quaintly angular and hard, and that of the prettified; all the youthful faces, broadly speaking, belong to the latter category. Making fair allowance for a painter at an early stage of his career, we can join in with Mr. Strudwick's eulogists: not that we think his style perfection, or his idea a portent of profundity, but that he is thoughtful, diligent, and artist-like. Mr. Albert Moore always shines where the pure aim after art—in form, and more especially in inter-relations of colour—is concerned; as for meaning, he has for several years past set that aside as surplussage. His large picture of *Birds*, a female figure looking up with a canary on the floor as focus of the colour-scale, and his small example, *A Study*, also a woman in yellow, are choice specimens: one can linger long and enjoyingly over both, as soon as one accepts the painter's point of view. We may

ay the like, but in minor degree, for Mr. Armstrong's picture, which, discarding all attempt at abstract invention of subject-matter, is simply named *Three Female Figures on a Marble Seat, with Orange-blossoms and Marigolds*. There are also a pea-hen, a blue unvaried sea, and a whiteish horizon, with an upper sky which gains a little blue. In respect of painting, perhaps the best thing here is the tone of the marble seat; while the least satisfactory (though it has some true connexion with the general scheme of colour) is the brownish-pink tendency of the flesh-tints. *The Rivals*, by Mr. Boughton, is one of his happiest hits: the subject seems to have presented itself with concrete spontaneity to his bodily or mental eye, and has been realised with equal directness—neither laborious nor negligent. Two young masons are hammering at a stone block, under the gaze of the woman whom each of them would fain be courting: a wreath of smoke ascends from a low point in the foreground up towards the right. Mr. Leighton contributes one of his best portraits, *Miss Stewart Hodgson*: a small girl in dark-red velvet and fur, standing on the brown floor, with a blue carpet-fringe in front running parallel to the frame; plump and rosy, with unoccupied hands. Another portrait of very superior calibre is that by Canon, *The Queen of Denmark*; precise but not meagre in general style, with a Rubens-like treatment of the flesh—somewhat harder, however, than was the mode of the great Fleming. Mr. Collier also exhibits an able portrait, *Mrs. Charles Beatty Pownall*, with unaffected expression, and delicately-mottled flesh-tint. Mr. Halle contributes four portraits, of varying merit: perhaps that of *Mrs. Poynter* ranks highest; also an ambitious personification, *The Rain-cloud*. *The Little Daisy* of Mr. Forbes Robertson may likewise be cited. There is much pleasant matter, pleasantly put together, and dealt with in an unpretentious but at the same time elegant style, in Mr. Hennessy's *Fête-day in a Cider-orchard, Normandy*. Miss Evelyn Pickering, with her *Venus and Cupid*, shows herself an accomplished hand-maiden in the temple-precincts of the Burne-Jones cult. *The Bell-ringers*, by Mr. Wills, is well-varied in action, not in facial type, for the whole batch of boys have a strong family likeness.

In the water-colour section the largest exhibitor is Mr. Richard Doyle. Some of the subjects are out of his true line, and not satisfactory: others are inimitable in their way. *Manners and Customs of Monkeys* is irresistibly comical, representing the monkeys of Darfur, which, it seems, get drunk on a kind of beer liberally tendered to them by the natives, and are then led off into captivity, one holding on by the other, a negro leading the foremost of the string. Equal to this is another very ludicrous conception, *The Witch drives her Flock of Young Dragons to Market*; and only a little less successful a comparatively large drawing, *The God Thor drives the Dwarfs out of Scandinavia by throwing his Hammer at them*. Lady Waterford, however, in virtue of her fine sense of style and colour, may be regarded as the most important contributor of water-colours. *Christmas*, "the Lord of the Season always sends his representative to receive homage and an offering," is a graceful and pathetic invention: a young mother and her infant, sheltered from the deep-drifted snow which is visible outside, are tended with rough yet kindly solicitude by a group of labouring people—the entire aspect of the scene being assimilated to that of the Madonna and Child adored by the shepherds. *The Parable of the Marriage-supper*, illustrating the text "compel them to come in," approaches near to the quality of Italian art of the sixteenth century, so far as the main current of feeling and characterisation is concerned; and *The Prodigal Son*, clasped in the long embrace of his father, is marked by great depth of feeling. Other good exhibitors are Messrs. W. H. Millais, Crane, Poynter, Howard, Jopling (*Wallflowers*), and Simms

In sculpture the work which excites most attention is the *Geraint and Enid* of Princess Louise. There are seven horses close together here, and an eighth in the distance: of course, anything but an easy matter for even a skilful hand to manage. The movement is consentaneous, not however particularly vigorous; but the work of a lady and a princess is assessed from a point of view rather different from that which applies to a professional sculptor. W. M. ROSSETTI.

THE EXHIBITION OF AMATEUR ART AT LOWTHER LODGE.

ON Wednesday week there was opened, in the splendid brick mansion near the Albert Hall known as Lowther Lodge, a show of various kinds of artistic productions. Attracted by the term "amateur," I paid it a visit, and I must say, in all honesty, that but for the modest disclaimer there is little to distinguish these works from those of professional artists, so light is the sprinkling of the less-masterly sort which one naturally expects to find in such a collection. The sketches of the Hon. Mrs. Hussey, Mrs. Bridgman Simpson, and Miss F. Blake, are beyond praise for their vivacity, fidelity, and technical accomplishment. Several other portfolios contained clever and decidedly effective works; but the subjects were either less attractive in themselves or the artist's eye was not quite so truly master of the situation as in those named. Among some very fair examples, however, were the sketches of Lady Gordon, Lord Windsor, and another distinguished amateur, whose portfolios were to be seen on the tables in two or three of the rooms. I found one example only of amateur illumination, in the form of a sort of Family Record by the Duchess of Cleveland. Of course her Grace will not suppose herself equal to a Van Eyck or a Clovio, but she may be congratulated on having produced a piece of very presentable work, done evidently with a loving, patient hand. I should myself like to see more of the sort of work which we are told the gods are pleased with. Slipshod flower-groups, or mere roughly-designed and coarsely-finished sentences from poetry or Scripture, are not the things to bring out the best qualities of illumination. Only patient, faithful book-work of at least half-a-dozen pages will really give the necessary training for both eye and hand. Such amateurs as the Duchess of Cleveland can appreciate the labour and the devotion needed for the pursuit of one of the most beautiful and fascinating of occupations, and will be among those who most thoroughly delight in the perusal of the charmingly exquisite *chefs-d'œuvre* of the miniaturists of mediæval Europe.

The embroidery, lace, &c., judging from comments which I overheard, must have been wonderful, and much of the wood-carving is far above the average of mere amateur performance. I may add that the copies, such as the *St. Roche* of Mrs. Hugh Seymour, were in two or three instances really fine. On the whole, possibly the success of this display of aristocratic art-talent may establish a good argument for a more frequent display, or, better still, for the formation of a Society of Amateurs whose exhibition should form part of the regular attractions of the season.

J. W. BRADLEY.

NOTES ON ART AND ARCHAEOLOGY.

THERE are now on view at Messrs. Darnley's, the Quadrant, Regent Street, two pictures by Mr. Cheltenham Wake which are of a nature to attract visitors. They are of the order of art which Mr. Frith has this year made as popular as ever. They represent a shorter "road to ruin" than that which is indicated by the popular Academician: the first picture representing the interior of a Casino, and the second the public parlour of an inn, in which a coroner is holding an enquiry into the death of a young woman evi-

dently cast up by the tide. The Casino is probably in London: the inn, we are informed, is the Falcon at Gravesend. Mr. Cheltenham Wake is by no means a master of the technicalities of his art—he is wanting in colour and draughtsmanship; but he is endowed with a certain skill in portraiture, and, still more notably, with some gifts of dramatic invention. Thus the suggestion of a crowd surging in at the parlour-door, but seen only by reflection in the mirror on the mantelpiece, is sufficiently clever; and many of the incidents of the evening at the Casino, which is the beginning of the ruin of the heroine of these pictures, are observed with indubitable keenness, and recorded with some piquancy. There is a large public that will derive not only interest but pleasure from an inspection of these works, though their purely technical qualities are beyond question inferior to their merits of dramatic power and observation.

WE understand that on several days during the middle of June there will be sold at Messrs. Sotheby's the large and much talked-of collection of engravings and woodcuts formed during fifteen years' diligent collecting by the late Mr. Michael Caspari. Many of the woodcuts were exhibited at the Caxton exhibition, and it is in this department of art that the Caspari collection is deemed rich, not only in the number of specimens it contains, but also in their quality.

THE publishers of *L'Art* have just produced a brilliant and large etching sure of instant popularity. It represents the Place de l'Opéra on a sunny summer afternoon, with just such an effect as may be found there during any of these present days: the Place alive with the movement of prosperous wayfarers, and behind it the lines—now massive, now delicate—of the great Opera House. The etching of architecture has always presented difficulties; and we do not opine that Mr. Mitchell, in his agreeable work, has been wholly successful in overcoming them. Some sense of solidity may be wanting to the treatment of the lower storey of the Opera House and of the vast flight of steps by which it is approached. But in the main the work is very creditable as a generally veracious and attractive representation of an attractive side of Paris and Paris life.

WE find that it was not the case, as we thought we had reason to believe, that the picture of Old London Bridge sold at Mr. Heugh's sale was among those offered to the choice of the nation by Mr. Wynn Ellis. Mr. Wynn Ellis's bequest included none of his English pictures, that part of his collection having been left to his heirs.

THE death is announced of M. Riesener, a French painter of some distinction, at the age of seventy.

WE are glad to notice that the attempt to reproduce the features of the art of the Assyrian empire, and to adapt its forms to the requirements of modern decoration, has met with some success. Mr. A. Hays, an amateur sculptor, has executed a pair of statuettes representing the two Assyrian kings Sennacherib and Assurbanipal or Sardanapalus. These statues, which are exact reproductions from the figures in the bas-reliefs, are now supplemented by a female figure representing the queen of Sardanapalus. This figure is reproduced from the bas-relief obtained from Kouyunjik in which the queen is represented as banqueting with the king. The forms and features and the elaborate embroidered drapery are rendered with most scrupulous fidelity.

IN addition to these statuettes there are two small reproductions of the head of a winged bull and one of the lion weights, which are most faithful in their rendering, and form interesting examples of the conventional treatment of animal life which is so marked a feature in the art of the Assyrian empire. Mr. A. Jarvis, of 43 Willis Road, Kentish Town, has obtained from Mr. Hays the right of reproducing these works for the benefit of such as may wish to possess some *souvenirs* of the greatest of kings.

At the recent sale of Daubigny's works his magnificent landscape, *Vendange en Bourgogne*, was bought for the Louvre for 10,000 fr.

It is strange that the Germans, who were the last to join in the Paris Exhibition, should be ready almost first. The Belgian section is not yet opened, nor is that of French sculpture; but with these two exceptions the whole of the Exhibition can now be seen, though in parts it is still very unfinished. The English section, as before stated, is the most popular.

Two prizes have lately been awarded by the French Academy of Fine Arts for works on art. One of these is an essay on art criticism, by M. Bougot, and the other *L'Egypte à petites journées*, by M. Rhoné. The prizes, which are derived from the Montyon foundation, are worth 1,000 fr. each.

A VERY characteristic portrait of Lessing, painted from the life by Anton Graff, is at present exhibiting at the Kunsthalle at Hamburg with a view to its ultimate sale. There are several portraits known of Lessing, but few of them have the striking individuality of this, which was painted in Berlin in 1771, and is the original of many copies.

AN Etching Society has been started at Weimar under the patronage of the Grand-Duke. Several of the most distinguished of the Weimar colony of painters belong to it. The first number of the Album, which it has put forth as a tentative effort, is only published in a very small edition; but if it find favour with the public, other numbers will follow of larger extent. The contributors to the present publication of the society are Brendel, Danz, Koken, W. Linnig, sen., Linnig, jun., Malchin, Weichberger, and Von Gleichen-Russwurm.

SOME further particulars are given by M. Duranty, in the *Chronique des Arts* of last week, concerning the restoration of the great altar-piece of the *Last Judgment*, by Rogier van der Weyden, which, as before mentioned, is now being exhibited in one of the Salles of the Louvre. It appears that this celebrated work, which ranks next after the *Mystic Lamb* of St.-Bavon as the greatest production of the Early Flemish school, has been for no less a time than three years in the hands of the administration of the Louvre undergoing treatment. Like Michelangelo's *Last Judgment* in the Sistine, this work had also suffered from the prudery of an age which would not permit even lost souls to appear without clothing. All the little naked figures of the composition, which were painted with a wonderful knowledge of anatomy, considering the date of the work, had been provided with gaudy drapery or else hidden by means of additional flames; other parts had also been retouched, and the picture altogether was in a bad state. By the most delicate treatment, however, it has been found possible to remove all this hideous over-painting without destroying anything of the original colour, which, according to M. Duranty, who is an excellent critic in such matters, remains as intense and brilliant as when this altar-piece was first set up by Chancellor Rollin in the Hospital of Beaune in the year 1477. It is stated that this interesting work will only remain for two months on exhibition at the Louvre, the hospital at Beaune being naturally desirous of regaining its "restored" patient. The rest of the world, however, can scarcely help regretting that this important work of Flemish art should not remain in the National Museum.

AN exhibition of heraldic art has lately been opened in the Vienna Museum für Kunst und Industrie.

THE *Zeitschrift für bildende Kunst* opens this month with an article by W. Bubeck on "Bourgeois Dwellings in Belgium in the Sixteenth and Seventeenth Centuries." So many of these delightfully picturesque habitations are being swept

away, even in the smaller towns of Belgium, that it is to be feared that future writers on their characteristics will be fain to speak of them as things altogether of the past. At present, however, Herr Bubeck is still able to quote many existing examples, several of which are given in illustration. The works of Wenzel Jamitzter, the famous goldsmith of Nürnberg, are not so well known as those of his great Italian contemporary, Benvenuto Cellini, though they often rival his in beauty and delicacy of workmanship. In particular the magnificent table-ornament preserved so long in the Merkel family, but recently acquired by the Germanic Museum, may compete with any Italian work in grace of design and exquisite fineness of detail. An illustration is given of this beautiful specimen of the goldsmith's art in this number, and Herr Bergau writes a critical and descriptive account of it. The other articles are by R. Redtenbacher, who makes known some particulars respecting the Palazzo S. Biagio della Pagnotta in Rome, which he believes to have been a work of Bramante; and the conclusion of the learned treatise by Dr. Julius and Ernst Ziller on the Theatre of Dionysus at Athens.

THE STAGE.

MR. G. L. GORDON'S *Auld Lang Syne*, produced at the Park Theatre on Monday last, is not entitled to be called a good comedy, but it indicates some amount of dramatic faculty in the author, and as the production of a new writer it well deserves notice. The comedy, which is in three acts, depends upon the old motive of a wife who has committed bigamy, and is subjected in consequence to the persecution and extortionate demands of her former husband, who, discovering her peaceful retreat, makes compliance with his wishes the price of his silence. To speak more accurately, Mr. Gordon's heroine, Mrs. Baxter, has really not committed bigamy, either in intention or in fact; for it appears that her rascally deceased husband has simply been personated by an equally rascally brother, who, aided by a strong family resemblance, is able to impose himself upon Mrs. Baxter in the character of the dead man. As this fraud, however, does not become known till the close of the play, it does not materially affect the relations of the parties. Mrs. Baxter has at least no doubt that she has unwittingly married again when not free so to do; and, as she has been guilty of concealing from her husband all knowledge of her former marriage, her embarrassments are necessarily considerable. It is, moreover, her sad fate to be subjected, not merely to occasional visits from her supposed husband—who calls himself Herr Rosenthal—but to a constant persecution at his hands, arising from the circumstance that he has been enabled to gain the confidence of Mr. Baxter, and to raise himself to the position of confidential clerk in his manufacturing establishment. It happens, however, that a guardian angel hovers over the lady in the person of one Cecil—a friend of Baxter's and an old admirer of Mrs. Baxter—who, being cognisant of her secret, plots to release her from her difficulties. Cecil's efforts, however, only create fierce jealousy on the part of Baxter, which ends in a separation at the close of the second act. The third act concludes with the detection of Herr Rosenthal as a convicted criminal by the instrumentality of Cecil, who, to complete his generous deed, rescues Mr. Baxter from the ruin in which the evil machinations of Herr Rosenthal had involved him, explains the true position of affairs, and restores the persecuted lady to the bosom of her husband and the society of her child. The most obvious defects of the piece arise from the common faults of inconsistency and insufficiency of motive. Most people who are compelled to choose between two evils are fain to accept the lesser. Not so, however, in comedies by inexperienced writers. To confess to her husband that she had deceived him in pretending to be a

spinster would, no doubt, have been painful to the lady; yet the temptation under which she laboured, arising from the unhappy nature of her first choice, furnished at least some approach to palliation. It must also be conceded that it would have been a terrible thing for Mrs. Baxter to have to tell Mr. Baxter that she had discovered too late that their union was null and void. These miseries, however, great as they would be felt to be, are incomparably less serious than those which the lady voluntarily prefers. For she is not only branded with disgrace, and driven from the presence of her husband and her child, who is forbidden to mention her name, but her husband is left without adequate warning in the hands of a designing scoundrel who affects a German name and German accent, and is to Mrs. Baxter's knowledge acting with sinister intentions. Nevertheless, what are technically known as "the situations" of the play are brought about with skill, and some of the scenes are genuinely pathetic. Mr. Gordon's dialogue is, however, unfortunately open to a good deal of objection. He is so anxious to garnish his work with smart sayings—apparently in imitation of Mr. Byron—that he constantly introduces witticisms, sometimes of a clever, but more often of a strained and feeble kind, without much regard to their appropriateness to the occasion. He seems to lack also a sense of harmony and fitness in other respects more distasteful to the feelings of an audience; as when he permits Cecil to assail Mr. Baxter in the very crisis of his sorrow and humiliation with coarse banter and heartless jests, which, though not meant to be ill-natured—for Cecil, it will have been observed, is the ever-present and beneficent hanger-on familiar in modern comedy—are not the less ill-timed and offensive. The minor personages whom the author has introduced indicate some sense of humorous character, but are rather feebly sketched, and moreover but loosely connected with the main purpose of the story. The acting of *Auld Lang Syne* is creditable to a suburban theatre. Miss Emmerson, who sustains the part of the heroine, has a considerable command of tender expression, and seems to want little but a more chastened style and just sense of proportion in her efforts to raise her to a leading position on our stage. Her performance in the scene in which she obtains a furtive interview with her child is touching in a high degree. Mr. Gordon performs the part of Cecil in his own play with excellent self-possession; and Mr. Desmond's performance of a minor part exhibits a promising degree of eccentric humour.

As the recent performances at the Gaiety Theatre on behalf of the Shakspeare Memorial Fund are stated to have resulted in a net profit of 450*l.*, Miss Kate Field's association of the poet's name with the "telephone harp," and the ghost of "her ancestor, Nathaniel Field," and "that greatest showman upon earth, P. T. Barnum," may be considered to have been attended with a substantial consolation. It is to be regretted that the Memorial Committee do not appear to have felt the force of the objections that have been urged against the proposal for erecting a Shakspeare theatre in the town of Stratford-on-Avon. That the town "ought to possess a fine Shakspeare library, open to all comers," is an opinion on which few persons will differ from Mr. Furnivall. The proposed Stratford Shakspeare Museum is also unobjectionable; nor is there anything to be said against a Shakspeare theatre or school of acting, except on the score of the locality chosen. The truth is that a provincial theatre is necessarily incapacitated for sustaining a high standard of art, from the impossibility of attracting, save under special circumstances, a numerous and cultivated audience. Nothing, after all, affords so good a stimulus to worthy work as what the political economists before Mr. J. S. Mill used to call "the effective demand;" and, though we are far from thinking

at a management can do nothing to raise the taste of audiences, it must be manifest that actors of genius and cultivation must quickly lose heart if they fail to obtain intelligent appreciation. If this were not so we should occasionally find fine performances in small country towns; but everyone knows—and certainly no one knew better than Shakespeare himself—that the capital is the only real nursery of dramatic genius. If the object of a Shakespearean dramatic theatre—which appears to derive its chief support from a wealthy amateur in Stratford—should be carried out, it is perfectly safe to predict that the result will in no way tend to the honour of Shakespeare's name or to the interests of the stage.

THE morning performances at the Aquarium Theatre are to be discontinued. Henceforth the Aquarium stage will—for the summer months at least—be devoted only to evening performances. Mr. Marshall's new comedy has been withdrawn, and its place will be occupied this evening by the revival of the *Vicar of Wakefield*.

Love or Life, a new drama by Mr. Tom Taylor and Mr. Paul Merritt, founded on one of Crabbe's tales, will be produced at the Olympic on Whit Monday. A leading part will be sustained by Mrs. Boucicault, who has for some time been absent from the London stage.

THE Lyceum season will come to a close on Wednesday next. A new play on the legend of *Andersden*, or the *Flying Dutchman*, will shortly be produced here. The authors are Mr. Percy Fitzgerald and Mr. W. G. Wills. Mr. Irving will represent the hero.

MR. BYRON has written for the Haymarket Theatre a new piece, entitled *A Hornet's Nest: in three Busses and a Sting*.

A COMEDY entitled *Scandal*, in three acts, adapted from the French by Mr. Arthur Mathison, will be produced at the Royalty this evening.

THE new play by Mr. Ross Neil, entitled *Anella*, will be produced at the Princess's Theatre on Thursday next.

A SPECTACULAR fairy play by M. Ernest Blum, titled *Le Chat Botté*, has been brought out at the Gaieté. It is described as in twenty-eight tableaux; but it appears to have proved more laborious than entertaining.

A NEW piece, of the class known in England as *vaudeville* comedies, has been produced at the Théâtre Cluny. The title is *Chamard*; the author, M. P. Burani. The new piece, which is four acts, appears to bear a close resemblance to the famous *Chapeau de Paille d'Italie*. The plot is a wedding-party, however, becomes in this instance two wedding-parties, who are constantly in pursuit, in the one case of the bridegroom, in the other of the bride, who have mysteriously disappeared. This kind of story seems to have now become so common as to be regarded as constituting a genus in itself. At least we infer so from the fact that M. Burani's piece, which seems to have been not very successful, is described in the playbills as a *vaudeville*.

MUSIC.

MOSES IN EGYPT.—SACRED HARMONIC SOCIETY.

Two musical works of importance have experienced so chequered a career as Rossini's opera *Moses in Egypt*. Its vicissitudes commenced immediately after its first production at the San Carlo, Naples, in Lent 1818. The circumstances which led to the introduction of the famous Prayer, too well known to need recapitulation here. In 1822 the work was given at the King's Theatre, with the title of *Pietro l'Eremita*, but without success. It was heard at the Italiens in Paris in the same year, and in 1827 the composer remodelled it for production at the Académie Royale. The alterations and additions at this period were

of the highest moment, proving, among other things, that Rossini had no stern ideas as to the immutability of his own work. In its new form the opera was heard at Covent Garden in 1850, but the title was changed to *Zora* and the plot secularised. The dramatic significance of the lyric drama was but little recognised in the third and fourth decades of the present century, but even then the utter absence of interest in the *dramatis personae* of *Moses* was severely felt; and in reviewing *Zora* an eminent English critic observed that "the theme is as susceptible of description as of presentment—fitter, therefore, for oratorio than for opera."

There could not be two opinions that an opera of this class would have not the faintest chance of success at the present day, and then arises the question whether the work has sufficient interest and vitality to deserve reproduction under more congenial circumstances. The Sacred Harmonic Society decided the matter in the affirmative, and musical amateurs have had the means of judging of the result. It would be generally acknowledged that if any revision was necessary for the presentment of *Moses* in its new guise, Sir Michael Costa was the right person to undertake the task. The sympathies of the Neapolitan conductor are pre-eminently Rossinian, and he might be expected to approach the subject with a loving anxiety to preserve in the fullest manner the original intentions of the master whenever practicable, modifying only in those exceptional instances where modification was absolutely essential. The changes made are of three kinds. Firstly, a considerable portion of the opera has been cut away. This may easily be forgiven, as a similar process of excision has to be exercised in the performance of many classical works. Secondly, additions have been made to the orchestration. In the consideration of this point, it must be remembered that Rossini could never have contemplated the choruses of *Moses* being sung by 500 voices, and it may well be that the strengthening of the score was necessary for the preservation of the balance of parts. Thirdly, Sir Michael Costa has substituted a *reprise* of the Prayer in the key of C for the original ending, which consisted of an extremely weak instrumental movement of forty bars. At first sight this may seem unjustifiable, but, inasmuch as the Prayer itself was an afterthought, it was only an extension of the composer's idea to add another verse. Certainly if the end can ever justify the means, it may do so here, for the climax of the work, instead of being ridiculously trivial and ineffective, is now highly imposing. It has been our desire to place in the most favourable light these various emendations, as the arguments on the other side are facile, and certain to be urged. But even if the principle of tampering with a great musical work be admitted—as in some instances it must for practical purposes—it should be laid down as an inflexible rule that, when alterations are made, their nature and extent should be indicated in the clearest manner. This seems so obvious as to scarcely warrant mention. But though it may appear incredible, it is, nevertheless, a fact that the Sacred Harmonic Society, in co-operation with Sir Michael Costa, have printed and published their version of *Moses* without affording the slightest indication that any change has been made in the music. Here is the title of the new edition, "*Moses in Egypt*, an Oratorio. The English Version by Arthur Mathison. The Music by Rossini. Arranged expressly for Performance by the Sacred Harmonic Society." There is no Preface, and no explanation or apology for the liberties taken with the original. The careful elimination of the word opera may have been necessitated by the Puritanical susceptibilities of the Exeter Hall authorities; but this does not condone the graver charge. It will be rendering some slight service to art if we place on record the exact differences between *Moses* as left by Rossini, and *Moses in Egypt* as given at Exeter Hall; particularly as this has not been done

in any of the notices that have appeared concerning the performance. In the first act, immediately after the opening chorus, a lengthy recitative between the various Israelitish characters has been excised. In the chorus of eight bars which follows Anais has to sing E flat, D sharp, E, in *Moses*. The new version is E flat, F sharp, G sharp. Immediately after the recitative for the Mysterious Voice there is a symphony of twenty bars. This has been cut down to eight. After the exit of all except Anais, there is another symphony of twenty-seven bars. This has also been reduced to eight. The succeeding recitative between Anais and Amenophis is likewise considerably shortened, and the second and third sections of the duet have suffered similar treatment, the voice parts in some places being entirely altered. In the second act the florid passages in the duet between Amenophis and Pharaoh have been modified, and the remainder of the act removed altogether. Except for the excision of the ballet airs, the third act remains in its original form. The duet between Anais and Amenophis at the commencement of the fourth act contains some minor discrepancies, and so does the subsequent recitative. But the next change of importance, and one which seems indefensible, occurs in the Prayer. Here, the last verse, in the tonic major, is now given in unison instead of four-part harmony. The symphony illustrative of the destruction of the Egyptians is slightly curtailed, and then in place of the trivial *coda* we have the *reprise* of the Prayer, bringing the work to a pompous and impressive conclusion. Such are the points of variation so far as may be discovered by a cursory comparison of the two vocal scores. A similar analysis of the full score would probably reveal additional remarkable changes, but enough has been said to justify the expression of our deliberate opinion that, be the cause what it may, the omission to notify the existence of this extensive revision is exceedingly reprehensible. It is an injustice to the composer, and it is an injustice to the public, who are thus wilfully deceived.

We have left but short space to speak of the work itself. It illustrates completely enough Rossini's grandest and weakest manner. Amid much that is frivolous in itself, and doubly so as being the setting of a sacred subject, there are some noble and beautiful thoughts, worthy to endure. Mr. Arthur Mathison would have been more successful in his translation if he had been careful to note the *tempi* of the different movements, and the effects of accent in the music. As it is, there is considerable awkwardness in many places, and occasionally a perversion of the meaning intended. The performance was in most respects worthy of very high praise. Sir Michael Costa had bestowed the utmost pains at rehearsal, and the result was commensurate with his efforts. The orchestra was not only careful in the matter of precision and general accuracy, but the quieter portions were rendered with strict attention to the *nuances*; and the chorus sang with as much delicacy as could have been expected from such a huge force. Many of the soloists were incapable of rendering justice to Rossini's florid strains, but this was in a measure inevitable. Mr. Edward Lloyd, however, sang magnificently, and Mdme. Lemmens-Sherrington and Herr Henschel were also equal to their respective tasks. On the whole *Moses* merits something better than oblivion, and the Sacred Harmonic Society deserve thanks for performing the work in the only form in which it would now prove acceptable.

HENRY F. FROST.

THE fourth concert of Mdme. Viard-Louis was even more lengthy than its predecessors, and it was five o'clock before the instrumental portion of Beethoven's ninth symphony was commenced. The three movements have been heard to better advantage, as there seemed a lack of attention to the details of expression. Mr. Kummer played Max Bruch's violin concerto in G minor in a very praiseworthy manner, and Mdme. Viard-Louis was

heard in Weber's Concertstück. There were no novelties of importance in the programme. The audience was very large, and we understand that it has been already decided to give another series of concerts next season.

At Herr Franke's concert, on Tuesday evening, a quartett in A minor, by Svendsen, was introduced for the first time. It is a very vigorous and effective composition, and was extremely well played by Messrs. Schiever, Franke, Peiniger, and Van Biene. The remainder of the programme consisted of items more or less familiar.

THE programme of Mr. Charles Hallé's fourth Recital at St. James's Hall yesterday week included Raff's piano quartett in G, Op. 202, No. 1—one of the latest works of its prolific composer, and not one of his best, displaying more knowledge than inspiration—Schumann's "Faschingschwank aus Wien" for piano solo; Rubinstein's sonata in D, Op. 18, for piano and violoncello, which, though given on this occasion for the first time at these recitals, has been more than once heard in London; and Beethoven's variations for piano, violin, and violoncello, on "Ich bin der Schneider Kakadu."

On the 23rd ult. the degree of Master of Arts was conferred by the University of Cambridge upon Prof. G. A. Macfarren, when the Public Orator, Mr. Sandys, delivered a speech containing many happy allusions to the Professor's principal compositions.

SOME months ago we referred to the performance of Bruch's *Odyssæus* and other important works by Mr. Waddell's choir at Edinburgh. We have received a programme from which it appears that the whole of Schumann's *Faust* music was to be given by this choir at a concert on Thursday last, assisted by a small orchestra. As no names of soloists are announced on the programme, we infer that the solo parts were to be sung by members of the choir. Mr. Waddell deserves all credit for being the first to produce in its entirety in this country a work of such importance, and, it may be added, of such remarkable difficulty.

THE current number of the *Revue et Gazette Musicale* gives a presumably complete list of all the musical performances, official and other, to be given in connexion with the Paris Exhibition. The list includes sixty-two concerts, vocal and orchestral, to take place in the large hall of the Trocadéro, and thirty-seven (chiefly chamber concerts) in the smaller hall. English music is to be represented by a "Festival of H. R. H. the Prince of Wales" on July 17, when Messrs. Sullivan and Henry Leslie are to conduct, and Mr. Leslie's choir to sing; by an English concert on the following day, and by three concerts of the orchestra of Covent Garden, under the direction of Signor Vianesi, the dates of which are August 16, 19, and 21. Other foreign musical societies announced to perform are the orchestras of the Dutch "Palais d'Industrie," of the theatre of La Scala (Milan), Mr. Gilmore's American band, the popular concerts of Turin, the orchestral societies of Madrid and Florence, and the orchestra of the Apollo Theatre at Rome. Besides this, the choral societies of students from Upsala and Christiania are to be heard on July 27; and several foreign quartett parties are also announced to perform in the smaller hall.

A NEW Requiem, composed by Camille Saint-Saëns, was performed for the first time on Wednesday week in the church of Saint Sulpice, Paris.

THE Lower Rhenish Musical Festival is to take place at Düsseldorf, from the 9th to the 11th inst., under the direction of Herren Joachim and Tausch. The chief works to be brought forward are two of Handel's Anthems, Schumann's *Faust*, Gluck's *Orpheus*, and Brahms's second symphony.

A NEW setting of Schiller's *Lied von der Glocke*, by Max Bruch, was produced with success at

Cologne, on the 12th ult. We have not as yet seen any detailed criticism of the work.

FRANZ VON HOLSTEIN, the composer of the operas *Der Haidenschuch*, *Die Hochländer*, and *Der Erbe von Morley*, and of many songs very popular in Germany, died in Leipzig on the 22nd ult., at the age of fifty-two.

UNDER the title of *Anciens Clavecinistes Flamands*, M. le Chevalier van Elewyck has just published in two volumes (Brussels: Schott Frères; London: Schott and Co.) a most interesting collection of old harpsichord music by Flemish composers of the seventeenth and eighteenth centuries. Readers of Mr. Hæwesi's amusing book, *Music and Morals*, will remember the enthusiastic account which, in the chapter on Bells, he gives of the celebrated *carillon*neur Mathias van den Gheyn. The entire first volume of the present work is filled with a selection from the compositions of this remarkable, though now almost unknown, musician, who was born in 1721 and died in 1785. There are a freshness and a vigour about his music which prove him to have been possessed of no ordinary gifts. Not the least interesting of the works given are two pieces composed for the *carillons*, which it is evident must have been extremely effective. The second volume contains a selection of works by Flemish composers not one of whose names, we confess, we ever met with before, though they may doubtless be found in musical lexicons. These are De Paep, La Fosse, Fiocco, Raick, Colfs, Van Meert, Boutmy, Baustetter, Krafft, Van Maldere, Robson, Van den Bosch, Van der Borgh, Kennis, De Trazegnies, F. Staes and G. Staes. Many of the pieces given are of great merit; and the volumes will be most valuable to the student of musical history. The work is beautifully engraved; and the editor has prefixed an interesting historical notice of each composer of whom he gives specimens.

LITERATURE.

Practical Political Economy. By Bonamy Price, Professor of Political Economy in the University of Oxford. (London: C. Kegan Paul & Co., 1878.)

Free Trade and Protection. By Henry Fawcett, M.P., Professor of Political Economy in the University of Cambridge. (London: Macmillan & Co., 1878.)

SOME years ago a resolute effort, vigorously supported by influential journals, was made to restore the failing credit of "orthodox" political economy. Repetitions of Ricardo and MacCulloch were received with acclamation as revelations of new and important truths; heresy and scepticism were suppressed by silence or snubs. For the moment this policy was followed with success. The old economic laws seemed re-established; even the doctrine of the wages fund was said to be rehabilitated. Yet what is the final result? The English press has lately teemed as it never teemed before with economic publications, most of them breathing rebellion against authority, and asserting the right of private judgment. The spectacle in this respect is not entirely satisfactory. By dint of controverting, criticising, censuring, and condemning, not merely Ricardo, who is only one of the minor prophets, but Adam Smith and Mr. Mill, several writers unknown in the world of letters have come to regard themselves as the equals, and even the superiors, of two of the most celebrated of modern philosophers. But revolt is declared in higher quarters, as the first of the two books above testifies, the author of which, Mr. Bonamy Price, Professor of Political Economy in the University of Oxford, affirms that "there must be a change of method," and undertakes to show us a more excellent way. This new method Mr. Price emphatically calls "practical," explaining that he does so "in contradistinction to what may be called scientific political economy. It is intended to indicate a mode of treatment which not only does not claim to be scientific, but which supposes the scientific method to be a mistake." At the same time Mr. Price affirms that he is only returning to Adam Smith's method. "Of this practical kind is the Political Economy of the *Wealth of Nations*. Adam Smith placed his discussions in the very heart of the everyday life of men. The thought that he was founding a science is absent from his economical writings."

The question whether Adam Smith meant to construct a special Science of Wealth has been repeatedly asked, and is one of interest and importance. Mr. Price, perhaps un-

consciously following Auguste Comte, affirms that he did not. The truth is that the modern classification of the sciences—itself somewhat arbitrary—had not been made in Adam Smith's time, but his own words in the *Wealth of Nations*, which seem never to have been appealed to, show the division he adopted; and a comparison of his works with the account of his lectures given by Dugald Stewart and Millar distinctly marks the place he assigned to political economy. In Book V., chapter i., of the *Wealth of Nations*—where he describes a science as investigating or explaining the general principles from which a number of connected truths are deducible, like effects from natural causes—he rejects the scholastic division into five sciences (another classification made seven), and approves of the division of ancient Greek philosophy into three, "physics or natural philosophy, ethics or moral philosophy, and logic." He was himself Professor of Moral Philosophy at Glasgow, and divided it into four branches—natural theology, ethics or the theory of moral sentiments, political economy, and jurisprudence; the connexion between them lying in the order of nature and natural laws, which he believed to be discoverable in the moral world. It is almost a question of words whether he considered political economy as a science. He regarded it as a particular branch of a wider science; but assuredly he conceived that the method of investigation and exposition pursued in it should be scientific—that is to say, should consist in exploring the coexistences and sequences of economic phenomena, and tracing in them the operation of general causes or laws. He was no doubt unfortunately influenced by the dominant idea of the philosophy of his age with respect to "nature" and a beneficent natural order of things. Hence his doctrine of "natural rates of wages, profit, and rent," "natural prices," a "natural progress of opulence," and a "natural system of liberty," which defined the duties of the State in all nations and states of society alike. Nevertheless, his method of investigating the economic history and condition of his own and other countries, and of seeking the causes of the natural order of things, was both scientific and practical—scientific, because leading to the discovery of the laws or conditions governing economic phenomena, and to the verification of hypotheses; and practical, because yielding principles and maxims of policy for the instruction of statesmen, and refuting popular errors respecting the nature and causes of national wealth.

Mr. Price contends that there is neither systematic induction, nor systematic deduction; "no deduction, step by step, from a few first principles, nor any construction of economic laws by induction;" no process of generalisation, in Adam Smith's work, or in political economy properly conceived. In point of fact the *Wealth of Nations* is both inductive and deductive throughout; it deduces the "natural progress of opulence" that would follow, according to the author's conception, under the simple conditions of liberty and security, from the desire of every man to better his own condition; and it investigates the actual course of

industrial history, and discovers the causes that had disturbed what he regarded as the natural order of things, and produced poverty instead of wealth, or at least obstructed its natural growth. The first sentence in the Introduction to his work is the generalisation that labour is the source of wealth; and it is one which, though not quite accurate, embodied a truth overlooked by the most celebrated French economists of his age. Again, the doctrine illustrated in his first chapter, that the division of labour is the main cause of the increase of its powers, and of the multiplication of the productions of different arts, is a generalisation of which few before him had a glimpse, and none thoroughly worked out. The proposition likewise that the division of labour is limited by the extent of the market is a generalisation of great value which a French economist of our own day, M. de Lavergne, has turned to brilliant account in his *Rural Economy of England*.

Had Mr. Price followed Adam Smith's method of investigating the industrial history and the actual economy of society in different nations, he might have avoided both practical and scientific errors in his own exposition of free trade.

"Political economy," he says (pp. 1, 13), "finds processes applied all the world over to the satisfaction of the wants of human life in the matter of wealth. It does not discover them. The ordinary instincts of human nature have adopted these processes ever since the origin of man. . . . The doctrine of free trade is only the explanation and enforcement against selfish perverseness of a very common practice, known and observed by all men: to the women the needlework, to the men the lifting of weights."

So self-evident does this principle seem to Mr. Price, and so happy this illustration of it, that he says again (p. 307):—

"This principle is identical with that of division of employments. It is supreme over all labour; it is instinctively practised by all that work. Let the women do the sewing and the cooking of the meals, and let the men lift the weights and do the digging, is a universal practice adopted by instinct without reflection, and it is the essence of Free Trade."

The neglect of the historical and inductive method of enquiry which Adam Smith followed, and for which his successors have vastly superior resources at hand, has here led Mr. Price into a blunder like that made by Ricardo in assuming that in the earliest stage of human society things possessed an exchangeable value exactly proportionate to the cost of making or getting them, when, in fact, there was no division of employment, no regular labour, no individual property, and no exchanges between individuals. In much later stages of European society feudalism, villenage, royal charters to towns, guilds, statutes, and ordinances, not individual aptitudes, mainly determined such division of occupations as there was; and at this day a highly complex set of conditions, compounded of law, custom, tradition, historical events, combinations, and exclusive regulations, govern in a great measure the employment of men, and still more of women. So far from "the instincts of human nature since the origin of man" having assigned to men the digging and the lifting of weights, to women the cooking

and sewing, the earliest division of labour gave all four to the women, and the feasting and fighting to the men. Had Mr. Price ever looked around him in Germany he must have seen in many places women labouring in the fields as they did in the days of Tacitus; in Belgium he may see women lading and unlading barges, and filling coal-carts at the pit's mouth, while the men wait quietly until the heavy work is done. The late Mr. Bagehot, in one of his last essays, expressly limited the principle of the free choice of employment and the free migration of labour to men. And, as the present writer has elsewhere shown (*Fortnightly Review*, November, 1870), when Adam Smith spoke of "the natural effort of every man to better his own condition" as the main-spring of progress in wealth, he meant literally the effort of every man, and had only the male half of society in view in his economic philosophy.

Wherever the followers of Adam Smith open their eyes to the actual structure of society, including both men and women, they will discover on all sides the failure of the little stock of principles and of the method of investigation that Mr. Price places at their disposal, to explain its economy. As to the particular question of free trade, the reader will find in a comparison of Mr. Fawcett's book with Mr. Price's chapter on the subject the best test of the efficacy of Mr. Price's system. Only a few points of contrast can be indicated here. Mr. Price ascribes Protection (pp. 13, 300) to the selfishness of particular classes; he thinks it both fair and prudent for the purpose of demonstrating the truth of free trade to opponents—its advocates need no proof—to assume "that the capital and labour employed to-day in a protected industry may, without suffering, be transferred to another occupation to-morrow" (p. 303); and from the postulate that "all trade is an exchange of equal values or services," he peremptorily concludes (p. 307): "The truth stands out in clear sunshine. Free trade cannot and does not injure domestic industry. English goods of the same value must be purchased by the foreigner, or the trade comes to an end. Free trade never does harm to the country which practises it; and that mighty fact alone kills protection." If protection is so easily killed, how is it that Mr. Price has to deplore its obstinate vitality? It will never be killed or even weakened by dogmatic assertions either of its impolicy or of its selfishness. Mr. Fawcett's method of controversy is widely different. He points out at the outset that nothing is more likely to retard free trade than to ignore the arguments of its opponents. He deprecates either speaking of protectionists as solely prompted by a desire to sacrifice the welfare of the community to their own selfish ends, or deriding them as the victims of economic fallacies so transparent that they ought not to mislead a child. He shows that the adoption of free trade in England was promoted by circumstances so exceptional that they do not now exist in any country where a protectionist tariff either has been or is proposed to be introduced; and that a speaker or writer who desires to convince the American or Aus-

tralian people of the injurious effects of protection has to employ very different illustrations, to use very different arguments, and to make very different appeals from those which thirty years ago exercised such irresistible influence in England. And he concedes that, however great are the ultimate advantages of free trade, it is a mistake to deny that when a great number of different manufactures have been artificially fostered, immediate loss and suffering may be caused to those who are engaged in them if the support of protection be withdrawn; just as the power-loom at first occasioned suffering and loss to those who lived by the hand-loom. Instead of attempting to floor the whole body of protectionists all over the world at one blow by flinging the principle of division of labour at their heads, he states their main arguments fairly, forcibly, and temperately, admits the plausibility of some of them, and conducts the controversy throughout on the admission that the advocates of protection are neither irrational beings nor utterly blinded by selfishness, but are for the most part quite as intelligent, and quite as pure in their motives, as the majority of free traders. No protectionists can be offended, many possibly may be almost if not altogether persuaded, by Mr. Fawcett, and few free traders can read his book without interest and instruction; Mr. Price, on the contrary, does not affect to say anything new to either one or the other, and his treatment of the subject can only provoke indignation or ridicule on the part of the protectionists.

The contrast between the methods of the two Professors is exemplified in reference to the hypothetical case which Mr. Mill puts as one where a protective duty would be temporarily justified in a young country. Mr. Fawcett, stating Mr. Mill's case in Mr. Mill's own words, and, conceding that temporary protection would be justified "if there were a reasonable probability that the conditions under which he supposed that such a protective duty could be imposed would ever be realised," proceeds to show that there is not the faintest possibility of it in point of fact. Mr. Price, on the other hand, unfairly and even grossly misstates Mr. Mill's case, while he does nothing to weaken its effect on the minds of protectionists, beyond pronouncing, with what must strike almost every reader as exaggerated rhetoric, that "it may almost be questioned whether Mr. Mill has not done more harm to the welfare of the human race by the countenance he has given to protection than he has done good by all his other writings on political economy." This is not the only instance, it may be remarked, in which Mr. Price misstates and misrepresents Mr. Mill. He does so in his first chapter by confounding his doctrine respecting credit with Mr. Macleod's. And in his chapter on Banking, referring to the crises of 1847, 1857, and 1866, he says, "Such were the events which Mr. Mill summed up under law, and to which he assigned an orbit that would bring them round every tenth year." Where has Mr. Mill laid down any such law, or given his adhesion to the theory of a decennial commercial cycle?

Mr. Fawcett's argument for free trade is almost everywhere so strong, and adheres so closely to the real facts of commerce and industry, that it is the more to be regretted that he has in two or three instances needlessly propped up his case by the fiction of an average rate of profit and wages, and the inappropriate metaphor that capital finds its level like water. The very case he cites (pp. 24-5) proves, not an equality of the profits of different trades, but that the profits of a business may for a whole generation be below the imaginary level, and that the miscalculation and lack of foresight in actual life are absolutely inconsistent with the assumption on which the doctrine of equality rests. "The effect of the Corn Laws in raising prices was over-estimated. . . . In no period were the English tenant-farmers in a more depressed condition." Again, from the same fiction he argues (p. 51) that the capital and labour invested in those particular trades which are guarded against foreign competition by protective duties will only be able to obtain the average rate of profit and wages. Yet he states—in proof of the extraordinary profits, on the one hand, of coal-mining a few years ago, and the much greater share obtained by capital than by labour of the extraordinary gain, on the other hand—that "the rise in the price of coal caused no less a sum than 66,000,000*l.* to be distributed among the owners and lessees of mines, whereas the amount distributed in the form of extra wages was not more than 15,000,000*l.*" Mr. Fawcett's whole statement in reference to the case shows that, so far from profits being equalised by competition, the capitalists in a particular business at one time may double or treble their capital out of their profits, and then withdraw to other investments, while the new competitors attracted by the report of enormous gains may afterwards come in for unequal profits in the opposite direction, in the shape of considerable loss. Neither free trade nor Mr. Fawcett needs the support of the broken reed of "the average rate of profit;" both are strong enough to stand and to advance without any such crutch. Another observation arising from the facts cited by Mr. Fawcett respecting wages and profits in the coal trade in the period in question is that Mr. Price's language (p. 266) much exaggerates the rise of wages. It would be easy to refute in like manner his proposition (pp. 213-14) that "every fortune made, every profit accumulated, and not wasted in luxury, is an eager demander for labour;" and that "capital cannot do otherwise than hunt up labour; it exists for no other purpose whatever."

Mr. Fawcett's exposition of the nature and causes of the present commercial depression is as superior to Mr. Price's as his exposition of free trade, in respect alike of method of investigation, attention to facts, and novelty of view. The subject is too wide to enter into here, but the remark ought to be made in reference to commercial crises, that Mr. Price will never be able to treat the subject either scientifically or practically so long as he remains blind to the fact that money is the only universal medium of exchange; that during a failure of

credit it performs functions which no other kind of wealth can fulfil; and that there may, therefore, be a disastrous crisis while all kinds of capital save money are abundant.

The majority of economists will, it may be predicted, agree that Mr. Fawcett's book is both scientific and practical, while Mr. Price's is neither. Mr. Price has, in short, wholly misapprehended the reason for the growing antipathy to the method of political economy followed by the school of Ricardo, the ground of which is, not that it is scientific, but that it is not so. His own method is at the same time as unpractical as Ricardo's.

T. E. C. LESLIE.

Dolce Napoli. By W. J. A. Stamer. (London: Charing Cross Publishing Company, 1878.)

THE city and people of Naples have so strongly-marked an individuality that they have long deserved a descriptive work of their own apart from the rest of Southern Italy. This want has been excellently well supplied by Mr. W. Stamer in his pleasant and instructive book entitled *Dolce Napoli*; and, although he has not given us a facsimile of Neapolitan life like that in Mr. Lane's wonderful monograph of the daily life of the modern Egyptians in Cairo, he has, nevertheless, produced a most life-like and interesting sketch, in which the main features of life in Naples are carefully and graphically described. It is an advantage that a book on Naples, whose charms, despite all drawbacks, are so great and manifest, should be written by a lover of the place and people; it is a greater advantage that it should be written by a discriminating lover, and such a one is Mr. Stamer, who, while giving the solid information acquired during a six years' residence, writes at the same time *con amore*, and in a candid and charitable spirit. Unlike too many English travellers, he does not at once condemn a thing because it is "so un-English," and because it does not square with the views of the vestrymen of St. Vedast's, or with the opinions of the old ladies of his acquaintance on Clapham Common, but he judges it on its own merits, and with due allowance made for difference of race, temperament, and climate.

With the single exception of a chapter on Pompeii, which seems in almost all respects the least satisfactory in the book, the author does not treat his subject from an archaeological or artistic point of view, and he almost entirely abstains from quotations from ancient classical authors. That he properly leaves to the guide-books. It is the people mainly that he has studied, and it is with the living and breathing people, the hot-blooded, noisy, much-abused Greek populace that he and his book have to do. As he declares in his brief Preface, Mr. Stamer "has portrayed the Neapolitan lower orders [he might fairly have added, the higher classes also] as they are in the flesh, which is slightly different to what they are represented by the artist, dramatist, and romancist of the period."

Those who know Naples well must have been struck by the abuse which most English travellers, and all "personally-conducted

tourists," lavish on the people. This abuse, with much justice and some humour, the author shows to be in great measure undeserved, and to be owing to the superficial knowledge of those "who are never happy except they are miserable, or can find something wherewith to find fault." Justice is especially done to the industrious habits of the Neapolitans, with whom in that respect few populations in the world can vie. The land in the environs is everywhere cultivated like a beautiful garden, and is made to produce a continual succession of rich crops. The very children of tender years in the city itself have their little industries and trades, as, indeed, was long ago acknowledged in that charming child's-book, *The Little Merchants* of Miss Edgeworth, and assuredly the men are not less diligent in their several callings.

"'Neapolitan laziness' may be very summarily dismissed. There is not a particle of truth in the accusation. Considering how poorly he is paid and how poorly fed, a more hard-working man than the Neapolitan is not to be found in Europe" (p. 79).

"Those stalwart wights who are basking like so many brown lizards in the sunshine are either fishermen or sailors—the '*lazzaroni*' of the intelligent traveller. If fishermen, they have been hard at work all night; if sailors, they left Castellamare, Meta, Sorrento, or whatever port they hail from, at daybreak, and, fair weather or foul weather, will be back there again before night" (p. 26).

"The fishermen, boatmen, and *facchini* sleep, not because they are too lazy to work, but that they are tired from work, and, being Neapolitans, prefer taking their *siesta* in the sunshine to going home and to bed" (p. 79).

With respect to the personal appearance of the people, Mr. Stamer truly remarks that "the men are handsomer than the women," and that "the fatal gift of beauty with which Dame Nature has so lavishly endowed the land, she has, for some inscrutable reason, thought fit to withhold from its daughters. Neapolitan women are the reverse of beautiful." The same fact holds good on the mainland of Greece, where, while the men are splendid fellows, it is hard to find a woman who is not remarkably plain. Another Greek characteristic of the populace, not noticed by the author, is their harsh discordant voices. With one's eyes shut, listening to the street-cries of Naples, one might fancy oneself in Athens or the Greek quarter of Alexandria. The chapter on "Society" gives an interesting account of the "upper classes," and the typical life of a *principino* from his cradle to the grave is given in full. The undoubted existence, however, of a class of students with whom the acquisition of knowledge is a passion, and who study as a bounden duty, which is found in Naples as well as in other Italian cities has somehow been ignored. And yet the writer of the present notice has known many young men who hold the positive duty of study more strongly than their English brethren, who are too apt to study as it were by stealth.

Much and interesting information is given on the subject of the popular religious pilgrimages and *feste* of the Neapolitans. At page 83, when condemning the cruelty to animals which is justly branded as a national vice, the author alludes to the

curious custom observed in the churches at noon on the day before Easter, when with Southern impatience that great festival is anticipated. The children on this occasion let loose small birds which they have brought to church tied by the leg with a string for the purpose. This, Mr. Stamer remarks is, "according to priestly teaching, highly pleasing to the Madonna and to th *Padre Eterno*, Who made and loveth all.' The origin of this extraordinary practice is not explained. The ancient Egyptians symbolised the soul by the image of a bird with a human head. Can it be possible that the liberation of birds typifies the liberation of the spirits in prison by Christ when He descended into Hades? This point well deserves investigation, and the more so as the people themselves can throw no light on the subject.

Mr. Stamer is plainly, as befits an Englishman, a lover of Italian unity and of that liberty which has been its consequence. He is not, however, blind to the faults of the Italian administration, and with justice he blames it for its wholesale confiscation of Church property, and its ruinous method of collecting the revenue:—"That the religious communities throughout Italy," he says, "were altogether too wealthy does not admit of a doubt (the monastery of La Cava enjoyed an income of 15,000*l.* a year); and had the new Government contented itself with cutting down their revenues to fair proportions, none but priests and bigots would have objected. But reduction is one thing, confiscation is another. The spoliation has been carried too far. The convent having been the almshouse of the district, its doors closed, the poor are left destitute; and destitute they are likely to remain, for the money derived from the sale of Church property, instead of having been set aside for the building and endowment of poor-houses throughout the country, has been appropriated to other uses" (p. 147).

Much valuable information is given in the present volume about prices, houses, sanitary precautions and other matters of great importance to intending residents. The statistics given as to the death-rate of English visitors are certainly enough to re-assure those who, misled by Roman landlords, have been used to regard Naples as little better than a pest-house: for the last two years the death-rate is only two and a fraction per thousand. Less than this, doubtless, it might be, for, "while travellers of other nationalities 'do in Rome as the Romans do,' the English stubbornly refuse to alter their habits so much as one hair's breadth, and live in Italy as in England; on the shores of the bay of Naples as on the banks of the Thames" (p. 97).

Very useful, and, alas! very just, are Mr. Stamer's animadversions on the conduct of those immaculate Englishmen who, believing in their own impeccability, are so ready to condemn everything that is foreign, and are consequently "earning for us the reputation of being the rudest and most objectionable of all European peoples."

"It is well-nigh impossible to impress on the middle-class Englishman that there are other countries in the world besides his own, other nations nearly, if not quite, as civilised as the British; that because a man has the misfortune to be a foreigner, he is not necessarily either nasty, or beastly, or dirty" (p. 295).

The faithful account of the conduct of our countrymen at Capri on the following page

should be read by every Englishman to whom the honour and good name of his country are dear. The following also is wholesome reading for many of our beloved countrymen:—

“Why doesn't the Italian Government stamp out brigandage?” demands Mr. Tomkins, hailing from Tooting, of Mr. Editor of Printing House Square. “Why cannot your Government put a stop to agrarian outrages in Ireland?” demands Signor Somebody of your humble servant, who responds, “Owing to the difficulty, to the impossibility of obtaining evidence, and a jury sufficiently fearless and honest to convict.” And so with brigandage in Southern Italy” (p. 297).

In fine, we can cordially recommend those who desire to know the inner life of almost the most charming city in the world to buy, read, and digest *Dolce Napoli*. The book is replete with information, and is written lively and pleasantly enough. There is perhaps here and there just a slight tinge of profanity (although not of the greasy, vulgar type found in works of the Mark Twain school) in some of the jokes, and the author has a habit of being “blessed” and a fondness for the elegant word “innards,” which is inexplicable in one who in all other respects writes like a sensible, cultivated, and amiable gentleman. These are almost the only blemishes we can discover. A hope may, however, be expressed that in the next edition Mr. Stamer will furnish his readers with some kind of index. His book is worth it.

GREVILLE J. CHESTER.

History of the Life and Reign of Richard the Third. To which is added the Story of Perkin Warbeck from Original Documents. By James Gairdner. (London: Longmans, 1878.)

MR. GAIRDNER'S new work displays the preference for traditional as opposed to sceptical views of history that might have been expected from his previous writings. Conservative students will welcome it as a timely check upon the tendency to the rehabilitation of criminals which has of late been carried to excess; and Liberal enquirers may not regret to find that it is for once permissible to accept the popular belief about a prominent historical personage without large qualification. The correctness, however, of the author's conclusions upon this particular case avails little to support his preliminary thesis that “the sceptical spirit” is “a most fatal one in history.” It may be freely admitted that scepticism is in itself barren and unable to substitute “new truths” for the traditions which it sets aside; but whether a belief in these traditions is better than no belief at all must depend upon their character. If they are palpably unreasonable, it is desirable to be rid of them at the expense of having nothing to put in their place. Mr. Gairdner himself acts upon this view in setting aside without discussion the mythical traditions respecting Richard's birth. Let the “origin” of every tradition be “accounted for” by all means, if possible; but if there is no evidence available for the purpose, we are not driven to acceptance of the incredible, the legitimate alternative being suspended judgment. In the present instance there is no such

a priori unreasonableness in the current belief respecting Richard's character as to invite suspicion, and Mr. Gairdner has little difficulty in showing that “the portrait with which we have been made familiar by Shakspeare and Sir Thomas More” is generally faithful. Richard was “not a monster,” but “the natural outgrowth of monstrous and horrible times,” . . . a bold and unscrupulous man,” who had received his training in a school of civil war, had become hardened to the spectacle of perfidy and violence in his own family, and had witnessed their success too often to hesitate to use them as tools of his ambition and stepping-stones to power.

With careful discrimination, Mr. Gairdner submits to analysis the evidence upon which each of the grave crimes laid to his hero's charge can be shown to rest; and, after making due allowance for exaggeration and prejudice, arrives at the conclusion that there are more or less solid grounds in every case to justify the verdict of guilty. The first crime traditionally imputed to him is the murder in cold blood of Edward, son of Henry VI., after the battle of Tewkesbury. The youth was brought as a prisoner into the presence of Edward IV. upon the faith of a promise that his life should be spared; and, in reply to the king's demand how he dared to enter the realm as a rebel, boldly avowed that he had come to claim his father's inheritance. Edward's rejoinder was an angry thrust or blow with his gauntlet, which his immediate attendants followed up with their swords. There seems no reason to doubt the statement of Holinshed, Hall, and other chroniclers, that among those attendants was the Duke of Gloucester; and, though the charge of his being solely responsible for the act must thus be held unfounded, he cannot be acquitted of the guilt of an accomplice. The murder of King Henry, which consummated the triumph of the House of York, has in like manner been solely attributed to Gloucester. He is expressly named by Warkworth, a contemporary writer, as having been a resident in the Tower with “many others” at the time it was committed; and from his high rank it cannot be doubted that he was there in some position of authority. It is probable, however, that Habington, although a late writer, is correct in stating that the murder had been resolved on “in King Edward's cabinet council,” and that the actual perpetrator shared its guilt with more than one confederate.

The part ascribed by Shakspeare to Gloucester in cajoling Anne Nevill—the youngest daughter of the King-maker, and the affianced bride of the murdered Prince Edward—to be his wife, and her consent to marry one who had been an accomplice in the murder, Mr. Gairdner deprives of their chief significance by recalling the facts that at the date of her betrothed's death “she had not completed her fourteenth year,” and that the hands of great heiresses at that period were “matters of bargain and sale.” Both alliances were doubtless dictated by political considerations; and no more choice seems to have been permitted to her than acquiescence in her fate. Her marriage to Gloucester was stoutly opposed by Clarence, who,

as the husband of her elder sister, claimed the whole of the King-maker's inheritance; and, though the feud between the brothers was settled by a compromise, it was never healed. The active share in bringing about the death of Clarence which Shakspeare imputes to Gloucester he cannot be shown to have really taken, Sir Thomas More—whose account the poet has dramatised—merely reporting it as a surmise on the part of others which he did not himself regard as being justified by evidence. It appears certain, however, that, although nominally opposing the condemnation of Clarence, Gloucester made no effort to save him after his sentence, or there could have been no force in the bitter words with which Edward was wont to reply to any subsequent appeals for the pardon of malefactors, that “not one creature would make intercession” for the life of his unfortunate brother. It is certain, too, that Gloucester was a considerable gainer by Clarence's death, obtaining immediately afterwards the title of Earl of Salisbury for his eldest son, and a grant of the whole lordship of Barnard Castle, of which he had hitherto held but a moiety.

The high-handed measures which he took upon the demise of Edward IV. to secure the authority which the king's last will had conferred upon him as Protector of the kingdom and his nephew's person were to some extent justified by the designs of the queen's party to supersede him in favour of her brother, the Earl of Rivers, who had filled the post of the Prince's Governor during his father's lifetime. Read, however, by the light of subsequent events, it seems clear that these measures were part of Gloucester's scheme to obtain the Crown for himself. In any case, the mock trial of Rivers, Lord Richard Grey, and others of the prince's council, before the Earl of Northumberland at Pomfret, which resulted in their condemnation and execution, was a manifest violation of law and justice. Equally unconstitutional was the summary vengeance taken upon Hastings for his desertion to the queen's party, after having been an adherent of the Protector. Both Rivers and Hastings were peers of Parliament, and could only be tried and condemned by that tribunal. According to More's narrative, the execution of Hastings was subsequent to Gloucester's demand that the queen should deliver her younger son into his keeping, but, as Mr. Gairdner shows by reference to contemporary authorities, really preceded it. It was evidently the Protector's policy to remove every important obstacle from his path to the throne before he proceeded to secure its possession, by getting into his power both the helpless children who were its lawful heirs, setting aside their claims under pretext of bastardy, and finally putting them to death. His utter defiance of restraint was shown in the instructions given by his direction to Dr. Shaw, the preacher selected to prepare the citizens of London for the proclamation of his title. According to More's account, the main argument—according to Polydore Vergil, the sole argument—employed by this infamous priest to sustain the fiction of the princes' illegitimacy was that the late king and Clarence were both falsely reputed to be the sons of Richard,

Duke of York, whose only lawful son was the Protector. The mother upon whose chastity this foul aspersion was thrown still lived, and the Protector himself was residing at the time in her house of Barnard's Castle. The shameless plea so disgusted the preacher's hearers that it failed of its intended effect, and was not revived by Buckingham in the speech which he delivered a day or two later to the mayor and citizens at the Guildhall, nor in the petition which embodied the desire of Parliament that Gloucester should ascend the throne. Mr. Gairdner gives some reasons for thinking that the ground therein alleged for setting aside the princes as illegitimate—viz. that Edward IV. was precontracted to Lady Eleanor Butler before his marriage with Elizabeth Woodville—ought not to be regarded as a mere invention. The story itself, although resting upon the evidence of a single witness, Stillington, Bishop of Bath and Wells, is not improbable, and some colour of truth was subsequently given to it by the pains which Henry VII. took after his marriage with Elizabeth Woodville's daughter to destroy every record of the suspicion that had been cast upon her legitimacy. The Parliamentary petition to Gloucester was ordered to be destroyed, and the allegations it contained were misrepresented. But for the researches of Buck in the reign of James I., and the later discovery of a Roll upon which the petition had been engrossed, the true story of the precontract would not have been known to this day.

No fresh light upon the blackest of all the charges brought against Richard has been thrown by Mr. Gairdner; but he marshals fairly enough the objections taken by Walpole and others to its credibility and decides that they are insufficient to shake the evidence upon which it rests. It is surprising, however, that he should attach no weight to what must be considered a conclusive proof upon the affirmative side of the question, if the accuracy of the writer who records it cannot be impeached—viz., the murderer's own confession of his guilt. In the speech which the chronicler Hall notes to have been delivered by Richard to his captains before the battle of Bosworth these words occur:—

"I may affirm that your approved fidelity and constancy maketh me to believe that I am an undoubted king. And although in the obtaining of the garland I being seduced by sinister counsel and diabolical temptation did commit a wicked and detestable act, yet I have with strict penance and salt tears, as I trust, expiated and clearly purged the same offence, which abominable crime I desire you of friendship as clearly to forget as I daily do remember to deplore and lament the same."

Of this speech, which Mr. Gairdner cites in its proper connexion, he says justly that, though it "could scarcely have been so well composed" as the chronicler records, "it was probably not less spirited and much to the same effect." After allowing for the time-honoured practice of all ancient historians to embellish the speeches which they put into the mouths of generals and statesmen, the substance of this address must be presumed to have included some such passage as the foregoing, unless Hall is to be wholly discredited. To what other "abominable crime" but the murder of his nephews could

the king refer as having been committed by him "in the attaining of the garland of sovereignty"?

To the brighter, or rather the less dark, side of Richard's character, his clemency to all opponents who were not dangerous, his respect for the laws when they did not stand in the way of his ambition, his administrative ability and his personal courage, Mr. Gairdner does full justice; nor fails to give him credit for a share in the wise legislation for which the Parliament that sat during his brief reign has always been honourably remembered.

The care taken by Mr. Gairdner to consult all available sources of contemporary information upon his subject, and to found an argument upon no fact for which he does not cite an authority, is worthy of his official position. That he is not a brilliant nor even a graphic writer will occasion less regret to the reader who remembers how many historians have earned those epithets at the expense of accuracy and candour. His English, if homely, is sufficiently readable. Two or three slight errors deserve correction in a second edition. William Worcester's reference to "Neyet, near Westminster" (p. 5), does not need a query. The place intended is the Abbot of Westminster's demesne manor of Neate. It is a solecism to speak of Ratchiffe and Catesby as having "dissuaded the revolting marriage" of Richard with his niece (p. 260). At p. 263, note 3, "Clarence" has been miswritten for "Lincoln."

The history of Richard's reign and downfall is fitly supplemented by a narrative of the attempt made by Perkin Warbeck to personate one of his victims, the murdered Duke of York, and supplant his Lancastrian conqueror. The true account of the pretender's origin, upon which so much doubt has been thrown, is here fully told by the aid of some fresh documentary evidence, for which Mr. Gairdner acknowledges his debt to the researches of Mr. James Weale among the records of Courtray and Tournay.

HENRY G. HEWLETT.

A Legacy. Being the Life and Remains of John Martin, Schoolmaster and Poet. Written and edited by the Author of "John Halifax, Gentleman." In Two Volumes. (London: Hurst & Blackett, 1878.)

Is it mostly for the better or the worse that we meddle with a fellow-mortal's destinies? We cherish the story of the younger son of a small Welsh gentleman, who, when his uncle, a fellow and tutor at Oxford, wrote to the head of the family, saying "Send the lad to me, and I'll make a man of him," sturdily declined to be so made a man of; made his own way in the Principality, and founded in his own county a still-flourishing country bank. Doubtless, in that case, the lad had both stamina and purpose to carve his own career, and was not the bodily wreck which John Martin appears to have been by inheritance; but still we cannot suppress our misgivings that the author of *John Halifax, Gentleman*, formed a somewhat rigid and severe estimate of her undertaking when she followed up,

doubtless to the best of her judgment, the responsibilities of her invitation through the curate, Mr. Linkwater, "Send the lad to me." The lad, in this instance, was a shy, reticent, scantily-friended "poor fellow" from the East of London, who had had the good luck to be sent for education to St. Peter's school, and to have come there under the notice of Mr. Rowley, the African missionary, who still survives his association in the heroic enterprise of Bishop Mackenzie. Hence, we may presume, his love of letters, and his taste and aspiration after higher cultivation than belonged to his rank in life. A reticence as to his precise family circumstances appears to have been imposed on Mrs. Craik, but enough is revealed to show that his father and his sister's husband belonged to the working classes, and there is good reason for surmising that domestic trials and drawbacks enhanced the poverty of the home from which John Martin's intellect and tenacity of purpose tempted him to emerge. Anyhow, he was assisted by two or three kindly and sympathetic clergymen, placed as master in St. Agatha's Mission School, and enabled to qualify for still higher educational posts; and it will be seen from his Remains, both in prose and verse, which represent "A Legacy," that he used the scant leisure of his arduous calling in giving no inconsiderable proofs of his exceptional culture. How far, in his brief and interesting lifetime, it was fortunate for him that an introduction to the author of *John Halifax* was procured for him by Mr. Linkwater, and that, "more sad than amused," she bade that gentleman "send the lad to me," we confess to grave doubts. Her first impressions are of "a sort of head that is called poetical—rather Shelleyish in character—with a youthful grace about it and an unmistakable refinement, very attractive." His manner, language, accent, tone, were all in his favour. Everything bespoke him above his station, and yet not set above himself in consequence. It seems to us, as we read, that one who had so far surmounted the "waif-and-stray" upbringing, and yet was evidently, through health and sensitiveness, so wistful of encouragement and fosterage for his literary yearnings, found less than the help which other modern patrons have bestowed on not more meritorious Glasgow weavers who took to poetry, in the cautious criticisms, the reiterated advice to read and study before rushing into print, in short, the well-meant repression, which might have been more reasonable in the case of one more healthy and less sanguine and sensitive. John Martin was, in fact, introduced to a "candid friend," who forbade him to give the world a taste of his calibre until he should reach her own theoretical standard; and he died before he did reach it. To our thinking his poetry includes some pieces that would have done credit to any sponsor who introduced them to a review or magazine editor: his prose, as the author of *A Legacy* more clearly sees, is of a yet higher and more finished and attractive caste. But it is difficult to read the poor fellow's letters to his repressive patron, and his piteous cries—"Ah me, life is gliding away: hopeful dreams unrealised"—and yet to agree

with the preconception or prejudice which led his censor to see in what he wrote to her only "a certain *posé* attitude, an affectation of literary effect," and the impression that the writer, who so evidently thought himself a poet, "would never succeed in being one" (pp. 254-5). An extract from the Journal which he conscientiously kept in order to chronicle much more his uncommon thoughts than the scanty events of his commonplace life (see vol. ii., pp. 118-9), expresses as much restiveness against the dictum of his mentor as one so socially alone in the world and so accustomed to "grin and bear" could have ventured upon; and the truth of his remarks is seen in the issue. Here is a portion of the record:—

"Sent a letter to Mrs. C. a few days ago, asking for leave to issue a modest volume of verse. Her answer is decisive:—'Go on with courage. Send the result from time to time. When I see anything likely to suit a magazine it shall be ventured. Never despair. So much has been done that the rest is sure to follow.' I am, therefore, not to publish. This fiat must be accepted. 'The rest is sure to follow.' Yes, if I live long enough."

Readers who care to follow up this passage will see how keenly and accurately John Martin gauged the effect of this fettering; and the more they examine his prose, and realise the largeness of view, the absence of class prejudice, the nobleness of thought, so to speak, which characterise his political, social, and religious views, the more they will lament that from him was withheld, though with the kindest intentions, the opening which he so unavailingly coveted. His practical and outspoken views as to reform (i., 141-3); his shrewd remarks on the culinary unthrift and family discomfort of the homes of the lower classes (i., 91-2); his just criticism of modern poets (i., 254), and lively estimate of the shakiness of many of them on their pedestals (ii., 7-8), bespeak him one who with introduction and encouragement might have earned a livelihood, and a name may be, as an essayist; while in his versatility, considering his area and range of observation, there is nothing of broadness or vulgarity to detract from decided merit. A single quotation from his Diary (i., 110) will show how widely he read and what use he made of his reading, the theme for the moment being a kind of anticipation of the *phonograph*:—

"October 23.—What a whimsical notion is that of Rabelais, found too in the writings of men before and after him, about a frozen land, in which, when the air was heated, might be heard music, oaths, sailors' cries, and various other sounds, long frozen and at last dissolved by warmth, as rain falls when the air is heated after a state of cold. Truth, too, very often, is frozen in our minds, and needs the love and warmth of the heart, before it will present itself to us in a shape we cannot overlook or mistake."

It would be hard to prove a negative to his literary executor's opinion that his prose was better than his poetry; but we are not sure that the latter might not have ripened into blossom and fruitage under warmer skies. His surroundings, circumstances, daily occupations, were so unfavourable to poetic growth that one marvels he reached the promise which his Remains evidence. There is wonderful fancy as well as expres-

sion in the lines "From the window," which are printed in ii., 109-10; and it would be interesting to know whether they veil a reality of the schoolmaster-poet's life. "Haunted" is clearly an effort of sheer imagination, and betokens something of morbid choice, or at any rate dearth of subject. There are some poetic stanzas and a high tone and purpose in the "Fragmentary Verses" (ii., 264-6), which lament the indifference alike to Nature and to Nature's God of the average run of daily toilers. "The Dead Poet," too, claims and will repay perusal, as surely picturing and imaging his own experiences and struggles. The most considerable, however, of his poetic achievements, is of course the three-act drama *Placidio*, of which truth would bid us admit that it savours of a first attempt at one of the most difficult of poetical experiments. The writer has studied the Elizabethan dramatists lovingly. He has affected their plan and plot, but missed their force, fire, and spirit. His angels, e.g., Placidio and Clement, are too white; his devils, Ambrose and Maldenzio, too pronouncedly and unnecessarily black. In the *dénouement*, too, there is a singular oversight, in that that portion of the circumstantial evidence which fixed the crime of Ambrose's murder on Placidio—namely, the discovery near the murdered man of a portrait of Placidio's mother—is not got rid of by the subsequent discovery that the real murderer wore a cloak, which he had purloined on purpose from Corso, a poor man to whom Placidio had recently given it. Surely the good gentleman was not so absent as to give away old clothes without searching the pockets, and removing family miniatures. Yet there are fine passages in *Placidio*: e.g., that one in Act ii., scene 1, where life is likened to a procession, with considerable wealth of fancy and imagery. We rejoice to think that the subject of this legacy has received from one whom we have already called his literary executor a substantial though posthumous acknowledgment. She has edited his "Life and Remains," and bestirred herself to set up his memorial in one scene of his labours, St. Peter's Church, London Docks, where he may "yet speak" to the boys among whom he worked. But we cannot resist the conclusion that those are likeliest to find the way to literary success who can be self-reliant enough to do without a patron or mentor, and decline *ullius jurare in verba magistri*, as well as overtures to "send the lad to me."

JAMES DAVIES.

Fontes Rerum Bohemicarum. Tom. III., Fasc. 1-3. Dalimili Bohemiae Chronicon. Vydal Josef Jireczek. (Prag: Grêgr & Dattel, 1878.)

THIS handsome quarto volume just issued by the Bohemian Museum is especially interesting, inasmuch as one of the principal authorities for the text of the so-called "Dalimil" was only discovered about three and a-half years ago in the Library of Trinity College, Cambridge, where it had slumbered among the other MSS. of the Gale collection since 1744. The writer of the Chronicle, which traces the Czechs from the Flood to the author's own time, the early part of the

fourteenth century, was in all probability a layman of rank, a decided patriot, and a man well read in the literature of his own day, acquainted with Latin and German, and deeply versed in the traditional lore of his own and the neighbouring nations. It was at one time ascribed to a Canon Dalimil, but without any good grounds, and the name "Dalimil" is merely retained as a convenient title for the work. The style is vigorous and rhymed throughout, the normal metre being a trochaic one of four trochees in a line, but longer verses are from time to time introduced *ad libitum*. The text is given mainly from the Cambridge MS. and two earlier fragments, what is wanting being supplied from a Vienna MS. of great beauty, written on parchment about the end of the fourteenth century, a paper MS. formerly belonging to the Franciscan monastery in the New Town of Prague, and now in the Lobkovitz collection, and another paper MS. in the library of the Premonstratensians at Strahow. The Bohemian text is given with the oldest German rhymed translation in a parallel column, and another German prose translation is printed at the end. At the bottom of every page are the various readings of the different MSS., both of the Bohemian original and of the German rhymed version. Altogether the work is a great treasure, both for the Slavonic and Old German scholar, and M. Jireczek may well be congratulated on the manner in which he has performed his arduous duty. It will, perhaps, be interesting to the students of Old German if I give a brief specimen from the beginning of the German translation:—

"Di tutsch kronik von Behem lant
Wirt zu rim hi wol bekant.

Do eteswen durch ere missetad
alle lute virdurbin drad
bis an acht von der sinfut,
darnach den si quam zu gut,
dy do bliben also lange.
Gen der sunen vffgange
diselbin do irstunden,
si gingen al, sy kunden,
all wege zu mitten tage
in forchte vnd in groszer clage:
dy sinfut forchtin sy zu phleg,
si gleubtin in selbir kein weg.
Do si waren vff dem acker,
der do waz gnant sennar,
da namen sy einen rad,
gar tumben mit der tad.
Si sprachen wedir sich also
vil vnweislichen so:
'Bowe wyr vns einen torm,
der an den humel mag geruren.'

Editions like this of ancient writers would be creditable to any country, but Bohemia deserves especial credit in this respect. Paternal governments are sometimes great patrons of literary and antiquarian research, but Bohemia has always lain in this respect under a very cold shade, and it is not so very long ago that to be a student of Bohemian antiquity was to incur the gravest suspicions of the Austrian Government. However, we must hope that this feeling will pass away, even as that most detestable of institutions, that suppressor of truth and falsifier of history, the censorship of the press, has passed away. If the Czechs are simply left to themselves, their spirit of patriotism and attachment to their glorious past is such that we may look for a rapid continuance of these valuable editions of the "Fontes" or

sources of their history under a succession of editors as capable and as careful as M. Jireczek.

A. H. WRATISLAW.

NEW NOVELS.

Kingsdene. By the Hon. Mrs. John Fetherstonhaugh. In Two Volumes. (London: R. Bentley & Son, 1878.)

Is He Popenjoy? By Anthony Trollope. In Three Volumes. (London: Chapman & Hall, 1878.)

At the Altar. Translated from the German of E. Werner, by Mrs. Parker. In Two Volumes. (London: Sampson Low & Co., 1878.)

The Hazard of the Die. By Mrs. Alfred W. Hunt. In Three Volumes. (London: Hurst & Blackett, 1878.)

Kingsdene is a very slight, but fairly readable, novel of society, turning on the sufficiently trite motive of a man, disappointed in love, marrying a woman who loves him, while he has no more than warm liking and respect for her, which develops at last into closer affection. The earlier part, wherein the heroine appears as a shrewd child with a sarcastic tongue, is the best; but she is not finished to pattern, as all the stronger traits are softened into general amiability when she grows up, which, though more comfortable for domestic purposes, is less amusing to read about. The hero is a mere lay figure, nor is the woman who fascinates him—a Norwegian peasant girl who has become a famous actress and singer—much more successful. It is in the smaller touches that the best work appears, but Mrs. Fetherstonhaugh has not got beyond the era of Congreve in her typical names. Sir Soapy Bland, Captain Nonchalant, and Pound Foolish are anachronisms since Thackeray's time, who reformed all that sort of thing.

Is He Popenjoy? belongs to the least pleasant of Mr. Anthony Trollope's three manners—that represented by such of his novels as *The Eustace Diamonds*, in which he is pleased to treat of the seamy side of society, to show how very slight are the barriers which part modern civilisation from ancient savagery, and in particular to impress on his readers that if they will scratch a girl of the period they will find beneath a sufficiently thin coating of Belgravian varnish the morals of an *helaera* united with the manners of a fish-fag. It is not a very comfortable view to take, and it may be hoped that Mr. Trollope's frightful examples, intended as warnings, are ideal bogies rather than genuine presentments. The enigmatic title refers to a question as to the legitimacy of the youthful heir of a certain raffish Marquis of Brotherton, who suddenly turns up with an Italian wife, respecting the date of whose marriage a doubt arises, on the solution of which depends the child's status, and also that of the heroine of the book, Mary Lovelace, daughter of the hero (if any) Dr. Lovelace, Dean of Brotherton, and married to Lord George Germain, next heir to the marquisate. The main situation of the book is the wedded experience of Lord and Lady George Germain; the gentleman dull, weak, obstinate, jealous, reserved, and almost ascetic in his distaste for those pleasures from

which poverty has long barred him, but yet "a gentleman all round," as one of the minor personages rightly calls him; the lady very young, sprightly, and pleasure-loving, though affectionate and pure, but too like Miss Lily Dale in *The Small House at Allington* to be entirely pleasing to that young woman's numerous non-admirers. How this pair, brought together originally in a marriage of convenience, where one had birth and the other money, get on in married life, and in their relations with the husband's brother and the wife's father, it is Mr. Trollope's business to tell us, and he does tell us with a realism which is his familiar quality. But the skill, unquestionable though it be, and diversified with touches of humour, such as the description of the Women's Disabilities movement, does not quicken us into caring a straw about any of the characters; and the clever, wealthy, low-born, ambitious, and thoroughly worldly Dean, by far the most vividly drawn of them, has none of the charm for us that Archdeacon Grantley still has; nor is the Close of Brotherton interesting after that of Barchester, though it has in it a converted Jew chaplain who does but remind us faintly of his greater brother Mr. Slope. None of our old friends are in the story, save as masquerading under new names. We have surely the Miss Todd who gave the picnic in the Valley of Jehoshaphat many years ago, reproduced as Mrs. Montacute Jones, and Jack de Baron does not differ much from Burgo Fitzgerald; but if we are to have the old types, we had rather have the old names too, and could cheerfully dispense with the harpy forms of Augusta Mildmay and Adelaide Houghton to get back again our dear Lady Glencora and Mrs. Thorne, *née* Dunstable.

At the Altar is a controversial novel, of a type once not uncommon in England, though written with more vigour than the ladies—such as Grace Kennedy and Mrs. Sherwood—who used to supply that class of literature put into their books. It is a highly melodramatic attack on the monastic and celibate systems of the Latin Church, not based on theological grounds so much as on social ones. The hero of the book, whose scene is laid in a mountain region closely resembling the Pusterthal, is Bruno Rhaneck, the unacknowledged son of a powerful Catholic nobleman by an irregular marriage with a Protestant girl of burgher rank, contracted when he had no prospects of succeeding to the title and estates of his family. The wife is deserted and dies; the child is delivered over to his uncle, abbot of a wealthy and powerful Benedictine monastery close to his father's castle, and is educated for the cloister and the priesthood, appearing at the outset of the story as Father Benedict, a young man of austere and gloomy temper, strong but controlled passions, and unusual mental power, whom his father, Count Rhaneck, secretly loves better than anything else on earth, and notably much better than Ottfried, his heir by a second and wealthy marriage, contracted in the first wife's lifetime. The two young men, who have an old dislike to each other, are brought into abrupt collision by both falling in love with Lucy Gunther, a girl of sixteen, sister of a Pro-

testant landowner, who has risen from poverty in his native North Germany to be master of a large estate in the midst of a Catholic and aristocratic neighbourhood. The young priest's passion increases the repugnance he already entertains for his vows, made at the close of a long seminary education, in complete ignorance of the world. He asks leave to take duty in a remote mountain village, in order to avoid temptation, but preaches a sermon against monasticism of so revolutionary a kind to a crowd of pilgrims that his Order thinks him too dangerous to live, and his death by an "accident" is arranged beforehand, to which his half-brother falls a victim, mistaken for himself through their likeness. As Gunther and his sister were near the spot where the crime was committed, and a letter was found on the dead man's person warning him off Gunther's premises, it is assumed that a quarrel had taken place between them, and Gunther is arrested on a charge of murder. Lucy, who has reason to think that Father Benedict was the assailant, seeks him out to induce him to save her brother. He does so, by declaring that he saw the Prior of the monastery commit the murder, abjures his vows, turns Protestant, in honour of his mother's memory as he partly alleges, engages himself to Lucy, becomes a Professor in a North German Protestant university, comes back to marry her when she is nineteen, and gets reconciled to his father. The book is written entirely from an outsider's point of view, and with an exaggeration which deepens into caricature, but with a certain force which might have been telling had the author really known the weak points of the system he assails. As it is, the purely personal and selfish motives he ascribes to his hero deprive his plot of all moral purpose. The translation is tolerable, but Mrs. Parker is not apt at transfusing idioms, and the technical phrases of Roman clericalism invariably baffle her, so that we have "deacon" put for "dean," where the word "Decan" was doubtless before her, and plenty of similar mistakes. Messrs. Remington and Co. have likewise published a translation of this work, by Miss Bertha Ness, under the title of *Sacred Vows*, which is a piece of honest and conscientious journey-work and nothing beyond.

It is always pleasurable to a critic when he can note progress and improvement, so that there is satisfaction in saying that *The Hazard of the Die* exhibits marked advance on Mrs. Alfred Hunt's previous novels. It is a very well constructed story of Yorkshire life at the beginning of this century, chiefly busy with a few clearly-marked and definite types of rural character, but having a plot of its own also, which, though sure to be detected from the first by experienced readers, is yet ingeniously worked out and not too abruptly disclosed. Mrs. Hunt has evidently made careful studies in some of the less modernised Yorkshire dales for her local colouring, and has introduced many vigorous dialectal phrases and quaint popular customs with considerable skill into the web of her novel, not overloading it with them, far less treating it, like Strutt's *Quenhoo Hall*, as a mere vehicle for antiquarian details, but just making it racy

of the soil. It is for its picture of manners rather than for its more romantic portions that it will achieve the distinction of being read a second time by those who have read it once; but they who have done so with appreciation will be glad to cast their eyes again over the rustic scenes and the description of two or three varieties of wilful Yorkshire folk, whether the hard-headed Squire Burnaby or the staunch and upright Faith Garthorne. The title, it is true, has nothing whatever to do with the story, while the plots and stratagems ascribed to Philip Mounsey, the mischief-maker in it, are too far-sighted and grown-up for a lad of twenty-one who has no elder adviser to prompt him and remedy the defects caused by inexperience of the world. But these are trifling drawbacks to a very pleasant and readable novel.

RICHARD F. LITTLEDALE.

CURRENT LITERATURE.

George Moore, Merchant and Philanthropist. By Samuel Smiles, LL.D. With a Portrait by G. F. Watts, R.A., etched by Rajon. (George Routledge and Son.) In his last biography Mr. Smiles rescued from oblivion "a Scotch naturalist." His present subject does not stand in so much need of literary record. The memory of George Moore, as he loved to hear himself called, is one that the present generation will not willingly let die. The bearer of that name studiously avoided public life. He preferred the payment of a heavy fine to serving the office of Sheriff for Middlesex; he repeatedly refused the offer of an easy election to Parliament; he avoided titles and honours from the Crown; his charities were often done by stealth; and yet no man ever gained a more honourable publicity. The very discursiveness of his benevolence, though it widened the area over which his fame was known, has perhaps prevented it from being associated with any single memorial. It may be urged, indeed, that such a life especially requires to be written, not in order to deepen the reminiscences that it has left behind, but that the world may learn the inner growth of that which was only known by its fruit. Mr. Smiles has submitted to undertake the subordinate duty of letting his hero tell the tale of his own life so far as possible in his own words and in those of his intimate friends. The man himself stands before us in these pages in perfect simplicity. His poverty and his wealth, his trials and his success, his educational deficiencies and his intellectual vigour, his religious narrowness and his universal charity, his private habits and his public deeds—all unfold their own lesson without any impertinent comments. The story divides itself into three chapters: the boyhood in Cumberland, prefaced by a sketch of the decaying race of "statesmen" from which he sprang; the early years, spent partly in a London warehouse and partly in "travelling" through the length and breadth of the kingdom; the maturity of middle age, no less actively occupied in the work of philanthropy. From first to last the life was consistent with itself. The physical robustness of the peasant's son, the indomitable energy of the tradesman, the discriminating charity of the city merchant and the country squire, show a continuous development of the same character devoting itself to different objects. George Moore possessed all the talents of a self-made man, with a minimum of those superficial defects vulgarly associated with the part. Rarely, if ever, has so warm a heart been united with the combination of faculties requisite for gratifying its every generous impulse. He transferred to the sphere of good works the business qualities that founded a commercial house. In the City of London, in his country home, and at the council board of many a

national institution, the stimulus of his example impelled others to emulate his munificence. We can here discover the methodical means by which alone that munificence was rendered possible. The portrait that forms the frontispiece will be a welcome present to many who never saw their benefactor in the flesh.

Lives of Famous Poets. By William Michael Rossetti. (Moxon and Son.) Since 1869 Mr. Rossetti has been engaged in editing for the publishers of this volume a series of "Popular Poets," and he has prefixed to each, with the exception, we believe, of Tupper, a critical and biographical summary of the life and qualities of the poet edited. These biographies he has at last collected and reprinted, adding to them seven other *Lives of poets* too important to be omitted—namely, Chaucer, Spenser, Shakspeare, Butler, Dryden, Gray, and Goldsmith. In order to link these essays still more closely together, he has inserted a page of names and dates between each *Life* and its successor. Thus between Dryden and Pope are given "Katherine Philips, c. 1632 to 1684," and so on down to "John Gay, 1688-1732," the result being that the volume serves in some sense as a useful book of reference. Mr. Rossetti always writes very carefully and conscientiously, and as long as he has nothing to do but to arrange in a pleasing form the well-known incidents of a life, or repeat the stereotyped judgment on work that no longer excites anyone, his *Lives* are very good. For instance, no one could wish a better notice on Mrs. Hemans than is to be found here. But to his estimate of Moore we cannot but take exception. Nothing, perhaps, is more difficult in this day than to appreciate the real genius and music of Moore underneath the tinsel and the jingle. In his own day he was considered supreme as a lyricist; at the present moment hasty critics condemn him altogether: it is difficult to decide which is most absurd. Moore was a true singer, and the ear that is not stirred by the melancholy and thrilling tones of his best melodies has no right to speak of music in poetry at all. Mr. Rossetti has the following singular remarks on this subject:—

"If we except the satirical compositions, choice in a different way, the best things of Moore are to be sought in the *Irish Melodies*, to which a considerable share of merit, and of apposite merit, is not to be denied: yet even here what deserts around the oases, and the oases themselves how soon exhaustible and forgettable! There are but few thoroughly beautiful and touching lines in the whole of Moore's poetry. . . . But let desert of every kind have its place, and welcome. In the cosmical diapason and august orchestra of poetry, Tom Moore's little Pan's-pipe can at odd moments be heard, and interjects an appreciable and rightly-combined twiddle or two."

A few such passages as this mar the success of an otherwise modest and capable volume, which may be cordially recommended to the general public, though scarcely calculated to instruct the instructed. It strikes us as a particularly suitable book to be given as a present to young people in whom the love of poetry is awakening.

The War Ships of Europe. By Chief-Engineer King, U.S.N. (Portsmouth: Griffin and Co.) This book, revised and corrected by an English naval architect, who has enriched it with notes, will be read with great interest at the present time, not only by naval and scientific men, but also by the educated portion of the general public. A few years ago there was a scare lest the navy of England should be overmastered by a combination of the fleets of two or three countries. That scare has completely passed away, and we were never so assured of our maritime supremacy as we are at present. The *Inflexible* has from sixteen to twenty-four inches of armour, and in two revolving turrets four 81-ton guns, capable of being fired all together at an enemy ahead, astern, or on either beam, and in pairs towards every point of the compass. Her mean draught

is twenty-four feet five inches. Her ends are unarmoured, but so constructed that even when they are riddled with shot the vessel will float, and the whole hull is divided into numerous compartments by watertight bulkheads. She has sail as well as steam power, and can ram. Finally, her cost was 521,750*l.* The most powerful Russian ship is the *Peter the Great*, which has armour of fourteen inches, and four twelve-inch 40-ton guns. Italy has two very powerful armour-clads, the *Duilio* and *Dandolo*, with twenty-one and a-quarter inches of armour, and two 100-ton guns each. We may remark, however, that the 81-ton guns of the *Inflexible* are to be replaced by 100-ton guns, which have been already constructed. No other ships come near the *Inflexible*. In the Appendix is given a tabulated statement of all British and foreign ships of war, a reference to which proves our incontestable superiority in every class of ship. It is particularly satisfactory to learn that the Americans have, by their own admission, nothing to match, as powerful, fast, unarmoured cruisers, the *Raleigh*, *Boadicea*, and the *Euryalus*. Not the least interesting part of the book before us is the chapter devoted to "Offensive Torpedo Warfare," now in its infancy, but on which the Russo-Turkish war throws a little light. Our Government has not till lately devoted much attention to the construction of special torpedo-launches. It may therefore be interesting to learn what has been done by Germany in this particular. The Germans caused the *Ziethen* to be constructed by the Thames Ironworks at Blackwall. It was completed in June, 1876. The maximum speed of the *Ziethen* is sixteen knots an hour, and the torpedo starts at eighteen knots an hour, which speed gradually diminishes till a range of 2,500 feet has been accomplished, when the torpedo will have run its course. Early in the summer of 1876 the Stettin Engine Company launched for the German navy the *Uhan* torpedo boat. The following is a description of this formidable engine of war:—

"This vessel will receive a torpedo charged with dynamite, to be carried on a ten-foot ram, lying deeply under the water-line, which torpedo is to explode on contact with the hostile ship. To protect the torpedo-boat from the results of the discharge of its own torpedo, the vessel is built with two complete fore parts, sliding one within the other, and having a considerable extent of intermediate space between them. This space is filled with a tough and elastic material (cork and marine glue), and thus, even if the bows were carried off, there would be a second line of resistance. The object of the filling is to act like a buffer, deadening the blow and protecting the stem. Another striking feature is the great power of the engines. . . . The vessel, in fact, is all machinery, only a very small space being left for coals and crew. . . . In order to save the crew at the worst, a raft has been constructed, which is filled with the above mixture of cork and marine glue, and is placed near the helm. When the *Uhan* enters into action the dynamite cartridge is to be fixed by divers at the point of the ram. The rudder is then to be fixed; and the crew are to open a wide port on the ship's side, and with their raft jump into the water. The steamer is then to be allowed to rush forward and burst its cartridge on the enemy's armour. The crew, however, are to hold on to the torpedo-boat by a line while they are awaiting the result of the explosion; and, in case their boat is not hurt, they are to board it again, in order if necessary to repeat the manoeuvre. The price of this torpedo-boat is about . . . 30,000*l.*"

The conclusion at which the author arrives after considering the results of the experiments with the *Oberon* is "that no ironclad can withstand the bursting of a torpedo in contact with her bottom: a torpedo would prove destructive wherever it struck, and a ship could hardly be saved by any turn of the helm." This book likewise gives an account of the Italian experiments at Spezia with the 100-ton gun against iron plates; a description of the Royal Naval College;

and much valuable information about naval machinery. In short it deals with the whole subject of modern navies in a very complete manner, and deserves an extensive circulation.

NOTES AND NEWS.

WE understand that in the forthcoming series of *English Men of Letters*, edited by Mr. John Morley, already announced in these columns, Prof. Huxley has undertaken to write on Hume, Mr. Thomas Hughes on Dickens, Prof. Nichol on Byron, and Mr. W. Minto on Defoe. The first volume of the series, Mr. Leslie Stephen's *Johnson*, will be published this week by Messrs. Macmillan and Co.

A SECOND edition of Dr. Cunningham Geikie's *Life and Words of Christ* is now in the press.

MISS BETHAM-EDWARDS's new (anti-Catholic) novel, *Brother Gabriel*, will be forthwith brought out in the Tauchnitz Series.

MR. GEORGE SMITH's *History of Sennacherib*, which, like the *History of Assur-bani-pul*, consists of the original texts with transliterations and translations, is now being edited by Mr. Sayce, and will soon make its appearance. Mr. Smith had completed it with the exception of the last few pages, the expense of publication being borne by the late Mr. J. W. Bosanquet and his son, Mr. B. T. Bosanquet.

MR. GLADSTONE's *Primer of Homer*, in Messrs. Macmillan and Co.'s series of Literature Primers, edited by Mr. J. R. Green, is now all in type, and may be expected to appear in about a fortnight.

MRS. HERBERT MARTIN's novelette, *Bonnie Leslie*, is being translated into German, and will shortly appear in a new series of English novels published at Strassburg.

WITH a view to arriving at some consensus of opinion as to the various schemes of Spelling Reform now before the public, Dr. Geo. Harley, Mr. E. Jones, of Liverpool, Mr. J. MacArthur, and Mr. George Washington Moon, have issued a circular addressed to phonetic reformers and educationists, exhibiting a comparison of ten different schemes of Spelling Reform without new letters, with a view to arriving at a common system. They invite criticism and suggestions.

MESSRS. LONGMANS announce *The Art of Scientific Discovery*, by G. Gore, LL.D., F.R.S.; *Notes on Physiology*, by Henry Ashby; and a *Dictionary of Medicine*, by R. Quain, M.D., F.R.S.

THE *Journal of Education*, after a life of about nine years, has ceased to exist. For the future it will be incorporated with the *Scholastic Register*, which may now fairly claim support from schoolmasters—especially of middle-class schools—as the leading periodical devoted to their interests and wants.

LADY HOBART has published, in the form of a pamphlet (Macmillan), the official correspondence of her late husband, when Governor of Madras, on the question of "The Salt Tax in Southern India." The views he expressed are calculated to confirm his reputation as a painstaking administrator and a sympathiser with native opinion. At the same time they are a severe condemnation of the policy adopted by the present Indian Government in raising the duty upon salt in the tracts recently stricken by famine, under the pretext of an equalisation of the rates ruling in the different provinces of the peninsula.

IN view of the new charter enabling the University of London to confer degrees on women, and the increased demand for a higher education of women, the Council of University College have determined to provide systematic instruction for them in regular college classes. In most subjects the junior classes for women will be distinct from those attended by male students. The senior classes will more generally be open to both sexes, and those classes which are already open to both—

as Fine Art, Philosophy of Mind, &c.—will remain so.

MESSRS. RIVINGTON will shortly issue a *History of the Romans to the Establishment of Imperialism*, by J. S. Reid, M.A., Classical Lecturer at Christ's College, Cambridge. This work is intended to be used by the higher forms in public schools, and by junior students in the universities. It aims at exhibiting in outline the growth of the Roman national life in all departments. Military history will not be neglected, but attention will be particularly turned towards the political and social changes, and the development of law, literature, religion, art, science, and social life. Care will be taken to bring the whole narrative into accord with the present state of knowledge, and also to present the facts of Roman History in a form likely to interest the students for whom the work is intended.

THE same publishers have also in the press a work entitled *A Practical Greek Method for Beginners: being a graduated Application of Grammar to Translation and Composition*, by F. Ritchie, M.A., and E. H. Moore, M.A., Assistant-Masters at the High School, Plymouth. The aim of this book, which is at once a grammar and exercise-book, is to afford practice in inflexion, &c., at the time that the grammar is being learnt, in order that, on commencing translation, the pupil may be familiar with the inflexions of verbs, substantives, &c., and may be able to concentrate his attention on the construction. The gradual introduction of the simpler rules of syntax is intended to prepare the pupil for more advanced Greek composition.

THE library of the late German poet Ferdinand Freiligrath is to be sold by auction at Canstatt, near Stuttgart, on Tuesday, June 18, and following days. Catalogues may be had on application to Oskar Gerschel, Schloss-Strasse 37, Stuttgart.

AMONG the latest additions to the manuscripts in the British Museum are the following:—A Greek MS. of the early part of the twelfth century, containing homilies on Genesis; a Latin Psalter, illuminated in Germany in the fifteenth century; an English MS. of the fifteenth century, being "The wys boke of Phylosophi and Astro-myke," treating of zodiacal influences, with medical recipes, and a treatise on surgery. Of historical interest are: Accounts of Subsidies and Taxes in Normandy in 1341-2; a Journal of the Return of the French Embassy under the Comte d'Avaux from the Northern Courts, February—August, 1636; Exchequer Accounts for the years 1543-1717; Copies of the Despatches of Sir Ralph Sadler, Ambassador in Scotland, in 1539, 1543; and Letters of the political agent Plantamour to Secretary Blathwayt, from Berlin, 1701-1702. There are also: Poor's-rate Book for Poole, April, 1697; Minute Book and Accounts of Hammer-smith Charity School and the Latimer Charity, 1713-1751; the Inquisition *post mortem* of lands of Anne, widow of John Holland, Duke of Exeter, 1458; Creditors' Accounts delivered in to the executors of the Duke of Richmond and Lenox, 1672; Coats and Crests of English Families, of the seventeenth century; a History of the Mansel Family, 1754; and a Register of Noble Families of Pistoia by the Cavaliere Franchi, in three volumes, 1701. Letters to Lady Sundon, lady-in-waiting to Queen Caroline, 1732-1737; a Poem of the seventeenth century, by G. Ellis—"Adam's calamitie and misery cured by Christ's humanity and mercy;" the Report of the Synod of Upsala for consideration of the Swedish Liturgy, 1593; Sermons in the Guarani dialect of Mexico, of the seventeenth century. A large number of volumes of music have also been added, chiefly containing church music by Italian composers of the eighteenth century; and also airs arranged for the organ, &c., by John Cooper, in the seventeenth century, compositions by William and Thomas Linley, and some operas by Meyerbeer and Rossini.

THE April *Bulletin* of the Société Franklin contains a full Report of the annual meeting of the subscribers. The President, reviewing the work of the society in the cause of popular libraries in France, stated that during the last ten years it had expended over 462,000 francs in supplying libraries with selected books at reduced prices. It has also issued a general catalogue of books suitable for such libraries, which is supplemented in its monthly bulletins, and a variety of special catalogues for the use of particular kinds of libraries, such as those for schools, villages, and soldiers. Of these catalogues 60,000 copies have been circulated. The society does not confine itself to making selections from the literature already published, but enters into relations with publishers for the purpose of pointing out books that it is desirable to reprint or to have written. The present *Bulletin*, for instance, has two papers, one pointing out the need for a good popular book on the French colony of Algeria, and the other noticing Mr. Smiles's *Life of Thomas Edward*, the naturalist, which has been recommended to the society for translation.

IN the *Archivio Storico* for May, Signor Minieri Riccio continues his Register of Charles I. of Anjou; and Signor Carutti in his article on Count Umberto I. gives a valuable criticism of the early chronicles of Savoy. Signor Giampietro gives an interesting account of the oldest original correspondence of an Italian prince which has been preserved entire, that of Francesco Sforza (1447-66) which is in the Milanese archives. It consists of reports of the different State councils, petitions presented to the Duke, and accounts of the State finances, and is a mass of material as yet unedited for a history of Lombardy in the fifteenth century.

IN the *Nuova Antologia* for May 15, Signor Zambaldi writes a suggestive article on the political attitude of the poets in ancient Greece. He shows that it was essentially conservative, partly from the fact that it drew its inspiration from the old heroic age, partly because in the times of struggle between the people and the aristocracy culture, which was as yet purely poetic in form, was the patrimony of the nobles. Prose developed with the growth of the democratic spirit to which it gave expression. Euripides, who tried to associate the new notions of democracy with poetry, was consequently the least perfect of the great poets of Greece, and prepared the way for the decadence of the art. Signor Broglio gives a lively account of the relations between Frederic the Great and Voltaire. Signor Brizio, also, has an excellent article giving a summary of the result of the recent criticism on the so-called Etruscan vases found in Italy, and gives the arguments for their Greek origin; he exhorts his countrymen to greater energy in the field of archaeological investigation.

THE *Rivista Europea* for May 16 consists mainly of continuations of articles previously noticed. It has, however, an account by Signor di Tivoli of the organisation and working of the University of Oxford. We wish Signor di Tivoli had supplemented his account by a criticism of the English university system as it struck one who is free from prejudice and had had ample means of accurately observing its results and contrasting them with other systems with which he was familiar.

THE *Preussische Jahrbücher* for May contains a philosophical article by Herr Hartung of the highest interest, on the "Modern Doctrine of Matter." He accepts the atomic conception of matter as the foundation of a new Idealism. "Natural science," he says, "is in its basis a chapter of Psychology." We construct the outer world out of sensations, and, on the hypothesis of a universal power working in the world ("Allgemeine Beseelung der Welt"), man's sensation becomes a part of this universal sensibility. If in man's mind lies the key to the phenomena of the

outer world, then a new field is opened for thought in investigating the peculiarities of the mind by which sensual antecedents assume determinate forms. The modern doctrine of matter thus forms a bridge between the Sensuous and the Ideal, and the modern spirit of investigation has freed Idealism from the thralldom of a materialistic conception of the world. Herr Boretius, also, contributes an interesting paper, contrasting the Holy Roman Empire with the modern German Empire.

THE fourth edition, revised, of Mr. Serjeant Cox's *Letters to a Law Student on the Arts of Writing, Reading, and Speaking* is in the press. It will contain a new chapter on "Stuttering, its Causes and its Cure."

THE *Allgemeine Journal-Repertorium*, published at Berlin since April 1, gives a survey of all original articles published in other journals.

HACKLÄNDER's autobiography, *Der Roman meines Lebens*, in two volumes, has appeared.

WE have received *A Treatise on Dynamics of a Particle*, by P. G. Tait and W. J. Steele, fourth edition (Macmillan); *Choice and Chance*, by W. A. Whitworth, third edition (Bell); *Catalogue of a Collection of Oriental Porcelain and Pottery* (lent to Bethnal Green Branch Museum), by A. W. Franks (Museum); *The Dean's English*, by G. Washington Moon, eleventh edition (Hatchards); *A Few Suggestions for Prayer-Book Reform*, by G. Biller (Wyman); *Em*, by M. Bramston, second edition (Marcus Ward).

OBITUARY.

MISS JANE LOUISA WILLYAMS, the fourth and youngest surviving daughter of Mr. James Willyams, of Carnanton, in Cornwall, died at Budleigh Salterton on May 28. She was born at Carnanton on October 20, 1786, and so far back as 1818, in conjunction with her sister, entered the world of letters by publishing, through the well-known firm of Constable and Co., an anonymous three-volume novel called *Coquetry*. This work has perished so completely that neither the British Museum Library nor the Advocates' Library at Edinburgh possesses a copy; the only interest now attaching to it arises from the fact that Sir Walter Scott, in pity for the young authors in their remote Cornish home, corrected the proofs and superintended the publication. In 1845 Miss Willyams published an historical tale called *Chillon: or, Protestants in the Sixteenth Century*: the local colouring used in this tale was based on a residence of four months in the castle of Chillon. This work was reprinted in Philadelphia and translated into the French language. Ten years later she published a *Short History of the Waldensian Church*: this passed into a second edition in 1855. A selection of her poems was printed for private circulation in 1863, and a volume from her pen describing, under the fanciful title of *The Tower of the Hawk*, some passages in the history of the House of Hapsburg appeared in 1871. Miss Willyams held strong Protestant opinions, and at various times published many treatises in support of the principles which she professed. It will be remembered that the widow of her eldest brother, on her death in 1863, left the then Mr. Disraeli her legatee in consideration of her "approbation and admiration of his efforts to vindicate the race of Israel."

NOTES OF TRAVEL.

FROM the June number of the *Church Missionary Intelligence* we learn that further news has reached the society from the Rev. Mr. Wilson, in Eastern Africa, by which it appears that only a very few days before his death Lieut. Shergold Smith sailed in the *Daisy* up Speke Gulf, and explored the Rivers Shimeeyu and Ruwana, and that he afterwards returned and surveyed Jordan's Nullah. The trip in question occupied a fortnight,

and we are informed that some valuable geographical notes are contained in the journal of it, together with some interesting pen-and-ink sketches.

No fears, we are glad to learn, need now be entertained respecting the safety of the recently established mission station in Stacey Island, South Cape, New Guinea, where some serious trouble occurred at the end of last year between the missionary schooner *Mayri* and some natives. When Mr. Chalmers visited the mainland, the natives treated him very kindly, and showed him where water was to be found. Mrs. Chalmers, writing on January 27, expresses some apprehensions as to the results of a rush of miners; and she regrets the absence of Mr. Lawes, who is very popular with the natives, and alone knows anything of them and their language. Mrs. Chalmers says that the people about Stacey Island are much darker and more debased than those at Kerepunu, and are, besides, much given to cannibalism. They have no religion at all, but have a firm belief in sorcery. The women are all tattooed on their faces and bodies, and their only garment is a skirt made of cocoa-nut leaves. The men wear no clothing, and do not tattoo themselves; but they besmear their bodies with black and white pigments.

WE hear that Commander Wharton, in H.M.S. *Faun*, has recently completed his survey of the coast-line of East Africa as far as Kilwa, including the island of Mafia. He also penetrated for some distance up the River Rufiji, and has added to our scanty information respecting that little-known stream. Afterwards, on his way down to the Cape of Good Hope, Capt. Wharton obtained a number of deep-sea soundings, which will be especially valuable if the project of a submarine cable between the Cape and Zanzibar be seriously entertained.

CAPT. RICHARD BURTON, who has returned to Trieste, hopes to be able to visit England shortly, in order to superintend personally the examination of the specimens which he has brought away from the mines of Midian.

THE RELIGION OF SHAKSPERE.

THE Rev. C. Hargrove, of Leeds, read a very interesting paper on "The Religion of Shakspeare," to the Liberal Social Union, last Thursday, in St. George's Hall. Contending, first, that even a dramatic artist could not hide himself in his works, that he must make them in his own image so that we could see him in them, and that Shakspeare was to be seen in his favourite characters, his extra-dramatic and his most highly-wrought passages, Mr. Hargrove first brought forward the negative, and then the positive evidence as to Shakspeare's religion. 1. Though specially tempted, by certainty of popularity for pandering to popular passion, to misrepresent and ridicule Jews, Roman Catholics, and Puritans, he had studiously refrained from doing so, and had instead defended them, or so treated them as to win his audiences' sympathy for them. As to Jews: compare his Shylock with Marlowe's Barabas, the murderer, poisoner, having no excuse for his crime, ending in a caldron of boiling oil, more brute than man. Set him beside Shylock, with his love for Leah—his "the patch is kind enough" (of L. Gobbo), his "Hath not a Jew eyes," &c.—a man with whom, through all his perverted rage, we sympathise. As to Papists: look at Shakspeare's treatment of friars and nuns. The popular line would have been to show up their licentiousness, avarice, jealousy of one another. But look how he treats the friar-scene in the *Troublesome Raigne* when he recasts it in his *King John*. That most effective exposure of the abbot's treasure-chest being opened on the stage, and a nun found in it, is cut out; and there are only two or three lines on Falconbridge's getting money from the abbey. Nay, Shakspeare is so kind to the friars,

that he has been claimed as a Roman Catholic on that ground; but you will notice that he leaves out all their religion and makes them philosophers, friends and advisers of folk in trouble; that alone shows that he was not a Papist. For nuns, see the noble character he has given Isabella, that "thing ensky'd and sainted;" but he takes care to make her wife, not leave her nun. As to Puritans, they must have been specially hateful to all playwrights and play-goers; no so certain applause could have been got as by abusing them. And Ben Jonson did expose all their hypocrisy and meanness unsparingly in his *Alchemist* and *Bartholomew Fair*. Contrast with this, Shakspeare's Malvolio and his Falstaff—for Falstaff is a demoralised Puritan, an Oldcastle first, a Fastolfe next, and his "vocation, state of grace," &c., are Puritan phrases. Who is there but has kindly feelings for them? The truth is, Shakspeare treated all religion as sacred ground, and designedly sacrificed temporary popularity to do so. 2. The positive evidence. What did Shakspeare hold as to a future life? You must not take his dramatic utterances of the "drunken sleep" of the villain, or the heaven—"the treasury of everlasting joy"—of the pious king, but note that the hope of future life was not a working power on saints or villains in Shakspeare; the one was not exalted, the other not frightened by it. It puzzled Hamlet, but Macbeth would jump it, so that he had not "judgment here." Assuredly Prospero was nearest Shakspeare's self, and he held "our little life was rounded by a sleep;" not annihilation, but sleep. He knew no more; he had no consolation from the thought of future life. As to Shakspeare's conception of God—he had a rich consciousness of the mysteries of things, a mystery around, above, below him; yet through it all, a power tending to righteousness: there was a Providence who shaped our ends, rough-hew them how we would. Amid all the evil there was a higher order working all for good; and by it, in the main, crime worked out its own judgment here. The universe was to Shakspeare the life-dwelling of a great moral Governor of men.

Mr. Furnivall, from the chair, expressed the strongest admiration for Mr. Hargrove's able and eloquent paper, and complete agreement with his views. He appealed to Shakspeare's *Sonnets*, in which the writer, bound by no dramatic tie, dealing with intensest feelings of friendship and of love, that ranged from the heaven of joy to the hell of grief, yet uttered not one word of a life hereafter, or the ordinary consolations or resources here of so-called religious folk. Reviewing the growth of Shakspeare's mind and spirit, as shown by the chronological order of his plays, Mr. Furnivall contrasted his treatment of the spiritual world in the youthful *Midsummer Night's Dream*—mankind the sport of fairies' whims—with that in his third period, his *Hamlet* time of doubt and unrest, and that in his fourth period, *Tempest*, where Prospero was master of the spirits of the world, and used them for the highest end, the redemption from crime and brutality of human souls. He insisted that only in Shakspeare's fourth period could have come forth his "Reverence, the angel of the world," and noted its identity with Goethe's final lesson in *Wilhelm Meister*.

Mr. Alfred Spalding followed in the same line; and the discussion was continued by Mr. Plumtre, Mr. Herbert Stack, Mr. E. Rose, Miss Marshall, Dr. Jusserand, and Mr. Southey.

MAGAZINES AND REVIEWS.

FOR the purely literary reader the *Fortnightly* provides more entertainment than usual this month, while there is no falling-off on its political and philosophical side. Mr. Saintsbury has a pleasant well-turned article on a pleasant and witty person, Charles de Bernard; Mr. Grant Duff contributes a paper on Emilio Castelar; and Mr. Garnett prints some still other unpublished Shelley memorials. When will the world be in a

dition to arrive finally at the bottom of the ous Shelley problems? So much has come, l so much seems to be still forthcoming. Mrs. alley described as a person of "excessive ortho- y" by Mr. Trelawny is the newest figure on the alley stage, and a very odd one she makes so ired. Mr. Garnett laughs at Mr. Trelawny's sent views of Mrs. Shelley, and contrasts m — on the whole successfully — with views he held in 1851 and 1858. With ard to the final catastrophe, Mr. Garnett's view hat there was a collision, but that it was an idental one, and after an independent investi- ion of the matter of the sailor's confession, on spot, he reports that it can now never be iver "examined into or verified." "The last er of importance" written by Shelley, pub- ured in this article for the first time, is full of uest, and puts Byron, we venture to think, in ight place altogether, though without ill- ure. Mr. Grant Duff's attention appears of a years to have been specially drawn to Spanish ary subjects, as it was long ago drawn to anish politics. His present article combines both ds, and gives us a very full and interesting picture eñor Castelar in his double capacity of politician l literary man. No greater contrast could well ound, as he himself points out, than exists ween the orator and declaimer Castelar and a man who was the subject of his last Spanish per, Balthasar Gracian, in whom Spanish in- uity and Spanish sententiousness, those old asi-Oriental qualities of the Spanish mind, ched their highest point of condensed expres- n. Castelar, however, is far from being a mere n of words, as it is commonly the fashion to ard him in this country, nor are his literary acilities to be gauged by that unlucky essay on ron which Mrs. Arthur Arnold was so unkind to translate. He can do a good deal better un that in his part of the literary man, as Mr. ant Duff shows by long translations from the eneo lectures and the *Recuerdos de Italia*. And fine as these rhetorical, half-historical, half- ilosophical passages are, we confess to finding them that fatal note of intellectual common- ice which spoils so much modern Spanish work; ich makes Amador de los Rios's literary history a dullest of reading; which takes the edge off en Gustavo Becquer's *Legendas* (though in his ems he managed to shake himself free from it), d besets almost every article and every piece of ygraphy the country produces. Señor Castelar's cription of the Colosseum is eloquent and usical—it would pass excellently into a piece sonorous Spanish verse—but analyse the oughts, and see which of them has not been pressed with the same emphasis a thousand nes already. How well a little of Heine's *zarrerie* would break the flow of the fine sen- ences!—and yet they are fine, and the rolling anish has its incommunicable charm, which, in ite of the goodness of these translations, is one 'the *cosas de España* that cannot be transplanted. ut how far Castelar as a political leader and ator surpasses Castelar as a literary and descrip- ve writer, can be very well gathered from Mr. rant Duff's paper by a comparison of all the her passages quoted with that taken from his mous speech at Rome in 1867 (p. 833). In ich speaking as this lies Castelar's real message his own time and to posterity.

THE *Nineteenth Century* this month depends r its circulation rather upon the political and icial articles than on those which deal with terature. With the former we are not ncerned, though we may be allowed to call at- tion to one, "The Social Origin of Nihilism ad Pessimism in Germany," which does not owe e whole of its interest to recent events. Mr. C. . Newton's paper on "The Religion of the reeks as illustrated by Greek Inscriptions" is as aluable as the author's name would lead us to pect, though it must be owned that it is far om easy reading. It is really the sequel of a

previous paper on Greek inscriptions in general; and with that it tends to show how much, since Grote and even since Curtius wrote, has been added to our knowledge of the life of Hellas by the study of the inscriptions. The time has not yet come for a new History of Greece; but twenty years hence, when excavation has done its work at least in the great centres, what materials there will be for the historian! Already, as this article of Mr. Newton's shows, enough is known to completely revolutionise the ideas of Greek ritual which a mere study of Greek literature, however full and careful, could give us. How land was purchased for the building of temples; how temples were endowed; how the State and not the priests administered sacred property; how the priests were selected, what were their duties, what the stages of the hierarchy; how slaves were owned by the god, and by what almost Roman process of sale a slave was transferred from an earthly master to the divine one, we now know from the inscriptions themselves: in most cases, from so many inscriptions that all doubt as to details and methods is practically eliminated. Thus, as Mr. Newton tells us, nearly five hundred inscriptions have been discovered at Delphi alone which relate to one of the two modes of enfranchisement. In fact, piecemeal discovery is doing almost as much for our knowledge of Greek institutions as great single discoveries, such as Niebuhr's of Gaius, have done in past times for our knowledge of Roman institutions. Another article that should be noticed in this review is that on "Voltaire and Madame du Châtelet," by Mrs. Clark, a writer whom we do not remember to have met with before. The article does not contain much that is new to Voltairean students; but in ground so well worked it is difficult to find novelty. It is, however, an opportune picture of the more human side of a man whose destructive work is just now receiving so much praise and blame in France; and the picture is well drawn, with perhaps more freedom of treatment than is usual in the English handling of such themes.

THE *Contemporary Review* returns to Canon Farrar's book with iteration as eternal as its theme. For the rest, the *Review* has literally nothing to interest the critic of *belles-lettres*, unless he finds pleasure in Mr. Freeman's third paper on Mr. Froude's "Becket," or in Mrs. Pfeiffer's Greek Sonnets. These last, to our mind, are far less attractive than the Russian poem which the same writer contributed a short time ago. A descrip- tion of Clytemnestra as a

"great ruling will
Seething in oily rage within the sphere
Which gods and men assign the woman here,"
does not remind us of Aeschylus. The *Contem- porary*, though in a general way its pages this month are unattractive, keeps up its good habit of printing reviews of "life and thought" in foreign countries. This time Prof. de Gubernatis writes of Italy, and "T. S." of Russia.

Macmillan's Magazine contains, beside more important articles, an interesting history of Free-masonry, by Mr. E. F. Willoughby, which, without revealing the secrets of the craft, contains much that the curious will like to know. There follows a fresh instalment of Prof. Max Müller's lectures: that on Fetichism, in which, as is well known, the Professor attacks the views of De Broeses and all who have followed him in holding Fetichism to be a primitive form of religion. The last article in the magazine is Mr. Matthew Arnold's Introduction to the new selection from Johnson's *Lives of the Poets*, which Messrs. Macmillan are about to publish. Mr. Arnold begins by protesting against the common aim of improvers of education—viz., augmentation and complication, rather than reduction and simplification, which is what we want. We want, in laying down a course of English literature such as the many could follow, first—

"a very brief introductory sketch of our subject;

then to fix a certain series of works to serve as what the French, taking an expression from the builder's business, call *points de repère*—points which stand as so many natural centres, and by returning to which we can always find our way again, if we are em- barrassed; finally, to mark out a number of illustra- tive and representative works, connecting themselves with each of these *points de repère*."

Such a point we may find in Johnson's *Lives*: not, indeed, as he wrote them, but in such a selection from them as would include their "kernel and quint- essence"—the six *Lives* of Milton, Dryden, Swift, Addison, Pope, and Gray, which are at once the principal part of the work and in themselves a history of English literature for a century and a-half. Mr. Arnold, as might be expected, has much that is interesting to say, both of the *Lives* and their writer. This period of a hundred and fifty years is "the passage of our nation to prose and reason; the passage to a type of thought and expression modern, Euro- pean, and which on the whole is ours at the pre- sent day, from a type antiquated, peculiar, and which is ours no longer." The establishment of this prose style, "clear, plain, and short," as Bur- net calls it—a style, as Mr. Arnold says, "ours by its organism, if not by its phrasing"—was the achievement of the century which followed the Restoration; and much of the credit of this achievement must be given to the French training and tastes of Charles II., whom Johnson calls "the last king of England that was a man of parts." The eighteenth century, then, is the cen- tury of prose, and Johnson, its foremost man of letters, is imbued with the spirit of prose, even in his criticism of poetry. But that need not make us condemn his *Lives of the Poets*, even as poetical criticism. His utterances, Mr. Arnold says, in some concluding sentences of warm appreciation, "are valuable because they are the utterances of a great and original man. . . . The more we study him, the higher will be our esteem for the power of his mind, the width of his interests, the largeness of his knowledge, the freshness, fearles- ness, and strength of his judgments."

A SHELLEY SALE.

WE mentioned the week before last the then ap- proaching sale (May 28) of certain papers, &c., connected with Shelley, belonging originally to Mr. and Mrs. Gisborne, and of late to Miss Rumble (not Rumley, as we inadvertently gave the name). We add now a few details as to items of particular interest, citing some words from the catalogue.

"Copies [made by Mr. Gisborne] of letters from Mary Shelley addressed to Mrs. Gisborne, May 1818 to January 1822, containing remarks from Percy Shelley about the Queen [Caroline], the Green Bag, the Minotaur, &c.:" 3l. 8s. (purchased by Mr. Ellis). The reference to "the Minotaur" will be understood by those who re- member a passage in another letter of Shelley, as published in Mr. Trelawny's new volumes:—"I wonder what in the world the Queen has done. I should not wonder, after the whispers I have heard, to find that the Green Bag contained evi- dence that she had imitated Pasiphaë, and that the Committee should recommend to Parliament a Bill to exclude all Minotaurs from the succession." In one of her letters Mrs. Shelley gives an amusing account of Shelley's fatal boat the *Don Juan*. This name was suggested by Trelawny; super- seded by some other name preferred by Shelley; but pertinaciously clung to by Byron, who got the name staringly inscribed on the boat itself, and some pains were needed to efface it when the boat arrived in the Gulf of Spezia.

"Transcript of letters (1822-25) from Mary Shelley; the predictions by Varley that ill-fortune was to attend Shelley every seven years, and Claire Clairmont:" 2l. 15s. (Ellis). The prognostic re- garding Shelley does not appear to have come true.

"Mrs. Gisborne's journal from May 2 to Decem- ber 26, 1820, with an account of those persons she saw, and what they said about the Shelleys:"

11. 5s. (Forman). Godwin at this time spoke with great bitterness against Shelley, accusing him of failing in his promises for the relief of the philosopher's money-distresses, and of having a natural and ingrained hostility to truth. He also affirmed (what has been often debated to and fro) that Fanny Godwin (Imlay) committed suicide because she was in love with Shelley, and found Mary preferred to herself.

Shelley's *Swallowfoot the Tyrant*, transcribed by Gisborne: 11. 11s. (Forman): corresponds very closely with the printed text.

"Transcripts of letters (1819-22) of Percy Shelley, Mary Shelley, and Claire Clairmont, including the long letter in verse addressed to Mrs. Gisborne. Shelley speaks of the Queen as 'the vulgar cook-maid.' Long letter from Mr. Trelawny how the *Don Juan* was lost, how they proceeded to find and reduce the bodies to ashes:" 101. 5s. (Ellis). This was a very important item. Most of the poet's letters here included have been printed, but with some abridgments, in Shelley's *Essays and Letters*. Two of those written by Shelley, in 1819 and a later year, are of pre-eminent value for estimating the question how far domestic comfort and sympathy existed between the poet and his wife: since we penned these words, the able article by Mr. Garnett in the *Fortnightly Review*, discussing this point among others, has appeared; his quotation, as printed, is not absolutely accurate. There are also letters showing that Shelley's enthusiastic regard for Emilia Viviani had abated, and that he was dissatisfied with his publisher Ollier, and wanted to get a different publisher. A long letter from Mary Shelley, detailing the latest incidents of her wedded life in Casa Magni, the alarms as to Shelley's fate, and the discovery of his corpse, is likewise of extreme interest.

"Transcripts of letters (1823-25) from Thomas Jefferson Hogg, Shelley's biographer, to Mrs. Williams; also from Mrs. Shelley to the same, in which she describes Lord Byron's treatment of her after Shelley's death, also his treatment of the Countess Guiccoli when he left for Greece:" 21. 15s. (Ellis). The treatment of Mrs. Shelley is spoken of as consisting of handsome offers, followed by dilatory non-performance, and at last she had to set Byron aside, and apply to Trelawny for what was needed.

"Gisborne's journal from April 12, 1827, to November 19, 1830; that period being spent in visiting Florence, Leghorn, Pisa, Rome, and other places, visiting the houses where Mr. and Mrs. Shelley had resided, conversing with many of their friends, with servants who had lived with them, &c., and at Rome 'shedding bitter tears on the grave of their dear departed friend P. B. Shelley,' detailing conversations with people, some much in their praise and *vice versa*;" 31. 3s. (Ellis). This journal is written with remarkable fullness and particularity, and would form a printed book of considerable size; the passage about Shelley's grave shows a singular intensity of affection and admiration for the poet on the part of Mr. and Mrs. Gisborne.

"Mary Godwin (Wollstonecraft), autograph letter," with two other items: 14s. (W. M. Rossetti). Written to Mrs. Reveley (Gisborne) very shortly before the birth of Mary (Mrs. Shelley). It may probably be almost the last letter that the authoress of the *Rights of Woman* wrote.

"Shelley, promissory note for 400*l.* in favour of Gisborne, Leghorn, June 30, 1820; also letter of Godwin to Mrs. Gisborne, March 10, 1818:" 5*l.* (Miss Rumble). Godwin's letter, written to introduce to Mrs. Gisborne the Shelleys, then about to leave England for Italy, speaks of Mary as "an unfortunate female infant" of whom Mrs. Gisborne had taken charge very shortly after her birth.

"Byron, autograph epitaph for Shelley's grave, eight lines:" not sold. This is a monstrous misdescription. The lines are Byron's, but are not his autograph, nor yet an epitaph, and still less

an epitaph for Shelley. They are the "Lines written in an Album at Malta," published among Byron's poems.

First editions of Shelley's poems:—*Alastor*, 5*l.* 15s.; *The Revolt of Islam*, 11. 15s.; *Epipsychidion*, 5*l.* 10s.; *Hellas*, 6*l.* 15s. The last contains, in MS., a passage for the preface never yet printed. It refers to the culpable indifference of the English regarding Greece, and uses the emphatic expression "tyrants and swindlers called sovereigns." While on the subject of Shelley, we will refer to a little volume lately published (Bell and Sons) which shows strongly how marked an advance the reputation of this great poet has made of late years among cultivated people of all classes of opinion. The "Members' Prize" in Cambridge University (prize given by the Members of Parliament for the university) was announced in 1877 to be awarded for an essay on "The Position of Shelley among the English Poets of his Time." Mr. R. Pickett Scott, of King's College, obtained this prize; and it is his essay which has now been published by the university authorities. Here the admiration expressed for Shelley is neither stinted nor confined to some one particular phase of his poetical or personal eminence: a leading point in the critical estimate is that Shelley and Wordsworth were jointly the great revolutionisers of English poetry at the beginning of this century. The essay contains much which we read with gratification and acquiescence: as to shortcomings or errors, it is no part of our business here to moot them. W. M. ROSSETTI.

THE VOLTAIRE CENTENARY AT PARIS.

THE great literary event of the last few weeks has been the Centenary of Voltaire. It has thrown into the shade even the struggles in the Academy, and the wrong which M. Taine has done himself with all his true friends by allowing himself to be placed in M. Thiers' *fauteuil* by a clerical and anti-republican clique. There has been a great deal of secret history in the preparations for the Centenary. First the dispute between M. Ménier, the great chocolate-manufacturer and Radical deputy, who wished to make it an ultra-democratic festival, an anti-religious demonstration, and the Société des Gens de Lettres, which made it its chief object to honour Voltaire himself, the most brilliant representative of the intellectual influence of France in Europe, the precursor of the French Revolution, and which was anxious that Victor Hugo should preside at the festival. The Government reconciled the Ménier and Victor Hugo committees by forbidding any proceedings out of doors, so that while the former on May 30 inaugurated the statue of Voltaire at the Myers Circus, the second gave an oratorical *séance* at the Gaité Theatre. Then we had the rush to arms of the clerical party, which could not lose such a fine opportunity of covering itself with ridicule. All the bishops fulminated pastorals, France was flooded with little pamphlets in which twenty passages or so were detached from their context in Voltaire's seventy volumes to prove that he was a bad Frenchman, an enemy of the people, an enemy of education: a grotesque association was formed under the presidency of the Duchesse de Chevreuse, which recruited even the fishwomen of the Halle to carry crowns to the statue of Joan of Arc; M. P. Féval, a novelist who is seeking to win a fresh reputation and a fresh public by passing over obtrusively to the clerical camp, wrote a letter comparing Voltaire to a "tête en caoutchouc;" and, finally, M. Dupanloup in one of his feeblest speeches ventured to ask the Government to authorise judicial prosecutions against a collection of fragments of Voltaire published by the Ménier committee.

But let us pass over these more or less burlesque incidents to dwell on the literary side of the festival in honour of Voltaire. The first literary homage which he received was that paid

him by M. Dufaure in the Senate in his reply to M. Dupanloup, in which he showed the services that Voltaire rendered to French society by the numerous reforms, judicial and civil, of which he made himself the apostle. On May 30, while the Municipal Council of Paris was crowning his statue at the Myers Circus, there was to be seen at the Gaité that strange and memorable spectacle of Victor Hugo, beyond all contradiction the greatest literary glory of France in the nineteenth century, pronouncing the eulogy of him whom Goethe called "the greatest man in literature of modern times." Victor Hugo long ago, in his royalist and romantic fervour, wrote lines severe to injustice against Voltaire:—

"ce singe de génie

Chez l'homme en mission par le diable envoyé."

He wrote also, in his Preface to *Cromwell*:—"Le dix-huitième siècle traine sa queue dans le XIX^e, et ce n'est pas nous qui la lui porterons." Now the times are changed, and with them Victor Hugo. In a parallel of singular audacity, which he only succeeded in rendering acceptable by his tact and eloquence, he compared the work of Voltaire with that of Jesus Christ, and finished his parallel with an admirable phrase: "Jésus a pleuré, Voltaire a souri. C'est de cette larme divine, et de ce sourire humain, qu'est faite la mansuétude de la civilisation moderne." If ever two men were unlike, surely they were Voltaire and Victor Hugo. One is all wit, the other all imagination; one has raised to the dignity of genius simplicity and nature, the other's genius is all for emphasis and hyperbole. One is a practical, pragmatical spirit, whose aspirations are wholly for the possible and the real, only proposing reforms which have all since been realised; the other is lost in sublime visions, and instead of reforms only proposes chimeras. But both, although in the most widely differing forms, have an ardent love of justice, of humanity, of liberty; and the greatest adversary of the penalty of death in our days was well qualified to speak of him who contributed more than any other man in the eighteenth century to the abolition of torture. So it was only of Voltaire as the foe to prejudices, the defender of Calas, of La Barre, of Sirven, that Victor Hugo spoke, and he expressed himself in admirable terms. The picture of the punishment of Calas and of La Barre, the passage on the smile of Voltaire, that on the great men of the eighteenth century in which he called Rousseau "ce rêveur oratoire," that in which he showed Voltaire alone, after the heads of the State, giving his name to an age as a "chef d'idées," and finally a great diatribe against war—all these are specimens of Victor Hugo's best style; never were his power and poetical inspiration greater. Of course his exaggerations, his jingling antitheses, reappear; but the general effect was incomparable. I must add, however, that more than one of his hearers found the passage against war out of place, even to be regretted. You must not tell a people mutilated as France has been that "the true victory is the Universal Exhibition"—that were to make her resign herself to her decline, and to lull her to sleep by dangerous flattery. I had behind me a young poet, a passionate admirer of Hugo's genius, who fought valiantly in 1870 to defend our country against the invader. He had tears in his eyes as he heard the multitude applaud this declamation against war—"that thief which robs mothers of their children." "We must teach the mothers," he said, "to know how to give up their children." A strange thing, truly, this must seem to all who think of what France now is. There is only one of the great sentiments of humanity which was not brought prominently forward in the festival of May 30—namely, patriotism. The fact is that Voltaire, the most intensely French of wits and of writers, the very incarnation of the French spirit, was not a patriot. More than one, doubtless, among the audience at the Gaité will find on reflection that, after the trials which France has undergone, without de-

g in any degree the general principles of duty and justice defended by Voltaire, there are duties more strict and more austere which should be recalled to the memory of a public too inclined to drain the intoxicating light of noble chimeras and sonorous phrases.

Deschanel's *conférence*, which preceded Mr. Hugo's speech, was a masterpiece of grace, style and solid wit. In an hour he told all Voltaire was, or rather let him tell it himself in quotations admirably chosen and read with exquisite art. He refuted the foolish accusations brought against Voltaire, and showed in the audience of *La Pucelle* an admirer of Joan of Arc, in him who wished "écraser l'infâme" one of the most earnest deists that ever lived. This evening, opened by a hearty and eloquent address by M. Spuller, at which a crowd of deputies, lawyers, and literary men were present, was certainly the grandest act of homage paid to a man whose name and work are still the subject of too passionate disputes to be the centre of a great annual festival. We must leave to Frenchmen the twentieth century the honour of paying tribute with unanimity the complete and perfect age which is his due. G. MONOD.

AFRICAN EXPLORATION FUND.

The Report which they have just presented to the Council of the Royal Geographical Society, the African Exploration Fund Committee call attention to the position of somewhat similar institutions in other countries, and point out that they obviously cannot compete with Governments, or even with Missionary Societies, in exertions on a large scale, having neither the resources of the former nor the pecuniary resources of the latter, and that they are unable to embrace the same objects, being restricted by the charter of the Society to science and geography. Under these circumstances they have not hitherto considered themselves in a position to undertake any independent exploration, and it has even been questioned whether their action should take the form of action at all, or be limited to grants in aid of expeditions organised by others, and discussing publishing results. They have, indeed, made a grant of 250*l.* to the Belgian International Association; and it is, no doubt, mainly owing to their action that, as we mentioned last week, the Council have directed the compilation of a map of Tropical Africa on an unusually large scale. Truly, however, the committee of the Fund have fully considered whether the means at their disposal might not be usefully employed in organising an expedition on a small scale, which, if well planned and successfully carried out, might produce useful geographical results.

In the course of their deliberations the committee have considered the advantages of more than one scheme of exploration. An expedition is proposed by Mr. Keith Johnston, having for its object the exploration of the country between the Cameroons, Formosa Bay, or some other point on the east side of the coast of Eastern Africa, and the Victoria Nyanza, passing by Mount Kenia. Though this project presented very great attractions and was ably drawn up, it was not deemed prudent to adopt it, partly on the score of expense, but mainly on the ground of the uncompromising hostility shown by the Masai tribe to all intruders, whether Arab or European. Two other courses were suggested to the committee—one by Mr. H. Stanley, which was to examine the valley of the Rufiji, from its delta to its sources in the highlands on the east side of Lake Tanganyika, an undertaking which would yield some good results; the other, the exploration of the country between the caravan road now being constructed from Dar-es-Salaam to the south of Zanzibar, and the northern end of Lake Nyassa. The latter project, in the opinion of the committee, recommends itself to a certain extent by the service it might render to a party already engaged in the useful

and important work of making a road into the interior. This has now been determined upon, and the expedition has been entrusted to Mr. Keith Johnston, who will be aided by a second European and will leave England for Zanzibar in October. The exploring party will commence their work from the present termination of the caravan road, and will make a general survey of the whole line of country between it and the northern end of Lake Nyassa. This region, as is already known, offers great attractions in the grandeur of its physical features, and is likely to yield discoveries of great geographical interest, independently of its practical importance in connexion with the best trade route to the lakes. Should the expedition reach Lake Nyassa (some 350 miles from Dar-es-Salaam) without much difficulty, the position thus gained would serve as a starting-point for a more important exploration to the south end of Lake Tanganyika, a further distance of 190 miles, and it is suggested that in that case the return journey might be made over new ground, as near as possible to the course of the Rufiji. A path or caravan route already exists, it is said, between the two lakes, and the chief aim of the exploring party would be in following this to investigate the surrounding country, and, what is of the utmost importance with a view to the future development of commercial intercourse, to gain the goodwill of the people. It is, therefore, to be hoped that the public will—now that real work is being undertaken—afford the committee the means of carrying out their plan in its integrity.

OXFORD LETTER.

Queen's College, Oxford: June 4, 1878.

Perhaps the chief event of the present term has been the Statement put forth by the Oxford Commissioners. True, it is merely tentative and provisional, rather inviting suggestions than making them. But we may gather from it the lines within which the Commissioners intend to work, and the principles on which their reforms will be based. And from this point of view it is certainly open to criticism: while the letter of Lord Salisbury's Bill has been preserved, the spirit of it has evaporated. One is almost tempted to say that the majority of the changes proposed could have been carried out by the university and colleges without the heartburnings and paraphernalia of a Commission. The "idle Fellowships" are to be allowed to remain, though shorn of part of their emoluments, and probably reduced in number. But by retaining them the Commissioners give a new sanction to the principle that a young man may draw a considerable sinecure annuity from a college without doing a stroke of work in return for it. And while these superfluous Fellowships continue to exist, the funds needed for the furtherance of real academic work are not to be had. The reforms contemplated by Lord Salisbury rested on the assumption that a sufficient sum of money would be set free by the gradual suppression of Fellowships, the chief *raison d'être* of which is to send missionaries of "Liberalism" into London and other benighted places. A second criticism to which the Statement of the Commissioners is open refers to the extraordinary principle, or want of principle, upon which the establishment of new Professorial Chairs is based. They are to be divided into two classes: one with incomes varying from 700*l.* to 900*l.* a year; the other with incomes varying from 400*l.* to 500*l.* But the importance of a Professorship, as represented by its endowments, is not measured by the importance of the subject, as might naturally be expected to be the case. It is difficult to see why the Chairs of Latin and Greek are to be assigned to the first class, while the Chairs of Anglo-Saxon, Celtic, and Neo-Latin are assigned to the second; or why the Professors of Greek and Roman History are to receive 700*l.* a year, while the Professor of Classical Archaeology must be content with 400*l.* The only conceivable prin-

ciple which lies at the bottom of this arrangement must be the valuation of a Professor by the number of undergraduates he prepares for the schools. But from this point of view there is no need of having any Professors at all. If the modern reformers are right in holding that the university exists solely for the sake of the undergraduates and their examiners, the sooner we sweep the Professors away the better. The work demanded from them can be far more efficiently performed by the college tutors and lecturers; indeed, recent experience has shown that unless the undergraduates are compelled to attend the lectures of the Professors they will not do so. Why should they? They are wise in their generation, and know that they can economise their hours of work by going to no lectures except such as immediately "pay" in the schools. To ask them to spend an extra hour in a Professor's lecture-room after three hours of college lecturing, from the mere love of knowledge, is the dream of a visionary or a German. Unless the first-grade Professors turn themselves into college tutors they are not likely to have many more pupils than the second-grade Professors. And even if they were, that seems hardly a reason for assigning them higher stipends. On the contrary, one would have thought that the subjects which most needed encouragement were those which lie outside the examination-room, and to which consequently only *bona fide* students would be attracted. If a difference of income must be made between the Professors, it had better be made by the exaction of fees. This plan would have the further advantage of showing whether or not a Professor were able to compete with the college tutors on their own ground.

But the limit of income assigned to the second-grade Professors is too low, unless it is intended that a Professorship should always be accompanied by a Fellowship of 300*l.* a year. Oxford is not a cheap place, especially for a man with a family; and most men who have achieved eminence in their special subjects can nowadays find better posts elsewhere. If adequate endowments are not provided the Chairs will be filled either with young Germans, who are waiting for appointments in their own country, or with third-rate men who would be dear at any price. In London, possibly, the experiment of establishing Chairs with inadequate endowments might be successful; but then London offers advantages to a *servant* which are not to be had in Oxford. It may be added that the university has already adopted a different view on this matter from that put forward by the Commissioners; at all events, it has fixed the income of the Professor of Celtic at 600*l.*—that is, at least 100*l.* a year more than that which they would allow him.

The number of Professorships contemplated is, again, difficult to explain. If Oxford is merely a big boarding-school, most of them are superfluous luxuries; if it is not, more are required. We have only to glance at the list of Professorships even at a small German university can boast of to see how far the scheme of the Commissioners falls short of what is demanded by a new and enquiring age. Two even that already exist—the Sanskrit and the Chinese—are entirely ignored; and why two Chairs are assigned to Moral Philosophy and Moral and Metaphysical Philosophy, while it is proposed to amalgamate those of Jurisprudence and International Law, it is hard to discover. It seems a pity that the opportunity was not taken of creating a class of men whose interest it would be to resist further change and disorganisation. As it is, the Commissioners will do but little towards removing the causes of the discontent which has resulted in their appointment, and there will be pretexts in plenty for the next Liberal Government to deal as they like with institutions which no one will be interested in defending. But the Statement of the Commissioners lies open to further criticism. It appears to have overlooked the proposal to found an Indian Institute; though

this can hardly be intentional, especially at a time when our connexion with India is being so forcibly brought home to us. The additional sum, too, with which it is proposed to endow the Bodleian Library will scarcely enable it to maintain its place in Europe and England, or even to keep its foreign departments up to the level required by resident readers. For good or for ill, books are expensive luxuries, and a great library must have a great endowment.

The work of cataloguing the existing contents of the Bodleian has now been well-nigh carried through. The catalogue is contained in 719 large folio volumes like those employed for the same purpose in the British Museum, and when the catalogue of Biblical literature, which is already written out, has been added to the rest, the whole will consist of 721 volumes. Mr. Turner's catalogue of the charters belonging to the library is also now finished, and the index is nearly all in type. During the present term some bundles of letters of the seventeenth and eighteenth centuries have been examined, and among them have been found the correspondence of Antiochus Cantemir and Zamboni. One of the Digby MSS., the oldest known copy of the *Chanson de Roland*, has further been sent to Prof. Stengel, at Marburg, to be photographed.

Apart from Prof. Max Müller's Hibbert Lectures, and Prof. Monier Williams's *Modern India*, among the literary productions of the term may be mentioned Mr. Bywater's *Gnomologia Barocciana*, a collection of 263 Greek aphorisms, which he has edited, with footnotes and references, from a Bodleian MS. of the twelfth century; and Prof. Chandler's *Chronological Index of Editions of Aristotle's Nicomachean Ethics, and of Works illustrative of them, from the Origin of Printing to the Year 1799*. Both books have been printed only for private circulation; indeed, Mr. Bywater has not thought fit to give the world more than sixty copies, and Prof. Chandler more than fifty. When bad books are so plentiful, it is a pity that good books should be so scarce. I must not forget to add that Mr. Robinson Ellis has just brought out a new edition of his *Catullus*.

Last week the Examination Statute obtruded itself again. By a large majority it was determined that it is expedient to have the Final Honour Schools but once a year. As things are, what used to be considered one of the main duties of the university—teaching and instruction—is interrupted and demoralised twice a year by the recurrence of the Final Class examinations. A lecture is broken up or dissolved in mid-term, and the lecturer himself may be carried off to the more important work of examining. With the increase in the number of the examinations the evil is continually growing worse, and the university is confronted by the dilemma: either the examinations must be held during the vacations or the mischief must be diminished by their taking place but once a year. With the present constitution of the university, it may be feared, the first horn of the dilemma is out of the question.

SELECTED BOOKS.

General Literature.

- DESNOIRESTERRES, G. *Iconographie Voltairienne*. Fasc. 1. Paris: Didier. 5 fr.
GROHMANN, W. A. B. *Gaddings with a Primitive People: being Sketches of Alpine Life*. Remington. 21s.
HENRIET, F. *Le paysagiste aux champs*. Paris: A. Lévy. 12 fr.
MARKHAM, A. H. *The Great Frozen Sea*. Daldy, Isbister & Co.

History.

- HEIDENHEIMER, H. *Machiavelli's erste römische Legation*. Leipzig: Simmel. 1 M. 60 Pf.
HURMUZAKI, E. de. *Documente privitoare la istoria Romanilor*. Vol. VII. 1760-1818. 32 M. Fragmente zur Geschichte der Rumänen. 1. Bd. 12 M. Bukarest: Gotschek.

Physical Science.

- DAMES, W. *Ueb. Hoplolichas u. Conolichas, zwei Untergruppen v. Lichas*. Berlin: Friedländer. 2 M. 40 Pf.

- MARTIUS, C. F. Ph. de, et A. G. EICHLER. *Flora Brasiliensis*. Fasc. 75 et 76. Leipzig: Fleischer. 90 M.
HAECKEL, E. *Das Protistenreich. Eine populäre Uebersicht üb. das Formengebiet der niedersten Lebewesen*. Leipzig: Günther. 2 M. 25 Pf.

CORRESPONDENCE.

THE "COURT OF LOVE."

Cambridge: June 3, 1878.

A very few words will perhaps suffice for the present on this subject, though I have plenty more in store.

When Mr. Arnold appeals from the text as printed in the edition of 1561 to that as printed by Dr. Morris, he does so in entire ignorance of the facts of the case.

The sixteenth-century MS. is in the library of Trinity College, Cambridge. It is the *very one* from which the text of 1561 is printed. No one has ever heard of any other.

The text of 1561 represents the MS. of 1561 very fairly and accurately.

When Dr. Morris reprinted the text, it occurred to him, naturally enough, that, if the poem was Chaucer's, it was absurd to print *them* when the word ought to be *hem*; the result being that, with great skill, he mediaevalised (to some extent) the text. It occurred to me at the time that it was a begging of the question. It occurs to me now that, as the text, even when thus treated, is as modern as ever in its prosody, the argument for the lateness of the text is all the more striking. Not even the skill of Dr. Morris has succeeded in turning the poem into fourteenth-century English; and I think it would be just as well, after even *he* has failed, to let the poem go.

It will, of course, be said that Dr. Morris should have given his readers notice of what he was doing. This is precisely what he did; the substituted words, such as *hem*, *here*, and the like, are printed in *italics*. I really think that a critic who wishes to discuss questions of language ought to have taken the trouble to find out what these italics meant.

The whole difficulty of the matter resides in this: that critics have preferred in general to adopt opinions on any slight grounds rather than go through the solid drudgery of textual criticism.

WALTER W. SKELT.

APPOINTMENTS FOR NEXT WEEK.

TUESDAY, June 11.—3 P.M. Royal Institution: "On Researches in minute and low Forms of Life," by the Rev. W. H. Dallinger.

8 P.M. Anthropological Institute: "On the Bulgarians," by Dr. J. Beddoe; "Ethnological Hints afforded by the Stimulants of the Ancients and of Modern Savages," by Miss A. W. Buckland; "On polygamous Marriage in South Africa," by Mr. Sanderson.

8 P.M. Photographic: "Alizarine, its Nature, &c.," by J. R. Johnson; "Alleged Fading of Carbon Prints," by T. Bolas; "Photographic Notes from a Travel in Russia," by Leon Warnerke.

THURSDAY, June 13.—3 P.M. Royal Institution: "On Molecular Physics," by Prof. Guthrie.

8 P.M. Mathematical: "Characteristics of Systems of Conics," by M. Halphen; "Expression of certain Numbers as Sums of two square Integers by continued Fractions," by S. Roberts; "Flexure of Spaces," by C. J. Monro; "Calculus of equivalent Statements, II.," by H. McColl; "Method in Analysis of Plane Curves, and Inflection-tangential Curve," by J. J. Walker; "New Method of finding differential Resolvents of algebraical Equations," by R. Rawson.

8 P.M. Historical: "Settlement of Britain by the English Races," by Hyde Clarke; "History and the Drama," by Dr. Altschul; "Columban Clergy in Scotland and Ireland," by H. H. Howorth.

FRIDAY, June 14.—3 P.M. Geographical: African Exploration Fund Annual Meeting.

8 P.M. Astronomical. Quekett.
8 P.M. New Shakspere Society: "Caliban," by Fredk. Wedmore.

9 P.M. Royal Institution: "Liquefaction of Gases," by Prof. Dewar.

SATURDAY, June 15.—3 P.M. Royal Institution: "Joseph Addison," by Prof. H. Morley.

SCIENCE.

WILLIAM CHAPMAN HEWITSON, F.L.S.

ANOTHER naturalist of eminence has quickly followed Andrew Murray and Vernon Wollaston to the tomb, William Chapman Hewitson having

died after a long and painful illness, on May 2 at his residence in Otlands Park, Surrey, aged seventy-two. Born in 1806, in the North of England, he acquired an ardent love of natural history at an early age, which to the last found a solace against long-continued indisposition. In conjunction with Mr. John Hancock, of Newcastle-on-Tyne, the distinguished ornithologist, he made a voyage to Norway in search of bird-nests and eggs, having also published a beautifully illustrated work on *British Oology*. He was, however, better known as the possessor of the most splendid collection of exotic butterflies in existence, which he has bequeathed to the British Museum. In conjunction with the late Edward Doubleday, of that establishment, he commenced an illustrated folio work in two volumes on the *Genera of Diurnal Lepidoptera*, which is supplemented by another work on *Erotic Butterflies*, in five quarto volumes, and a monograph on the lovely little *Lycaenides* and *Theclides*. His illustrations of all these works, and of numerous detached papers on his favourite objects in various periodicals, were executed by his own hand, and have never been surpassed for truthfulness of delineation and splendour of colouring, upon which latter he especially prided himself. His love of beautiful objects led him to lay out the grounds of his residence with exquisite taste, and to plant them with the choicest conifers and other trees, which are now the gems of the neighbourhood, visitors being allowed liberal access to them. The best of his pictures he has bequeathed to the National Gallery, while his large fortune has been divided among many charitable institutions and his private and scientific friends.

J. O. WESTWOOD.

SCIENCE NOTES.

PHYSIOLOGY.

Physiological Action of Glycerine.—It has already been shown by Catillon that the internal administration of glycerine is followed by a diminished excretion of urea together with a slight but decided rise in the temperature of the body. After a time, moreover, a steady increase of weight may be observed. Although glycerine, when introduced into the stomach, is completely absorbed (mere traces of it being found in the urine), all attempts to demonstrate its presence in the blood have proved unsuccessful. The natural inference is that it undergoes oxidation in the system. The ultimate products of its decomposition are carbonic acid and water; and a decided increase in the elimination of the former compound through the lungs ought, if the inference in question is correct, to be observed. To the determination of this point Catillon has accordingly directed his attention (*Archives de Physiologie*, Mars-Avril, 1878). By collecting the products of respiration in dogs to whom glycerine had been administered, he succeeded in demonstrating a marked increase in the absolute amount of carbonic acid excreted. None of the intermediate products of the oxidation of glycerine, such as formic and oxalic acid, could be detected in the blood. Hence it may fairly be concluded that the process of combustion takes place both rapidly and completely.

Observations on the Accelerator Nerve.—Baron has recently investigated the effect of maximum stimuli on the accelerator nerve in the dog (*Revue et Dubois-Reymond's Archiv*, 1877, Heft 6). An interrupted current of the same strength was employed throughout; but the length of time during which it was permitted to traverse the nerve varied from one to thirty-six seconds. Both nerves were always divided as a preliminary measure, and curare was administered in sufficient quantity to eliminate voluntary contraction of the muscles of the trunk. When the accelerator nerve was stimulated under the above conditions, the resultant effect upon the heart may be divided into three stages: a period of increment, during

the pulse-rate gradually rises to a maximum beyond which no augmentation of either intensity or the length of stimulation can be obtained; a period of maximum pulsation; and a period of declension, during which the heart's pulsations gradually return to their initial rate. The following are the chief results of the experiment. 1. It was found that the maximum pulse-rate is altogether independent of the length of the ring which the current was allowed to act on the nerve. This is absolutely true of stimulating from six to thirty-six seconds, and is only true for periods between one and six seconds. Moreover, the maximum rate attained is a function of the initial pulse-rate. The period of increment consists of two periods. During the first the pulse-rate undergoes very rapid acceleration; during the second acceleration takes place at a steadily diminishing rate. Now, the total length of this period is independent of the length of stimulation. In other words, if the current act upon the nerve for one second, it leaves behind it an effect of which the pulse-rate climbs to a maximum through a period of eight to ten seconds. 3. Between the point at which the maximum pulse-rate is reached, and the point at which subsidence to the normal begins, there is an interval during which minor fluctuations may occur, but the average rate remains constant. Now, the total length of this interval is proportionate (within the limits stated above) to the length of stimulation; but that part of it which intervenes between the cessation of the current and the commencement of subsidence is a constant quantity, altogether independent of the length of stimulation which the current has been allowed to act upon. 4. The stage of declension to the initial rate is proportionate to the time during which the nerve was subjected to the action of the current.

Normal Reaction of Parotid Saliva.—The reaction of the parotid in man is usually stated to be more strongly alkaline than that of the salivary glands. A. Staschewsky (*Centralblatt f. d. med. Wiss.*, April 13, 1878) finds, on the contrary, that it always turns blue litmus-paper of a reddish or reddish-violet colour in the mouth; if dropped on red litmus-paper, it turns blue after the lapse of from one to three seconds. The primary effect is obviously due to the presence of a volatile acid—in all likelihood carbonic acid. The saliva appears to acquire its acidity during its passage through the ducts of the gland; for if the flow be very rapid (e.g., if salivation is induced by the hypodermic injection of pilocarpin) the acidity is greatly diminished, or may disappear altogether, speedily returning, however, if the saliva be mechanically forced back in the ducts. The diastatic power of parotid saliva usually corresponds pretty well with the degree of acidity. The usual method of testing the subject of its reaction may be tested for either by the employment of red or of blue litmus-paper in the investigation, the sample of the secretion having been obtained after the use of a powerful sialagogue is either.

the Secretion of Sweat.—A paper on this subject, by Adamkiewicz, was read before the Zoological Society of Berlin a short time ago (*Monatsschrift der Dubois-Reymond's Archiv*, 1877, Heft. 6). Experiments were made on the human subject and on kittens. As regards the former, it was found that stimulation of a motor nerve (median, ulnar, &c.) was followed by an outbreak of perspiration over the muscles that had been thrown into contraction, and also upon the corresponding skin on the opposite side of the body. This phenomenon was not influenced by pressure or the circulation through the skin. Sweating of bilaterally symmetrical regions was also induced by stimulation of the sensory ends in the skin. In the case of kittens, stimulation of all four extremities was induced forty-

five minutes after death by stimulation of the medulla oblongata. This result was obtained even after hemisection of the cord in the upper lumbar region. Faradisation of the central end of the brachial plexus caused sweating of the opposite paw, even after the spinal cord above the level of the third cervical vertebra and below the middle of the dorsal region had been completely destroyed. Stimulation of the central end of one sciatic was followed by sweating of the opposite hind-paw, even after destruction of the cord as low down as the fourth lumbar vertebra. After complete removal of the lumbar cord together with the cauda equina, the hind-paws may still be made to perspire by stimulating the central end of one brachial plexus. This no longer occurs when the lower end of the dorsal cord (up to the tenth dorsal vertebra) has likewise been removed. Stimulation of the lumbar cord induces perspiration in the hind-paws even after the posterior roots of all the spinal nerves have been divided. This experiment may be successfully performed on a preparation consisting of only the lumbar portion of the spine, together with the lumbar cord, the hind legs, and the plexus of nerves connected with them.

The True Origin of the Chorda Tympani.—At a meeting of the Académie des Sciences on April 29, M. Vulpian gave an account of some experiments he had performed in order to ascertain the true source of the fibres of the chorda tympani nerve. This nerve conveys excito-secretory filaments to the sub-maxillary gland, vaso-dilator filaments to the same gland and to the tongue, gustatory filaments to the anterior part of the lingual surface; but it contains no musculo-motor fibres. Differing from the portio dura in its functions, it differs from it in its minute structure likewise. Concerning its ultimate origin two hypotheses exist. According to one, it is derived from the facial; according to the other, it comes from the superior maxillary division of the fifth, joining the facial in the Fallopian aqueduct on a level with the geniculate ganglion. It was found that section of the portio dura where it enters the internal auditory canal, and even its division close to its deep origin under the floor of the fourth ventricle, is followed by degeneration of all the fibres of the facial, those of the chorda remaining unaltered. On the other hand, the chorda underwent complete degeneration after intracranial section of the trigeminus. Although the difficulty of carrying out these experiments, and the many possibilities of error involved, prevent any absolute conclusion from being arrived at, the results obtained lend strong support to the view that all the fibres of the chorda are derived from the fifth nerve.

PHILOLOGY.

In the *Philologus*, vol. xxxvii., part 3, Langen continues his notes on Cornificius, and Spengel contributes remarks on the *Captivi* of Plautus. Margaret Angela Krepelka ("Römische Sagen und Gebräuche") publishes the first instalment of an essay on the early Roman history and mythology, to parts of which she attempts to apply the hypothesis of nature-myths. F. G. Unger ("Die Winter Nemeen") argues, against Reuss and Droysen, that the Nemean festival was never held in the winter. The following number has a good paper on Dares Phrygius by O. Wagener, who argues that Dares drew upon no sources now known to us, but on some lost Latin manual or manuals of mythology. Albert Müller ("Die Rangordnung und das Avancement der Centurionen in der römischen Legion") brings out some of the difficulties attending the theory of Lange, Göler, and Marquardt on the promotion in the Roman army after the introduction of the cohort. Lahmeyer has a valuable paper on the difference between *excido* and *excindo*. Notes on Lucan, Valerius Flaccus, and Statius are contributed by Köstlin, and on Cicero's rhetorical and philosophical works by A. Weidner. H. Skerlo publishes the first in-

stalment of an essay on the Homeric verbs. The "Jahresberichte" in these numbers are on Plotinus, by H. F. Müller, and on Quintilian, by F. Meister.

In Bursian's *Jahresbericht* (1876, part 12) A. Eberhard concludes his Report on the recent literature of the later Greek prose and of Middle-Age and modern Greek prose and poetry. Those of Richter on Catullus, of Preuner on Greek and Roman Mythology, and of Georges on Latin Lexicography, are also finished. Susemihl deals with Aristotle and Theophrastus, and Hagen with the Latin Grammarians. In the third part of the volume for 1877 W. Nitsche reports on Xenophon, Schanz on Plato, Wecklein on the Greek Tragedians, Riese on Ovid and the Latin Anthology, Bursian on the history of classical scholarship. Kammer and Fritzche conclude their respective Reports on Homer and Horace.

Fiedler's Scientific English Grammar. Revised edition by E. Kölbing, Vol. I. (Leipzig: W. Violett.) Fiedler's work, the first edition of which appeared in 1849, was the first attempt on a large scale to apply the results of scientific philology to English grammar. Since then English philology has been almost completely revolutionised, not only by the advance of philology generally, but also by the large number of Middle-English texts that have been published, chiefly by the Early-English Text Society and its kindred associations, and the special investigations of English and German workers. Two other historical grammars on the same plan as Fiedler's have also appeared, those of Koch and Mätzner. It is evident, therefore, that the older work must be completely antiquated by this time, and that the value of the new edition depends almost entirely on the extent to which the editor has revised and rewritten it. Unfortunately Dr. Kölbing, as he states in his Preface, was unable to give more than a limited time to the work of revision. All, therefore, that can be demanded of him is that he should have removed all the positive errors of the original, pruned away superfluities, and added the really essential material that has been provided by the advance of English philology since 1849. Taking the circumstances under which he has worked into consideration, Dr. Kölbing has certainly performed his task very creditably. Some sections he has entirely rewritten, and the incorrect Anglo-Saxon and Gothic words and forms have been corrected throughout. In one important respect the present work is really ahead of its rivals, Koch and Mätzner—viz., in that the editor has utilised the phonological investigations of Messrs. Ellis and Sweet. He has not only given due prominence to the real sound—over mere letter-changes, by which the history of the sounds first becomes intelligible, but has also added some general remarks on the history of English pronunciation, referring the reader for details to Ellis's *Early English Pronunciation*, and Sweet's *History of English Sounds*. The sections treating of the consonants have, however, been left in their original form. The editor might, perhaps, have carried his pruning a little further. At least the twelve pages of literary extracts to show the proportion of French and Teutonic words might very well have been omitted. The extracts are also said to be from the best authors, but Moore's *Lalla Rookh* can hardly, perhaps, be ranked now among the British classics. The statements that the development of *ch* in *church* and the loss of guttural *h* (=kh) were due to French influences should not have been allowed to stand, still less the extraordinary one that the English word-order is to be explained in the same way! It is well known that all these changes have perfect parallels in the Scandinavian languages. Among words with the close *o*-sound we find *sword*, *four*, and *door* given (p. 128), although all three have the broad sound.

MEETINGS OF SOCIETIES.

ROYAL SOCIETY OF LITERATURE.—(Wednesday, May 22.)

W. KNIGHTON, Esq., LL.D., in the Chair. Two papers were read: one contributed by Mr. J. W. Redhouse, the other by Sir Patrick Colquhoun. In the former, Mr. Redhouse traced the progress of the "Turkish Race" from the earliest period to the present time; in the latter, Sir Patrick Colquhoun treated of the populations commonly called "Modern Greeks." Mr. Redhouse stated that a branch of the race often called by ethnologists "Turanian," and consisting of a vast agglomeration of tribes or hordes from Chinese Tartary, about 1,100 years ago spread into the country west of the Oxus and sea of Aral, extending their power and name almost from the shores of the Polar Sea to the confines of India. Their language was, and still is, generally called "Turk-dili," "the Turkish language;" and, notwithstanding the wide expanse it covers, its dialectal differences are no impediment to its being generally understood over the whole of this geographical area. Mr. Redhouse then showed the connexion between the Turks, Tartars, Mongols, &c., pointing out also that the present Shah of Persia is really of a Turkish family, and giving at the same time a general estimate of the present population of the Ottoman empire.—Sir Patrick Colquhoun, in his paper, argued that the Greeks of the classical period have long since been exterminated and replaced by other and principally Slav tribes; and maintained that *Ῥωμαῖοι*, or Romans, is the proper name for them, as that they bore under the Byzantine Empire.

LINNEAN SOCIETY.—(Annual General Meeting, Wednesday, May 22.)

PROF. ALLMAN, F.R.S., President, in the Chair. In his anniversary address the President gave a résumé of the principal recent discoveries in the anatomy and development of the Polyzoa, and of the resulting important features in their systematic grouping. Much had been due to the labours of Busk and Nitsche. It was maintained that investigations were mainly in favour of the so-called "Brown Bodies" being merely the residuum of degraded and withered polypides, and that they have no real morphological or physiological importance. He coincided with the views of Nitsche, Joliet, and Busk, that the supposed "colonial nervous system" is but an irregular plexus of cellular and protoplasmic cords and filaments derived from the walls of the zoecium or polypide cell, and not a true nervous system. Joliet's idea of its being the origin of new polypide buds, and of certain minute free corpuscles found in the zoecium, is, however, too exclusive. *Cyphonantes* is a singular little free-swimming marine creature, of pyramidal shape, the soft body of which is contained within a bivalve shell. Schneider has regarded it as a larval Polyzoon, and announced the startling fact that before its transformation into the adult, it becomes totally disorganised and reduced to a homogeneous protoplasmic mass, though previously its structure had been complex. Thereafter arises a new polypide, and the whole is metamorphosed into the adult form. Strange as this history may seem, it has been confirmed by the researches of Nitsche and Joliet. Finally, the question of "Individuality" or relation of the polyzooal colony was taken up, and the following opinion enunciated:—That the zoecium or cell in which the polypide is lodged must be regarded as having a zooidal individuality of its own, and that the two thus form a compound element which becomes associated with similar ones in order to form the colony. This compound element is thus composed of two zooidal individuals—zoecium and polypide; on the zoecium devolving the functions of sexual and non-sexual reproduction, and on the polypide that of nutrition.—The Report on Publications was read by the senior secretary, and that of the balance sheet by Dr. R. C. A. Prior. Afterwards the treasurer (Dr. J. Gwyn Jeffreys) laid his statement of accounts, &c., for the year 1877, before the meeting. This showed a very satisfactory financial position, a balance of 46*l.* 13*s.* remaining on hand after all current expenses had been paid, while 700*l.* had been invested since the last Annual Report.—The alterations in the bye-laws relative to an increase in the rate of payment for

fellows compounding, previously read at two successive general meetings, was put to the ballot and confirmed by the fellows at large, in terms of the charter.—The secretary gave a notice of the fellows and foreign members who had died during the past twelvemonth: of the former there were ten and of the latter four. Among these Mr. Henry Adams, Dr. Elias M. Fries, Mr. Andrew Murray, Prof. Parlatore, Mr. Fox Talbot, Dr. R. Visiani, Dr. H. A. Weddell, and Mr. T. V. Wollaston deserve mention as of considerable repute in the scientific world.—During the year thirty-eight ordinary fellows and five foreign members had been elected.—At this meeting the following gentlemen were elected into council: Mr. J. Ball, Dr. T. Boycott, Mr. F. Du Cane Godman, Dr. A. Günther, and the Rev. G. Henslow, in the place of Mr. J. G. Baker, Dr. W. B. Carpenter, Mr. Henry Lee, Prof. W. K. Parker, and Mr. S. J. A. Salter, who retired by rotation. The president and officers were re-elected.

ROYAL SOCIETY.—(Thursday, May 23.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—"Researches in Spectrum Analysis in Connexion with the Spectrum of the Sun. No. V.;" by J. N. Lockyer; "Observations on Arctic Sea Water and Ice," by Dr. E. L. Moss; "Experimental Results relating to the Rhythmical and Excitatory Motions of the Ventricles of the Heart of the Frog, and of the Electrical Phenomena which accompany it," by Dr. Sanderson and F. J. M. Page; "Contributions to the Anatomy of the Central Nervous System in Vertebrate Animals," by A. Sanders; "On the Formation of Chloride and Bromide of Ethylidene," by Dr. Maxwell Simpson; "Note on the Specific Gravity of the Vapours of the Chlorides of Thallium and Lead," by Prof. Roscoe; "Extract from the Report to Sir Wyville Thomson on the Brachiopoda dredged by H.M.S. *Challenger*, 1870-75," by T. Davidson; "On the Equation of Circles: Second Memoir," by Prof. Casey; "On the Bodily Tides of Viscous and Semi-Elastic Spheroids, and on the Ocean Tides upon a yielding Nucleus," by G. H. Darwin; "Electrodynamic Qualities of Metals, Part 7. Effects of Stress on the Magnetisation of Iron, Nickel and Cobalt," by Sir William Thomson; "On the Existence of a Rudimentary Head-Kidney in the Embryo Chick," by F. M. Balfour and A. Sedgwick.

THE COLLEGE FOR MEN AND WOMEN, 29 QUEEN SQUARE.—(Monday, June 3.)

A REPORT was read of a Conference held at Florence by the Commendatore Cammarota—well known as Provveditore of Public Education in Italy—on the Higher Education of Women, in reference to the day school lately founded in that city on the model of those of the Educational Union. M. Cammarota combated the current idea that ignorance was the necessary training of the *buona madre di famiglia*. He urged that the future "good wife and mother" should be educated as thoroughly as a boy and in the same subjects. While he believed in mixed education, he did not propose its being yet tried. In place of the convent, or what is in Italy practically the same establishment, the boarding-school, to which children are confined without holidays, and only seen by anxious parents in some three domiciliary visits a year, he recommended the day school, where the best education could be obtained without the destruction of family influence. In the discussion which followed, all opinions were represented; but the meeting supported M. Cammarota's views, which were especially urged in an address of rare humour and feeling by the Signora Giglioli, who argued that all that could be said against women's education equally applied to that of men. Professors de Gubernatis, Tozzetti, and Zandonella also addressed the meeting in the same sense.—The reading was followed by a discussion on the object of education (mental training as distinguished from cram), and the mode in which it should be carried out in girls' schools, and much sympathy was expressed for the work of the patriotic Florentines.

FINE ART.

THE SALON.

(First Notice.)

Paris: June 1, 1878.

I cannot express the degree of weariness and melancholy which comes over me at our successive Salons, more and more crowded each than the other, more and more disorderly, more and more opposed to the object of their institution. In year the Palace of the Champs Elysées contained 4,985 pictures, drawings, water-colours, pastels, miniatures, enamels, specimens of porcelain, faience, sculptures, medals and cameos, architectural plans and drawings, engravings, lithographs. There are 400 more than last year. I will not condemn in the mass these (roughly speaking) 5,000 objects. Certainly the sum of effort represented is enormous, and testifies to an arduous activity which, if it does not always add to the ranks of masters in their art, may at least add to the ranks of artists who apply their talent, in case of necessity, to decorative industry, which is one of the well-springs of our national fortune. Assuredly, too, there are some really excellent pieces, by artists young and old. With 500 selected objects it would be possible to compose an exhibition of very high interest, which would bring forcibly before the science and sincerity of a large number of painters and sculptors. But how overwhelming is this vast collection as a whole! How difficult these isolated works to light upon! It is good to maintain the institution of the Salon so that every year, with the view of glory, of sale, ambition or self-respect, that great mixture of solemnity and trade may provoke excitement in all the studios. I know not what, at this point, may be the plans of M. Guillaume, who has just replaced M. de Chennevière as Director of the Fine-Arts. It is possible that, belonging to the Institute, this eminent sculptor may put in execution a plan which has already been repeatedly proposed by the reactionary party, and which would leave to the jury, composed of members of the Institute or its adherents, the choice of five or six hundred objects only. This would be a very formidable weapon, yet more cruel than that which now exists in consequence of the indirect vote, a sword of Damocles suspended over the head of all independent characters. Such was not the view of M. Ingres, a man as enamoured of authority as can be imagined. In a volume (just published by Charpentier) under the title of *L'Atelier d'Ingres*, containing *Reminiscences* by Amaury Duval, a book full of instructive anecdotes and characteristic traits of Ingres and his pupils, I read this paragraph:—"M. Ingres était ennemi déclaré de toute espèce de jury pour l'exposition des Beaux-Arts. Quelques injustices trop criantes dont il avait été témoin l'avaient exaspéré de telle sorte qu'il s'était dressé publiquement de ses fonctions de juré. 'On doit recevoir tout le monde,' disait-il, 'et je ne reconnais à aucun artiste le droit de juger un confrère, car il peut y avoir derrière ce confrère une question d'avenir; l'empêcher d'exposer son œuvre, d'exposer au public, m'a toujours semblé une très-mauvaise action.'"

I believe that the best plan would be for artists to make their own arrangements, to form exhibitions in groups, with admission guaranteed to whoever has won his spurs as an artist on having a work hung for the first time. Order would be introduced into this disorder if full powers were left to a jury of classification. In this way the good things would be grouped in the principal rooms; the public might go and see the others if it wished; there would be no need for anybody to undergo the always humiliating fate of rejection.

However wearisome the first visits may be, I think at the moment of writing that I have seen almost all that there is to be seen, and that I can give you some general information. I shall be

rief and very summary, as we are all to be in our newspapers and reviews on of the space occupied by the Universal tion. I shall only mention a very small of works—only those, in fact, which appear decided originality.

landscapes are very numerous and remarkable of execution. A considerable number of able people, ladies especially, have applied ives to this kind of painting, which affords leasant occupation, and does not require id studies as figure-painting. At the sea- u see as many large parasols as umbrellas. go out with their colour-box under their they used to do with the requisites for mbroidering, and make a study which is ly worthy of being signed, framed—and ed. I am not speaking ironically. Land- s painted at the present day in a simple l and one which conveys more assuredly f old the sensations produced by contact ture. Unfortunately, this method eliminates ent. With the exception of two landscapes late Daubigny, which are exhibited because died within the twelvemonth, I will only n the *Matin dans la Vallée de Cernay*, by ouse, the most vigorous member of the hool; a *Matinée d'Automne*, by M. Nazon, ter possessed by a truly poetical ideal; a e; *Le Matin*, by M. Mouillon, a more e painter. All the rest may be grouped these three types. The success of the rests with M. Bastien-Lepage, who is a list, less frank than Courbet, less idealistic J. F. Millet, and more sincere than Jules 1. His subject is simply a peasant woman , resting in a field at haymaking time. M. n also exhibits an excellent little portrait, f a talented poet and novelist, M. André iet.

great pictures are feeble, with few excep- because it is still the fashion to celebrate the title of high art what is simply painting arge surface. The two artists who won the u Salon, founded by M. de Chennevières to f against the *prix de Rome*, have received an rable check: M. Lehoux with an ancient rian scene, entitled *Surprise*; and M. Syl- with a piece of antique melodrama, *La de Vélatus*. Why not award this *prix du* just as much to a simple *genre* or landscape er, who would thus have an assured livelihood vo or three years? I may mention as ex- onal among the *prix de Rome*, by reason of tellectual qualities, M. Ferrier's *Martyre de e Agnès*.

hen you reach the large square gallery, you on your left a painting of considerable merit of great size, the execution of which, without brilliant, is not devoid of skill. It is the heosis of M. Thiers. The illustrious old sman is lying dead on an iron bedstead. only see his aquiline profile and the upper of the breast, with all his decorations hanging t. France in mourning stands sobbing by. the other side a genius with outspread wings retching out his arms to heaven. On the nd, in the shadow, a hideous figure which is g to burn the escutcheon of the City of Paris bolises those Monarchical parties which, on 24 and 16, banded together to overthrow the ublic, and all but hurled the country into the es of civil and religious war. In the fore- and are crowns bearing the principal titles of Liberator of the French Territory. Then in background, on the left, is the funeral pomp ing through Paris on its way to the cemetery Père-Lachaise; on the right, Paris, besieged bombed by Germany. Finally the ex- distance is occupied, as in pictures which s us into fairyland, with scenes drawn n the illustrious historian's *Le Consulat et npire*. All this is more anecdotal than philo- hical, and would suggest the apotheosis a warrior rather than that of a statesman who

had such a mighty influence over the politics of his time, did we not recognise in one of these episodes that famous sitting of June 16, 1877, in which Thiers received from the Chamber that spontaneous and enthusiastic ovation. This episode, the most spirit-stirring perhaps in the aged orator's career, has struck two other artists; M. Garnier, who has painted it, and M. Ulmann, who has drawn it in sepia. M. Ulmann's drawing will give an occasion for a fresco in some national monument. On the left, in the tribune, the May 16 Minister of the Interior, the Bonapartist Four- ton, has just read these insolent and mendacious words:—"L'Assemblée Nationale a été la paci- catrice du pays et la libératrice du territoire." In the middle, a space half empty shows on their bench M. de Broglie, pale as a spectre, and all the Ministers, whose names are now fallen into oblivion, cowering down as if the walls were about to fall and overwhelm them. On the right, M. Thiers, sitting upright on his bench, dignified and full of emotion, while the three hundred deputies of the Left rise at him, crying "Le libérateur du territoire, c'est lui, c'est lui!" My pen trembles and my eyes grow dim as I think of the eloquence of that scene, of which I chanced to be a spec- tator.

M. Carolus Duran has committed a very cause- less act of imprudence by exhibiting in a hori- zontal position a ceiling which will be seen in perspective, and under a cross light a painting which will be lighted *de bas en haut*. The public cannot understand either the necessary deforma- tion of lines, nor the strong contrasts of tone. The ceiling, intended for one of the Salles of the Luxembourg, is devoted to the glory of *Marie de Medicis*. When in position it will produce a great effect. By its side M. Ranvier has exhibited another ceiling, intended for the Palace of the Legion of Honour. Its subject is *Aurora*, a fresh and rosy dawn, whose advent a cock celebrates by his crowing, while genii salute it with clashing of cymbals and blowing of trumpets. M. Ranvier has composed his ceiling like a picture, without striving after those flying groups, those foreshort- ened limbs, those voids in ether, which were the triumph of the Italian decorators of the Decadence, and have in truth no charm save in the Venetian school.

Battle-pieces are very few and far between. The Universal Exhibition is a solemn date in the history of the peace of the world. I believe its action to extend far beyond our frontiers; but, without making any allusions to foreign politics, I may say that it has certainly caused, in France, at all events a temporary pacification in men's minds. Hostile parties are overwhelmed by its success; and Germany, by sending us a selection of her pictures, has put us under the obligation of being equally courteous in our turn. The Ministry has requested our artists to withdraw all pictures which might wound the susceptibility of the Ger- mans. The artists have complied, and these pic- tures, to the number of forty, are on exhibition gratuitously at Messrs. Goupil's. M. de Neuville shows the best page of his whole work, *La Reprise du Bourget*. The patriotism which dictates the choice of these subjects is liable, perhaps, to the charge of not perceiving how painful to French hearts are these recollections of the National De- fence, of the blood which was shed to no pur- pose.

To resume: it is the portraits that do honour to this Salon. It seems that at the present moment there is a reaction in every school in favour of portraiture and naturalism. In your exhibition at the Champ de Mars—which is exciting keen surprise among our artists—all admiration is concentrated on Frederic Walker, who was a naturalistic poet, on Mr. Watts, on Mr. Millais, and on the other artists who have painted portraits. The same is the case with the contributions of Germany. Here I must first mention *La Famille D...*, by M. Fantin-Latour. M. Fantin- Latour is too well known and too highly esteemed

in England for me to dwell on his merits. But he has never before produced so complete a work. Four persons are together in a room with a grey wainscot, ornamented with a modern gilt border. The father is seated; the mother is seated; one of the two sisters is in front of them, and another sister (the painter's wife) is standing. Three of the group are in black; M^{me}. Fantin is in blue. No picturesque incident troubles the serenity of the pose, of the subdued tones, of the sober ease, of the general effect, which is neither gloomy nor frigid, but simple with the simplicity of middle- class life. This family is brought together one knows not wherefore. It matters not. It lives, it thinks, it feels, like families in real life, without affecting any order. This has not been seen in the French school since the work of Chardin. The *bourgeoisie*, which, in its virtues as in its defects, in its secret energies as in its conservatism, is the real, absolute force, the rule and resource of our country, finds, after the lapse of a century, an artist who, because he is himself a *bourgeois*, paints it with an intensity of expression that cannot be surpassed. M. Fantin, a pupil of M. Lecoq de Boisbaudran, the greatest professor of these times, is, in my opinion, quite at the head of the French school. The Ministry should have decorated him on the very day of the opening of the Salon, for decoration is, with us, the visible sign of official esteem. But the Ministers are closely watched by the formidable faction of the Academicians, and the echo of the applause of the multitude does not reach their ears.

There are other portraits, and excellent por- traits too. M. Delaunay, for instance, has painted expressively the romantic face of the widow of a young musician prematurely dead, Georges Bizet. M. Paul Dubois, the sculptor, who has just re- signed the Directorship of the Luxembourg to assume that of the Ecole des Beaux-Arts, vacant through the promotion of M. Guillaume, has painted the full face of a young girl. The light caresses those pure features, that intelligent coun- tenance, and brings out its healthful and ingenu- ous qualities. It seems to me that, though he is without his diabolical intensity, no one has ap- proached nearer than M. Paul Dubois to the work of Leonardo da Vinci. It approaches it more frankly, if not more forcibly, than Prudhon him- self. When they are in possession of the mode of handling the palette and of its resources, sculp- tors model flesh with more freedom than painters.

An artist who has often allowed his talent to stray into mannerism—M. Chaplin—wins a bril- liant success this year with two portraits painted in a bright key of colour, in the pleasing, distin- guished and unpedantic style of the eighteenth century in France. Nattier, who painted the ladies of the Court of the Regency and of Louis XV. in the costume of Hebe, Diana, or Calisto, might sign these portraits, so delicate are they, so aristocratic, so prettily pompona.

M. Ribot also gives two of his best pieces of work, a portrait of an old peasant woman, with her skin tanned by exposure and her eye bright as that of a bird of prey, *La Mere Marion*, and an old woman doing an addition sum. The blacks of the dresses and of the shadows are very varied.

M. Vollon shows himself a very powerful and very skilful executant in his reproduction of the *Casque de Henri II.*, borrowed from the collec- tions of the Museum of Artillery, and in a figure of a *Spaniard*, dressed entirely in black, sitting on a table.

M. Maignan has painted a picture full of style—a *Saint-Louis soignant un lépreux*.

However vigilant the jury may have been, an Impressionist has found means to slip in. M. Renoir has forced them to accept the portrait of a young woman seated, as fresh as the flowers near her. Once admitted it cannot be got rid of. They have avenged themselves by hanging the frame so high that it is difficult to know very pre- cisely what it contains. Two years since, I told you of a pamphlet on *La Nouvelle Peinture*, by

M. Duranty, now editor of the *Gazette des Beaux-Arts*. Very recently M. Théodore Duret published (at the Librairie Parisienne) another pamphlet, full of wit and good-sense, on "*Les Peintres impressionnistes*, Claude Monet, Pissarro, Renoir, and M^{me}. Berthe Morisot." The principles of this young school, which must neither be systematically rejected nor systematically accepted, but which have exercised a manifest influence over the method of painting of the Academicians, and have forced them to paint in brighter colours, to pay more attention to the fleeting phenomena of universal life—these principles are set forth by M. Duret with force and earnestness. By a singular vicissitude of things here below, M. Manet—whose famous painting, *Le Bon Bock*, fetched 10,000 francs last month at the sale of the collection of the singer and amateur Faure—M. Manet has become a Classicist. Perhaps one day he will be a member of the Institute. Why not?

I was on the point of forgetting in my notes a portrait of M. le Comte Montalivet, seated in an arm-chair, and bowed down by years, but proud of his unblemished honour, by M. Bonnat. The type of the Parliamentary bourgeois is fixed, as in the portrait of Bertin by Ingres is the type of the bourgeois militant. PH. BURY.

THE ROYAL ACADEMY EXHIBITION.

(Third Notice.)

Landscapes. The number of able and presentable landscapes is this year decidedly large; yet there are not many examples which produce a marked impression. Among the foremost are those by Messrs. Millais, Brett, Graham, Cecil Lawson, Henry Moore, and Rodeck.

The *St. Martin's Summer* of Mr. Millais is, as usual with him, a work in which force is allied with facility, and both with the power of presenting the scene as it would at once strike a person with an average eye for the picturesque. It must always rank among his successful landscapes—hardly among his very best. At the summit of the picture, the stream tumbles over rocks; then it ripples resolutely down to another ledge; and hence it falls in a faint streak, leaving almost smooth the water which lies in front, tinged deep orange-brown in its reflection of the rocks, and yellow in that of the greenish sky. Here the leaves of autumn float scatteringly, and a contorted branch of a tree. All upwards from the rippled space there is a great amount of light, and also in front, but not in the immediate foreground. To right is a medley of green bushes, sweet and shimmering; to left and nearer the eye, the vegetation is autumnally ruddy; the dense brown of the seamed and creviced rocks maintains a vigorous control over the other hues. The *Cornish Lions* of Mr. Brett expresses stark strength and grandeur of rock-form amid brilliancy and sprightliness of sea, and under clear brooding sunshine. The green waves curl over, transpierced with light; cumulus clouds parade above the sea; gulls fly and settle on the sand. This large and elaborate work shows Mr. Brett in full possession of his uncommon mastery over facts and appearances, the fruit of unremitting scrutiny and strenuous practice. Mr. Graham, it need not be said, works with far less intensity than Mr. Brett; from time to time, however, he hits the mark very happily, and this is especially the case with his *Wandering Shadows*: a Scotch mountain-scene, with mist and sun-gleam, grey of shadow and green of grass, and a few sheep taking care of themselves while the old shepherd throws his line into the burn. Here the effect of drifting sunlight is very liquid and true, while the general workmanship is adequately solid. Mr. Lawson has two pictures—*The Wet Moon, Old Battersea*, and *An Autumn Sunrise*. Though less conspicuous than the works he has sent to the Grosvenor Gallery, these are fully worthy of the same hand. The Battersea picture has a genuinely poetic

character; a cloud is just floating aside from the moon, cattle show out against the lunar sheen on the river. The autumn picture is rich and red in mist over a moorland with its red-leaved trees. Mr. Henry Moore's *Highland Pastures* is a painting of large dimensions, and containing a great deal of well-realised matter, without any single object of especial prominence; its orange tint has a rather clayey tendency. The *Moonlight* of the same artist is a sea-piece; a moderately flowing sea, a light halo round the moon, a sweet but mildly veiled effluence of light. Carl Rodeck, whose address is near Hamburg, appears as the author of a remarkable *Forest-Scene, Evening*, in which the rich light of sunset, threading the glades of the wood, and striking with sumptuous glow upon the tree-trunks, is triumphantly effective; this is the intrinsic motive of the picture, which in other respects is less observable, but still highly proficient.

For the mass of the landscape-painters a few words each must suffice. Aumonier, *Waste Land*: weeds and sea-gulls, and the sea beyond; very clever. Valentine Davis, *The Evening Glow of a Winter's Sun*: the clearness of atmosphere and liquidity of water are very good here; the scene not especially well chosen. Farquharson, "*When the Kye come Home*": highly expressive of the feeling of evening, with its tender and blurring dimness and approaching rest; skilful likewise in handling. McLachlan, *Jarl Hacon in the Pentland Firth*: a large sea-picture of considerable buoyancy and energy; the fierce surf rolls and plunges amid the rocks, the sky is varied and streaked with red. John Collier, *A Glacier-stream*: a work of important scale, approvable in execution and in sense of beauty. Sealy, *The Skirts of a Wood, with a Storm coming on, Dogmersfield Park, Hants*: this also is large-sized, with an ample share of serious and sensible work. Enfield, *Salt-water Marsh, near Tankerville on the Seine*: vigorous in tone and perspective. Colin Hunter, *Ebbing Tide*: simple and peculiar, and uncommonly good. Clara Montalba, *The Last Journey*: a lordly funeral-convey passing in a barge over the Venetian lagoon, brilliantly handled; the atmospheric effect is clear and bright, without exceptional serenity. Inchbold, *Abroad: from the Mosque of Sidi Abder Rahman to Cape Matifon, Algiers*, and *At Home: from High Wickham to Beachy Head, Hastings*. These two companion-pictures are widely separated on the Academy walls. In both a blue tint prevails, and is managed with more mastery in the English scene, which is an attractive and choice work; the other wants fullness of ensemble. Holloway, *Night on the River*: effective, with ample technical skill. E. Ellis, *The Last of the Wreck*: a vigorous work, showing much force and singleness of aim; the ponderous onpour of the surf is what the painter has chiefly set himself to express. Anthony, *An Incident by the Wayside*: a girl drinking from a dripping spring; not one of this excellent painter's most complete works, yet partaking of his accustomed power. Pickering, *Spring*: gracefully treated, with almost a monochromatic tendency in colour. Henry Martin, *Penzance*: unobtrusive and skilful. Frank Miles, *Salmon-Leap, Cennarth Falls, Cardiganshire*: the fish is bounding upwards against the downward cataract of water, the network of foam being managed with unusual abundance of detail. Hennessy, *A Summer Evening on the Thames*: grass-laden barges, with swans, and much appropriate material; large in size, but in treatment more elegant than potent.

Here we must leave the landscapes; only further naming as well-deserving exhibitors Messrs. Macartney, H. R. Robertson, Yglesias, Naish, Henry Gibbs, Albert and Henry Goodwin, John and William Linnell, R. C. Leslie, Leslie Thomson, R. W. Allan, Tristram Ellis, Meyer, Cooke, Poole, Joseph Knight, F. S. Walker, De Breanski, McWhirter, Frank Walton, W. T. Shaw, Benham, J. Clayton Adams, Oakes, May, A. J. Hook, Emslie, Edwin Edwards, Stuart Wortley, David

Murray, and Batley, Mrs. Ellis, and Mrs. Goodwin.

Portraits. The three-quarter-length likeness of *The Earl of Shaftesbury*, Painted by the Bible Society, is undoubtedly one of Mr. Millais's finest portraits: it is, in fact, not only from being, all things considered, the highest artistic success in the present Academy Exhibition. The resemblance is beyond description or cavil; the expression has that patrician look of one who has laboured hard and earnestly for momentous purposes, and who finds in the evening of life that he is still in the outskirts and beginnings of the overbearing task. The accessories are all treated with comparative slightness, a writing-table being a principal item; but they are sufficient to keep the pictorial calibre of the work. *A Jersey*, the likeness of the beautiful Mrs. Langtry, is among Mr. Millais's female portraits, only a less high than the Earl of Shaftesbury among male ones. The flower which gives the picture its title is held in the lady's hand: her cheeks, blue eyes, and auburn hair, make almost the very type of the "pretty woman" of modern society—an abstract standard of beauty, not so much in the painter's line: the figure draped in black silk, has received comparatively little attention from him. Mr. Millais's portrait, *The Countess of Carysfort*, in dark green velvet, calls for little remark: it is a piece of professional work, and, being Millais's work, is of course of the higher level of contemporary portraiture, but beyond this we need go far in commendation of it. Mrs. Langtry appears in a portrait by Mr. Poynter, with the pomp of costume, and a more obvious aim at pictorial style in the general design and treatment: the handling would please us better had it a touch of crispness. This also is a very advanced work of art; and the Poynter and the Millais have their respective partisans, like the two beauties in a ball-room. Mr. Pettie sends two of his customary fancy-portraits: *Olivia Here Esq.*, the landscape-painter, in a *Holbein* costume with a florid athletic look, a very telling likeness; and *J. Taylor Whitehead, Esq.*, who might be an Elizabethan magnate: this is one of the most decided successes. *La Lecture*, by E. Fantin, is a portrait-group, two ladies in morning, both somewhat turned of thirty, and rather awkwardly close together: one of them black but dingy in complexion, the other dark. The figure is reading, and according to the intention of the picture (we must presume) reading aloud: but mouth however is closed, and the natural impression of the work is hereby considerably injured. Technically regarded, it is a fine example of tone. Mrs. Frederick Leyland, by Mr. P. Morris, is portrayed with remarkable elegance and refinement. Habited in white silk, and holding a Japanese flapper, the lady stands her full height against a background of deep-tinted orange-brown velvet hangings. This work should go far towards giving Mr. Morris a leading position among the portrait-painters in whom good-looking ladies can confide for doing them justice. Two notable good portraits, by a painter not hitherto of special note, Mr. Cyrus Johnson, are here—*W. H. Plowden, Esq.*, and *George Fownes Luttrell, Esq.* The former, a placid white-haired old gentleman, strikes at once by unforced truthfulness of expression: nor can the latter be regarded as less laudable.

Other portraits which deserve attention are the following; some shining more in artistic quality and others for direct portrait-like value. We divide them into two lists according to this criterion, but without affecting minute accuracy of classification. In the former category are Orchardson, *Conditional Neutrality*, a study in a costume of the early seventeenth century, absurdly enough misnamed; Watts, *Laurence Lawley*, and Jacques Blumenthal, two pre-eminently fine samples of this distinctive

er, and some others are hardly up to his
; Scholderer, *Young Girl in a Fancy Cos-*
; Bastien-Lepage, *Mrs. J. Lebegue, in Fancy*
me, rather too ponderous in manner; Stephen
e, *Mrs. John G. Sandeman*; Arthur Hughes,
I and Ruth Orrinsmith; Julia Folkard, *Miss*
hière. In the second category—Pellegrini,
McGregor; Wirgman, *A Lady*, and *Mrs.*
iams; J. Hanson Walker, *Col. Davies*, and
Hon. Home Browne; Henry Gibbs, *A Por-*
; Louise Jopling, *Mrs. James Tomkinson*;
es Dickinson, *Mrs. Lucas and her Daughter*,
J. Bewicke Greenwood, Esq.; Hodgson, *Major*
rn, very characteristic and able; Oules, *J. D.*
, Esq., *Sir William Wright*, and *The Earl of*
iousie; Webster, *Portrait of Himself in a*
ey-chaise; Richmond, *The Right Hon. W.*
Smith, M.P.; and *The late Sir G. Gilbert*
t; Wells, *Henry H. Armistead, A.R.A.*, and
iam Shaen, Esq.; Edward Hughes, *The Lady*
ress; S. M. Fisher, *Sir William Drake*;
erington, *A Portrait of an elderly gentleman*
a pot of scarlet geranium; Collier, *The Earl*
haytesbury, and *Mr. Justice Hawkins*; Blanche
rins, *A Lady*; Long, *Henry Irving as Duke*
Floucester; Calderon, *The Marquis of Water-*
; Lehmann, *Lady Elizabeth Bulteel*; Archer,
Sylvia Schlesinger, and *Herr Joachim*; Cot-
, Edward Green, Esq., M.P.; Pope, *Peter*
rt, Esq.

Animals and Still-life. Mr. Rivière and Mr.
ks stand foremost this year as animal-painters.
former gentleman has had a really bold in-
ation in one of his subjects, thus defined in the
logue by a motto from Omar Khayyam:—

They say the lion and the lizard keep
he courts where Jamshyd gloried and drank deep."

der a flood of moon-lustre "as light as day"
a once superb palace-terrace, now long de-
ced and decayed: its stairs remain silent to
padded and noiseless footstep of lion and
less, and its fissures give exit and re-entrance
the lizard's sinuosity. Like all else, the lions
bleached by the moonlight: their tawny hue
almost effaced. While highly applauding the
a of this picture, we do not find anything very
ceptional in its execution: this is adequate and
lful, but does not do much for the subject
ond what is necessarily involved in itself.
ere is, however, another picture by Mr.
vière, *An Anxious Moment*, pre-eminently good
execution: the subject is a flock of geese
concerted by finding a battered old hat
hich retains perhaps rather overmuch of its
ginal blackness) lying across their familiar
thway; hence ensues much stretching of
ck, accompanied by the entire gamut of
sking. As the geese are coming forward
ht in front of the spectator, their faces
all foreshortened; this is managed with an
ount of dexterity and variety well worthy of
liberate inspection. In Mr. Marks's picture also
e personages are all birds, a *Convocation* of adjut
storks, nine in number, with a tenth coming
gerly over to join them, from the sand-hillocks
the river side. The profound expression of the
orks—sage remark, critical comment, abstruse
gitation—are abundantly humorous. Mr. Marks
is often made quaint mirth out of birds, but
ver, we think, with quite so much felicity as in
ie present instance. Mr. H. W. B. Davis con-
tributes four works, all skilful enough, but not any
ie of especial mark—increasing paintiness has
me with increasing sureness of hand; *Mid-day*
helter, and *Evening Light*, are however very clever
performances. *Changing Pasture*, by Mr. Meyer-
sim, turns cattle and a crow to good account.
azy Moments, a very large picture of two hounds
uchant in kennel, is decidedly creditable to Mr.
S. Noble; and Mr. Bodkin exhibits a very able
icture of cattle being stalled in the gathering dusk,
nder the title of "Come along, Beauty; Come
spot and Daisy." Mr. Heywood Hardy and Mr.
Paton may also be named among the animal-

painters; and, for Still-life, M. Fantin (*Roses*), Mr.
George Marks (*Almond Blossom*), and Miss Kate
Thompson (*Après le Déjeuner*).

W. M. ROSSSETTI.

ART SALE.

THE Novar collection—of which the first and
modern portion was sold about two months since,
and the second and ancient portion last Saturday
at Christie's—will prove to be the historical sale
by which the present sale-season will be re-
membered; and though the second portion of the
collection was not by any means of the uniform
excellence of the first, it contained a few pictures
the equals of which appear but rarely in an auction
room. First and foremost, in respect of popular
interest and in respect of the stir that had been
made about it, was the greatest of the two
Raphaels—the *Madonna dei Candelabri*: the
Madonna with the two candlesticks. It would
certainly be rash to assert that this picture was
in blameless or untouched condition: rasher still
to say that in point of intellectual interest or of
sentiment it is comparable with such masterpieces
of the master's work as are to be seen in Florence,
Dresden, and Paris; but, as bearing the evident
stamp of his invention, it is, leaving aside the
question of its present condition, a picture of
very remarkable value and interest. It found
no purchaser on Saturday. It was bought in at
the extraordinary price of nineteen thousand five
hundred pounds; but its owner, we feel justified
in saying, will have no cause of complaint if he finds
it matter of no difficulty to obtain a larger sum.
The minor Raphael at the Novar sale—the Raphael
known as the *Vierge à la légende*, or *La Vierge de*
Novar—was accounted infinitely less precious.
The auctioneer had received no instructions to re-
serve it, and it fell to the first bid, which hap-
pened to be a bid of three thousand guineas. It
is possible that some of the better and more
genuine pieces in the Novar collection would have
realised higher prices than they did on Saturday
had they been unaccompanied by works which were
obviously nothing better than school pictures or
copies, but which appeared under the names of
the greatest masters. For nearly all the Titians,
for example, the description, "after," or "in the
manner of Titian," would have been plainly more
appropriate than the unqualified name of the
master himself; and we doubt whether fine and
genuine examples sell the more readily when in
the presence and companionship of copies that
find, and deserve to find, purchasers at a few
guineas only. Certain it is that the prices
paid for the best work in the sale of Satur-
day were not generally high. The sum of
three thousand guineas, for instance, was by no
means excessive for the very beautiful example of
the art of Claude, described as *A Grand Seaport*;
nor was eight hundred guineas at all too much for
the secondary, but still important example, styled
Philip Baptising the Eunuch. The landscape that
obtained the highest price next to that of the
great Claude was one by Hobbema—one of two
so described in the Novar collection: a "richly
wooded river scene;" it fell to the bid of two
thousand one hundred guineas.

There were several interesting Murillos—satis-
factory and agreeable examples of the art of a
sometime over-rated master. *The Miracle of the*
Loaves and Fishes—a sketch apparently for a great
work at Seville—sold for 300 gs.; *A Group of*
Spanish Beggars, believed to be an early yet not
immature work, sold for 280 gs.; while a more
celebrated canvas, *St. Anthony caressing the In-*
fant Saviour, reached 2,250 gs. By Jacob Ruys-
dael, a fine and important sea-piece realised 1,400
gs., and a like sum was obtained for a sea view
with fishing-boats, by the same master. Among
other Dutchmen the two best-represented were
Gerald Terburg and Jan Steen. The Terburg,
called *The Glass of Lemonade*, and representing
an interior with various figures of that gentle life

which Terburg loved to paint, and with which he
appears to have been best acquainted, was a replica
with variations—or more probably an early copy
—of the well-known St. Petersburg picture, and
was knocked down for 1,850 gs. Jan Steen
was represented by some of his most brilliant
and forcible, but not by any of his most
agreeable work. There were two pictures of
his deserving notice, and two which obtained it
while the collection was on view. Of the two, the
one styled *The Effects of Intemperance* (but by some
slight blunder not a little misdescribed in the cata-
logue) was undoubtedly the greater. It realised
1,250 gs. It is a large picture, representing the
garden of a Dutch house in a pleasant and sub-
dued light. Of the accessories much is made, and
much is made effectually. The little background
group, of two servants, it may be—a man and
a woman—sitting fondling in an arbour, is in Jan
Steen's best manner as to grace of line and har-
mony of treatment. The painting of the fore-
ground detail—the texture of the various stuffs of
the drunken housewife's dress, for instance—is of
that quality which Jan Steen but occasionally
sought, and when he did seek it was sure of suc-
cessful rivalry even with the greatest masters of
the art of pure imitation. But in invention and
in happy expression lay Jan Steen's greatest art.
He was the keenest comedian, in painting, of the
seventeenth century; and it is not for his most
special qualities that the admirable work sold on
Saturday is so remarkable. There was, perhaps,
more of actual comedy in the artist's second pic-
ture—a picture which struck us as in less brilliant
condition—called *After Dinner*: also an illustra-
tion of the favourite Dutch vice which Jan Steen
so constantly satirised. But this piece was not
deemed worthy of a higher bid than 230 gs.
Rembrandt was ill represented. The portrait of
the artist when a youngish man had indeed some
signs of having been painted by the master; but,
even if entirely genuine, it can never rank with
the greater of those many studies of his own face
and character which Rembrandt poured out in
such profusion. By Wouvermans, there was a
halt of cavaliers and ladies at a farrier's shop,
which sold for 300 gs.

Among the French school, the collection con-
tained no very important Greuze—none, perhaps,
more admirable than the portrait of the artist's
daughter, which fetched only 150 gs., and which
had little more than the superficial charm of the
lightest styles of portraiture. Watteau, though
variously represented, was on the whole much
better represented. Of the *fêtes champêtres*, there
is very likely not much to be said: the one that
was originally the best bearing upon it the signs
of much retouching. The large allegorical design
Le Printemps—one airy figure crowned by another
—was interesting as showing a phase of the great
Frenchman's art with which the English public
is generally little acquainted; it fetched over
600 gs. But a far more substantial piece of work
—passing under the name of Watteau, and of
great beauty, though almost certainly by a different
master of the French school—was the portrait group
of *Les Deux Marquises*. The two little mar-
chionesses were marvellously alike, and yet subtly
different. Two children, with powdered hair over
very simple faces, fronted you with pose modest
yet self-reliant. As a serious effort at the
higher kind of portraiture, and as a brilliant
example of assured mastery in the art of painting,
Les Deux Marquises will long be remembered. It
fell to the bid of 2,250l.

Of the Italian pictures apart from the Raphaels,
there may be named a very considerable picture
by Caracci, in which the painting was good and
the forms graceful and agreeable. The Caracci
being out of fashion—and, on the whole, deserv-
ing to be so—this unusual picture passed into the
hands of the purchaser for but a small sum.
The greatest Italian picture—again apart from
the Raphaels—and perhaps the only one perfectly
genuine in condition and perfectly certain in

attribution—was the *St. Helena*, or *Vision of the Invention of the Cross*, by Paul Veronese. It belonged to the great Duke of Marlborough, from whose possession we are assured it passed into the hands of Lord Godolphin; and it was sold at the sale of the late Duke of Leeds's collection to the late Lord Hertford. It was knocked down to Mr. Burton on Saturday for the substantial sum of 3,300 gs., and the National Gallery has thus secured what was the most indisputable prize in the collection. The sale realised over 40,000l.—of course irrespective of the one reserved work which was bought in, the *Madonna dei Candelabri* of Raphael.

NOTES ON ART AND ARCHAEOLOGY.

PROFESSOR COLVIN has resumed in the pages of *L'Art* his studies, begun in last year's *Portfolio*, on the engravings of the age of Albert Dürer. The first article of the new series, published in *L'Art* for May 19 and 26, deals with the anonymous fifteenth-century set of Flemish engravings illustrating the book of Boccaccio *De casibus illustrium virorum*, &c., and known as the work of the *Maître aux sujets tirés de Boccace* (Passavant, vol. ii., p. 272). As a specimen of the series, Prof. Colvin gives a reproduction, admirably executed by Amand-Durand, of an undescribed first state of the plate illustrating the prologue—prologue and dedication in one—of the book. This beautiful engraving formed part of the Kerrich collection, and is now in the Fitzwilliam Museum. Referring to the copy of the French translation of the work, published by Colard Mansion at Bruges in 1476, which exists in the library of Lord Lothian at Newbattle, and which differs from other known copies of the same edition, in that it is actually adorned with the series of engravings in question, Prof. Colvin brings forward a chain of evidence to prove that originally Colard Mansion made no provision for adorning his edition in this manner; that then he cancelled and reprinted the first leaf of the prologue only, in order to adorn it with the single illustration now reproduced by M. Durand; and that subsequently he in like manner cancelled and reprinted the first leaves of seven, and finally of eight, out of the nine books of which the work consists, in order to adorn them in the same way with engravings, the subjects thus added being by another and inferior hand to the first, or dedicatory subject. To students of old engraving and of bibliography alike, these facts will be new. Prof. Colvin gives to Mr. Bradshaw the credit of the minute bibliographical researches on which his conclusions principally rest, and to Mr. David Laing, of the Signet Library, Edinburgh, that of having been the first to draw attention to the unique and hitherto unnoticed Newbattle copy of the Colard Mansion edition. We believe that Mr. Laing has in preparation a publication in facsimile of the illustrated pages of the copy in question.

At the Gallery of Messrs. Dickinson and Foster, 114 New Bond Street, is now to be seen a large picture with a multitude of figures on a rather small scale—*The Badminton Hunt*; containing portraits of the Duke and Duchess of Beaufort, and many other personages interesting in society, the sporting world, or the locality of the hunt; the horses, as well as the riders, are mostly, we believe, portraits from life. The work is no doubt, to a large extent, founded upon photographs: an engraving from it will be issued.

THE sale of the famous Castellani Collection of old Italian pottery took place at Paris on the 27th ult. and two following days. Very large prices were realised. A splendid decorated basin of Urbino ware in the form of a tortoiseshell, and attributed to Orazio Fontana, fetched the large sum of 25,000 fr. A plate with a portrait of Charles V. with inscription and date, attributed to the same artist, brought 20,000 fr. The examples of Gubbio ware by Maestro Giorgio also

fetches high prices, ranging from 15,500 fr. to 2,000 fr., and a beautiful example of Caffagiolo ware was sold for 16,000 fr. The collection was large and various, including examples of Siculo-Arabian, Della Robbia, Pesaco, Deruta, Castel Durante, Faenza, Roman, Castelli, and Medici, beside those before mentioned.

WE are rejoiced to know that the magnificent example of the art of Veronese—the *St. Helena: the Vision of the Invention of the Cross*—has been acquired for the National Gallery. It is some time since the national collection has received an addition so important and in all respects unexceptionable. The picture has apparently been untouched and undamaged. It is a consummate instance of freedom of design, and freedom of painting, inspired not this time, indeed—since the theme did not allow it—by all of Veronese's fire, but by all the potency of his imagination. The National Gallery was, it is true, before the present purchase, by no means poor in work of the great Venetian, or, to adopt the perhaps more exact classification of the Catalogue, the great "Veronese" master. We had already five examples of his work: the *Consecration of St. Nicholas*, presented fifty years ago by the Governors of the British Institution; the *Rape of Europa*, a small and finished study for a large picture now at Vienna; the *Wise Men's Offering*, a much larger work originally placed in the Church of San Silvestro at Venice; the *Family of Darius at the Feet of Alexander*—actually an important portrait group—purchased at Venice from the Count Vittore Pisani in 1857; and, lastly, an agreeable design, the gift of Mr. Wynn Ellis, *The Magdalene laying aside her Jewels*. But there was nothing in the possession of these pictures to render impolitic the acquisition—even though it has been by the outlay of more than 3,000 gs.—of such an example as the *St. Helena* affords of the power, freedom, vehemence, and splendour of a master whose position in the world of Art is far beyond the touch of the caprices of fashion in matters of art-taste.

WE have received from the office of *L'Art* a tastefully-bound volume containing etchings by M. Chauvel, chiefly from the pictures of other masters. Chauvel is generally an interesting, if not always a thoroughly accomplished, etcher. We by no means give to the mass of his work the same high character which is claimed for it by the writer of the introductory notice to the volume we have received. His work is sometimes incomplete in that it halts between the frank sketchiness of a vivid memorandum and the useful elaboration of a finished picture. Hardly anywhere in this volume is M. Chauvel seen to such advantage as in an etching published separately by the proprietors of *L'Art*—an etching which recalls with singular felicity and perfection a picture of Daubigny. In that etching M. Chauvel has succeeded to a rare degree in reproducing the characteristics of the painted work of the original master. And in one original etching produced long ago, this engraver realised exquisitely a charm of country landscape which was none the less of his own finding because it recalled Gainsborough. One of the illustrations in the volume before us is original, and it represents just such a simple rural scene as this artist handles best: unity of impression being well preserved. Among the reproductions one of the best is from a picture by Crome, thoroughly characteristic in subject, the light and shadow on the quaint country house and the roundness of the foliage being such as Crome loved. The other reproductions are mostly from less-known masters, and, handsome as is the volume, we are not sure that it is among the most permanently valuable of the contributions which the proprietors of *L'Art* have made to the stock of popular art.

Two books with some such illustrations or sketches of travel as were first made popular by the *Voyage en Zig-zag* of Miss Tuckett have come

to us: the one from Messrs. Macmillan, the other from Messrs. Bickers and Son, of Leicester Square. Messrs. Macmillan's little publication, *A Week at the Lakes*, by J. Priestman Atkinson, aims particularly at being funny; and the fun of the *Voyage en Zig-zag* is continued in it with some measure of success. The illustrations are as good as many of those of which we are tolerant in the comic newspapers when the genius of Charles Keene has no hand in them; and the letterpress—written in the jerky style apparently deemed proper to work of the order before us—is a sufficient, though not a brilliant, commentary on the designs. The book is quite free from vulgarity, and many will deem it humorous. Messrs. Bickers's publication, presenting itself under what seems to us the unfortunate title, *The Adventures of Miss Brown, Miss Jones, and Miss Robinson at Biarritz and in the Pyrenees*, aims likewise at humour, and does not always aim at it, but it is also remarkable for the pleasant and artistic touch of the designer in picturesque record of castle and town, water and coast. Of the two volumes this will constitute the more substantial possession, and many tourists to Biarritz and the Pyrenees will find in it agreeable souvenirs.

THE death is announced of M. Dantan, *aimé*, at the age of eighty. Among his principal works were *L'Ivresse de Silène*, his *Jeune Napoléon jouant du tambourin*, and a great number of busts.

AT a recent meeting of the Cambridge Antiquarian Society, a communication was read from Mr. E. Hailstone upon a gold ring, which had been found about five inches deep in the ground at Montpensier in Auvergne by a shepherdess in 1866, set with a fine *balais* ruby, and bearing on the outside of the bezels s. ex-or-er-vs. The stone is engraved with a head in nearly full face, with massive hair in short curls, which strongly resembles the type found on the coins of Edward III. Around the shank of the ring itself is read in relief RESVS. AVTEM. TRANSIENS. PER. MEDIVM. &c.—a common charm for travellers. Immediately round the ruby are the words SIGILLVM SECRETVM cut in the gold. From all these details and from the elegance and richness of the *bijou*, Mr. Hailstone inferred that it must have belonged to some warrior of high rank in the English army during the French campaigns in the fourteenth century, if not to the Black Prince himself, as French antiquaries consider most probable.

THE Fathers of Saint-Louis, who are settled on the ruins of Carthage, have just prepared a fine map of the site, and have sent a number of copies to M. Léon Renier for the Institute, French public libraries, and individual scholars. The Fathers have conducted excavations among the ruins of Carthage at their own expense; and have purchased all the antiquities the discovery of which in the adjacent country has been reported to them. They have thus formed a large collection of Punic and Latin epigraphs, which they are about to present to the Academy of Inscriptions.

A MODEL of the Wellington monument has just been placed close to the entrance of the Architectural Court in the South Kensington Museum, where also some full-sized casts of the colossal figures which decorate the canopy may be seen. The model is not large enough to give any just idea of this noble work of modern English sculpture, which only needs the equestrian figure designed by Alfred Stevens for the top of the canopy to be placed in its position, to make it the grandest sepulchral monument we have in England. It serves, however, to draw the attention of visitors to the Museum to this much talked-of work, and may cause some to make a pilgrimage to St. Paul's to see the original. The zeal of those who do will receive its reward.

THE municipality of Milan purpose erecting a bronze statue to Mazzoni, on the Piazza San Fedele.

SOME important frescoes in good preservation have lately been discovered in the Church of S. Collinaria, in Orosio. It is not known by whom they were executed, but Italian critics speak in high praise of their merit.

THE statue of Titian which is to be set up next summer at Cadore will shortly be cast in bronze at the foundry of De Poli at Vittoria (Treviso). The model has been executed by the Italian sculptor I. Zotto.

AMID the general dull uniformity and occasional ringing vulgarity of the covers of the publications that lie on our library table, that of the new rural *Piccadilly* stands out with pleasant variety. Maurier's effective sketch of the well-known quality is in truth a work of such artistic composition that it might well hold a place in portfolios instead of on bookshelves; but we welcome it more warmly in the latter place, and hope it may inaugurate a fashion for covers of a commonplace character than those which are now inflicted on us. It may be possible, however, to grow tired of that tall and delightful young lady who takes her morning walk with such serene self-consciousness, or even of the supercilious young gentleman who follows. When this happens, would it be too much to expect of *Piccadilly* that it should ask M. du Maurier to try his pleasant invention?

THE Antwerp Museum has recently acquired for a large sum a fine and well-known portrait by Rubens. It is the bust portrait of a man which was formerly in the Van Saccegheem collection, where it was engraved, together with its pendant, a portrait of a woman, now in the Wilson collection—by the Flemish engraver Spruyt. Both works are described by Smith (Nos. 889 and 890) in his *Catalogue raisonné*. The Antwerp portrait represents a man of about 40 years of age, with a full beard and fair hair; his head, which is finely modelled, standing out with great effect from a background of red drapery. He is dressed entirely in black, with a large white collar, concerning which the *Athenaeum Belge* gives a curious detail. It states that Rubens' father was first painted in a large ruff, the border of which reached the ears, making the head look as if it were separated from the body. But the fashion for these enormous ruffs going out soon after the picture was painted, Rubens—probably at his sitter's desire—changed the ruff into a turn-down collar. The traces of the former attire are, however, still distinctly visible. This portrait is sold with its pendant at the Van Saccegheem sale, twenty-seven years ago, for 11,100 fr.; but the *Athenaeum Belge* believes that the Antwerp Museum has now paid more than double that sum for the portrait of the man alone.

M. HENRI JOUIN's recent work, *David d'Angers: vie, son œuvre*, has obtained a prize from the French Academy.

A RECENT number of *L'Art* contains another of Mr. Frederick Wedmore's pleasant Studies in English art. Mr. Wedmore has before written the critical appreciation of "Old" Orome and Wansborough, and now, following in the same vein, he gives a similar survey of the art of John Constable, the third good landscape-painter our eastern counties have produced. Though working, as may be said, almost in the same fields as his two predecessors, Constable's art is yet thoroughly individual. He saw Nature, any artist ever did, without looking through the spectacles of any other master, Dutch or English, and thus his pictures please or not according to the spectator is able to sympathise with the peculiar point of view of the artist. His art has been more appreciated, and has had more influence, strange to say, in France than in England, and it is, perhaps, fitting therefore that this latest position of it should find place in a French journal. Two large and decidedly skilful etchings by John Park, from the well-known *Cornfield* in

the National Gallery, and the *Romantic House*, accompany the text, and give a more faithful rendering of Constable's characteristics than most engravings we have seen. The sky in particular, which is always one of the chief difficulties in the reproduction of Constable's work, is cleverly managed, conveying an idea both of the colour and gusty nature of his clouds. The trees, perhaps, in the *Romantic House* reproduce somewhat too faithfully the "Constablesque" style. They become in the etching rather too much like a dish of boiled spinach. A study of trees drawn in crayon which is reproduced as a photint shows, however, that Constable could draw on occasion with the greatest care and delicacy.

THE STAGE.

A NEW comedy by Mr. Mathison, founded on M. Théodore Barrière's *Les Scandales d'hier*, has been produced at the Royalty Theatre. The original play, which was brought out at the Vaudeville in Paris about two years and a-half ago, enjoyed but little success; and Mr. Mathison's version, in which he attempts to transfer the story to English ground, is not likely to secure any greater share of public favour. Miss Fowler sustains the part of the heroine. Mr. Wills's historical play, *Nell Gwynne*, lately produced at the Royalty, still occupies a place in the playbill, but in a modified and abridged form, the greater part of the last act having been suppressed, and the four acts reduced to three.

MR. IRVING will appear this evening at the Lyceum for the first time in the new romantic poetical drama entitled *Vanderdecken*, by Mr. Percy Fitzgerald and Mr. W. G. Wills. The scene of the play, which is in four acts, is laid in Norway at the beginning of the eighteenth century; the scenery, by Mr. Hawes Craven, representing, among other objects, a view of the Skaggerack, the quay of a fishing village, and the deck of the phantom ship, is said to be very picturesque and striking.

A NEW fanciful legendary play entitled *Elyfnella*, written by Mr. Ross Neil, has been produced this week at the Princess's Theatre.

Love or Life, a romantic drama by Mr. Tom Taylor and Mr. Paul Meritt, founded on one of Crabbe's poems, will be produced on Monday next at the Olympic.

MUSIC.

THE OPERAS.—"PAUL ET VIRGINIE."

THE quasi-failure of M. Victor Massé's most recent production might surely have been anticipated by the few who, in this country, are acquainted with the composer's career. Born in 1822, Massé is no novice in his art, and at the age of fifty-six it is, to say the least, unlikely that a musician would be able to pursue a hitherto untrodden path with success. *Galathée*, *Les Noces de Jeanette*, and *La Reine Topaze*, are at the best but operettas, and these are the works which have been chiefly instrumental in securing for the composer of *Paul et Virginie* a place in the catalogue of noteworthy musicians. True, the production of that opera in November, 1876, was greeted with a chorus of approval by the Parisian critics, and Massé was immediately—and, we may add, hastily—recognised as an acceptable composer of *opera seria*. But Frenchmen of mark are seldom without honour in their own country. It may be said of *Paul et Virginie* as was said of *La Mule de Pedro*—the only other work of large proportions ever given to the world by Massé—that it is a small sketch in a gigantic frame, a tiny jewel in a very large casket. Bernardin de St.-Pierre's once-favourite romance is too idyllic in its simplicity to form the groundwork of an extended opera. Messrs. Barbier and Carré have recognised this, and have

carefully and cleverly eked out the slender materials on which they had to labour. The first act of the opera is chiefly occupied by the episode concerning the runaway slave, which in the original tale is one of the events of the very early history of the unfortunate pair. Now, the planter, M. de Ste.-Croix, is made to pardon the slave, Méala, because the charms of Virginie have inspired him with love. Here is a point of departure which the librettists might have followed up had their respect for the author been less. As it is M. de Ste.-Croix and his passion fade out of the book without exerting any perceptible influence on the *dénouement*. In the third act, operatic necessity demands that the heroine should not be altogether absent from the stage, and the device of presenting her in a vision to her lover may be commended as meeting the exigencies of the case fairly and effectively. Concerning the music a few remarks on its salient features will serve the purpose better than a lengthy analysis. M. Massé has succeeded best where he has allowed his fancy to have free play. The three airs for Méala are charmingly characteristic, and the whole of the scene in the planter's domain is wrought out with excellent knowledge of effect. Here unqualified praise must end. The phrase which serves to typify the unchanging love and fidelity of Paul and Virginie is impassioned enough, but its unfortunate resemblance to the Graal theme in *Lohengrin* militates against the interest which it otherwise might evoke. There is melody of a weak kind in many of the numbers, but the concerted pieces are not well developed; and, indeed, after the first act there is a perceptible falling-off in the music. The orchestration is tinged with the distinctive style of Gounod. In brief, *Paul et Virginie* is a work of many reminiscences, with but little that is fresh. If it fail at Covent Garden it will be on account of its own inherent weakness, as the performance is one of exceptional excellence. Mdlle. Albani invests the character of Virginie with much charm, and M. Capoul, though over-energetic, must be warmly commended for his artistic earnestness as Paul, a part which he created in Paris. Not less meritorious is the presentation of Méala by Mdlle. Scalchi. She delivers the piquant airs allotted to this character with splendid effect, and secures hearty and well-merited applause. The lesser characters are also in good hands, and the opera is mounted on the scale of magnificence usual at this house. A moonlight view in the second act errs by excess of colour; but the scene of the plantation is a marvel of beauty and completeness.

On Monday a Mdlle. Mantilla, whose name did not appear in the prospectus, essayed the trying rôle of Selika in *L'Africaine*, but without much success. Mdlle. Mantilla is evidently an experienced artiste, but her voice already exhibits symptoms of wear, and her acting is devoid of charm.

At Her Majesty's Theatre the most interesting performance of the week has been that of *Rigoletto*, with Mdlle. Gerster as Gilda. On the whole, we are inclined to consider this the best of the gifted Hungarian lady's impersonations. Such an exquisite delivery of "Caro nome" has not been heard since the days of Sontag; but the forcible though purely unaffected acting of Mdlle. Gerster in the second act also merits the highest encomiums.

HENRY F. FROST.

THE concert of M. Pasdeloup at Her Majesty's Theatre on Saturday evoked but a slender amount of interest, though it might have been supposed that the opportunity of hearing a portion of Berlioz's *La Damnation de Faust* would have been sufficient to secure a representative gathering of musicians. The work exhibits at once the strength and the weakness of its composer. There is neither passion nor tenderness in the love-scene between Faust and Marguerite. But nothing could be more exquisite than the Dance of Sylphs, for example; while the Hungarian March has an immense amount of rude force, and the Ride to Pando-

monium is unsurpassable as a piece of descriptive writing. The performance was fairly good, considering that the orchestra was playing for the first time under M. Padeloup, whose method of conducting differs essentially from that of Sir Michael Costa. Mlle. Minnie Hauk, Signor Rota, and Signor Marini were the soloists, of whom the first and second deserve commendation.

THE concerted pieces performed at the Musical Union on Tuesday were Schumann's pianoforte quintett in E flat, Mendelssohn's quintett in A, and Beethoven's Quartett in A, No. 5 of the set dedicated to Lobkowitz. Mlle. Montigny-Remaury, a pianist of excellent calibre and legitimate style, played, among other selections, a Pastoral Variée by Mozart, recently published for the first time by Durand and Co., of Paris. In consequence of the state of political feeling in St. Petersburg, M. Auer is deterred from coming to London this season, and Signor Papini will therefore be the leading violinist at the four remaining *matinées*.

At Mr. Hallé's fifth Recital, on the 31st ult., at St. James's Hall, Brahms's beautiful piano quartett in C minor, Op. 60; Schubert's fantasia for piano solo, Op. 15; Beethoven's sonata in A minor, Op. 23, for piano and violin; and a clever but somewhat laboured piano quintett in D minor by Friedrich Gernsheim, were the works brought forward.

On the same afternoon M. Breitner gave his first piano Recital at Steinway Hall, assisted by M. Paul Viardot as violinist, and Mlle. Marie Macca-Rowa as vocalist. The chief pieces announced in the programme were—Rubinstein's sonata in B minor for piano and violin; Mendelssohn's "Variations Sérieuses"; and smaller pianoforte pieces by F. E. Bach, Kimberger, Chopin, Schumann, Stamaty, Beethoven, and Rubinstein.

DR. HANS VON BÜLOW's first recital at St. James's Hall was announced for Thursday afternoon—too late for notice this week. His programme included the grand prelude and fugue in B minor, and two smaller pieces, by J. S. Bach; Beethoven's sonata in A flat, Op. 110; Schubert's Impromptu in G, Op. 90, No. 3; Mendelssohn's Capriccio, Op. 5; and a selection from the works of Chopin and Liszt.

Mlle. IDA HENRY gave her annual concert at the concert-room of the Royal Academy of Music last Monday evening, with a very excellent programme, the most important items of which were Schumann's piano quintett, Op. 44; Haydn's trio in G; three movements from Goldmark's Suite in E minor for piano and violin; and piano solos by Mendelssohn, Field, Lachner, and Chopin, played by the concert-giver.

MR. FRANCIS RALPH's second Classical Chamber Concert was given at the Royal Academy concert-room on the 31st ult., the programme including Schumann's piano quartett, Op. 47; Chopin's sonata in G minor for piano and violoncello; Mozart's string quartett in E flat; piano solos by Mlle. Kate Roberts, and songs by Miss Mary Davies.

THE annual performance of the *Messiah* for the benefit of the Royal Society of Musicians is to take place this afternoon at St. James's Hall. The vocalists announced are Miss Emma C. Thursby, Mlle. Lemmens-Sherrington, Mrs. Mudie-Bolingbroke, Mlle. Patey, and Messrs. W. H. Cummings, J. L. Wadmore, and Lewis Thomas. Mr. J. T. Willy will be the leader, Mr. T. Harper the solo trumpet, Mr. E. J. Hopkins will preside at the organ, and Mr. W. G. Cousins will conduct.

WE noted last week the announced performance of Schumann's *Faust* by Mr. Waddel's choir at Edinburgh. A copy of the *Scotsman* has been forwarded to our office, containing a detailed notice of the concert. We learn that the choir consists of about fifty picked voices, and that, as

we surmised, the solo parts are sung by members of the society. The report speaks of the whole performance in very high terms, stating that "absolute precision was maintained in the singing of every choral number throughout." Those who know the *Faust* music will agree with us that no small degree of praise must be due to Mr. Waddel; for there are few works in the whole range of choral music which more severely tax the energies of even a first-rate choir.

IT will be in the recollection of our readers that three years ago the Festival of the Three Choirs, then held at Worcester, was shorn of all its importance by the action of the Dean and Chapter of that city. The announcement of the Festival for the present year has just appeared; and it is most satisfactory to find that the Worcester authorities have reinstated the performances on their former footing. The date of the Festival is from September 10 to 13; and the chief works announced are Handel's *Dettingen Te Deum*; Purcell's "Jubilate" in D; the first part of the *Creation*; Mozart's *Requiem*; Mendelssohn's *Hymn of Praise*, *Elijah*, and "Hear my Prayer;" Dr. Armes's oratorio, *Hezekiah*; Spohr's *Last Judgment*; and the *Messiah*. There will be also two grand choral services, and two miscellaneous concerts in the College Hall. A very strong cast of vocalists is advertised, and Mr. Done, the organist of Worcester Cathedral, will conduct.

MESSRS. NOVELLO, EWER AND Co. have just published an octavo edition of Cherubini's magnificent "Coronation Mass" in A major—a work far less known than it deserves. It is written for only three voices, which may probably be one reason of its neglect in this country, as it contains no contralto part. Being neither unduly long nor unreasonably difficult, it ought to be welcome in choirs where contralto voices are scarce.

THE Silesian Musical Festival is to take place from the 23rd to the 25th inst. at Görlitz. The chief works to be given are Beethoven's ninth symphony, Kiel's *Christus*, Brahms's "Ave Maria," and a selection from Weber's *Euryanthe*.

At a festival to be given next week at Dordrecht, Handel's *Alexander's Feast*, Schumann's *Paradise and the Peri*, and Brahms's *Rhapsodie*, are announced.

FRANZ ESPAGNE, the Custos of the musical department of the Royal Library at Berlin, died in that city on the 24th ult., at the age of fifty. Herr Espagne was well known as one of the most learned musicians of Germany: he was one of the editors of Breitkopf and Härtel's complete edition of the works of Beethoven.

THE death is also announced, at the age of thirty-five, of Herr A. Tombo, the harpist of the Munich Opera. Some of our readers may remember Herr Tombo as having visited London last year to take part in the Wagner Festival at the Albert Hall.

MENDEL's great *Musikalisches Conversations-Lexicon* is now rapidly approaching completion. The publisher (Herr Oppenheim, of Berlin) has forwarded us the ninth volume (S—Stradivari), and it is evident that one or, at most, two more volumes will suffice for the remaining portion of the work. The present volume, though containing but very few long articles, shows a high average level of excellence. We have, of course, not read through the whole of its 471 closely-printed pages; but we have tested it in various ways, and have found it most trustworthy. Among the more important biographical articles are those on Schubert, Schumann (Robert and Clara), Sontag, Spohr, Spontini, and Steibelt; while some idea of the completeness of this portion of the work may be formed when it is said that there are notices, more or less extended, of eight Schmidts, twenty-three Schmitts and nine Schmitts, seventeen Schneiders, nine Schuberts,

and twenty Schulz and Schulzes. The theoretic and historical articles are also, as usual, of great value, among the most noteworthy being those of Scherzo, Septimenaccord (the chord of the seventh), Singspiel, Sonata, Spanische Musik (the most elaborate article in the volume, occupying twenty-five pages), Spielleute, Stadtmusikus, Stimmgebung (voice-training), and Stimmorgan (the vocal organs). As a work of reference the lexicon is simply invaluable.

No. 319, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Despatches, Correspondence, and Memoranda of Field-Marshal Arthur, Duke of Wellington, K.G. Edited by his Son, the Duke of Wellington, K.G. Vol. VII. (London: John Murray, 1878.)

THE present instalment of the Duke's correspondence and memoranda begins with the last days of George IV., and covers a space of about a year and a-half (April 1830—October 1831). The interest of this short period is varied and considerable. In Great Britain it includes the opening of a new reign, the end of the Duke's own administration, and the progress of that resolute opposition to the Reform Bill which he organised in the Lords: in foreign politics it includes the Revolution of July, the flight of Charles X. to England, the Belgian Revolution, the election of Prince Leopold, and some episodes in the Portuguese struggle for liberation. A volume rich in original documents relating to such events cannot but gladden the heart of the historical student. The Duke's own letters show a clear title to permanent rank in historical literature. Guided by a mental habit rigidly formed by practice in military despatches, he never wrote without reason, or without conveying a clear impression of his own personality, and never left a doubt of his meaning.

No paradox-monger has hitherto held up the Duke of Wellington as a statesman of the first rank. Nor, on the other hand, will history stamp him as one of those whom success in some narrow department of State business has unhappily thrust into a position of eminence for which they have proved unfit, whose failure has been signal, and whose fall calamitous. The Duke possessed sincerity, penetration, readiness, resolution, natural capacity for public affairs, and a large measure of genuine public spirit. No Whig of the last century was less servile to the Crown; no popular statesman of the present has associated his name with measures of more real importance to the people than the final victory in the cause of Catholic Relief, and the Repeal of the Corporation and Test Acts. In passing these liberal measures the Duke was no mere stalking-horse for the Canningites. Many touches in his correspondence remind us rather of the old Whig than of the modern Tory. His respect for precedent (p. 159), his appeal to the doctrine of the Original Contract as applied to the union with Scotland and Ireland (p. 410), and his bias in favour of the old "family and property" influence (p. 387), recall the doctrines

of the Rockingham and Portland party; and more characteristic still is his incessant harping on the old Whig string of "Parliament." The fetish-worship of "Parliament" was practised by the old Whigs with a sort of ritualistic solemnity. For this merely formal veneration the Duke seems to have substituted a humble but enthusiastic faith. There is something pathetic in the way in which he piously puts his whole trust in that worn-out and powerless Dagon, on the very eve of its collapse. Early in the history of the Second Reform Bill he thus writes to Lord Cowley:—

"Now, it is one of the curious circumstances attending this country, and shows in the strongest manner the power of the Parliament as now constituted, that however frequent the changes, convulsions, and revolutions in this country, they have always been made by Parliament. For instance, the Reformation and all its conformation? Parliament. The Commonwealth? Parliament. The Restoration? Parliament. The Revolution? Parliament. The succession of the House of Hanover? Parliament. I don't fear a revolution by force" (p. 470).

Again:—

"History shows that a great change has never, since the wars of the Houses of York and Lancaster, been produced in England by any authority but Parliament. No individuals, however numerous or powerful, have ever been able successfully to resist the power of Parliament" (p. 530).

In his conception of "Parliament," it is hardly necessary to add, the Duke included the borough-mongering system. Neither the old Whigs nor the Duke were opposed in general to reforms which left this system untouched. Political oppression produces public discontent, just as the non-redress of personal grievances makes mutineers of the best of troops. To the task of making all British citizens equal in the eye of the law the Duke lent his aid not unwillingly, and quite in the spirit of an old Whig, though in so doing he was sapping the foundation of his personal position by alienating the Tories. But the demand for Parliamentary reform excited in him the sharpest antipathy. It implied a further series of reforms, including not only reforms for the people, but reforms by the people. Seen in its modified shape, it was, as the Tories felt, and as everyone now knows, a demand for changes penetrating to the roots of national life, for a forced exchange of functions between the organs of the State, and a transfer to the people of the substantial sovereignty. The Duke resisted it both on principle and on sentiment. He resisted it as he would have resisted a demand on the part of his soldiers to elect their own officers, and to have a voice in the plan of their campaigns.

An incident highly characteristic of the man precipitated the Duke's fall from power. A little more subtlety and reticence, and a little more deference to the ultra-Tory party, would probably have enabled him to maintain a Fabian policy, and put off the settlement of the Reform question a few years longer. At that time the Liberals had great hopes of him; for in an age of wonders such as the Test Repeal, there seemed no reason why wonders should cease. The Duke's fall was occasioned by his blunt announcement of a

halt in the march of progress. He refused in 1828 to allow the forfeited East Retford franchise to be transferred to Birmingham, and that on grounds not special but general. The bounds of his Liberalism were thus clearly indicated; and the Canningites forsook him, to swell the numbers of the Tories whom he had estranged. Such an opposition became irresistible; and the Ministry steadily declined to its fall. About half the present volume covers the end of the Duke's administration; the remainder is taken up with the beginnings of his policy as a leader of opposition to Parliamentary Reform. The Duke's opposition was not of that mild and moderate kind to which the present generation is accustomed. It has long been known that the Duke was prepared to dragoon the British nation into submission. The present volume proves it; and the next volume will no doubt prove it more abundantly. The Duke took a view of the situation which, though narrow and foolish, was not inconsistent or unpractical. The people were said to want Reform—that was to say, a transfer to them of political power. It was not easily credible that they could really be thus presumptuous. Granted, however, that they were; that the nation looked on Reform as a right, and that the demand for Reform was a stern reality. So much the worse for the people; they would not get it. The rights of men were their advantages; and the men of property meant to keep their rights. If the people were in earnest, it might be objected, they would probably fight for it. Again, so much the worse for them; he, the Duke, had undertaken many a less promising task than that of out-manoeuvring a Birmingham mob in the field. In that case the question would be settled by some short period of decisive action, involving, perhaps, a certain amount of bloodshed. It would, however, be soon over; and if such were the rash determination of the British people, the sooner the crisis came the better. But the Duke had not as yet convinced himself that this issue was inevitable. Odd as it now may seem, when the Second Reform Bill was on the eve of rejection by the Lords, he was yet fortifying himself with the persuasion (1) that the mass of the people cared nothing for the Bill, and were neither agitating nor agitated; (2) that the agitation, if any, was subsiding; and (3), that it would subside if time were only given, as a similar agitation had subsided ten years before. The degree of sagacity implied here is moderate enough, but it will not be readily believed that the Duke at one time believed the agitation to be produced by the gold of French Jacobinism! Here, however, is the authority (p. 373):—

"To the Earl of Malmesbury.

"My dear Lord,

"I entertain no doubt that there exists a formidable conspiracy. But as yet I don't believe that we have got a trace of it. We certainly had not when I quitted office, and I don't believe the king's present servants have.

"I am inclined to think that the operations of the conspirators in this country are conducted by Englishmen. But that the original focus is at Paris.

"We have in this country, unfortunately, a very numerous class of men, well educated, who have

no means of subsistence, and who have no employment. These are the gentlemen who go about in gigs.

"You will ask, How are these men subsisted? How are the gigs, &c., paid for? I answer that I know that the Société Propagande at Paris had at its command very large means from subscriptions all over Europe, but particularly from the revolutionary bankers in France.

"A part of these means is, I think, now applied to the purpose of corrupting and disturbing this country. "Believe me, &c.

"WELLINGTON."

It is only fair to give an illustration of the close tactical judgment by which the Duke was guided in matters of detail. It is taken from a letter to the Duke of Cumberland, written a few days after the defeat of the Second Reform Bill:—

"... My opinion is that Parliament will meet in December. I think so because the Radical newspapers and the mob desire it, and the gentry of the country, including even the Ministers themselves, do not. . . . They [the mob and newspapers] continue to insist that Parliament shall meet: and Parliament will meet—early in December. I should say probably on Tuesday, the 6th of December. They will bring in the Reform Bill immediately, and most probably read it a second time in the House of Commons before Christmas" (p. 571).

In a note the Editor says: "Parliament met 6th December, 1831. Third Reform Bill moved by Lord J. Russell and read first time 12th December, 1831. Passed second reading 18th December, 1831." The Duke goes on:—

"I don't much care for the 30,000 men said to be in arms. I think that we are already in London stronger than they are. I would engage to get the better of them with what we have. We should rouse the whole country and put an end to these proceedings."

The Duke's letters in this volume are quite equalled in interest by those addressed to him by a host of correspondents which includes official colleagues, gossiping friends, and anonymous "Admirers of the Duke of Wellington." Two long letters of the last sort (pp. 500 and 545) were worth preserving, as being rubbish of the kind sometimes more valuable to the historian than the purest bullion. Mr. Mill has somewhere described the writings of a certain philosopher as a rich mine of every species of *a priori* fallacy. These two anonymous farragos of Tory sophistry run Descartes himself hard for the palm, and go far to justify that celebrated caricature which Sydney Smith constructed and called "The Noodle's Oration." E. J. PAYNE.

POSTHUMOUS POEMS OF PHILOTHÉE O'NEDDY.

Poésies posthumes de Philothée O'Neddy (Théophile Dondey). (Paris: Charpentier, 1878.)

THERE are poetical natures which, like the apricot-trees in an English garden, flower too soon with a rash abundance, and suffer in consequence from sterility when the time of harvest comes. A fantastic charm not easily accounted for hangs about the perilous efflorescence of such persons; the more dangerous the situation, the more the ardour and colour of youth delight us, and the more do we hope against hope that so much promise may not be frustrated. There are

periods in history, as there are seasons in the year, when favourable circumstances more than usually combine to push forward unripe genius to an exhausting effort of expression; among these periods the third decade of the present century in France is perhaps the most remarkable, because certainly the most fatal. There never were so many "sculptors like Phidias, Raphaels in shoals, poets like Shakespeare, beautiful souls," who came to nothing, as in Paris between 1825 and 1835. The failure of the majority of the actors in the romantic drama does not deprive them, however, of their interest or their charm for students of human nature. Their later doings are no more regarded than the branches of the fruit-tree which has cast its untimely blossoms; all that we remember is the wealth and radiance of that flowering-time. The youths of *le petit cénacle*, shaking their Merovingian manes "en costume d'orgie," pledging poetry and genius out of skulls brimming with Chambertin, or insulting with wild snatches of verse the execrable *bourgeois* in the pit of the theatre, remain to us as the very types of generous extravagance and unworldly devotion to a thankless muse. Among this body Philothée O'Neddy was the most intoxicated, the most ebullient, and the most unfortunate, and combined in his person almost all the extravagant qualities of that age and fashion.

From a very well-written biographical Introduction, by M. Ernest Havet, we learn that Auguste Marie Dondey, born on January 30, 1811, quite early in life declined to accept his baptismal name, and adopted that of Théophile. Entering in due time the ranks of the Romanticists, he felt that Théophile Dondey was no name for a friend of Augustus Mac-Keate and Napoléon Tom, and he therefore assumed the anagram Philothée O'Neddy, from which, perhaps, had he been better acquainted with colloquial English, he might have shrunk. They were all Anglo-maniac, these young men, but not according to knowledge. Gautier has left us a wonderful description of O'Neddy at the age of twenty-one. He was swarthy, like a mulatto, with thick, full-coloured lips, but around his head floated an aurora of light, flaxen curls, like the locks of a Norseman; his clear blue eyes were excessively near-sighted, and he was never seen without a pair of eye-glasses pinching his nose. He had the peculiarly delightful habit of going to bed in these glasses, affirming that without them he could not clearly distinguish his dreams, and so lost all the pleasures of sleep. I confess, for my own part, that I am inclined to consider this the most delicious contribution to thought that O'Neddy has handed down to us. Such was the eccentric young poet when the death of his father, in 1832, suddenly forced upon him the lugubrious fate of a small clerk, dependent for bread upon the drudgery of his office; and there is no doubt that he felt bitterly the irony of fortune which compelled him to waste his best hours in ungenial work. The Emersons and Carlyles have not quite explained, in eulogising drudgery, why it is that so vast a majority of the men eminent in genius have enjoyed leisure and an immunity from wearing

labour. At all events in Philothée O'Neddy's case, the clerk seems to have subdued the poet. But before this sad consummation he collected his lyrics into an astonishing volume, entitled *Feu et Flamme*, which remains one of the curiosities of literature, and which is now so extremely rare that the last copy which entered the market fetched 300 francs.

We have no space to analyse *Feu et Flamme*, a reprint of which, by the way, would be a most valuable pendant to the volume under review. It was a very pretty book typographically, and had an etching by Célestin Nanteuil. It consisted of ten pieces entitled "Nuits"—realistic scenes from the life of a romantic dreamer—and six fragments named collectively "Mosaïque." The first "Night" is by far the most curious, for it professes to introduce the reader to the *cénacle* in all its glory, assembled in an atmosphere of opium and punch, in the studio of Jehan Duseigneur, the sculptor; Borel, Bouchardy and many others are described under thin disguises, and the whole poem is of the first importance to historians of the period. Of the tone of the poem and of the book a very fair impression may be gained by the reading of these amazing verses:—

"Ce fut un long chaos de jurons, de boutades,
De hurrahs, de tollés et de rodомontades,
Dont les bruits jaillissant clairs, discordants et
durs,
Comme une mitraillede allaient cribler les murs!
Et jusques au matin les damnés jeune-Français
Nagèrent dans un flux d'indicibles démenées. . . .
Pareils à des chevaux sans mors ni cavalier,
Tous hurlant et dansant dans le fauve atelier,
Ainsi que des penseurs d'audace et d'ironie
Dans le crâne orageux d'un homme de génie."

Sternly reproved by such leaders of the older school as Chateaubriand and Béranger, and possibly not encouraged by the saner members of the *cénacle* itself, no success attended the author of *Feu et Flamme*. His book was almost as brilliant as it was audacious, however, and there was every reason to suppose that he would rise through failure into work worthy of a metrist so powerful and a thinker so distinguished. But he was discouraged, and though he lived on for more than forty years, he never published another book. Gautier tells a curious story of his meeting him in late life, and asking him when he was going to publish another volume of poems. "Oh!" answered O'Neddy, with a wistful smile, "when there are no longer any *bourgeois*!" We learn from M. Havet's Preface how these last forty years were spent. It is a melancholy story of disappointment, disenchantment, and the final victory of mental lethargy. But in spite of his retirement, Dondey was never completely idle, and the results of his long barren summer and autumn are contained in this volume. He was not quite without ambition at first: he published three brief novelettes, *L'Abbé de Saint-Or* in 1839, *Histoire d'un Anneau enchanté* in 1842, and *Le Lazare de l'Amour* in 1843; he contrived once or twice to print his poems in periodicals. But the romanesque poem, *La Lame et le Fourreau*, which had been announced at the end of *Feu et Flamme* was never written, and the long poems which he did complete were

never sweetened by sustaining hope. Between 1834 and 1846 he composed three sets of sonnets; until 1842 he continued to write fragments under the old rubric of *Mosaïque*; and in 1846 was finished *Les Tablettes amoureuses du Vidame de Tyannes*, an unfortunate poem which bears a striking resemblance to the ravings of the madman in *Julian and Maddalo*. In 1857 he completed a wild and romantic drama, *Miranda*, which purported to be written by the said Vidame: a drama the scene of which is laid in old Spain, and which is full of fine old crusted armour and sonorous soliloquy. *Les Visions d'un Mort-Vivant* date from 1862, and in 1863 he composed what is by far the most original and striking of all his posthumous poems, the *Cul-de-jatte*, written on the thirtieth anniversary of the publication of *Feu et Flamme*. In this poem, which is not without a simplicity and strength of imagination that rise far above mediocrity, he describes himself and his fate under the figure of a poor cripple, who, thrown in early life from a horse too fiery for his untrained skill, has lost his limbs, and dragging his maimed torso painfully through life, sees without envy—even with enthusiasm—happier horsemen ride by to glory on the road of life. He, only too keenly sensitive to his wretched condition, has no pleasure save to dream of what might have been, and to cheer on to victory, with words they never hear, these more fortunate travellers and pilgrims. The poem is not without mannerisms of style, but it is powerful and pathetic in the extreme.

In old age Philothée O'Neddy enjoyed a few consolations. He began to be sought out as a curious relic of Romanticism; and young poets, such as M. Armand Silvestre and poor Mdlle. Louisa Siefert, paid him a homage for which he was sincerely grateful. France rediscovered him as we discovered the author of *Joseph and his Brethren*. Paralysis, however, had long threatened, and at last attacked him; his brain became affected, and when at last he died, on February 19, 1875, the release from a painful frame was welcome. Such was, in a brief summary, the career of a man whose personality vastly outweighed the positive value of his work, and who was perhaps the most eminent instance of a poet *manqué* that France has produced.

EDMUND W. GOSSE.

The Troubadours: a History of Provençal Life and Literature in the Middle Ages.
By Francis Hueffer. (London: Chatto & Windus, 1878.)

It is a pity that Dr. Hueffer's book on the Troubadours is not more exhaustive. The want of a competent work on this subject has long been experienced, and Dr. Hueffer is, of all writers in our language, perhaps the most capable of worthily treating the matter. We read in his Preface—"My present purpose was rather to attract learners than to teach more or less proficient students;" and in wooing a cultured public to an unwelcome subject no one can wield a more subtle pen than Dr. Hueffer. The enthusiasm, however, that added zest to his writings on the leaders of new thought in

music has here somewhat failed him. In stripping the tinsel of romance from this most extraordinary poetical movement of the Middle Ages he gives but little to entice the general reader to a deeper study. Sismondi, with a respectful if not a keen sympathy with mediaeval poetry of the cognate Latin languages, closes his account of the Provençal literature with a harsh but true statement. He speaks of the Troubadours:—"Ils ont été célébrés par tant de bouches, ils ont fourni des sujets à tant de fictions brillantes, qu'on arrive à eux tout rempli d'enthousiasme. Il est rare qu'on se retire sans dégoût." Their more brilliant poetry was in their lives and adventures, their chief interest in the stirring episodes of their time, and their greatest wonder in their sterile florescence of gilded lifeless song which, nurtured for some three centuries by valour and beauty, was destined to drop away as from a blight. If the Troubadours and their real history are ever to interest any in England but the archaeologist this is certainly one of the most fitting moments. Both periods have a certain analogy in the decrepitude of various modes of religious thought, and in the flight of poetry to the narrow cells of set forms of verse, expression, and even of feeling. Of all artistic movements the Renaissance is the one whose study now most affects us, and in the early culture of Provence we are at the real spring-head of modern art.

The great cleverness of Dr. Hueffer's book lies in his attempt at interesting us in the historical purport of his subject, and not in the romantic. We are startled at finding names so familiar and adventures so uncommon as those of Rudel or Sordello absent from the notices of the lives of certain of the Troubadours. In the case of Rudel we especially marvel that Dr. Hueffer has not quoted a little lyric addressed to the lady of Tripoli, where the Provençal form is happily blended with the Arabic recurrence of the same word in place of rhyme, and which is one of the few instances of heartfelt adaptation of apt rhetoric to sentiment. Dr. Hueffer might also, without incurring the rebuke of courting pretty triviality, have laid more glowing colour on his episodes from the life of Peire Vidal—the perfect type of the Troubadour as vulgarly imagined, and a salient figure in that class of poets of whom Empedocles was the first and Lord Byron the last example. It is upon such singers as Bertran de Born that Dr. Hueffer has bestowed most attention. As he suggests, there is ample scope in the study of this subject for the English archivist. And Bertran de Born, as the chief instigator of the warring between Henry II. and his sons, has a hold upon our history. This period, however, is not the most momentous in our annals, and even on this ground the general interest dies. Of the five great literatures of modern Europe our own has derived the slightest direct impetus from the Provençal. France, Italy, Spain, Germany, were all immediately influenced. We were affected through these. Our language was not yet in a recognised condition among our Norman nobility, and the culture of Provençal letters can hardly have penetrated beyond the Court of our early Plantagenet kings. Between

the writing of the Trouvères and Chaucer we can find certain points in common, but nothing can be more alien to the set method of the Troubadours than the clear transcript of nature given by the father of our poetry. It is needless to speculate what a really independent genius like Dante's might have worked in the language. What the Italian of the opera is at this present such in some measure was the Langue d'Oc in the Courts of mediaeval Europe, a language of set expressions on a series of familiar subjects that the cultivated could easily understand. The individuality among their poets is hard to find. What interest can we take now in their mere compilation of phrases? Their greatest poem, the *Lancelot* of Arnaut Daniel, has not reached us; and despite Dante's praise, what place can his *motz obscurs* and *rims cars* find in truly plastic art? It would have been well if these singers of love or hate had reasoned like Ermengand in his rhymed homilies:—

"Lo popol s'enueja moult leu
E play li quil fay ben e bren."

Dr. Hueffer begins with a slight account of the rise of the Langue d'Oc, and passes swiftly to the subject of Provençal epic poetry, popular and artistic. Dismissing *Ferabras* as a translation from the Northern French, Dr. Hueffer gives an epitome of *Girart de Rossilho* as belonging to the first class; and merely mentioning as belonging to the artistic epic the *Roman de Jauffre*, and Arnaut Vidal's story of *Guillem de la Bar*, lately edited by M. Paul Meyer, he dwells at some length on the *Nova* of "Flamenca." Here Dr. Hueffer really warms to his subject, and our only regret is that the purport of his work compels him to leave this most lovely of Romances. What "Aucassin and Nicolette" is for sweet colour and delicate fancy, "Flamenca" is for truth of picturing and knowledge of human nature. Between Petronius and *Gil Blas* we have no transcript of manners and ethics so complete as what we may consider the first novel of the Christian world. The style is flowing and clear. The story progresses with a sure undivided interest through its graceful pictures of mediaeval life, realised by frequent touches of cynical observation that would have done honour to a Thackeray. It is a pity that Dr. Hueffer, who combines in his translations a Teutonic fidelity of rendering with a certain sympathy of treatment that is purely English, does not undertake a paraphrase of this exquisite romance. But narrative and didactic poems are not most characteristic of the Provençal poetical movement; and after some clever and interesting writing on the social positions of the Troubadours and Joglars, we come to the popular forms of verse, the Pastorela, the Serena, and the Alba, not to be confounded with the Anbade of the French. Dr. Hueffer quotes the Alba, which Mr. Swinburne has imitated in one of his "Poems and Ballads," and appends a poetical translation of his own. In fact, all the verse translations in the book are extremely good, and, though Dr. Hueffer would almost convert us to this form of rendering, he further gives interlinear versions at the end of the book for those who prefer this generally more faithful method. After interesting accounts of the Ballada, the

Sestina, the Descort, the Breu-Doble, and the Retroensa, we come to the more typical forms; the Tenso, the Sirvente, and last but not least, the all-important Canzo. Guillem de Cabestant—the original hero of the strange history of Sigismunda—Peire Vidal, and Bertran de Born, whom we have already mentioned, and the Monk of Montaudon, each afford an opportunity for a characteristic and interesting sketch. A chapter is devoted to Beatrice de Die and the lady Troubadours, and the series includes an account of the crusade against the Albigeois, an episode naturally hurried over by the Abbé Bayle in his otherwise comprehensive *Poésies Provençales au Moyen-Âge*. The book ends with a treatise on the origin of rhyme—which we cannot but think rather fantastic and far-fetched—and with technical remarks on the rhyme, rhythm and verse-form of the Troubadours. Here lies at once their beauty and their bane. Dr. Hueffer, in writing an interesting book on a subject which is known to all men and familiar to none, is much to be congratulated. With all the defects of the Provençal poetry, let us, to quote Dr. Hueffer's own words, not be blind "to its refinement, its tenderness of feeling, its unrivalled perfection of form. The Troubadours were the first harbingers of reviving literary culture after the storms which wrecked the Western Empire. They had no models to fall back upon; for the poets of antiquity were more or less above their ken, and the simple creations of the popular mind beneath their attention. They had even to create their language from a mixture of provincial patois."

THEO. MARZIALS.

Riding Recollections. By G. J. Whyte-Melville. (London: Chapman & Hall, 1878.)

MAJOR WHYTE-MELVILLE has long ago won his spurs both in the fields of literature and the hunting-field. As a rider he can hold his own in winter in the shires, and in the summer across the sweeping moors of North Devon behind Mr. Bissett's hounds on the track of the wild deer. As a novelist, in *The Gladiators* he has shown power that almost placed him in the first rank. He loves the horse, and writes of him with the spirit of a true sportsman and in the cultured style of a man of letters. At the present day probably Mr. Anthony Trollope is the only writer possessing these singular qualifications for describing with equal spirit and knowledge the brief but stirring incidents of a run with hounds; and yet, perhaps from the very expectation of brilliant performance in such a line, *Riding Recollections* is rather a disappointing book. The truth is that the high-water mark of this class of writing was reached by Apperley in his well-known *Quarterly Review* article on the Chase; and no combination of knowledge of hunting with literary power can improve on that brilliant and comprehensive description of the favourite sport of Englishmen.

There is no doubt, however, that more men, and women too, take an interest in hunting than was the case half a century ago. The facilities of the rail make every

pack of hounds within a hundred miles of London accessible to the wealthy professional classes, who can afford money, but not time, for the pursuit; and many a busy lawyer, doctor, and merchant, devotes his Saturdays throughout the winter to fox-hunting, sending down his hunter over-night, and traveling by rail to some favourite meet. Few men who ride but like to read of riding, and to the enthusiasts of this class Major Whyte-Melville's *Riding Recollections* will recall personal recollections of their own that will add to their interest in the book, which at one time would have found readers chiefly among country gentlemen.

There is, probably, no more widespread fallacy among those whose knowledge of hunting is derived solely from its literature, than the belief that riding to hounds entails necessarily the negotiation of almost impossible fences, and that every hunting-man faces brooks, walls, and stiff five-barred gates as a matter of course. In almost every country there are hunting enthusiasts who as a fact never face a fence at all, who never enter a field unless they see a good gap or open gate to get out of it, but who, by knowledge of the country and of a fox's ways, manage to see more of the hunting than the hardest rider in the field. In Devonshire, where there are as many true lovers of hunting as in any county in England, and where hunting of some sort is pursued all the year round, the fences are almost impracticable, and from the necessity of following lanes and lines of gates, the hardest riders neither acquire nor require the habit of jumping at all. There is a story told, probably with truth, of a celebrated North Devon squire, a leader with Mr. Bissett's hounds, that neither he nor any of his horses could leap a three-foot hurdle if that feat were necessary to maintain his place. Yet from no sportsman could Major Whyte-Melville have obtained better hints for negotiating the North Devon country, and none could he follow more safely over Exmoor.

A great merit in *Riding Recollections* is that Major Whyte-Melville does his best to destroy the hard-riding delusion, and to show that it is not necessary for the enjoyment of real sport. He is not ashamed to avow that he ranks discretion before valour, that, in his own case, the stiffness of a fence does not enhance his pleasure, and that to his eyes a wall appears more and a hedge less than its real height at a certain distance off. There is nothing easier than to pop over a stiff piece of timber when mounted on a good fencer, fresh and willing; but when the good horse is pumped, and the spring taken out of him, there is no fence at which he is more likely to roll helplessly over his crushed rider. As Jem Mason, the steeple-chase rider, shouted to Lord Strathmore on such an occasion, "Eternal misery on this side, my Lord, and certain death on the other." No sensible man would leap a stiff gate if it were possible to open it. Listen to Major Whyte-Melville (p. 33):—

"If not pulled about and interfered with, a hunter that understands his business leaps timber, so long as he is fresh, with ease to himself and security to his rider. He sees exactly what he has to do, and need not rise an inch higher, nor fling himself an inch further than is absolutely

necessary, whereas a hedge induces him to make such exertions as may cover the uncertainty it conceals. But, on the other hand, the binder will usually bear tampering with, which the bar will not; therefore, if your own courage and your horse's skill tempt you to negotiate rails, stiles, or even a gate—and this last is very good form—sound discretion warns you to select the first ten or fifteen minutes of a run for such exhibitions, but to avoid them religiously when the deep ground and the pace have begun to tell."

The book closes with descriptions of stag-hunting and fox-hunting both in the provinces and the shires. The chapter on stag-hunting will somewhat disappoint the reader who has himself enjoyed the romantic sport amid the most splendid scenery in the world. He would expect something more than practical instructions how to skirt a combe, or to follow a native across the treacherous swamps of Exmoor. What recollections do the mere names of Cloutsham, Porlock, Badgeworthy, and Brendon, rouse in every man who has ever galloped throughout a long autumn day over those purple hills! What recollections does the illustration in the book of "Brought to Bay" arouse of the lovely forest glens and the rocky North Devon streams, where the antlered monarch stands at bay amid his baying foes! No man is more qualified than Major Whyte-Melville to describe such a run, with such a finish; but he has hardly attempted it, and bestows more of his descriptive powers on calf-hunting in the Vale of Aylesbury than on the genuine sport, the boast of the West country.

Of the two descriptions of fox-hunting in the shires and the provinces, the latter appears to me the gem of the book. The account of young Rapid and the King of the Golden Mines is not equal to Mr. Snob's celebrated gallop; but no better description of genuine country sport is to be found than that contained in *Riding Recollections*. Major Whyte-Melville loves Nature as well as hounds and horses:—

"There is an indescribable charm in what I may call the romance of hunting—the remote scenes we should perhaps never visit for their own sake; the broken sunlight glinting through copse, and gleaming on fern; the woodland sights, the woodland sounds; the balmy odours of nature, and all the treats she provides for her votaries, tasted and enjoyed with every faculty roused, every sense sharpened in the excitement of our pursuit."

It is but fair to state that the book is admirably illustrated by Mr. Edgar Giberne, who can draw a horse as well as could either Leech or Alken.

JAMES INNES MINCHIN.

Records of Shelley, Byron, and the Author. By Edward John Trelawny. In Two Volumes. (London: Pickering, 1878.)

WE know few works of anecdotal biography equal to this. Many of our readers will be aware that it was first published twenty years ago, under the title *Recollections of Shelley and Byron*; and, though it excited a good deal of animosity (chiefly on the ground that Mr. Trelawny recounted his having looked at the feet of the over-sensitive Byron as he lay dead, an incident which of course reappears in the present form of the book, with greater moderation

and precision of phrase), it at once took rank as a very important contribution to our knowledge of both poets; and, for several years past, those who feel serious interest in Shelley are generally agreed in thinking that Trelawny's book does more than any or all others towards giving us a real and genuine, and at the same time earnestly affectionate, likeness of the man. We say this without at all undervaluing the highly-important and interesting details supplied by Shelley's widow, which express the beauties of his mind and character rather than his personality, or the graphic semi-grotesque delineations of Mr. Jefferson Hogg. To the latter, indeed, Mr. Trelawny does ample justice in his present edition: he even does not seem to think that Hogg exaggerates, as most readers will probably persist in thinking that he does. The difference between the two writers might be expressed by saying that in the pages of Trelawny Shelley lives before us, while in those of Hogg he is put through his paces, and gambols and gesticulates to the heart's content of his biographer. And yet it is the same Shelley in both portraits, with the difference of years and experience, and also of treatment.

The present book is very considerably enlarged from that of 1858. In relation to Shelley, it must contain, perhaps, nearly double the amount of matter, while the account of Byron is in a minor degree augmented, with a sensible increase of kindness in feeling and in construction of motives: several harsh expressions have disappeared. The book being so well known already, we shall probably best fulfil our duty as reviewers by mentioning some of the principal items of new information.

As regards Shelley, we find him spoken of in the Preface as "the ideal of what a poet should be;" and remarks of his are recorded upon Byron's dramas, "all our knowledge is derived from infidels," the supposed great men of the day, jealousy (of which he had some experience in his wife Mary Godwin), "the mythical monster Everybody," and the theory of heredity. There are interesting or amusing anecdotes of how Shelley stepped over his infant Percy without recognising him; of a conversation on a bridge at Pisa, where Shelley and Lieutenant Williams gave some account of their start in life; of his taking out Mrs. Williams and her children in a boat, and, in a fit of poetic *furor* or abstraction, proposing to "solve the great mystery" on the instant; of his entering the saloon of the Casa Magni naked from a sea-bath, his clothes having drifted away; and of his earliest meeting with Mary Godwin, and separation from his first wife, Harriet, whose good qualities, and ensuing melancholy fate, are dwelt upon by Mr. Trelawny in a spirit of manly sympathy. The details published in 1875 regarding the alleged drowning of Shelley by the crew of an Italian fishing-boat are reproduced, our author adhering to his opinion that the allegation is true. Four letters addressed by Shelley to Medwin, with part of a fifth, are added; also the last letter which Mrs. Williams wrote to Shelley immediately before his death, and the brief account of the cremation written by Tre-

lawny at the time. There are also some remarks correcting certain points mis-stated by Mr. Barnett Smith in his recent volume.

As regards Byron, the question regarding his separation from his wife is debated, with the general conclusion that incompatibility of temper and habits is sufficient explanation, and that Lady Byron's accusations, as set forth by Mrs. Beecher-Stowe, should not be credited. The notes concerning Byron's last days, written down on the poet's coffin by Trelawny from the information which his valet Fletcher supplied, are given *verbatim*—a most interesting item; and there are letters from Byron and Lady Byron concerning their daughter Ada; also an account of certain supposed Byron relics which were really the belongings of Trelawny himself, and a conversation with John Murray, years after the noble poet's death, regarding the sale of his works.

The Records "of the Author," referred to in the title-page, are substantially the same as in the original edition, extending only to the date when he quitted Greece: some additional letters from General C. J. Napier, written during the Grecian revolutionary war, are inserted.

The illustrations are five in number. Two of them, the woodcuts of Casa Magni and of the Cave of Odysseus, are the same as in the first edition. Two are new: a woodcut of the burning of Shelley, after a drawing recently made of the locality by Miss Trelawny, and a "portrait of Byron, aged twenty-five, autotype from a miniature by Holms, taken from life, now in the possession of Alfred Morrison, Esq." The portrait of Shelley, from the likeness which Clint painted, founded on the oil-picture by Miss Curran and a lost water-colour by Lieutenant Williams, is a modification of the illustration which appeared in the first edition. That was a lithograph by Vinter: but, the stone not being now forthcoming, one of the lithograph prints has been autotyped, with, as we think, an improved result—the face coming out darker and firmer in modelling, and stronger in character.

We may as well correct an evident misprint on p. 173 (vol. i.). Trelawny is represented, after the arrival of Leigh Hunt and his family at Lord Byron's residence in Pisa, as saying to his lordship, "The Hunts have effected a lodgment in your palace." So characterless an observation was not, and is not, in Trelawny's style: it should no doubt be "the Huns," not "Hunts."

We will only add that Trelawny's merits as a biographer consist mainly in clear insight, the power of saying exactly what he means in language that is at once plain, terse, and pointedly descriptive, without any amplifying or circumlocution; and a wholly unconventional tone and temper of mind. He observes well, remembers well, and expresses well. His first book was avowedly put together without any effort at exactness of arrangement; and the present reissue follows suit—which is not to be objected to. Wherever you open the book, you find some matter of interest, and you continue reading on and on, without wanting to stop, or to pursue a more rigidly consecutive course.

W. M. ROSSETTI.

Lettere di una Gentildonna Fiorentina del Secolo XV. ai Figliuoli Esuli. Pubblicate da Cesare Guasti. (Firenze: Sansoni, 1877.)

It is a rare good-fortune to be able to leave the beaten paths of political or literary history in so remote a period as the fifteenth century, and trace the simple elements of life and character as they are shown in private and intimate relationships. The materials for Florentine social history in the fifteenth century are tolerably copious; but they are in many points perplexing. The contradictions which they offer are hard to reconcile. The political and social corruption wrought by the Medici may be easily portrayed in dark colours; but if we turn to the pages of Vespasiano de' Bisticci we find an atmosphere of idyllic simplicity and freshness which lends an entirely different light to the picture. The more we look into the actual details of the history of Italy in the fifteenth century the more chary do we become of general statements. We feel that the fullness of life and the diversity of character which then existed cannot be reduced to a definite shape, though no doubt they may be used to lend colouring to any partial picture which a writer chooses to put forward. We should perhaps be nearer to a just understanding of that epoch if we were to recognise that its main interest lies in perceiving the depth and thoroughness of the individual's self-realisation, rather than in trying to gather materials for political speculation or sociological theory.

The letters of Alessandra Macinghi negli Strozzi, which Signor Guasti has edited with scrupulous care, give us an insight into the daily life of Florentine citizens at a most important epoch in the history of the Republic. The earliest of these letters is dated 1447; the last, 1470. They are written by a widowed mother to her exiled sons, and consequently are full of the small details of daily life and business. They are in no sense great literary productions; Donna Alessandra was not a scholar or a learned lady, nor was she in any way remarkable among her contemporaries. She was a plain, sensible, pious woman, an affectionate mother, and endowed with a great deal of practical wisdom. Her letters have nothing to claim for them an exceptional interest; they are the ordinary letters of a mother to her sons. Of course few Florentine mothers had need to write so much to their sons; but the doom of exile had fallen upon the Strozzi family, and Alessandra's maternal heart was grieved by the pain of separation from the sons she loved so well.

At the age of sixteen Alessandra Macinghi married Matteo Strozzi, a learned man, who delighted in the studies of the early Renaissance, and left his books with difficulty to take part in the affairs of Florence. In the struggle between the Albizzi and the Medici Matteo strove to be impartial, but it was of no avail. On the return of Cosimo in 1434 Matteo was exiled and left behind him his wife, who was only of the age of twenty-eight, with seven children. Early in 1436 he died, just before his wife gave birth to another son. Three of the children died, but the young widow of thirty had to bring

up five of them on her own responsibility, and had need to use all her prudence and economy to manage the task. As the sons grew up they went away to the offices of their cousins, who were glad to give the youths an opening in life. The eldest went to Naples, the second to Bruges. Trade prospered with them, and they had hopes of raising again the fortunes of their house. But in 1458 the mother's heart was shattered by a law which exiled for twenty-five years longer the sons of those who had been exiled in 1434. It was not till ten years later that the ban was removed from the two Strozzi brothers, owing to the earnest request of King Ferdinand of Naples, who was under obligations to the Strozzi bank. Alessandra was able before she died in 1471 to see her two sons restored to their rights as Florentine citizens, and married to two Florentine wives.

The letters of Donna Alessandra are useful for many purposes. They give from time to time many political notices which are important; thus it is very noticeable that Alessandra set her hopes more on the Medici than on their opponents, and expresses her conviction that Luca Pitti was a slight man who would never succeed. These letters are also full of details which are most valuable for the social, financial, and economic history of Florence. We have the details of the arrangements relating to the weddings of Alessandra's two daughters and the payment of their dowries: we have brought before us the incidence of taxation and the difficulties which it caused; the ravages wrought by the plague, and its frequent recurrence; the care which Alessandra took of her son's wardrobe; the things which she made for him and sent him from Florence; and the things which, in return, she imported from Naples. Suchlike questions of family management come before us in entire simplicity; but still more interesting than these are the searches which Alessandra made among the young ladies of Florence to find fitting wives for her sons, and the reports which she sends them on this subject. Neither Alessandra nor her sons thought of any wife save a Florentine; but it was not easy to find a Florentine lady who would be given in marriage to an exile. For several years Alessandra was unwearied in her search, and gives descriptions of the personal appearance, character, and accomplishments of the ladies she recommends from time to time, and also some account of their family and their pecuniary prospects.

But there is a still deeper interest than this attaching to these letters; it is the character of the writer and of her sons to whom the letters are addressed. As we read, one after another, the seventy-two letters which this volume contains their simplicity becomes most eloquent, and a deep impression of the massiveness of the character of the writer is left upon our mind. There is nothing flighty, nothing sentimental; all is serious, sober, and business-like. Alessandra was not learned, but she certainly had great intellectual capacity and practical force. She had deep and strong feelings, but they were always kept under restraint. She was simple in character, but possessed a clear insight into the

meaning of things. She faced without a murmur the difficulties of her lot and of her position; self-summed and self-contained she was always ready to submit to God's will and do her duty to the utmost, so far as she saw it. Her piety was most genuine, and was the mainstay of her life; but it was something entirely personal to herself and was not seated in formulae, or priests or ceremonies, to which she never refers. She writes a wonderful letter to her eldest son on receiving from him the news of the death of his youngest brother. It is too long to quote at length, and extracts would not show its force as a whole. But the contending feelings of her strong nature are there clearly seen at work, deep grief and entire submission, a feeling of the need to curb her own grief lest it increase that of her son, a practical sense of his double value to her now that his brother is gone, a tender care of his health which she allows to distract her sorrow. All tends to show a nature at once deep and strong, which has a clear conception of the meaning of life and its duties, which can at once feel deeply and act wisely. If such was the Florentine matron of the fifteenth century we do not wonder that the Florentines were a mighty stock. Already Dante in his own day had complained of the decay of Florentine manners, and had looked back to the heroic age of Bellincion Berti and his fellows. But a reader of the letters of Alessandra Macinchi negli Strozzi would find in them the representation of the manners of the heroic age of the modern world of commerce, of the days when prudence and shrewdness were joined with piety and uprightness.

M. CREIGHTON.

NEW NOVELS.

A Struggle for Rome. Translated from the German of Felix Dahn. By Lily Wolffsohn. (London: R. Bentley & Son, 1878.)

Hathercourt Rectory. By Mrs. Molesworth. (London: Hurst & Blackett, 1878.)

Honour's Worth. By Meta Orred. (London: Chapman & Hall, 1878.)

A TRANSLATED historical novel, in thirteen hundred pages, dealing with a subject of which the general reader has, it may be feared, hardly any knowledge whatever, may seem at first sight a somewhat formidable work. We confess that it was not with lively anticipations that we began *A Struggle for Rome*. But a very few pages sufficed to show us that there was no need for fear, and, long as the book is, we read it through with very great interest and pleasure. The subject is the fortunes of the Goths in Italy, from the death of Dietrich of Bern to the last fatal conflict at Vesuvius, and the author, Herr Felix Dahn, appears to have composed it in the intervals of his historical studies on the same period during the last twenty years. We venture to suspect that this slowness of composition has not a little to do with the merits of the book. Those merits, indeed, depend mainly upon the author's faculty of imagining and delineating character, a faculty which is, it need not be said, quite independent of historical

knowledge or ignorance. But his familiarity with his subject, and the patience with which he has set about his task, have enabled him to complete his drawing with a firmness and elaboration which the monthly novelist who writes not at ease can scarcely attain unto. Herr Dahn has adopted the safest of all plans for rendering historical subjects capable of fictitious treatment, the selection for central figure of some imaginary or half-imaginary personage, in bodying forth which the artist is not cramped by fact. In this case the hero is Cornelius Cethegus Caesaris, Prefect of Rome, who is represented as the moving spirit in a last attempt to play off Byzantines against Goths, and thus recover the independence of Italy. The historical events and personages are made to square with this very skilfully, but the character of Cethegus remains the chief point of interest. Herr Dahn has succeeded admirably in creating a type of the Italian character as it may be supposed to have been half way between the Caesar whose name was Julius and the Caesar whose name was Borgia. The steady envisagement of a great and noble end, and consequently the utter indifference to the nature of the means, is the abstract idea of the character, but Cethegus is not at all painfully abstract. Round him are drawn all the historical illustrations of the time from Justinian and Theodora to Procopius and Alboin. Perhaps the length is excessive, and the multiplication of personages may be rather bewildering to those who have not even reminiscences of their Gibbon to help them. This, however, is not the author's fault; and if he perchance succeeds in sending a few people to Gibbon, or to Procopius himself, so much the better. Miss Wolffsohn has on the whole done her work very well, though some of her Latin titles, &c., would be the better for a little revision. It is rather too bad also to make "Thule" rhyme to "cool." But these little slips do not occur very often, and such passages as the death of Amalaswintha in the Lake Castle of Bolsena, and the final battle at Vesuvius, lose very little in the translation.

Mrs. Molesworth, who first made herself known under the pseudonym of "Ennis Graham," as author of a little story called *Carrots*, has written in *Hathercourt Rectory* a capital domestic novel. She is probably herself ignorant of the strong resemblance which admirers of *Pride and Prejudice* will find in her main situation to the situation of that admirable book. But when we say that Mary Western reminds us pleasantly even of Elizabeth Bennet Mrs. Molesworth will see that we are paying her a very high compliment indeed. We wish she could have made her quartette happy without breaking a very delightful damsel's back, and killing off a harmless youth with hereditary consumption, but she may justly retort upon us that little accidents of this sort do very frequently make other people happy in this universe of compensations. The great charm of the book is, in the first place, its thoroughly bright and healthy tone; and, in the second, the excellence of its dialogue, which, without being at all witty or brilliant in the impossible

Congrevian manner, brings out the characters capitally, as dialogue ought to do. If we were not afraid of offending Mrs. Molesworth, and bringing down on our heads a quotation from Lamb about "il-liberal comments," we should request her in future to pay a little more attention to the auxiliary verbs of the future tense and the conditional mood. Error on this point is a trifle, no doubt, but it is one which is extremely irritating to the nerves of the feeble folk who dwell south of the Tweed.

We confess to being slightly bewildered by Miss Orred's book. The conversation and the feelings of some of the characters are altogether too wonderful and excellent for us, and the conversation and conduct of some others are not nearly excellent enough. We do not know which we like less, a lady who says "of course, being in India and all that, you did not hear," or a lady who remarks that "lives seem sometimes so uncompleted; of course in the hereafter—." Nor do we care to choose between the gracious dames who flirt crumbs of bread across the breakfast-table of a country house at their gentlemen friends or the noble colonels who are always fainting and looking "gray and awful," and generally performing extraordinary antics. There is a good deal of very elaborate description of the kind which consists in comparing everything to something quite different—the night to a flower, an odour to a sound, and so forth. There are also some really good *tableaux vivants*, which must have done the stage-manager credit. But the main story consists of the loves, first, of the young woman who talks about "the hereafter" with the gray and awful colonel; secondly, of those of another young woman, whose language is nowise inferior, with a young man who has neither means nor profession. Both courses run anything but smoothly; in neither, however, are the impediments of a very comprehensible nature to the outsider, who chiefly perceives that some things come right at last and others do not. Besides the characters just mentioned there are a great many others. There is a privileged person who makes remarks for which in real life he would probably have been kicked down stairs, a monkey, a white cat, a very nice little girl, a foolish old person who plays the violin, a divine painter with a drunken Italian wife who habitually upsets his easel, &c., &c. If the central figures had the least notion of behaving with the ordinary reticence of English ladies and gentlemen, instead of rhapsodising and fainting and tumbling about in all directions at the slightest provocation, there might be something to be said for the book; but, as it is, it is heavily weighted.

GEORGE SAINTSBURY.

CURRENT LITERATURE.

Memoirs of Georgiana, Lady Chatterton. By E. Heneage Dering. (Hurst and Blackett.) We will not say that Lady Chatterton deserved a better biographer, but she certainly deserved a better biography. We never hear so much as when she was born, still less are we told the dates of her three great sorrows—the deaths of her aunt, her father, and her mother. Even the date of her first marriage is left as a matter of inference: for it did not interest her in writing her recollections

to put down dates precisely, and apparently it did not interest her second husband to fill in such details. Her recollections, which form the first and most interesting part of the volume, need a great deal of annotation if they are to be fully enjoyed, and we have very little; though when a remark occurs to the editor, as that Holford House has the pleasantest site in London, he is never at pains to suppress it, and, *à propos* of a casual mention of the late Mr. Maurice, we are favoured with an interesting excursus upon the grounds on which devout Roman Catholics may have hopeful views of his eternal prospects. In the second part of the book, which is written entirely by Mr. Heneage Dering, we have a great many letters from Dr. Ullathorne, who superintended Lady Chatterton's slow and conscientious conversion to the Roman Catholic faith, and all the letters have a perfect right to a place in a *Life of Bishop Ullathorne*. In a *Life of Lady Chatterton* one of them, or extracts from two or three, would have been quite enough to enable us to appreciate her real distinction among clever and hyper-sensitive women. Like them she was tormented by her own subjectivity; like many of them, she had the sense to see that she wanted advice: few of them perceive so clearly as she did that what is wanted is advice for the soul rather than advice for the body. She had cleverness and perseverance enough to keep herself well before the public for many years as a fashionable novelist, who, if she never made a great success, never fell below a *succès d'estime*. Mr. Heneage Dering, who has a right to speak, because he helped to write her most successful novel, and is himself the author of one of the most respectable novels with a purpose, thinks that the limit of her success lay partly in her health, which prevented her from working out her ideas elaborately, and partly in an ethical standard too high to be really popular. Perhaps the idealism which always distinguished her made it hard to meditate upon the mere realities of life; all her meditations turned to aspiration and to the means of vindicating our right to aspire. In spite of her earnestness and disinterestedness, she did not succeed in reaching the goal of her own aspirations till the shadow of death was upon her. All her influence was thrown into the support and even the propagation of a creed which she was not able to profess. Apart from this trouble, her life seems to have been singularly happy; her deafness did not interfere with her attaining a large measure of social success, which she deserved by her sweetness and decision. There are some amusing anecdotes of Lady Cork and Lady Blessington, who told her that her deafness, like Harriet Martineau's, was due to intellectual overwork.

DR. NEWMAN dedicates the new edition of his *Essay on Development* (Pickering), as his latest work, in language of exquisite felicity, to the President and Fellows of Trinity College, Oxford, of which he is once more a member. Several sections of the book have been rearranged; the most important of the annotations is a piece of ferocious Erastianism from the *Quarterly Review* of 1873, quoted in support of the thesis that the persecutors in will or in deed of modern Roman Catholicism are the true heirs of the spirit of the persecutors of primitive Christianity.

An Essay on New South Wales, the Mother Colony of the Australias, by G. H. Reid (Sydney), may be recommended as a thoroughly trustworthy, able, and comprehensive account of the condition, resources, and prospects of this part of Australia. It is the description of a country as extensive as France and the United Kingdom put together, with an excellent climate, almost unlimited resources for pastoral and agricultural enterprise, abundance and variety of timber trees, treasures of coal, iron, gold, copper, and tin, and fine seaports, under a stable and powerful Government, prosperous and happy in every respect, and lacking in nothing but in more men to aid in developing its vast resources. The chief aim of the essay is to urge on the home country

the encouragement of emigration to our own colonies in Australia. It would, indeed, be difficult to point to richer fields than these for the surplus labour and capital of the United Kingdom; and yet, unhappily for Australia, the current still sets in other directions, the United States absorbing the one and Europe borrowing the other—much of it never to be repaid.

Gesta Romanorum. Translated by the Rev. Charles Swan. Revised by Wynnard Hooper, B.A. (Bell and Sons.) This revised edition of the standard translation of the *Gesta Romanorum* is a most useful addition to our stores of mediæval fable. Mr. Swan's translation, originally published more than half-a-century ago, was produced not from any scientific impulse but merely to furnish a book of quaint and entertaining reading. In those days there were probably not half-a-dozen scholars in Europe who fully grasped the important place which popular fable holds in the history of law and social growth. As Mr. Swan was not aware of this he was not to be blamed for making his book loose in texture—aiming at catching what he thought the spirit rather than the letter of what was before him. By so doing he has, however, rendered his book far less useful than it might have been, and in one instance, at least, has directly altered the moral of a story for the sake of making it fit in better with modern notions. Mr. Hooper has corrected most of the flagrant errors of this kind, and introduced many minor improvements. He might have gone still further with advantage, and cut out many of the original translator's watery notes. We do not think a better book than this is on the whole could easily be made on the basis of Swan's translation, but we would suggest that an entirely different plan might be followed with advantage. The Latin versions differ much among themselves, and the Old English and other early versions in the vernacular contain matters of great interest. A complete edition of the Latin originals and their early versions should be produced, and from this a translation made that should give all the tales without the repetitions which would be needful in reproducing the early texts. Where the tales varied it would be proper to select the earliest form and give the variations in a note. Until something of this kind is done the student who uses this or any of the other modern books about the *Gesta* has the uneasy feeling that if he could but get to the fountain head he might find the legends which interest him told differently, or in a simpler and more instructive form.

Driven to Rome. By an Ex-Anglican Clergyman. (Williams and Norgate.) We are told on the title-page that the author of this book has been a clergyman of the Church of England, and he gives us something which we gather to be an extract from, or synopsis of, one of his sermons. Had it not been for these things we should have come to a pretty confident conclusion that the writer was not old enough to have taken deacon's orders. The object of the book is to find fault with existing religious organisations, or at least with the human beings who work them. Whether the author thinks that he has written a book in favour of or against the Latin Church, we do not know. Careless readers may possibly surmise that it has similar objects to those aimed at by such tales as *Geraldine* and *Loss and Gain*. To compare them in any way would be absurd; but even the object seems different. Only a few people can set forth in print with effect those things they have seen and known; no one, surely, except in farce or wild romance, would try to portray those things with which he was not in some degree familiar. Yet we suppose this book is meant to be regarded, in some sort, as a picture of life as it is now in clerical society and that part of the outer world which is influenced by clerical ideas. If that be its object, nothing that we have ever seen can less perfectly accomplish its end. Southey tells us that when Hartley Coleridge was a child he invented a history of the kings of England who

were to be in the future. When asked how he knew that the things he told of would happen, the boy replied, "It must be something or it would not be in my head." This, surely, was an unanswerable argument. If the ex-Anglican clergyman had but used it, we should have known what to make of him, and could have shrewdly guessed what the "something" was and whence it had come. As he has not put in this plea, we must confess ourselves to be quite in the dark both as to the "something" and its origin. We will not, of course, take upon ourselves to say that the Macdonalds, the Lamorts and the Joyces of whom we are told so many strange things may not be accurate pictures of the clerical Englishman of some future period, though we cannot reconcile our imagination to the notion that our countrymen will ever degenerate quite so far; but of this we are certain, that it would be impossible to find anything bearing even a remote analogy to them in contemporary life. It is just possible that, notwithstanding the Introduction, we may be misjudging the book altogether—that it is but a romance, not intended to bear any constant relation to the things around us. If this be so, a few dragons, ghosts and fairies, or some spirit-writing at least, should have been thrown in that we might have known in what region we were travelling. The ex-Anglican clergyman quotes a great number of books. If he had carefully read through even one quarter of them, he could not, one would charitably hope, have written on grave subjects in the loose manner he has now done; and his style might have been so far matured by the process as to have precipitated some at least of the slang with which it is at present turbid.

The Colloquies of Erasmus. Translated by N. Bailey. Edited with Notes by the Rev. E. Johnson, M.A. (Reeves and Turner.) If an English classic is to be edited, literary honesty requires that every word and letter shall appear, so far as possible, exactly as the author put it; but is there any reason why the same rule should apply to a translation? It is true, a translation may rise almost to the rank of a classic, and this seems to be what is claimed for Bailey. Bailey's translation of the *Colloquies* is, indeed, an excellent one. It is clear, however, that Bailey made a wise use of his predecessor, Sir Roger l'Estrange, and one is half inclined to regret that a judicious castigation was not applied to his own work, with a view to bringing it a step or two nearer perfection. But as Bailey was to be reproduced *literatim*, it is safe to say that the work could scarcely have been better done. We have not noticed so much as a misprint, except the transposition of "ac" and "ad" in the Latin quotations on page xix. No one will complain that the notes are in excess. The few there are are judicious and accurate.

The Slavs and European Civilisation. A Lecture delivered at Sion College, February 23, 1878. By Arthur J. Evans, B.A., F.S.A. (Longmans.) Mr. Evans's lecture reminds us throughout of his book on Bosnia, not merely by the selection of subjects treated of, but also by its enthusiastic tone, and poetical, occasionally florid, style. Of course it was addressed to a sympathetic audience, and argument is consequently its weakest point. As a man to whom nothing human is alien, the writer of these few lines is ready enough to accept Mr. Evans's high estimate of the Slavs, without therefore approving of his unsympathetic remarks about the "Ogres." But at the present moment it is, perhaps, exorbitant to expect impartiality of an Englishman writing about the East of Europe. Otherwise, we would observe that the century-and-a-half arrest of Ottoman conquest in Europe, placed by Mr. Evans (p. 13) to the credit of his Bulgarian and Servian friends, is commonly attributed to the efforts of the rival "Ogres" of Hungary and the non-Slavonic House of Hunyadi. When we first read the lecture it struck us that one of the greatest of Slavonic countries was, like the effigies of Brutus and Cassius, conspicuous by its

absence. Reading it a second time, however, we find that the name of Poland does occur. But still, in a general way, it is fair to say that Mr. Evans's Slavs are the Slavs south of the Danube.

Chums: a Tale for the Youngsters. By Harleigh Severne. Illustrated by Harry Furniss. (Griffith and Farran.) This is a boys' book of a familiar type, though it has certain novel features of its own. The school is a "dame's school," and the hero is described as "not more than six or seven years old." The usual wicked boy turns up to act after his kind, and of course he meets with his due. But none of the other characters possess those angelic virtues which are commonly ascribed to the not-bad boys in books of this sort. The chief merits of the writer are that he has thrown himself with considerable skill into the personation of the little man who describes his own adventures; and that every chapter runs over with that ebullient restlessness and insistance upon trifles which is the most characteristic mark of young folk. His boys are natural, because they are ever at mischief, but their mischief is prompted by the innocence of kittens and not by the malice of monkeys. We cannot say that the story is much helped by the romance running through it that centres round the hero's father, or by the art of the illustrator. But on the whole we can recommend it as interesting and wholesome reading for the class to whom it is addressed.

The Civilisation of the Renaissance in Italy. By Jacob Burckhardt. Authorised Translation, by S. G. C. Middlemore. 2 vols. (O. Kegan Paul and Co.) Everyone who has read this book in the original, and observed the growing interest in its subject of late years, must have wondered that it had not been translated long ago. It is an excellent historical essay upon the social and political causes and effects of the Italian Renaissance, written with considerable literary skill and taste, with perfect sobriety of judgment, and founded on real erudition. It is a model book of its kind, and we only regret that its scope was not extended, and that its author had not dealt also with the contents, as well as with the surroundings, of the literature and art of the Renaissance. The object which the writer has set before himself he has carried out admirably, and has given a lively and sympathetic picture of Italian civilisation in the fifteenth and sixteenth centuries; yet there is no straining after effect, no delight in rhetorical antithesis, and none of those violent contrasts or over-refinements to which French and English writers on this period have accustomed us. Mr. Middlemore's translation is careful, yet fresh and idiomatic: he has done justice to his author, and the book is as readable in its English dress as it was in the German. We are only sorry to see that it is left without an index, an addition which it well deserves.

NOTES AND NEWS.

MR. H. SWEET is engaged in the preparation of a new edition of his *Anglo-Saxon Reader*, the first edition being already almost exhausted. The texts, grammar, glossary and notes will be thoroughly revised, and the results of recent investigation at home and abroad will be utilised as far as possible, so as to keep the work up to the present level of Old English philology.

MR. ROBINSON ELLIS has relinquished the task of bringing out an edition of Homer's *Odyssey*, xiii.-xxiv., and has placed his materials in the hands of Mr. Butcher, Fellow of University College, Oxford. Mr. Ellis is at present preparing an edition of the *Ibis* of Ovid.

MR. D. B. MONRO will shortly, we are glad to learn, bring out a first instalment of his long-expected work on Homer, in the shape of a volume on the peculiarities of Homeric Grammar.

DR. R. WÜLCKER has been examining the literary remains of the great Old English scholar

Dr. Grein, who died last year. Dr. Wülcker has undertaken to bring out Dr. Grein's nearly completed re-edition of *Beowulf*, utilising his own collation with the MS. Also to re-edit the *Bibliothek der angelsächsischen Poesie*, first collating all the texts with the MSS. Dr. Wülcker further promises to continue the series of Old English prose texts, of which Grein published a single volume. May he be able to carry out these arduous and extensive enterprises speedily and successfully!

THE Duke of Devonshire, having at first lent nine of his Shakspeare Quartos for the series of facsimiles to be executed by Mr. Griggs under Mr. Furnivall's superintendence, has now kindly lent eleven more—namely, those of *Richard II.*, 1597 and 1608; *Love's Labours Lost*, 1598; *Romeo and Juliet*, 1599; *The Merchant of Venice* (Heyes), 1600; *Lear* (the first), 1608; *Troilus and Cressida*, 1609; *Othello*, 1622; *Henry V.*, 1608, and the *Whole Contention*, 1619. The first set of nine Quartos have been all duly photographed; the second set of eleven will be so during the next seven weeks. Others will be taken meantime in the British Museum, so that the negatives of the two dozen most important Quartos will be in hand before the Series starts. The last dozen will probably be secured before the season closes.

MR. HENSLEIGH WEDGWOOD is revising his *Dictionary of English Etymology* for a new edition.

MR. T. H. HALL CAINE, of Liverpool, is writing a small book on the mythopoeic side of Shakspeare's art. He is to read a paper on "Shakspeare Supernaturalism" at the first open meeting of the Liverpool "Notes and Queries Society" on July 1 or 8, at which Prof. Dowden is to take the chair. The proceeds are to go towards the formation of a Liverpool Shakspeare Society.

MR. ALEXANDER WOOD has succeeded Mr. Charles Walker as editor of the *Ecclesiastical Art Review*.

MESSRS. COLLINS, SONS AND CO. are about to publish, in their series of English Classics for Schools and Colleges, Scott's *Lay of the Last Minstrel*, with Introduction and Notes by James Morison.

THE Cambridge University Press has arranged with Mr. J. S. Reid, Classical Lecturer of Christ's College, to prepare for early publication an edition of Cicero's Dialogues *De Senectute* and *De Amicitia*. An edition of the *Agamemnon* of Aeschylus, with a translation in English rhythm and notes by Prof. Kennedy, will shortly be brought out by the same press.

THE June number of the *Jahrbücher für Nationalökonomie und Statistik*, founded by the famous Hildebrand, of Jena, now edited by Prof. Conrad, of Halle, contains an elaborate exposition by Adolph Samter of his doctrines respecting property, which may interest English readers desirous of ascertaining the views of the new schools of political economy in Germany to whom the general name of *Kathedersocialisten* has been given, though their doctrines really differ essentially in practical objects and tendency. Herr Samter, who is not a professor, but for many years a merchant or banker at Königsberg, belongs to the extreme left section of the *Kathedersocialisten*, or the section inclining most to Socialism in the English sense, and in the present essay in Dr. Conrad's *Jahrbücher* his fundamental idea seems to be that private property ought not to be regarded as absolute, or independent of all right of the community. A new feature of the present number of the *Jahrbücher* is the commencement of a series of descriptive lists, for the convenience of German readers, of the works of French and English economists, including, so far as can be ascertained, their writings in periodicals. The series begins with Mr. Cliffe Leslie's chief publications.

THE Curators of the Schleiermacher Fund in Berlin offer a prize of 600 marks for the best essay on Schleiermacher's "Doctrine of Temperaments and their Influence on the various Spheres of Intellectual Life." The essays must be handed in before November 21.

A SOCIETY at Leipzig offers a prize of 700 marks for a collection of authenticated Slavonic names borne by villages or country districts in the German Empire.

MR. MACGAHAN, author of *Campaigning on the Oxus*, and *Under the Northern Lights*, and the well-known special correspondent of the *Daily News* at Constantinople, died in that city on the 9th inst. The death is likewise announced of Mr. William Cullen Bryant, on the 12th inst., in his 84th year; of Mr. E. Spender, founder and chief proprietor of the *Western Morning News*, and author of a volume of travels in Norway; and of the Rev. Robert Stirling, D.D., minister of the parish of Galston, Ayrshire, of which he wrote an account. He was the inventor of an air-engine which was first patented in 1816.

THE *Journal of the National Indian Association* for June (C. Kegan Paul and Co.) contains two articles worthy of attention, suggested by the recent famine in Southern India. The first, signed "R. H.," is sensible in tone, if not very definite in suggestion. The second, entitled "The United Empire and the Indian Peasant," is contributed by Miss Florence Nightingale. It is, we trust, a fortunate symptom for the future of India that this illustrious woman has extended her active sympathy to that country. She here delivers an impassioned appeal, somewhat in the style of Victor Hugo's dithyrambic prose, to all who can assist in ameliorating the permanently helpless condition of the native cultivator. The glory of the empire is staked on this question much more deeply than on the issue of diplomatic and military events.

MESSRS. FIRMIN-DIDOT AND Co., of Paris, have issued the first volume, containing the letters A to M, of a Supplement to Brunet's *Manuel du Libraire et de l'Amateur de Livres*. The last edition of this invaluable work was completed in 1865, and its venerable author died two years afterwards in the eighty-eighth year of his age, leaving behind him a considerable collection of notes, corrections, and additions, destined to form a supplement to his great work. These notes having unfortunately disappeared, Messrs. Pierre Deschamps and Gustave Brunet have undertaken the laborious task of describing a large number of works which were either unknown to Brunet or passed over by him as being then of but little value. The taste which has of late arisen and caused such enormous sums to be given for early editions of the French poets and dramatists of the sixteenth and seventeenth centuries, as well as for books illustrated with the designs of Eisen, Moreau, Gravelot, Boucher, Cochin, Marillier, Choffard, and other artists of the eighteenth century, has necessitated large additions to such headings as those of Molière, Boileau, Corneille, La Fontaine, Le Sage, Olémet Marot, and the Lyonnese poetess, Louise Labé. Considerable additions have been also made to the bibliography of the romances of *Amadis de Gaula* and *Lancelot du Lac*, the *Melusine* of Jehan d'Arras, and the *Roman de la Rose* of Guillaume de Lorris, and to that of the novels of Boccaccio, Cervantes, and Marguerite de Valois, Queen of Navarre. Much has been added to the notices of the editions of Aesop, Cicero, Horace, Livy, and Longus, as well as to that devoted to the countless editions of the *De Imitatione Christi*. The headings Bible, Heures, and Missale have been greatly extended, as have in a lesser degree those of Catalogues, Costumes, Chroniques, Discours, Entrées, Histoire, Lettres, Mémoires, and Mystère. Bibliographies are given of the writings of the late Ambroise Firmin-Didot and of works relating to

Mdme. de La Vallière and to the Libri controversy. Calvin, Luther, Melancthon, Bossuet, and Fénelon receive important additions to the literary history of their works, and much valuable information connected with the arts of design may be gleaned from the articles devoted to the *Ars Moriendi*, the *Alphabets xylographiques* of the Bibliothèque Nationale, the ornamental designs of Charles Mavelot, the architectural works of Jacques Androuet du Cerceau and Jean Le Pautre, the *Danse Macabre*, the works of Holbein, and the numerous books on lace and embroidery collected together under the heading *Dentelles*. Errors and omissions are inevitable thorns in the path of every bibliographer, and must therefore be leniently dealt with, especially when, as in the present case, the work has been entered upon as a labour of love, and well and conscientiously carried out.

MR. JAMES CROSTON, F.S.A., has printed for private circulation a pamphlet on the history of the "First Free Library in Manchester," from which it appears that as early as 1636 the Stanley Chapel in the parish church was set aside with the consent of Lord Strange (afterwards the martyr Earl of Derby) for the use of a library. Whether this was intended exclusively for the use of the clergy, who formed a collegiate body, is not certain. In 1653 the Jesus Chantry was given by its possessors as a depository for a collection of books bequeathed by John Prestwich. The maintenance and repair of this building was charged upon the local rates, as Mr. Croston shows by extracts from the records of the court-leet. The library was augmented by a bequest of Humphrey Chetham, and a catalogue of its 65 folios and 137 quartos may be seen in *Notes and Queries* of last year, having been disinterred by Mr. J. E. Bailey. An earlier instance of a free town library is that founded at Bristol in 1613 by Mr. Robert Redwood, who gave his lodge for the purpose. This foundation, after a period of alienation as a subscription library, is now, we believe, part of the public library of Bristol.

THE rapid disappearance of the *patois* of the Vaud, which has for some time past almost equally distressed the scholars and patriots of the Canton, has led to the foundation of a society for the preservation of the fragments which still remain. The members propose to follow out the plan of the Deutsch-schweizerische Idiotikon, to save the remains of the various dialects of the Vaud from their threatened extinction by collecting them and providing them with a glossary, and thus hand them on to the coming generations. The society will subdivide itself into local sections, each taking one of the more important local dialects as its peculiar share. It also intends to publish a monthly paper as a means of communication between the members. The members ask for the contribution of any proverbs, sentences, rhymes, or literary productions in *patois* which appear to be worth saving, although they do not bind themselves to print everything which may come into their hands.

ACCORDING to the recently-issued half-yearly Report of the Prussian Ministry of Instruction, for the winter of 1877-78, 924 teachers have been actively engaged in the nine Prussian Universities, the Lyceum of Braunsberg, and the Academy of Münster. Of these, 466 are ordinary professors, 7 honorary professors, 208 extraordinary professors, and 243 Privat-docenten. In the same winter half-year the total number of matriculated students (this excludes the hearers of lectures) has amounted to 8,801, of whom 7,635 were Prussian subjects. Berlin had the largest attendance, with 2,834; Breslau follows next, with 1,253; then Göttingen, with 900; Bonn, with 859; Halle, 854; Königsberg, 655; Greifswald, 460; Marburg, 415; Münster, 303; Kiel, 242; and Braunsberg, with 17. The total number of "hearers" was 2,340. Berlin had 2,172 of this total, and Bonn 86.

IN the delayed April number of the *Library Journal* Mr. Axon suggests that courses of lectures should be delivered in connexion with libraries, showing the right way to read and indicating the best books on some specific topic or class of literature. Similar suggestions have often been made in France in the *Bulletins* of the Société Franklin. There is no doubt that a great deal might be done in this way, not only to stimulate curiosity, but also to direct students who would otherwise waste time over inferior books. Annotated catalogues do something; and excellent results have been attained in more than one American town by articles in local papers enumerating and characterizing the books in the town library upon some question of the day. But more than all might be done by a zealous and intelligent librarian always ready to give advice and help in individual cases. The librarian of the future ought to be the "people's professor." But then he must be better qualified than the librarian mentioned in Mr. Mullins's paper on "The Standard of Library Service," who referred "an enquirer who wanted information as to a bust of Lord Nelson to the Statutes at Large," and the librarians he says he could find us who would refer a student of the Anglo-Saxon period to Lord Macaulay's History! Mr. Homes, of the New York State Library, in a paper on "The Selection of Books for Popular Libraries," asks for the best method of furnishing thousands of librarians with impartial lists from month to month of books worth purchasing, and suggests that competent readers should send the titles of books read and approved for general reading for publication in the *Library Journal*. The greater part of the number is filled with news and with Mr. Cutter's very careful notes on new publications in bibliography and library literature.

NOTES OF TRAVEL.

THOUGH he is not sanguine enough to expect that China will in a few years be covered with a network of railways, Mr. G. J. Morrison, the late engineer of the Shanghai-Woosung line, has been endeavouring to make himself practically acquainted with the districts through which main lines will have to be constructed if the country is ever "opened up." With this end in view, he travelled early this year from Hankow to Canton, partly through regions where Europeans had probably never been seen before, and he has furnished a lengthy account of his journey to the *North China Herald*. The distance in a straight line is about 525 miles, but by the route Mr. Morrison took it was 860 miles, and he accomplished it, partly on foot and partly in boats, in six weeks. The chief places visited, after leaving Wu-chang, the capital of Hu-peh, were Yo-chow, Siang-yin, Chang-sha, the capital of Hu-nan, Siang-tan, a very populous and important commercial mart with large suburbs extending for two and a-half miles along the river, and Lei-yang in the coal districts. About eighty miles further on he crossed the Chih-ling pass, the summit of which is at the watershed between the basins of the tributaries of the Yang-tze and of the rivers of Kwang-tung, and thence journeyed to Canton by way of I-chang, Ping-shih, Lo-chang, and Shao-chow. Mr. Morrison was much interested in the examination of the coal-fields of Hu-nan and Kwang-tung, and in some parts he found that the coal-trade had largely increased since Baron F. von Richthofen's visit. The observations he made on his journey have enabled him to construct what he believes to be a more accurate map of the route than has yet been published, and this, when available, together with the detailed itinerary, which has been printed in pamphlet form at Shanghai, will, doubtless, be very acceptable to future travellers.

SEYMOUR L. M. D'ALBERTS is expected to arrive in England immediately. He proposes to bring with him the whole of the natural-

history collections which he has formed in New Guinea.

THE new *Bollettino* of the Italian Geographical Society contains among other matter an account of the work of Italian naturalists in New Guinea, and a letter from Signor Geasi and Dr. Matteucci, dated from Beni-Scianguoll on March 1.

IN the course of some remarks which he made at the anniversary meeting of the Royal Geographical Society with regard to what had been done recently towards advancing geographical teaching, Mr. Francis Galton announced that Sir Walter C. Trevelyan, one of the trustees of the society, had offered the council a handsome sum as a prize for a model county geography, as he felt that such works were urgently needed. Mr. Galton also mentioned that the council had received a letter from a master of one of our great schools, suggesting to them the advantages which would result to schools from a system of diagrams explanatory of different physical features. Both these matters are, we believe, still under consideration, but no absolute decision has yet been arrived at.

THE Royal Geographical Society have just published (Stanford) a new edition (the fourth) of their valuable *Hints to Travellers*, which has been carefully revised under the superintendence of Mr. Francis Galton. Some of the *Hints* which appeared in the older editions have been replaced by contributions from more modern authorities, the most important addition being a paper on "Surveys with Sextant and Prismatic Compass" by Major C. W. Wilson, R.E., whose name is well known in connexion with surveys in Palestine. Mr. R. Strachan, of the Meteorological Office, also contributes some "Meteorological Hints to Travellers," and Mr. John Coles, the present Curator of the society's collection of maps and instruments, some valuable hints about watches. To the last-named gentleman, we believe, the traveller is indebted for the carefully-selected tables at the end of the volume, which have been specially chosen with the view of enabling an individual on a detached expedition to take with him, in a compact form, the most necessary information. The volume is issued in a handy shape, but it would have been much improved by larger type and by the addition of an index.

MAGAZINES AND REVIEWS.

THE *Cornhill* has this month some excellent papers, and its two novels keep up their interest. That charming writer, Mr. Henry James, jun., appears with the first part of a "study," or short story, called "Daisy Miller," which we commend to all who own the fascination of the lovelier and more winning of the travelled Americans. "J. A. S." writes some graceful notes of places and things in Lombardy, under the heading of "Lombard Vignettes:" a difficult task to perform well, but here performed successfully. The most notable, perhaps, of the articles is one that bears the transparent signature of "E. W. G.," entitled "Captain Dover's Cotswold Games." Captain Dover was a Jacobean celebrity, who started (or revived) under almost royal auspices some contests of strength and skill on Cotswold, and who was glorified by a high-flown contemporary as "the great Inventor and Champion of England's Olympicks, Pythycks, Nemicks, and Isthmicks." The chief interest of this worthy is a literary one: a few years before his death a collection of verses written in his honour by no less "eminent hands" than Jonson, Randolph, Drayton, etc., was published under the title of *Annalia Dubrensis*. This book, which was extremely rare, has been lately reprinted by the indefatigable Mr. Grosart, and it is of its poetical contents that the article gives an account. The best by far is the Eclogue by Randolph, which Mr. Gosse calls "an ingenious, pretty poem; one of the best eclogues we possess in English." The article called "Notes of a Resident in

Portugal" is scarcely up to the general average of the *Cornhill* either in matter or style. As to "the cultured and generous Saracens" who conquered the Goths and imparted "their invaluable knowledge" to them, apparently beginning this process of education immediately after the Battle of the Guadalete, to judge from "J. L.'s" expressions, we could have wished that a few of these picturesque sentences had been a little toned down before finding their way into print by some comparison, say, with such a book as Prof. Dozy's *Musulmans d'Espagne*. We should especially like to recommend to "J. L.'s" notice the following remarks on the Arabs in general:—

"Par suite du contact avec les peuples qu'ils avaient vaincus," Dozy says, "ils ont cultivés les sciences, et ils se sont civilisés autant que cela leur était possible. Cependant, même après Mahomet, une période assez longue s'est écoulée avant qu'ils perdissent leur caractère national. Quand ils arrivèrent en Espagne, ils étaient encore les vrais fils du Désert."

These "vrais fils du Désert" broke in, according to history, upon the civilisation—a decaying one, it is true—of Isidore, Leander and Julian, upon the great cities of Baetica, upon Merida with her churches and monasteries, her great bridge, and what of her Roman splendour the fifth century had left her, upon the churches and palaces of Toledo—according to "J. L." upon "the wild tribes of the Visigoths," upon these "uncouth Portuguese Cymons" to whom their conquerors taught "the sweet civilities of life." Talk of this kind is indeed a curious illustration of the remoteness of Spain and Portugal from English thoughts and interests, speaking generally. It could not pass muster about any other country in Europe, except, perhaps, Russia. And in smaller matters "J. L." is equally amazing. He has a note on the history of the words "guitar" and "lute" which is quite refreshing in these days when people are supposed to take a little trouble about their statements. He is kind enough to admit that "the name guitar is no doubt a Romance word," but its connexion with the Latin *cithara* does not seem yet to have dawned upon him. Again, the Portuguese must have "first taught the name and use of the Arabic lute to the rest of Europe, for they only of European nations have preserved in *Alaude* its full Arabic name *Al ud*. Even in Spanish it is shortened to *aude*." We cannot say whether "J. L.'s" Arabic is right, but it is as well to point out that the Spanish Academy Dictionary—as we possess it, at least—is wholly innocent of such a word as *aude*, while *laud* keeps the place in it which it held in the language of the Archpriest of Hita.

Of the remaining magazines, *Fraser* is really almost the only one that contains an article of interest. Under the thin disguise of initials, "M. B.-E." writes a sketch of the French religious writer and philosopher, Jean Reynaud, the friend of the Père Enfantin, and afterwards journalist, member of a Provisional Government, and finally a writer who spent the long afternoon and evening of his days in literary retirement at Vineuil and elsewhere. Probably there will always be with regard to his work *Terre et Ciel* the same difference of opinion among readers that was exhibited by the critics on its first appearance, when M. Taine thought that it "utterly failed to establish a union between religion and science," and M. Henri Martin declared "the way he opens to us is a true way." Still it is certain that the writer of the paper speaks truth in calling it "a choice and an edifying and a memorable book." The French bishops assembled in synod at Périgueux thought otherwise, and condemned it and its rejection of the theory of eternal punishment in language too full of theological amenity to be passed over:—

"Enfin, nous déclarons que quand bien même, non seulement un homme ou le monde entier, mais, par impossible, un ange du ciel enseignerait une doctrine contraire, la nôtre doit demeurer pour tous les chrétiens l'objet d'une foi très-ferme et tout-à-fait immuable."

Si quelqu'un agit autrement, qu'il sache qu'il s'est exclu lui-même de la foi catholique, et qu'il a encouru les mêmes peines éternelles dont il nie l'existence."

It is to be feared that the subject of the other paper of interest which *Fraser* contains must have in her time "encouru" the penalties threatened by the bishops. This is Mary Wollstonecraft, of whom Mr. Kegan Paul gives a most interesting account which he entitles "a vindication." Interesting, however, as it is, we do not see that this article is successful as a vindication. To those who think as Mary Wollstonecraft thought, she was vindicated already; to others, she will always remain a woman who not only held extreme views about the relation between the sexes, but was in herself a sad instance of their impracticability while society remains as it is. Before she "married" Godwin she was already "married" to Imlay, an American, who made her a mother and then deserted her; and yet, even with this experience—which she felt to the pitch of attempting, almost with success, to commit suicide—she still went through no ceremony of marriage with Godwin until very shortly before the birth of her second child, who was afterwards Mrs. Shelley. In this carelessness for social forms Godwin was fully her match; even when the marriage took place (on March 29, 1797, at Old St. Pancras Church), "it was characteristic of Godwin that he did not notice the circumstance in his minute and careful diary, so wholly did he regard it as superfluous, the marriage having been binding on his heart and conscience long before."

FLORENCE LETTER.

AMID the mass of literature inspired by the dissension between Church and State, the *Stati e Religioni*, by Giacomo Pisani (Rome: Barbèra), demands special mention as the most daring and downright attack on the Papacy hitherto published in Italy. Its writer is an earnest student of Machiavelli's writings, and has assimilated, not only the ideas, but even the style of the Florentine Secretary. Yet this is done so naturally that it excludes the notion of any *tour de force*; the quaint diction is a garb well suited to Signor Pisani's method of arranging his ideas, and adds to their force. In all respects this book may be said to be the exact opposite of Curci's famous volume (already reviewed in the *ACADEMY*); for here there are no contradictions, no doubts. The author not only has the courage of his opinions, but also knows how to formulate them in the clearest way. His book is divided into very short chapters, each of which enlarges on the single proposition or assertion at its head. Proceeding slowly down from the origin of Paganism to the present day, the author arrays a battery of proofs drawn from ancient, mediæval, and modern history, in support of his theory that the Church is, and always has been, the greatest enemy of the State, the cause of the corruption and ignorance of the people. He seeks to show the impossibility of any man being at the same time a sincere Catholic priest and a good citizen. He refuses to recognise any of the claims of the Catholic Church on the gratitude of mankind. He insists that the Papacy will sap the foundation of Representative Monarchy in Italy, and asserts that the Republic is the only form of government that can successfully withstand Church encroachments. But his ideal Republic must, he says, if Catholic, be modelled on the Venetian rather than the Florentine pattern. He considers that unless Italy decides on extinguishing the Papacy, the Papacy will in the end overthrow the Italian Government, and that the future safety of Italy depends on a religious reform of so radical a nature that the priesthood will then serve religion, religion serve the State. "Do not tell me," he writes, "that such a change is impossible in our country: the Greek Empire, England, Germany, have all accomplished it, why then should not Italy?"

Unfortunately there is one obvious objection to the somewhat one-sided theories enunciated in this really remarkable volume. Some great writer, whose name escapes me, has observed that Italy has never undertaken any religious war. And certainly, unless Signor Pisani's work be the herald of a great and startling change, no spirit of religious reform can be said to exist in Italy. As regards spiritual matters, Italians may be roughly divided into three classes—bigoted believers, thorough sceptics, and mild *pococuranti*, who, for the sake of peace, adhere to the Church, without any particular belief in her dogmas.

Prof. Angelo de Gubernatis has just published a *Storia comparata degli usi natalizi in Italia e presso gli altri popoli Indo-Europei* (Milan: Treves), which is an interesting compilation of curious birth-customs, traditions, rites, and superstitions among the Aryan races. His preceding volumes on Marriage and Funeral Customs, *Usi nuziali*, *Usi funebri*, are in their second edition, and the series is now complete. All usages connected with the Cradle, Altar, and Tomb, to use a transatlantic expression, are here copiously illustrated by learned and curious excerpts from writers of all periods and all countries. My space does not allow of quotations from this interesting work, which is a perfect treasury of folk-lore. It gives much new information on curious "survivals" in little-known parts of Italy, and is especially rich in details of Sardinian popular customs. It must, however, be confessed that the volume on birth-customs gives too detailed an account of all savage superstitions connected with childbirth to be altogether fit for general reading. This is the more to be regretted, as the same volume comprises a particularly charming chapter upon Christmas-trees.

The *Luigi Settembrini* of Francesco Torraca (Naples: Morano) is a very disappointing book, for the subject of the monograph, Prof. Settembrini, stood in the foremost rank of Italian patriots, and his noble life, his commanding intellect, and his sufferings in the cause of Italian freedom, might well have been the theme of a loftier work than Signor Torraca's little volume. This is not only loosely written and badly put together, but the writer's youth apparently removes him too far from the most interesting period of Settembrini's life for him to be able to narrate it with sympathetic fervour. To the English public Settembrini is best known as the fellow-prisoner of Carlo Poerio, one of the martyr band of Neapolitan exiles, who were landed on our shores in 1850, thanks to the daring of Settembrini's son Raffaele. It may perhaps be remembered how this fine young fellow—at that time an officer in the Peninsular and Oriental Company's service—contrived to get on board the American vessel hired to convey King Bomba's prisoners to America, in the disguise of a cook's mate, and how, as soon as the Neapolitan steamers were out of sight, he took possession of the vessel and compelled the skipper to change his course. The enthusiastic welcome given to the exiles in England, if almost forgotten by us, still lives in the grateful memory of the survivors of that band. Signor Torraca, who narrates tamely enough the dramatic episode of the prisoners' liberation, also omits all details of the eight years spent by Settembrini in Bomba's dungeons. His excuse for this is that the Professor seldom referred to that time of wretchedness. That may be; but as his surviving fellow-prisoners are less reticent upon the subject, Signor Torraca might easily have gleaned many interesting particulars from their lips. He does, however, mention the accuracy with which these men, shut up in an island prison, managed to obtain news of all that went on in the political world, and he also records the heroic self-denial with which Settembrini refused Pisacane's offer to land on the island and break open the prison doors. He preferred to resign all hope of liberty—his sentence was for life—rather than let

loose upon society the felons and murderers who shared his chains. In short, incomplete as Signor Torraca's volume is, it is useful as a memorial to easy-going Young Italy of the bitter trials of a past generation. Settembrini's farewell letter to his wife before the commutation of his death sentence is a masterpiece of pathos, patriotism, and resignation. His chief literary works were his *History of Italian Literature*, and his translation of Lucian, with an essay on the poet's life. This latter was the task which, as he himself said, had saved him from losing his reason, for it was written amid the horrors of the small and filthy dungeon, where five at least of his ten room-companions were common thieves and assassins. On the expulsion of the Bourbons, Settembrini returned to Naples, and from that time till his death, last November, his career was one of indefatigable political and literary activity. After filling the office of Inspector-General of Public Instruction, he was nominated to the chair of Italian Literature at the Naples University, and was raised to the rank of Senator shortly before his decease. It is impossible to enter here into an examination of his merits as an author, but I may mention that his political writings are distinguished by sound patriotism and vigorous good sense, and his literary works by a clear, sympathetic style which lights up every subject undertaken.

Giosuè Carducci has recently brought out a tiny poem, *Canto d'Amore* (Bologna: Zanichelli), which contains some very noble passages in the author's best style. It might more fitly be entitled "A Reverie in Perugia," for it lightly touches on various episodes of Perugian history, and gives in lines of sweetest melody the effect of the grand Umbrian landscape as beheld from the town. The concluding verses on the late Pope are scarcely in the same key as the rest, but the epithet "*Quel di è stesso antico prigionier*" is undoubtedly happy.

A valuable contribution to the history of Bologna during the eighteenth century will soon be forthcoming from the pen of Signor Ernesto Masi, Government Inspector of Schools. It will bear the lengthy title of *Francesco Albergati Caparelli, Commediografo Bolognese del secolo XVIII., i suoi amici e i suoi tempi*, and will comprise many interesting letters from noted personages, and also a hitherto unpublished episode in the career of the famous adventurer Giacomo Casanova. At a recent meeting of the Academy of Bologna the author read the whole work, and an instalment of it has been published in the shape of a chapter on the Republic of Bologna in the eighteenth century, which is full of well-digested and brilliantly-handled research. Evidently the biography of the literary Marquis gives Signor Masi an opportunity for describing with fullest knowledge "that ghost of an aristocratic Republic which, dead for centuries, persisted in fancying itself still alive." We are shown a graphic picture of the lavish splendour, the empty forms and ceremonies which constituted the sole duties of the Gonfalonier and magistracy of Bologna, while all real power was in the hands of the Cardinal Legate. At that time the reigning Pope, Benedict XIV., was himself a Bolognese, and his wit and joviality were typical of his birthplace. Signor Masi records the sally which decided this Pontiff's election after a six months' conclave:—"Why can't your Eminences make up your minds? If you want a saint, choose Gotti; if you want a politician, choose Aldrovandi; if you would be satisfied with a good fellow, you had better choose me." This, too, was the Pope to whom Voltaire dedicated his tragedy of *Mahomet*; and to whom Horace Walpole erected a monument with a highly eulogistic inscription. Benedict was greatly flattered by this English testimony to his merits, and forwarded a copy of the Italian translation to his friend Canon Peggi, of Bologna, with the remark that Peggi would now perceive that "he [the Pope] resembled the statues on the façade of St. Peter's, which seen from afar made a fine appearance." But this brilliant chapter is

not confined to the historical aspect of Bologna. The city's intellectual effervescence is depicted in equally vivid colours. Literary *dilettantismo* was then the rage, and formed the neutral ground on which men of all classes met, very much as nowadays political *dilettantismo* is a common bond of union. The shop of Lelio della Volpe, bookseller and publisher, was for many years the *rendezvous* of all men of science, *letterati* and *beaux esprits*, and the birthplace of the sparkling *bernesque* verses that were the delight of the town. In those days the University was still an important element of Bolognese life; the citizens felt a warm interest and personal concern in its smallest proceedings, and all its professors were sociable men of the world, mixing freely in the amusements of the pleasure-loving aristocracy, instead of forming a separate clique as was usually the case in university towns. Count Algarotti, a writer of the period, noted his surprise at finding that the learned doctors of Bologna did not live in the hermit-fashion of the Paduan Dons, but were to be seen at all the routs and junketings and gambling-tables of the *beau monde*. Then, apparently, the wheels of life did not whirl with the feverish activity of the present age; and learning, however severe and abstruse, left a margin of leisure and disposition for lighter pursuits. Signor Masi gives many amusing anecdotes illustrative of the rollicking life of the nobility and the free-and-easy manners of the witty, chattering, card-playing ladies of Bologna. Certainly it is not too much to assert that, judging from this specimen chapter, the author's promised volume will prove to be an exhaustive and brilliant study of Bologna life in the last century. Signor Masi is a young writer, and it is only two years since he published his maiden work—a volume of careful historical studies, treating chiefly of the influence of the Reformation in Italy, and containing many fresh and interesting details concerning the Duchess Renée of Ferrara and her friendship with Calvin.

Of all the arts sculpture is that which shows most signs of life in Florence. A very young artist, Signor Rinaldo Carnielo, has been exhibiting the cast of a subject hitherto unattempted in sculpture. It represents the death of Mozart. The composer is seen in his last moments, half buried in the cushions of a huge armchair and with the score of the *Requiem* on his knees. At first sight this extremely clever work excites a strong feeling of repulsion. The dying man is in the last stage of emaciation, the mortal faintness and exhaustion subtly expressed in the whole attitude; the hands are pendant, the face drawn, the lips parted—every detail, in short, is rendered with a ghastly realism, the result of much earnest study in hospital wards. One is compelled to regret that Signor Carnielo should have devoted his powers to a subject so painful as to be almost outside the domain of pure art. But the statue's merits having gained the approval of the Committee of Selection for the Paris Exhibition, it has been sent to that city. Afterwards it is to go to Vienna, to be shown during the Mozart Festival which will be held there later in the year.

CORRESPONDENCE.

TWO MS. MISSALS.

St. John's College, Oxford: June 8, 1878.

I have lately been brought in contact with two MS. Missals, the existence of which, as they are in private hands, must be generally unknown, and a short account of which may be therefore acceptable, although a detailed description of their contents would occupy too much of your valuable space.

1. A folio MS. Sarum Missal, rubricated, written c. A.D. 1375, the property of Sir Henry Dryden, Bart., at Canons Ashby. It was found unbound in the chapel at Tusmore, co. Oxon, and was given to Sir Henry Dryden by Miss Ramsay, August 1841. It was much gashed and otherwise mutilated, the ornamental letters having been cut out, and whole leaves being occasionally missing, including the Canon of the Mass from "Te igitur" to "Supra quas propitio." It has since then been stitched, repaired, and handsomely bound, seventeen blank sheets having been substituted for as many missing leaves.

At present it consists (exclusive of the blank sheets) of 117 leaves 15½ in. long by 10½ broad, and ends abruptly in the middle of a rubric in the *Ordo Sponsalium*, "Vir enim aut mulier ad bigamiam." It is in gatherings of eight leaves, the pagination being marked by the insertion of the catchword on the lower right-hand margin of the last page in each gathering.

It contains the following marginal MS. entries:—

- Fol. 1 a. "Hic liber emptus a garbranio for X^r and if it do lacke any parte, he doth promise to make it complete."
- Fol. 4 b. in the Kalendar, Oct. 22. "Obitus m. Will. Kale tertii custodis hujus collegii. Anno. Dom. MCCCCLIX."
- Fol. 87 b. "Habeatur in memoria Henricus Ohichele, Cantuariensis Archiepiscopus, fundator."

The last two entries prove that the Missal once belonged to All Souls College, of which Chichele was the founder, 1437, and William Kale (or Kele) the third warden, 1445-1459.

2. A folio MS. Sarum Missal, rubricated, written c. A.D. 1400, the property of Dr. Garland, chemist, Walworth Road, S.E. According to the tradition of the present owner's family it came originally from Knowsley, but Lord Derby, with whom I have communicated on the subject, and to whom I have submitted the internal evidence which the MS. affords, asserts that there is no foundation for such a tradition.

It is less finely executed than the Dryden Missal, but its handsomely-illuminated borders and letters have more generally escaped mutila-

tion, and are in a good state of preservation. Its contents are complete with the exception of the loss of eight pages containing the eight middle months of the Kalendar. At present it consists of 201 leaves 14½ in. long by 10½ in. broad, in gatherings of eight leaves, marked off by the insertion of the catchword on the lower right-hand margin of the last page in each gathering.

It contains the following marginal MS. entries:—

- Fol. 1 a. "(Jan. 25) Obitus Roberti Pletcher."
- " (on the lower margin) "Haec est voluntas Roberti Pletcher, quod Robertus Ewer, consanguineus ejus et haeredes sui ut sui assignati tenentes terrarum et tenementorum quondam ipsius Roberti Pletcher, annuatim custodiant obitum suum cum placebo, et dirige, et missa, ad Requiem in perpetuum, cum incrementis ipsarum terrarum, tenementorum, et pro uxore et benefactoribus suis, et inveniant unam ceream intra sepulchrum annuatim ad Pascha, et unam ceream super altare cremandam, dum divinae celebrantur in perpetuum, et aliam ceream coram ymaginem gloriosae Virginis Mariae eodem modo."
- Fol. 2 a. "(Nov. 7) Dedicatio ecclesiae beatae Mariae Magdaleneae de Flaunden in crastino die post Festum sancti Leonardi perpetuis temporibus duratura."
- Fol. 91 b. "Anima Will. Loveit et Aliciae uxoris ejus et animarum omnium fidelium defunctorum miseratur omnipotens Deus."
- "Anima Ricardi Loveit et Sarae uxoris ejus."
- "Anima Thomas Loveit."
- Fol. 201 b. "Orate pro bono statu Agnetis Hutton, nuper uxoris et executricis Johannis Parke et pro animabus Johannis Parke et Helene Keele qui dederunt unum vestimentum nigrum capellae Sanctae Mariae Magdaleneae A.D. M.D.XXVI." (on lower margin) "Imprimis ye pract. of ye chapel of seye, on ye dedication daye."

The single flyleaf at the end of the volume is portion of a fourteenth-century rent-roll, too long for transcription into your columns.

F. E. WARREN.

A PROTEST.

Homedale, Camberley: June 10, 1878.

I have received from the author, Mr. Eustace Hinton Jones, a copy of a pamphlet entitled *The Cross of Oniris, or the Cross of Life*. My name appears on the title-page as having written jointly with Mr. Jones two volumes entitled *Popular Romances of the Middle Ages* and *Tales of the Teutonic Lands*; and in the body of the pamphlet the only quotation is one from my *Aryan Mythology*. The reader would thus naturally be led to suppose that there is a general agreement between the author and myself with regard to the opinions set forth in this paper, and that my name appears on the title-page with my permission. This is not the case; and if my permission had been asked, it would have been absolutely refused. I am sorry to be obliged to say that I regard the author's inferences and beliefs generally with abhorrence, as being altogether false, and dangerously mischievous.

GEORGE W. COX.

LEVER'S "WITCRAFT."

Brighton: June 3, 1878.

In calling attention to Lever's early English manual of Logic, Prof. Fowler says it has, he believes, hitherto "escaped the notice of logicians." It may be worth while to point out that in this he is mistaken. More than twenty years ago I signalled Lever's special merits, and gave some account of his work in the notes to my *Essay on the New Analytic of Logical Forms*. After wait-

ing a considerable time and giving commissions to several booksellers, I succeeded in obtaining a copy of the rare little volume about the time I was preparing my *Essay* for the press; and in a note dealing with the various technical terms proposed for the different parts of the syllogism I referred to it as follows:—

"The only thorough-going and consistent attempt ever made that I am aware of, to render the technicalities of logical science into English terms, was that of Ralph Lever, Dean of Durham. In his logical treatise entitled *The Art of Reason, rightly termed Witcraft: teaching a Perfect Way to Argue and Dispute*, and published in London in the year 1573, he expressly undertakes to accomplish this. He explains and defends his procedure in the Preface (forespeech), of which the following extract may be taken as a specimen:—'For trial hereof I wish you to aske any English man, who understandeth neither Greek nor Latin, what he conceiveth in his mind when he heareth this word, a *baekset*, and what he doth conceive when he heareth this term, a *predicate*. And doubtless he must confess, if he considers the matter aright, or have any sharpnesse of wit at al, that by a *baekset* he conceiveth a thing that must be set after, and by a *predicate* that he doth understand nothing at all.' He accordingly renders every (or certainly almost every) technical term of common use in logic by combinations of purely Saxon words. I may give, both as a specimen of his coinage and as pertinent to the purpose of the present note, the terms which he uses to express the different members of the syllogism. These are *foresay* and *endsay*, *first foresay* (major premise), *second foresay* (minor premise), *endsay* (conclusion); or, in his own words, 'The two first shewesayes (propositions) that are placed in a reason by rule, are called *foresayes*—the third may be termed an *endsay*.' (New Analytic, pp. 37-8).

More recently I have made a point of referring in some detail to Lever's work with my own students in the classes both of Logic and English Literature, particularly the latter. I have always felt with Prof. Fowler that, apart from its logical value, the book was of special interest in relation to the history of the language. And in my English class I instance Lever's *Witcraft* as one among other illustrations of the strong desire to enrich and purify the language which animated many English scholars in the second half of the sixteenth century. The language was then in a comparatively fluid state, and such men as Cheke and Ascham, Lever and Puttenham, were laudably anxious to retain and develop the power of forming native compounds to meet new verbal wants instead of borrowing from foreign tongues. Several of them made a resolute effort to translate instead of transferring the scholastic technicalities and learned terms which the growing use of the vernacular for purposes of instruction had introduced into English. I have collected a mass of curious materials illustrating this effort, which, but for the pressure of other work, would before now have been given to the public. Lever's *Witcraft*, from the intractable nature of the subject, and the ingenuity displayed in dealing with it, is certainly one of the most curious examples of the movement, and I give it prominence in my class expositions on this account. As a result, most of my students are familiar with Lever's name and the general character of his work.

THOS. S. BAYNE.

APPOINTMENTS FOR NEXT WEEK.

- MONDAY, June 17.—4 P.M. Asiatic.
- TUESDAY, June 18.—3 P.M. Royal Institution: "Minute and Low Forms of Life," by the Rev. W. H. Dallinger.
- 7.45 P.M. Statistical: "The Owens College, Manchester, and a Northern University," by James Heywood.
- 8.30 P.M. Zoological: "Squirrels of the Neotropical Region," by E. R. Alston; "On a Third Collection of Birds made by the Rev. G. Brown in Duke of York Island and its Vicinity," by P. L. Selater; "Notes on the Male Hippopotamus which recently died in the Zoological Gardens," by Prof. A. H. Garrod.
- WEDNESDAY, June 19.—7 P.M. Meteorological: "The Climate of Lundy Island," by A. J. H. Crespi; "On the Auroral or Magnetic Cirrus," by the Rev. S. Barber; "Contributions to the Meteorology of Natal," by Dr. R. J. Mann; "Mean Relative Humidity at the Royal Observatory, Greenwich," by W. Ellis; "On a Method of Determining the Amount of the Diurnal Variation

of the Barometer on any Particular Day," by the Hon. R. Abercromby; "Relative Duration of Sunshine at Greenwich and Kew Observatories, 1877," by G. M. Whipple.

8 P.M. Geological. "On a gold Signet Ring found by Dr. Schliemann at Mycenae," by T. H. Baynes.

THURSDAY, June 20.—7 P.M. Numismatic: Anniversary.

8 P.M. Linnean: "On Two Kinds of Dimorphism among the Rubiaceae," by C. B. Clarke; "On the Presence of the Echinidna (*Tachyglossus*) and Ornithorhynchus in N. and N.E. Queensland," by Capt. W. E. Armit; "On the Stapellae of Thunberg's Herbarium," by N. E. Brown; "Observations on the White Whale (*Beluga leucas*) exhibited at the Westminster Aquarium," by Dr. J. Murie.

8 P.M. Chemical.

8.30 P.M. Royal. Antiquaries.

FRIDAY, June 21.—8 P.M. Philological: "Report on the Present State of my Dialectal Investigations," by A. J. Ellis.

SATURDAY, June 22.—3 P.M. Physical: "Experiments with a new Polaroscope," by Prof. W. G. Adams; "Starch and Unannealed Glass under the Polaroscope," by W. Baily; "Equipotential Surfaces of a Conductor under Influence," by Sir F. Elliott; "Complementary Colours," by Dr. Gorham; "Flow of Water from Orifices at Different Temperatures," by Prof. W. C. Unwin; "Co-ordination of Space," by C. H. Hinton; "Magnetic Figures Illustrating Electrodynamical Relations," by Prof. S. P. Thompson.

8.45 P.M. Botanic.

SCIENCE.

Accidents in Mines: their Causes and Prevention. By Alan Bagot, Mining Engineer. (London: C. Kegan Paul & Co., 1878.)

THE owners, managers, and engineers of mines appear to look upon mining accidents as the necessary, and, to a great extent, unavoidable concomitants of a hazardous occupation; and they are always ready to assert, either directly or by implication, that most accidents are due to recklessness or carelessness on the part of the men themselves. The miners and their friends, again, while admitting that accidents arising from falls of coal and stone are mostly under their own control, contend that a large proportion of the lives lost in other ways might be saved, if the management could be induced, or forced, to adopt better means and more efficient precautions. Lastly, the general public have always manifested a keen and active sympathy for the victims of mining disasters; but, as they do not know much about the matter practically, they are apt to be led away by the insinuations of one side or the asseverations of the other. It is to readers of the last class that a book like Mr. Bagot's would prove particularly valuable, if it were written with strict impartiality, and without any leaning towards either the employer or the employed, and we are, therefore, sorry to find our author showing a decided bias in favour of the former. For example, in the chapter on dangerous practices not forbidden by the Mines' Regulation Act, he says:—

"We know from personal knowledge that the mines' inspectors of the midland and northern districts are able practical men, not appointed in any undue haste, but after a careful consideration of the excellent and valuable experience that they undoubtedly possess in all matters relating to mines. If these men cannot assist in reducing the casualties in mines, it is very evident that others cannot. It is a matter of common occurrence to find a tub standing on the top of an incline in a pit with the wheels unsecured, and which merely requires a push to send it off down the incline to the 'face.' The 'cager' at the bottom of the drawing shaft constantly walks across under the opening of the shaft at the pit bottom, although he is purposely provided in most collieries with a passage round. If he fail to make use of this passage, he does so at the risk

of his life. It must be stated, in fairness to colliery proprietors, that the majority of accidents in mines, we believe, occur through neglect or breach of rules, and that if the public were more aware of this we should not hear of the accidents so often thoughtlessly attributed to mismanagement on the part of the owners. Until miners can be made aware that carelessness in mines may amount to criminal negligence, many forms of accident will continue to occur annually."

Mr. Bagot here refers to two frequent causes of accident: one due to leaving unsecured tubs standing at the top of inclines, the other to the foolhardiness of the *cager* in walking across the bottom of the shaft. In a later chapter he again calls attention to the first, and suggests means for preventing it; but as he dismisses the second summarily, in the words given above, and as the impression likely to be produced on the general reader is, in our opinion, an utterly wrong one, we shall endeavour to state what appear to us to be the true facts of the case. The *cager* (*hitcher* or *bottomer*) is the person who superintends the loading and disloading of the cages in which the little coal waggons, the men, and all materials are raised and lowered to and from the surface. He is, therefore, always at the bottom of the shaft, and it is frequently necessary for him and his assistants to cross over from one side to the other—a distance of about six feet in a straight line. In doing so he is exposed to two kinds of danger, one from pieces of coal or other substances falling down the shaft, the other from the uncertainty as to when the cage will descend upon the bottom. It is true that there is, as Mr. Bagot says, a passage provided in most collieries whereby anyone—and of course the *cager* also—can pass from one side of the bottom to the other; but in a large number of cases (we will not say in most, because we can only speak of what we ourselves have observed), the distance the *cager* would have to travel, if he made use of this passage, varies from ten to a hundred yards. Can it be wondered at, then, that he usually takes the shorter passage with its accompanying risks? But inasmuch as there is not the least practical difficulty in the way of making an equally short and perfectly safe passage alongside the cage, the public, to whom Mr. Bagot appeals, will be unable to understand why such a passage is not *always* provided in order that the temptation to cross under the open shaft may be entirely removed. We cannot pretend to say why it is not done; but we suppose that, if there are any reasons, they are similar to those which might be advanced in favour of the custom of leaving the *cagers* quite unprotected from falling bodies while engaged at their legitimate work—a state of affairs that is far too common at the present day.

Mr. Bagot's language is often careless, even to grammatical incorrectness, and the various parts of his subject appear to have been thrown together without much attempt at arrangement. Indeed, we could not better describe our impression of the whole volume than by saying that it resembles a collection of notes made for the author's own information during a course of desultory reading on mining subjects.

In the first chapter, which is a dissertation

on the uses of the barometer and thermometer in coal mines, the author gives it as his opinion that there should be two barometers and two thermometers in every mine; he also laments the incorrectness of the instruments usually employed, and suggests the advisability of having every one of them compared with standard ones, to be supplied to the inspectors by Government. He refers to a paper published in the *Proceedings* (not *Transactions*) of the Royal Society, 1872, by Messrs. Scott and Galloway, entitled "On the Connexion between Explosions in Collieries and Weather;" and we think he would have done well to follow out the later contributions of the same authors to the *Quarterly Journal* of the Meteorological Society, October, 1874 and 1875—in which he would have found simpler rules and a more efficient method of recording pressure and temperature than those given by himself. In the last of these papers (October, 1875) it is also stated that one barogram would be sufficient for any number of mines in the same neighbourhood, provided that information of a downward tendency of the curve could be quickly conveyed to those in charge at the mines. Thus, instead of requiring two barometers and one or two observers at every mine, like Mr. Bagot, these authors tell us that one barometer and one observer are sufficient for a whole district in which there may be hundreds of mines. By extending the same principle still further, we arrive at the conclusion that a few such stations would be sufficient for the whole of Great Britain, if warnings could be sent to the mines by telegraph; and that this arrangement would be infinitely preferable to the present one, which, as Mr. Bagot says, is almost wholly inoperative in consequence of the carelessness, indifference, and, perhaps we ought also to add, ignorance, of many of those whose duty it is to observe the instruments and profit by their warnings.

Mr. Bagot thinks it necessary to reply to a writer in the *Times* (1875) who stated "that the barometer would not indicate the presence of carbonic acid gas, and was therefore an instrument worthless to mining engineers." His arguments are not convincing, and we will therefore attempt to supply him with better ones. The foul or deoxygenated air and carbonic acid gas of mines are formed for the most part by chemical changes which take place in open fissures in the solid ground, and in the interstices of rubbish and stowing. The capacity and temperature of these spaces are sensibly constant during an interval of several days or weeks, and, consequently, every change of atmospheric pressure must necessarily produce a corresponding change in the mass of their gaseous contents. If the ground produces fire-damp they will contain that gas instead of choke-damp, either in a state of rest, or flowing through them into the workings. When the atmospheric pressure decreases, foul air and stagnant fire-damp are discharged, and the rate of flow of fire-damp is accelerated; when the atmospheric pressure increases, on the other hand, fresh air is absorbed in the first case, and the rate of flow of fire-damp is retarded in the second. Where

fire-damp in a state of tension is escaping through fissures of microscopical dimensions the result is the same in kind; but it is different in degree, and gradually approaches, although it never actually reaches, a limit at which the fissures are so small, and the tension of the fire-damp so great, that no ordinary barometric oscillation can produce an appreciable variation in the rate of flow. These are fundamental principles of physics, and are beyond reasonable controversy. Otherwise, Mr. Bagot might have chosen to meet mere personal opinion by an appeal to practical experience, and probably he could not have found a better example than the reply of Mr. T. J. Taylor, of Earsdon, to a question of the Select Committee of the House of Lords on Accidents in Mines (1849). The question and answer were as follows:—

“Q. 6036.—Then should you say that in shallow mines the observations of the barometer would be useful in practice?”

“A.—Yes, I should say so; for example, I have the management of a little colliery not far from my own residence, where there is no fire-damp, but where a great quantity of carbonic acid is discharged from the fissures of the roof; and after the glass has been high for some time [past?], particularly if a sudden fall takes place, I have sometimes had occasion to send word to the under-viewer to be upon the look out, knowing that there would be a great deal of stithe or carbonic acid discharged into the mine at the time.”

W. GALLOWAY.

BOEHTLINGK'S SANSKRIT CHRESTOMATHY.

Sanskrit Chrestomathie, von Otto Boehtlingk. Zweite Auflage. (St. Petersburg, 1877.)

It is always a pleasure to see an old friend rejuvenescent. Boehtlingk's Sanskrit Chrestomathy appeared for the first time in 1845, and it then helped many of us in our first attempts at acquiring a knowledge of Sanskrit, a language which at that time was not quite so easy to learn as it is now, when grammars, dictionaries, and texts, critically edited, abound. After thirty-two years it has appeared again in a second edition, containing all that was really useful in the first, and a great deal of additional matter that will prove still more useful to those who are now making their first steps in Sanskrit.

Dr. Boehtlingk has, in the mean time, finished his *magnum opus*, the Dictionary of the Sanskrit Language, a work which others may have praised more loudly, but few more sincerely than I have. Nor have I any doubt that to a true scholar, such as Dr. Boehtlingk has proved himself to be, an honest appreciation of his labours will always be far more welcome than superlative generalities which, the more sincere we are towards ourselves, the more we dislike to hear from others. There have been some passages of arms between Dr. Boehtlingk and myself which, much as I regretted them at the time, I cannot regret now, as they have only served to confirm my old conviction that the honest scholar is always the honest man, from whom we may differ, but for whom we can feel nevertheless a true sympathy and a legitimate admiration.

The new edition of Dr. Boehtlingk's Chrestomathy—I beg his pardon for omit-

ting his well-earned titles, for he is really *Son Excellence le Conseiller intime de Sa Majesté l'Empereur de toutes les Russies*—differs from the first chiefly by what we may call its articulation. We see in this the best evidence of the progress which the study of Sanskrit literature has made during the last thirty years. At the time when it first appeared, Sanskrit scholars were still chiefly occupied with some curious specimens of the later Sanskrit literature, the Meghadûta, the Hitopadesa, Sakuntala, the so-called Laws of Manu, the Mahābhārata, and Rāmāyana. The really ancient and historically important literature of the Brahmins was just beginning to attract attention. Thus in the first edition of Boehtlingk's Chrestomathy the Vedic literature just peeps out at the end with a few hymns from the Rig-Veda. In the second edition the hymns of the Rig-Veda occupy, as by right, the first place, and they are followed by extracts from the Aitareya-brāhmaṇa, the Satapatha-brāhmaṇa, and the Brihad-āraṇyaka-Upanishad. All these, with the exception of the extract from the Aitareya-brāhmaṇa, are accentuated, thus showing that a knowledge of the rules of accent can no longer be dispensed with in a scholarlike study of Sanskrit. Next follow, still belonging to the Vedic period, extracts from the Grihya-sūtras, or rules on the initiation of the pupil who is to receive a liberal education.

Here the historical thread is broken; and, instead of the grammatical rules of Pāṇini which we expected, we are led on at once to passages from the two old epic poems, the Mahābhārata and Rāmāyana, old, if not in their present form, at least in the matter of which they treat. Between these and some portions of the Vishnu-purāṇa, there is a short passage from the Raghuvamśa, the only specimen of Kalidāsa's poetry which the Chrestomathy presents. We then proceed to still more modern compositions, such as the Bhaṭṭikāvya, the Kathāsaritsāgara, Hitopadesa, and Gitagovinda, and return then only to the Laws of Manu, or, as they are more properly called, the Mānava-dharmasāstra, and the Mitāksharā. After these legal extracts follow short specimens of medical and astrological literature, from Susruta and Varāhamihira; next, grammatical and rhetorical extracts from Pāṇini, the Amarakośa, and the Kāvya-darsa; a specimen of later Indian philosophy, the Vedāntasāra, and lastly a play, the Ratnāvalī, edited from five manuscripts by Prof. Cappeller. At the end of the book there are notes, a translation of one of the grammatical extracts, and a complete translation of the Vedāntasāra. A charming translation of the Ratnāvalī, based on the text, as edited by Prof. Cappeller, has lately been published by Ludwig Fritze (Chemnitz, 1878).

All the texts, so far as I have been able to verify them, have been carefully edited, in some cases, I should say, a little too carefully. I cannot approve, for instance, of the alterations introduced into the text of the Rig-Veda. I agree with Dr. Boehtlingk in looking on the Samhitā text, as we now have it, as a kind of compromise between the Pada text and the requirements of classical grammar. We all know, and the ancient

Vedic metricians knew it too, that in reading the Samhitā text certain alterations must be made, in order to restore the ancient metres. Sometimes one syllable must be pronounced as two, sometimes the semi-vowels must be treated as vowels, sometimes elided vowels must be restored, while others must be elided, sometimes two syllables must be pronounced as one. There may be differences of opinion on some points, particularly with regard to Synizesis, of which I treated in the preface to my translation of the Rig-Veda, p. cxliii. But in the main, every Sanskrit scholar with an ear for metre will know how to read, without our tearing the words to pieces or running them together in print. Besides, if we once begin that, we must go on. If we print martiam in i., 41, 2, we must print aniyasya for anyasya in vii., 103, 5; we shall soon see nidhātāh (i. 41, 9) for nidhātōh, &c.

How do we know that tredhā was pronounced trayadhā, and not tredhā? It might no doubt be argued that tredhā occurs but twice as disyllabic, and that dhā is otherwise monosyllabic; but this argument would still leave a sufficient amount of uncertainty to make us hesitate before admitting so exceptional a form as trayadhā into the text. It would not be difficult to remove many of these apparent anomalies by conjecture. Thus, instead of sūsham, i., 154, 3, we might read sūshyam. But we may also read sūsham. There can be little doubt that instead of mṛla (ii., 27, 14) we have to read marḍa; but here even Dr. Boehtlingk shrinks from so extreme a step, nor does he venture to write nrīrīn instead of nrīn (vii., 28, 3). The corruptions which have crept into the text are no doubt numerous; but first of all they are old, older than the Brāhmaṇa period; secondly, they are instructive, if it were only as forcing us to account for their origin; thirdly, they can be so easily removed conjecturally that one shrinks all the more from the attempt. Thus, in iii., 59, 2, the confusion of the metre seems due to the insertion of enam, which, though useful, was not necessary, and by the removal of which the metre is restored, as in amho aṁōti there is no necessity for elision. In x., 129, 7, every reader would at once suggest yadi vā dadhe, yadi vā no dadhe, reading no as two syllables, as in x., 86, 2. But then one asks, if the text was so easy, how could the misunderstanding have arisen? And if the corrections are so easy, why did they not suggest themselves to the Śrotṛiyas as well as to ourselves?

Dr. Boehtlingk is right in pointing out a misprint in my Index to the Rig-Veda. The vocative pūshan in i. 42, 5, ought to have been arranged under the cases where the vocative has the accent on the first syllable. It is rightly printed so in every one of my four editions of the Rig-Veda. If Professor Aufrecht gives it as unaccented, this can only be an accident, such as will happen occasionally even to the most painstaking scholar. As to Pāṇini's rules applying to this case, see hiranyavāśimattama in the next line, and Sāyana's remarks on agne in i. 1, 6; vol. i., p. 51.

F. MAX MÜLLER.

SCIENCE NOTES.

ASTRONOMY.

The Star-Clusters in the Constellation Perseus.—The exact determination of the relative positions of the stars in scattered clusters is obviously a first and essential condition of any future recognition of their relative motions. Nearly half-a-century ago Bessel devoted much time and trouble to observing the brighter stars in the Pleiades by means of the Königsberg heliometer, and more extended series of observations referring to the same group have since been made at Washington and at Paris. Some other groups of stars have also been carefully observed; so that in their cases a fair foundation has been laid for examination and comparison. That the rich and beautiful star-clusters in Perseus have eminent claims to be observed and measured with great exactness is evident. Accordingly Prof. Krüger, the present director of the Gotha observatory, undertook, in the autumn of 1860, while he was still assistant at the Bonn observatory, the measuring of a considerable number of stars in the cluster λ Persei, by means of the Bonn heliometer. It was his intention to extend his observations over the whole group of stars, comprising the two clusters λ and χ Persei, some connexion between which is very probable. But his leaving Bonn, in the spring of 1862, for Helsingfors frustrated the execution of his original plan, and he had to content himself with finishing the observations of the preceding group. The results of these Bonn observations were published by him in 1865 in a paper, "Der Sternhaufen λ Persei," in the *Abhandlungen der Finnischen Societät der Wissenschaften*. Some years later observations of the second group χ Persei were undertaken by Dr. H. O. Vogel at the Leipzig observatory, and, after some delay, the results have now been published in a paper, *Der Sternhaufen χ Persei*, &c. (Leipzig, 1878). The measures were made in the years 1867-70 by means of the 8-inch refractor at Leipzig, with the object of fixing the relative positions and magnitudes of the stars of this cluster, so that any future change may not pass undetected. One hundred and seventy-six stars, in all, have been fixed in position by the filar-micrometer. The brighter stars were determined by measures of position-angle and distance in reference to four selected stars of the group. These four were connected by means of position-angles and distances, and also by differences of right ascension and declination, and they were further connected with two stars of the preceding cluster λ Persei, which had been observed with the Bonn meridian circle. The pairs of stars were observed alternately on different threads of the micrometer, the zero-points determined under the same conditions as those of the observations, and the position-angles measured by turning the circle alternately in opposite directions. From four to six measures of position-angle and distance were taken each night, and for each pair of the brighter stars at least four nights' observations were secured. The probable errors of the final positions of these brighter stars were found to be less than 0.1" in both co-ordinates. The positions of the fainter stars were referred to those of brighter ones by differences of right ascension and declination, at least in two nights for each star, and were determined with an accuracy of less than 1" in each co-ordinate, which the observer considered sufficient for his purpose. The magnitudes of the 176 observed stars of the cluster range between 6.5m. and 13m. Each of the fainter stars was determined by eye-estimates of magnitude at least five times. The brighter stars were determined on several evenings by the eye, and, on two nights, each was compared by a Zöllner's photometer with one of the selected standard stars. The agreement of these estimations of magnitudes is very close and satisfactory. About 14 degrees south of the two splendid clusters λ and χ Persei there is a third remarkable

star-cluster in the same constellation. This cluster, known as No. 34 Messier, was observed in the years 1860-67 by M. Pihl at Christiania, who, by means of a refractor of only 3½ inches aperture, and furnished with merely a ring- and a bar-micrometer, has succeeded in making as good determinations of the positions of the brighter stars in the cluster as could be obtained by such simple means. The results of his observations were published in 1869 in a separate paper, "Micrometric Examination of Stellar Cluster in Perseus." It ought to be the aim of observers with adequate instruments at their service to extend a strict examination to all the more remarkable clusters scattered over the heavens.

Return of Encke's Periodical Comet.—The geocentric path of Encke's comet on its return to perihelion in the present year will be somewhat similar to that described by it in the year 1845, and not favourable for observations in the northern hemisphere. Dr. von Asten, of Pulkowa, has published an ephemeris for the present apparition, in continuation of his very elaborate and troublesome researches and discussions referring to the orbit. According to his calculations the comet will pass its perihelion on July 26, and will be nearest to the earth on August 21, at a distance rather greater than the distance of the sun. It is much to be desired that the comet may be observed independently and well at more than one observatory in the southern hemisphere.

THE Annual Visitation of the Royal Observatory, Greenwich, took place on June 1. From the Report of the Astronomer-Royal to the Board of Visitors, read on that occasion, we learn that the computations for the Nine-year Catalogue of 2,263 stars, including some supplementary investigations, were completed in the course of 1877. The catalogue, which comprises the observations of stars made from 1868 to 1876, is drawn up in the same form as previous catalogues, the only noteworthy alteration being the addition of another decimal place to the right ascensions and their annual precessions, so that the right ascensions are thus made to correspond more nearly with the polar distances as regards the degree of accuracy exhibited. Some investigation has been made of the systematic errors in right ascension, depending on the assumed places of the clock-stars. A correction of the assumed co-latitude has also been deduced, and the result of the new determination based on all the observations of circumpolar stars is stated to be 38° 31' 21".40. The Nine-year Catalogue is intended to form Appendix I. of the Greenwich volume for 1876, while Appendix II. will consist of the continuation of the Astronomer-Royal's Numerical Lunar Theory. In the remarks referring to the latter the Astronomer-Royal mentions that a cursory collation of some of the terms with those known before had led to the supposition that there might be some error in the computations of the Annual Equation and related terms, but that a most jealous re-examination had detected nothing, and had confirmed his belief in the general accuracy of the numerical computations; that he could not yet venture to assume an error in Delaunay's theory, but that he remembered that the Annual Equation had given great trouble to the late Sir John Lubbock, who more than once had changed his conclusions as to its true value. Adverting to the reduction of the observations of the Transit of Venus, the Astronomer-Royal states that it soon became evident that the different stages of phenomena at ingress (and egress) must be most accurately discriminated, and that had been done by Captain Tupman with great care and with great general success; although Captain Tupman himself had been induced lately to modify his interpretation of the observer's language in one or two instances. Then it became evident that in one instance there was indubitably an error of one minute in time, and suspicions arose of a similar error in other observations. Finally, a Report

had been made to the Government on July 5, giving as the mean result for mean solar parallax 8".76, the results from ingress and from egress, however, differing to the extent of 0.11". A more complete calculation by the Astronomer-Royal himself had given sensibly the same result, liable to no error except from the interpretation of observers' language. All had subsequently been re-examined by Captain Tupman; different interpretations had, in a few instances, been put on the records; several observations from colonial stations had been combined; instead of using different phases in the observations, attempts had been made to ascertain the one phase "contact of limbs;" the notes of a few unpractised observers had been rejected; and the result for parallax had been increased to 8".82 or 8".83. Of the numerous photographs taken at the various stations, the Astronomer-Royal says that they had been carefully measured by Mr. Burton and re-measured by Captain Tupman, and that the measure of photographic distortion had been well ascertained, but that the results from photography had disappointed him much. The failure had arisen, perhaps, sometimes from irregularity of limb, or from atmospheric distortion, but more frequently from faintness and from want of clear definition. Many photographs, which to the eye appeared good, lost all strength and sharpness when placed under the measuring microscope. It had once been remarked to him, "You might as well try to measure the zodiacal light." A final result 8".17 had been obtained from Mr. Burton's measures and 8".08 from Captain Tupman's.

CHEMISTRY AND MINERALOGY.

New Minerals from Laangban.—A number of new and interesting mineral species from this locality have been described by A. E. Nordenskjöld (*Jahrbuch für Mineralogie*, 1878, 206). Atopite is the name given to a yellowish-brown or resin-brown, semi-translucent mineral which possesses the following composition:—

Antimonic acid	72.61
Lime	17.85
Iron protoxide	2.79
Manganese protoxide	1.63
Potash	0.86
Soda	4.40

100.04

The antimony appears to be present in the form of the higher oxide of that metal; and the numbers correspond with the formula $2\text{RO}, \text{Sb}_2\text{O}_5$. Monimolite and romeite are the minerals most closely allied to the new species; it differs from the former in containing no lead oxide and a larger proportion of antimonic acid, and from the latter in the ratio of base to acid, and in the fact that all the antimony is present as antimonic acid. Atopite is found at Laangban disseminated through hedyphane, which occurs in fine veins and layers in rhodonite. It crystallises in regular octahedra, and has a hardness of 5.5-6.0, and the specific gravity of 5.03.—Ekdemite is a coarsely crystalline mineral of a bright yellow colour, with a faint greenish tinge; in thin plates it is translucent, and is uniaxial and exhibits a distinct basal cleavage. The hardness is 2.5-3.0, and the specific gravity = 7.14. The solution of this mineral in acid reduces potassium permanganate. A pure specimen of ekdemite was found to possess the following composition:—

Lead oxide	58.25
Lead	23.39
Chlorine	8.00
Arsenious acid	10.60

100.24

These numbers indicate the formula $5\text{PbO}, \text{As}_2\text{O}_3 + 2\text{PbCl}_2$ as that of the new species. The mineral occurs, imperfectly foliated, in mangano-calcite, and as greenish-yellow deposits encrusting it. The author also found at Laangban small

lemon-yellow granules enclosed in the calcite which fills the cavities of a resin-brown coloured garnet; these granules contain arsenic, lead, and chlorine, but a satisfactory analysis of them could not be performed from want of material. He states that they crystallise in the rhombic system, and, regarding them as ekdemit, he believes the new mineral to be dimorphous.—Hydrocerussite is a white mineral enclosing native lead; it appears to be a hydrated lead carbonate having the composition represented by the formula $2\text{PbO} \cdot \text{CO}_2 + \text{H}_2\text{O}$.—Hyalotekite is a white or pearl-grey, semi-translucent mineral possessing a coarsely-crystalline structure, and cleaving in two directions lying 90° or nearly 90° apart. It is easily fusible, and is insoluble in hydrochloric acid and sulphuric acid. An imperfect analysis showed it to contain the following ingredients:—

Silicic acid	39.62 per cent.
Lead oxide	25.30 "
Baryta	20.66 "
Lime	7.00 "
Loss on ignition	0.82 "
Alumina, potash, &c.	not determined.

In appearance it very closely resembles a greyish-white felspar, and it occurs associated with hedyphane and schefferite.—Ganomalite is the name which was given by the author in 1876 to a lead silicate occurring at Laanghan. As it has recently transpired that certain specimens which were believed to be ganomalite contain no lead whatever, and are in reality tephroite (manganese silicate), Nordenskjöld has published fuller details and an analysis of the mineral. Ganomalite occurs massive associated with tephroite, which it so closely resembles that any specimen under examination should be tested by the blow-pipe. It is white or greyish white, possesses marked doubly refractive power, has a hardness of 4.0, and the specific gravity 4.98. When heated with soda in the reducing flame, the yellow crust on the charcoal and the reduced metal indicate the presence of lead. The composition of a specimen of this mineral was found to be:—

Silicic acid	34.55
Lead oxide	34.89
Manganese protoxide	20.01
Lime	4.89
Magnesia	3.68
Alkalies, &c.	1.86

99.88

On one specimen, which appeared to be ganomalite in the crystallised condition, the angle between two planes of cleavage was found to be $104^\circ 33'$. The last of the minerals mentioned in this interesting paper has been termed jacobsite. It has strongly developed magnetic characters, and contains, in addition to some constituents which are apparently accidentally present, the following oxides:—

Iron oxide	58.39 per cent.
Manganese oxide	6.96 "
Manganese protoxide	29.93 "
Magnesia	1.68 "

The formula of jacobsite appears therefore to be $\text{MnO} (\text{Fe}_2\text{O}_3, \text{Mn}_2\text{O}_3)$.

Adamite.—This mineral, a zinc arsenate, hitherto met with at Chanarcillo, Chili, and the Mine de la Garonne, has been found by Laspeyres in the calamine deposits of Laurium. It forms small crystals of a greenish hue, and occurs in the cavities of the rose-red or reddish massive ore of the Greek mines, associated with arseniosiderite, crystallised smithsonite, and sometimes with mimetite. Its crystallographic characters were found not to differ materially from those of the specimens of adamite from Chanarcillo. Braun draws attention (*Jahrbuch für Mineralogie*, 1878, 188) to the interesting group of minerals, more than twenty in number, occurring in the Laurium beds, and points out the advantages which would accrue to science if they could be examined *in situ* by a good mineralogist. The ore which is now being raised is calcined before it is shipped,

and the minerals associated with the calamine are consequently destroyed.

The Reduction of the Chlorates.—Tommasi finds that dilute solutions of the chlorates of copper, lead, sodium and barium are not reduced by sodium amalgam; zinc and sulphuric acid, on the other hand, effect a complete reduction; while zinc alone removes the oxygen in part only. Copper chlorate is partially reduced by cadmium, aluminium, and iron. Lead chlorate is only reduced by aluminium; mercury chlorate is not acted upon by zinc, sodium amalgam, tin, aluminium or copper. Free chloric acid is not reduced by sodium amalgam; zinc and sulphuric acid, however, remove the whole of its oxygen. Zinc alone in contact with chloric acid was found, in 100 hours, to have reduced 14 per cent. of the acid (*Ber. deut. chem. Gesell.*, Berlin., xi., 345).

Absorption of Water by Sodium Hydrate and Calcium Chloride.—Müller-Erzbach describes an interesting experiment (*Ber. deut. chem. Gesell.*, Berlin., xi., 409) made for the purpose of testing the relative attractive force of these substances for water. He placed a tube filled with solid sodium hydrate in communication with a similar one containing solid hydrated calcium chloride, the free ends being carefully closed. After the lapse of two months he found that the tube containing the chloride weighed 15 mg. less, and that filled with soda 16 mg. more, than at the commencement of the experiment. To completely effect the removal of moisture from a gas by means of calcium chloride appears an impossibility. The attraction for water exhibited by potash appears to be intermediate between that of the substances mentioned.

A New Product of the Oxidation of Lead.—Red lead, as is well known, is prepared by heating litharge (lead oxide) in a fine state of division to 500° in a current of air. The oxide slowly takes up 2.3 per cent. of its weight of oxygen, and is converted into an oxide represented by the formula Pb_3O_4 . Dumas regarded this substance as a compound of lead oxide and lead peroxide ($2\text{PbO} + \text{PbO}_2 = \text{Pb}_3\text{O}_4$); Berzelius, on the other hand, believed it to consist of lead oxide and lead sesquioxide, and to resemble magnetic oxide of iron (Fe_3O_4) in point of constitution. Although he did not succeed in isolating the sesquioxide, it has now been shown by Debray (*Compt. rend.*, 1878, lxxxvi., 513) that such an oxide can under certain conditions be formed. When lead peroxide is heated to 440° a brisk evolution of oxygen is observed to take place; after the lapse of four or five hours the substance is entirely converted into red lead. If the lead peroxide be heated to 350° gas is plentifully evolved, but the action very soon ceases, and a product is obtained having exactly the composition of lead sesquioxide. It is a greenish-brown powder, which, both in properties and in point of composition, stands intermediate between red lead and lead peroxide. It can also be produced by heating lead oxide, or, what is better, lead carbonate, at 350° in a current of air or oxygen. The cause of the failure of the earlier chemists to isolate this oxide is clearly to be traced to their having employed too high temperatures.

PHILOLOGY.

At a meeting of the Society of Biblical Archaeology on Tuesday, June 4, an important paper was read by the Rev. W. Houghton "On the Hieroglyphic or Picture Origin of the Characters of the Assyrian Syllabary." After adducing some evidence to show that written language probably originated in pictures representing objects or ideas, the author gave a few instances of the fact from ancient Chinese characters, and then passed on to trace some of the characters of the Assyrian syllabary to their primitive pictorial forms. Of the 522 characters given in Sayce's *Grammar*, very few indeed of the simple characters exhibit their

primitive forms; the composite characters, on the other hand, often reveal their origin. It is only when we go back to the archaic forms of the simple characters that their primary form and meaning can in many cases be discovered. Thus, the character which represents the "domestic ox" may be shown to be the picture of that animal's head, while the character which denotes "the wild bull," or *Bos primigenius*, was originally the head of an ox conjoined with an ideograph denoting "country." Among other characters analysed and explained by Mr. Houghton were the ideograph of "fire," which he traced back to a combination of wood, a fire-machine and sparks of fire; the ideographs of "foot" and "yoke," traced back to the pictures of a saadled foot and a pair of fetters; and the ideograph of "rest," originally represented by the picture of the sun setting behind a mountain. A specimen-page of a list of the cuneiform characters under their different forms—archaic, linear, hieratic, later Babylonian, Assyrian, hieratic Assyrian, Protomedic, and Susian—with a column in which the hieroglyphics out of which they had come are explained, was circulated among the members of the society. The specimen-page belongs to a work which is being written by Mr. Houghton, and is to be published by Messrs Bagster and Sons.

Wörterbuch der ostfriesischen Sprache. Von J. ten Doornkaat Koolman. Heft 1.-3. (Norden: Harm. Braams.) This dictionary of the important East-Frisian dialect promises to be a very elaborate one, the end of the third part bringing it only down to "Daksel." It is, however, very much to be regretted that this breadth of treatment has been lavished mainly on long-winded etymological discussions, which seem to take up at least two-thirds of the work. The author would have done better to publish his etymologies in a separate form, instead of tacking them on to a dictionary of a so-little studied dialect as East-Frisian, where the general student can be hardly expected to seek them. It is now generally admitted that the first business of dialectologists is to present the actual dialect itself as fully and accurately as possible, in a careful phonetic notation, and with full examples of every form and meaning. So far as can be judged from what has appeared of the work, the phonetic notation seems to be hardly minute enough to satisfy the requirements of the present day; it certainly has not the thoroughness and consistency of such a system as that adopted by Winteler in his *Kerenzer Mundart*.

Einführung in das Studium des Angelsächsischen (Grammatik, Text, Übersetzung, Anmerkungen, Glossar). Von Karl Körner. Erster Theil: Formenlehre. (Heilbronn: Henninger.) The work of which the present brief grammar (67 pp.) is the first instalment aims at supplying the want of an elementary introduction to the study of the oldest period of the English language, especially from a scholastic point of view. The grammar consists mainly of a sketch of the inflections, with a few scattered remarks on the syntax, and a few introductory ones on the history of the language and the phonology. What strikes us, especially in a German work, is the extraordinary meagreness of the treatment of the latter subject, which is summarily dismissed in two pages and a-half! A considerable portion of this narrow space is further taken up by superfluous remarks on the punctuation of the MSS. and other subjects which are of no interest whatever for ordinary students. The vowel-changes are dismissed in the following summary style: "Die Vocale werden oft unter einander vertauscht, so dass ein und dasselbe Wort in der verschiedensten Orthographie sich findet." As examples are given, among others, *man* and *mon*, *eōwan*, *iōwan*, *iewan*, without any hint of the fact that many of these different forms really belong to distinct periods of the language. The statement that *ange* interchanges with *enge* is quite incorrect: the former is the adverb, the latter the

adjective. Nor does *æfen* ever appear as *æfen* in West-Saxon texts, except by a mere slip of the pen. All this really amounts to a return to the chaos of a hundred years ago: it cannot be too strongly urged that an intelligent knowledge of Anglo-Saxon is an impossibility without a previous mastery of the elements of its phonology. In the consonants we are told that consonants are sometimes dropped, so that, for instance, *cūðe* stands for *cundē*, *pēn* for *pēgn*, &c. The beginner might infer from this that the form *cundē* actually exists side by side with *cūðe*. The author seems to be more at home among the inflections, although his want of attention to the chronology of the language often tempts him to draw conclusions from isolated forms in late MSS. which are, to say the least, extremely dubious. It is especially dangerous to base any inductions on the extremely corrupt texts of the poetry, many of which were written by scribes who only very imperfectly understood what they wrote. Thus we find (p. 8) the old delusion about a genitive in *-as*, although this form never occurs in old MSS. Indeed, the mere fact of such forms as *dages* (*-as*) being the only ones in the very oldest eighth-century glossaries is enough to prove the impossibility of such a genitive as *-as*, for if it had been retained till after the general change of *a* into *e*, we should have had **dages* through the whole range of the language, just as we have the acc. *cere*, &c.: the form *dages* unavoidably postulates a prehistoric **dages*. Almost equally dubious is the instrumental in *-g* (p. 7). In his remarks on the *tenses* the author has called attention to an interesting use of the preterite for the present in a continuous, half-perfect sense, which he also finds in the well-known passages of *Beowulf*: "Ic *was* endesæta, ægwearde heold." "Mihig god manna cynnes weold," &c.; and several other original observations will be found scattered through the work.

MEETINGS OF SOCIETIES.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, May 28.)

MAJOR-GEN. LANE FOX, F.R.S., V.-P., in the Chair. Mr. Hyde Clarke exhibited a carved stone object which was considered to have come from Central America.—Col. Paske read a paper on "Buddhism in Little Tibet." After a brief description of the route through the Kangra and Kulu valleys to the high mountain passes leading into Lahore and Spiti, the paper gave particulars of the physical features of those countries, their products, &c., with some account of the habits and customs of the people, concluding with observations on Buddhism. Col. Paske gave an explanation of the modified form of Buddhism prevalent in the provinces of Little Tibet, and brought to notice the ritual and religious customs of the Lamas or Buddhist priests, described his visits to Buddhist monasteries, exhibiting specimens of Buddhist ritualistic instruments and other curiosities, with a small painting representing the *Triumph of Buddhism*, executed by a Lama recently arrived from Lhasa.—Mr. Brabrook read a paper by Mr. Alfred Simson, entitled "Notes on the Piojés of the Putumayo." A tribe of Indians occupying the middle and lower Aguarico and a considerable stretch of the left bank of the Napo, are known as the Santa-Maria Indians or Piojés, from the word in their language *pioje*. They speak the same language and have several traits in common with the Indians inhabiting the borders of the Upper Putumayo, who seem to have no special appellation, but whom Mr. Simson proposed to call the Macaguajes, or Piojés of the Putumayo. Mr. Simson's experience of these Indians extended only to those living on the banks of the main stream, during long journeys with a number of them selected from different villages, and visits and sojourns in most of these villages. Their dwellings, religion, and customs were fully described. Mr. Simson also communicated a "Vocabulary of the Zaparo Language."

ZOOLOGICAL SOCIETY OF LONDON.—(Tuesday, June 4.)

PROF. FLOWER, F.R.S., V.-P., in the Chair. The Secretary read a Report on the additions that had been made to the Society's Menagerie during the month of May.—Mr. Sclater exhibited a young speci-

men of Temminck's Manis (*Manis Temminckii*), and read a note describing the habits of this animal in captivity by Mr. F. Holmwood, Assistant Political Agent at Zanzibar. He also called attention to the extraordinary mimicry of the true *rectrices* by the elongated upper tail coverts in *Ciconia maguari* and *C. episcopus*, as observable in the living examples of these birds in the Society's Gardens.—Mr. E. R. Alston exhibited, on behalf of Dr. Elliott Cones, two specimens of *Synaptomys Cooperi*. To this species—the type of *Synaptomys*, proposed in 1867 by Prof. Baird as a subgenus of *Myodes*—full generic rank had been accorded by Dr. Cones in 1874. The present specimens were, so far as was known, the first typical specimens sent to Europe.—Prof. Huxley read a memoir on the cray-fishes, in which he gave a review of the various generic divisions of this group of Podophthalmous Crustacea, and pointed out how remarkably these divisions corresponded with their geographical distribution.—Prof. W. H. Flower exhibited the skull of a two-horned rhinoceros from Tipperah, and read a note on the peculiarities of its structure.—A communication was read from Messrs. Godman, Salvin, and Druce, containing a catalogue of the Lepidoptera collected by Mr. S. N. Walter in the Island of Billiton. Messrs. Godman and Salvin also read a list of the butterflies collected in Eastern New Guinea and some neighbouring islands by Dr. Comrie, during the voyage of H.M.S. *Basilisk*.—Mr. A. G. Butler read a paper containing the description of a new species of the orthopteran genus *Phylloptera* from Madagascar, which he proposed to name *Phylloptera segonoides*.—Messrs. Sclater and Salvin read a Report on the collection of birds made during the voyage of H.M.S. *Challenger*. The present communication, forming the eleventh of the series, contained a description of the Steganopodes and of the Impennes. Of the first group the collection contained thirty-three specimens belonging to eight species; of the second, thirty-seven specimens belonging to six species.—Prof. E. Ray Lankester read a paper in which he gave an account of the structure of the hearts of *Ceratodus*, *Protopterus*, and *Chimaera*, with an account of certain undescribed pocket-valves in the conus arteriosus of *Ceratodus* and of *Protopterus*.

CHEMICAL SOCIETY.—(Thursday, June 6.)

DR. GLADSTONE, President, in the Chair. The following papers were read:—"Analogies between the Action of the Copper-Zinc Couple and occluded and nascent Hydrogen," by Dr. Gladstone and Mr. Tribe. The authors have observed that finely-divided copper charged with hydrogen converts nitre into potassium nitrite and ammonia, and reduces potassium chlorate to chloride. The copper-zinc couple converts nitrobenzol in aqueous solution into anilin, a reaction which the authors have utilised for the detection of small quantities of nitrobenzol. The action of palladium-hydrogen, platinum-hydrogen, and carbon-hydrogen on various substances have been investigated and compared with the action of the copper-zinc couple. During the reading of the paper, Dr. Russell took the chair.—"On the Alkaloids of the Aconites, Part III.," by Dr. Wright and Mr. Luff. The authors have continued their researches on these alkaloids, and in the present paper investigate the saponification, &c., of aconitin and picroaconitin, and have obtained two new bases, aconine and picroaconin; acetyl and benzoyl derivatives of several of the bases have been formed. The authors draw an important practical conclusion from their work: that it is quite possible to obtain crystallised alkaloids of constant composition from *A. ferox* and *A. napellus*, instead of the amorphous preparations which are now sold, and which often contain 40 and even 90 per cent. of bases more or less inert.—"On the Alkaloids of the Veratrums, Part I.: Alkaloids of *Veratrum sabadilla*," by Dr. Wright and Mr. Luff. After discussing the conflicting statements which have been made by previous observers, the authors give details of the process of extraction, which consisted in digesting the crushed seeds with alcoholic tartaric acid, evaporation and extraction by numerous and prolonged shakings with ether. Three alkaloids were obtained: veratrine ($C_{27}H_{45}NO_{11}$), which on saponification splits up into veratric acid and a new base, verin; cevadin ($C_{22}H_{35}NO_6$), splitting up on saponification into cevadic acid (methylecrotonic acid) and cevin; cevadillin ($C_{21}H_{33}NO_6$), which does not crystallise or form crystalline salts.—"On the Action of Hydrochloric Acid upon Chemical Compounds," by J. W. Thomas. The

author has examined the action, in several ways, of hydrochloric acid on many salts—nitrates, sulphates, tartrates, citrates, chromates, oxalates, &c.—"On the Action of Oxides on Salts, Part I.," by Dr. Mills and Mr. Wilson. The object of the authors was to determine the law in consequence of which the action of oxides on salts leads in general to the formation of other oxides derived from the salts in question. They have studied the action of tungstic, silicic, and titanous oxides on potassic carbonate at a high temperature.—"On a New Test for Glycerin," by Dr. Senier and Mr. Lowe. This test is founded on an observation of Iles, that borax when treated with glycerin gives to a Bunsen flame the green colour characteristic of boracic acid. By means of this test one-tenth per cent. of glycerin was detected in beer after concentration, &c.—"On Ammonium Triiodide," by G. S. Johnson. The author has prepared this substance by dissolving iodine to saturation in a strong aqueous solution of ammonium iodide, and by stirring crystals of ammonium iodide and iodine with a small quantity of water till the resulting black liquid refused to dissolve more of either ingredient. The liquid on evaporation over sulphuric acid gave dark-blue prisms of the substance in question, slightly deliquescent, and possessing a specific gravity of 3.749.

LIBRARY ASSOCIATION.—(Friday, June 7.)

ROBERT HARRISON, Esq., Treasurer, in the Chair. Mr. Ernest C. Thomas was elected to the joint-secretaryship vacant by the resignation of Mr. E. B. Nicholson.—A paper was read on "The projected Universal Catalogue," by Mr. W. E. Axon.—Mr. E. B. Nicholson exhibited and explained a specimen of the card-catalogue used in the Ecole des Langues at Paris.

FINE ART.

SMITH'S BRITISH MEZZOTINTO PORTRAITS.

British Mezzotinto Portraits; being a Descriptive Catalogue of these Engravings, from the Introduction of the Art to the beginning of the present Century, &c., &c. By John Chaloner Smith, B.A., M.B.I.A., M. Inst. C.E. Part I., *Adams to Faber*. (London: H. Sotheran & Co., and J. Nosedá, 1878.)

"MORE than two centuries have elapsed," says Mr. Chaloner Smith in his Preface, "since the introduction into this country of the newly invented method of mezzotinto engraving. From that time it was rapidly developed here, and was practised to an extent and with a skill and success not attained to elsewhere, so that it may justly be denominated 'our national art.'" Indeed, on the continent of Europe the art which we call mezzotint is almost as well known under the name of *manière anglaise* as under its more usual name of *manière noire*. The best known of the early mezzotint engravers, such as Blooteling and the Fabers, were foreigners working in England, or for the English market; but when once a native school arose the foreigners were distanced, and no Dutch, or German, or French names can be put for a moment by the side of those of the Watsons, Valentine Green, J. R. Smith, and the many English masters of equal fame. It is perhaps to be regretted that Mr. Smith has not prefixed to his work a short historical summary of the progress of the art; for with the mode of arrangement which he adopts—viz., by engravers placed alphabetically—it is not possible to gain a consecutive view of the history of mezzotint from the book itself. It would have been interesting, for example, if Mr. Smith had undertaken to vindicate the claims of mezzotint to the place of our national art

by showing how, under the fostering care of Alderman Boydell, "the small number of eminent engravers, most of them foreigners," of whom that patriotic citizen speaks, gave way to the brilliant group of English artists with whose names mezzotint is now and for ever identified. He has not chosen, however, to do this, and perhaps it is not to be asked of the maker of a catalogue on this scale, who may fairly demand of his readers that if he gives them the facts they must do their generalising for themselves. Certainly of preface and introductory matter Mr. Smith has been most sparing. Even on the bibliography of his subject he has little to say, and seems to write for those who are already well acquainted with what Granger, Bromley, and Evans have done in the same line. We need only say that, in defending the mode of classification which he has adopted, Mr. Smith has succeeded in an easy task. No one in these days would wish for a catalogue arranged by personages or artists rather than by engravers, or would think of returning from the principle of Bartsch to the principle of Granger.

The design of the author, then, is to give in four stately volumes, of which the first is before us, a complete account of "all mezzotint portraits published in England, Scotland, or Ireland down to the early part of the present century, not including those by engravers, such as S. W. Reynolds and Charles Turner, whose principal works were produced at a more modern date." Together with the account of the portraits he gives a few chronological notes both on the engravers and on the persons represented; and each article includes an account of the different "states" of the portrait. It is evident that such a work, if it is to be at once accurate and complete, demands the most arduous labour and the widest and closest observation. It is the sort of work that would be attempted by no one but an enthusiast, and carried through by no one but a man of infinite patience. Mr. Chaloner Smith has certainly both these qualities to a great degree, and the imperfections of his book are perhaps due rather to his circumstances than to himself. A civil engineer living in county Wexford cannot, unless by a miracle, write as satisfactory a catalogue as the curator of a great museum; no private collection, however complete (and Mr. Smith's is said to be very complete), is large enough for the purposes of a definitive list of this kind. A few examples will show what sort of deficiencies are to be found in this book.

Take the engravings after Richard Earlom. Mr. Smith does not mention one of the most beautiful of the portraits in Boydell's *Houghton Gallery*, "A Lady Reading, after F. Boll (sic)" (1775). Of No. 36, *James, Duke of Richmond*, he gives two states only. The British Museum has one before any letters whatever. Of No. 16, *William Henry, Duke of Gloucester* (Hamilton), a state undescribed in the catalogue exists, with an *etched* inscription. Of No. 44, the very interesting print of the 1771 *Exhibition of the Royal Academy*, there is no mention of the first state, with an inscription quite different from that given by Mr. Smith. In the account of engravings by that charming

artist, W. Dickinson, several imperfections may be noticed. The date given for the first state of the portrait of *David Garrick* (after Pine) is May 10, 1778. In the British Museum impression it is December 1, 1776. In No. 28 (*Jane, Duchess of Gordon*, after Reynolds) a curious mistake occurs which Mr. Smith should have noticed. The first impressions have "publish'd Feb' 29th, 1775"—which, as 1775 was not leap-year, was an impossible date. Afterwards the inscription was altered, in some impressions to March 1, and in some to February 28. Mr. Smith only mentions the last. Of No. 50 (*Dr. Mudge*) a state exists before any letters, Mr. Smith only noticing the state with dotted inscription. In No. 95, of which he notes three states, he omits one (Brit. Mus.) earlier than any of the three, and without the name "Lydia."

In his descriptions of the plates of the two Fabers, Mr. Smith is far in advance of anything that has previously been done. Here also, however, a few instances picked almost by chance from the British Museum collection have shown him to be not altogether accurate. Of the younger Faber he says "he does not appear to have issued proofs before letters, as those met with in this state are seldom quite finished." But of three casually examined by us (Nos. 152, *Arutin George*; 266, *Anne, Princess of Orange*; 293, *Alexander Pope*) the British Museum has finished examples before any letters, unmentioned by Mr. Smith; and no doubt a more thorough search would have revealed many more.

Mr. Smith does not seem to have a keen literary sense, or a keen sense of humour. Otherwise he would not have been content to speak of the inimitable translator of Aristophanes, John Hookham Frere, as "distinguished for his clever literary productions;" or to have left the paragraph in which he gives an account of *Jane, Duchess of Gordon* (p. 181), as we find it:—"She was also most careful in the education of her children; three of her daughters became duchesses."

It is not to be forgotten that this book, like all those which make great numbers of statements of fact, is one that is very difficult to write and very easy to find fault with. It is evidently the fruit of years of labour, of labour for which all lovers of mezzotint—and they are a numerous and increasing band—will be grateful to the author. It is a book that will certainly be accepted as the authority on the subject, and it is not likely to be superseded for a very long time. But precisely for that reason it ought to be carefully tested, and those who are able to offer any of those "additions and corrections" which the author frankly invites ought not to hesitate to offer them. The present writer has selected for comparison, almost at random, some fifty or sixty portraits described by Mr. Smith, and he is bound to say that he has found the errors of description more numerous than he had expected.

T. H. WARD.

THE INTERNATIONAL EXHIBITION, PARIS, 1878.

(Second Notice.)

THE effect of State patronage is conspicuous in the French section, where *la peinture officielle* predominates, just as it predominates every first of May in the Paris Salon. Each of the many rooms devoted to French painting shows vast works, compositions which sometimes occupy whole walls, all abounding in proofs of intelligence and skill, some sustained by high ambition, and some distinguished by indisputable talent. In other sections this kind of work is rarely seen, while in some it is totally absent. America, Sweden, Denmark, Holland, Italy, Spain, Switzerland and Greece do not present a single example of this class deserving special notice; United Germany, from which one would naturally expect a great deal, has but one, and that not important—Gebhardt's *Last Supper*; Austria-Hungary, on the other hand, not only challenges attention with Herr Makart's gigantic canvas, *The Entry of Charles V. into Ghent*; but Matejko's *Recantation of Galileo*, Gyula's *Baptism of a Heathen Prince*, and L'Allemand's *Laudon*, 1759, all demand serious consideration; in our own section Mr. Leighton's *Elisha* stands alone; lastly, Norway puts in a claim with the *Adam and Eve* of Heyerdahl. Of Russia and Belgium I cannot now speak, for twenty days after the opening of the exhibition these divisions were still closed, the Belgians being very anxious, it was said, to outdo all the rest in upholstery; but this is the less to be regretted since Russia sends only an insignificant number of works, and Belgium forms, in truth, but a branch of the French school, and is regularly represented in the yearly Salons of Paris.

Heyerdahl, whose *Adam and Eve* expelled from Paradise hangs in the Norwegian section, dates from Munich, and most of the painters of Norway have been trained either at Munich, Düsseldorf, or Paris. This *Adam and Eve* looks like the work of a very young man, and if so it is deserving notice. There is something truly lamentable in the abject shivering misery of these two hapless creatures, something singular and strange in the types selected; and, moreover, this sadness and strangeness and wretchedness seem to have come to the painter unforced. There are three kinds of sentiment which we soon begin to recognise in works of art: first, that which is most common—the sentiment which the painter has consciously willed to have, and which generally results in grimace, and is worth just nothing at all: the sentiment of Bouguereau, for instance; secondly, there is that which is the fruit of experience, which is burdened with the results of long labour and profound study: the sentiment which one sees in M. Gaillard's work, and which makes one say at once, "This man breathes, eats, drinks, and sleeps with the masters of his art, and his spirit is impregnated with the seeds of their life;" and this second class of sentiment is rare, but there is a third sort, and that is rarer still. No will can tame it, no learning, no communing with the past, no feeding on high thoughts in the present, will bestow it. It is a gift from unseen forces, and it comes unsought. Neither he who has it nor we who recognise its presence can tell why it should be there; we see its manifestation and that is all. Something of this gift, just something, is perhaps discernible in this *Adam and Eve* of Heyerdahl's, which is full of imperfection and incompleteness, and weak, it seems to me—wanting firmness in practice and certainty of knowledge, so much so that it may seem odd that one should pause beside it, and yet one does pause, and that with a sentiment of pity.

Now, one feels no pity, no sense of tragedy, when, on entering the cold black-and-green room of United Germany, one turns to Gebhardt's *Last Supper*. It does not, indeed, raise a laugh such as is excited by the pretentious contortions and grimacing of the personages who figure in his smaller picture of *The Crucifixion*; for the *Last*

upper contains honest work, and gives evidence of some sincerity of intention: it does not attract the eye by any signs of a desire for beauty either of form or colour, it is a dull, steady, careful effort to put in practice conventions carefully got by heart, but if it is absolutely devoid of feeling it is at least respectable and does not offend by any affectation of unreal sentiment.

In this respect M. Bouguereau is one of the worst offenders, because he is one of the most ble. With him all is artificial—artificial colour, artificial light and shade, artificial stuffs, artificial sentiment—and in this assemblage of unrealities M. Bouguereau is eminently at home; he handles them with a consummate ease and skill which would perhaps forsake him should the least little bit of inconvenient truth intrude. His half-dozen devotional pictures, *Vierge Consolatrice*, *Pietà*, *La Charité*, &c., &c., all ranged in a row, recall Bertall's "Boutique pour tableaux religieux." "Des auréoles sur fond d'or," says the dealer; "c'est plus riche, mais plus cher. Je pourrais vous assortir à moitié prix des petites auréoles rés-convenables, ocre jaune et jaune de Naples." But M. Bouguereau can afford to reject yellow ochre and Naples yellow; he does not work at half price, he commands his market, and the halos of his Blessed Saints and Virgins are all *sur fond d'or*. The assortment which his shop contains is intended only for full purses, for those whose habits of life are cast in the mould of fashionable elegance, for women who would be as much ashamed of a shabby crucifix as of a lover who was not *à la mode*; and it must be allowed that M. Bonnat's *Christ* of the Palais de Justice would look as out of place in the charming upholstery of their oratories as the ruffian of the Assize Courts himself in their drawing-rooms. A bit of terrible fact would shock and embarrass M. Bouguereau's public no less than himself; truth must be "well-strained" to please; and, fortunately, now that he is in possession of the mysterious receipt which enables him to return from a two months' holiday with seven or eight large canvases complete, there is no fear of the necessary supply running short.

Should not such work as Gebhardt's, which is infinitely inferior in point of talent, rank higher than such work as Bouguereau's? Both are necessarily based upon certain conventions. Bouguereau's Virgins are done to match the conventions of the fashionable society of the day, but Gebhardt's *Last Supper*, utterly uninteresting as it is, is at least produced according to rules which save for their object, not the pleasing of a small class of lookers-on, but the worthy rendering of the subject. In this lies the merit of purely academical work such as Lematte's *Orestes and the Furies*, which makes no pretension to anything except that which can be learnt and practised with the exercise of patience and steady honest labour. Orestes must look as uncomfortable, and the Furies as furious, as is consistent with the general lines of a carefully-studied composition; and the drawing must be thorough, and the choice of forms as good as possible, and the painting solid and free from tricks—in short, the whole work must be an example for soundness of method; the result is not likely to be very entertaining, perhaps, but on that very account there is the less risk that the young student should be led astray. This sort of work and class of aim has the merit, generally, of not being wanting in dignity, and the mere desire to do the work thoroughly well often issues in an adequate representation.

Sylvestre's *Locuste essaye en présence de Néron le poison préparé pour Britannicus* has this merit. It is not a work of imagination or invention, but it is a serious, studied, and thoughtful presentment of tragedy. This is not a little merit: it is not so easy even for a man of distinguished talent to achieve the serious and competent presentment of tragedy. As Charles Jacques said one day, looking at David's pictures in the Louvre, "It's all very well to chaff David's Romulus and Epaminondas;

it isn't given to every man to see Epaminondas and Romulus." To be dignified without pretentiousness is rare, and the slightest straining after effect is just as fatal to the tragic aspect of a scene, as the slightest straining after sentiment is fatal to the poetic character of a subject. The Germans are the worst offenders in this respect; but it is not they alone who in the effort to be dignified become ridiculously pretentious: M. Boulanger's St. Sebastian jumping up from behind a column and shouting "Bo" at the Emperor Maximian is a grievous specimen of bathos. St. Sebastian, it is said, after his first martyrdom, hid himself in the Imperial palace, and as the emperor was on his way to a solemn sacrifice, he suddenly rose before him, and cried in grave tones, "Maximian, I have returned from the dead to tell thee that the day of vengeance is at hand." This is the scene which M. Bouguereau, in spite of the best intentions, has turned into comedy. St. Sebastian has of course been meant to be very terrible, but his screams and grimaces irresistibly recall the grotesque head of a peasant's tobacco-pipe. We need only look at this work in order to see that learning and ability and skill will not suffice even for the merely adequate treatment of a serious historical subject: something more is required; it is necessary to possess, not only an absolute sincerity of intention, but a certain power and vigour such as Georges Becker evidences in his *Rispa protecting the Bodies of her Sons from the Birds of Prey*.

Rispa, furious with grief and despairing love, repels with her uplifted torch the attacks of a great vulture swooping downwards, her mourning garments of purple and yellow are blown backwards by the chill night wind, and above her head the gibbeted bodies of the seven sons of Saul swing terrible in the gathering darkness. There is a great deal worth study in this work. It is full of energy, the arrangement is admirable, the disposition of the dead bodies upon the gallows is a triumph of skill, and in rendering the oncoming sweep of the vulture, and the action of the brave woman by whom he is kept at bay, M. Becker shows considerable power of drawing movement. The picture looks remarkably well in its present position, seen at a level with the eye; and the same may be said of M. Benjamin Constant's *Mohammed VI., on May 20, 1543*, which seems to have gained rather than lost since its exhibition in the Salon: partly because, now that it is hung near the eye, one is less sensible of the emptiness of a great space in the foreground. When the picture was on the walls of the Palais de l'Industrie this empty space created the impression that the Sultan, like Mohammed's coffin, was suspended between earth and sky; it is possible also that the broadly effective and somewhat vulgar colour in which M. Constant indulges is improved by conditions which are fatal to works of a different order.

On all sides floods of brilliant out-door light pour through the vast uncurtained doors of the French section, and from the grey asphalt floors a reflection is thrown up which completely discolours most of the pictures. Very few, indeed, are able to stand such an ordeal. Regnault's *General Prim*, and what is more his *Execution without Trial*, which is exceedingly ill-placed, are both seriously affected, and the brilliant tone of the *Execution* is entirely destroyed. Here, it looks black, which it certainly is not when it hangs in the Luxembourg. Another sufferer from the same cause is M. Glaize. Perhaps the principal beauty of his admirably-composed picture *Fugitives* was the beauty of the moonlight tone and the exquisite discretion with which the values of local tints were rendered under this effect. The glaring daylight and grey reflections of the International have mercilessly transformed *Fugitives* into a monochrome drawing, which it certainly is not.

It is possible that M. Cabanel also may have some griefs on this head. His *Scenes from the*

Life of St. Louis, intended for a chapel of the Pantheon, do not produce a satisfactory impression in spite of the enormous learning and talent which they display. In the first compartment Blanche of Castile, sitting on a dais, and surrounded by priests and nobles, directs the education of her son; in the second and chief, St. Louis is seen enthroned to the left, and all his great civil reforms are symbolised in the scenes which take place around him, while his people look up from beneath in admiration and awe; in the third division is an episode of the king's unfortunate crusade—the Saracens, having slain their chief, do homage to his prisoner and offer him the command. It is impossible to pass over M. Cabanel's work, because it is so full of ability and knowledge. The group which forms the immediate centre of the large composition is in some respects remarkable for beauty. A sick woman is borne through the street on a stretcher; her bearers stop at the foot of the throne, and another woman, who accompanies her, bids her gaze on the king; she herself raises her feeble body, and, encircled fondly by the arms of her companion, turns her head and lifts her hands in a gesture full of nobleness and grace. The style of the drawing of the head and hands of this figure is well worth notice, the forms are so large, and at the same time so elegant; and for once the sober colour of the draperies of the group permits us to see the general outline, which in work of this class is, or should be, important. Unfortunately, M. Cabanel, in attempting to play the colourist, has throughout the rest of these designs totally destroyed the outline of his groups: the eye seeks in vain for something like a profile as it wanders over the extraordinary patchwork which the dresses of his personages present. The only chance of working this extraordinary diversity of hues into a general effect lay in a skilful employment of the illusion of light and shade—by renouncing, in fact, the strict conditions of mural decoration, and using the resources of the "picture," the line which is taken by M. Henri Lévy in his decorations for St. Merry. M. Henri Lévy does not pretend to be bound by the restrictions of mural decoration; his works are pictures divided into an upper and lower half, the scenes throughout being treated with wonderful talent and spirit. There is, indeed, one passage, the little moonlight episode in which Catulla is seen bearing off the relics of the saint, which proves that M. H. Lévy could, if he chose, treat his subject in a thoroughly monumental spirit; but the general purpose of his designs is that of effective pictorial display. In dealing with that very awkward problem, St. Denis's head, he has had a singularly happy inspiration: the saint rising in the clouds uplifts his arms and holds it just above where it ought to be. M. Laugée, whose thoroughly scholarly designs for the churches of St. Otilde and La Trinité are extremely ill-hung, in treating the same subject replaced the head, which the Saint held before him in his hands, by an outline which, although capable of successful interpretation as a bit of symbolism, did not satisfactorily explain itself.

On the screen, opposite to M. Henri Lévy's two paintings, hang M. Emile Lévy's three graceful decorations for a *salle de mariage*. Every figure in these three compositions is a separate study of physiognomy observed and delineated with a delicacy which is never wanting in charm. The third compartment is specially noticeable for the grace of its arrangement; unfortunately the colour, which in the studio was noticeable for its purity and refinement, is, in this ill-lighted corner, wholly lost. This is the more to be deplored as the showy work of M. Emile Lévy's talented namesake is seen to advantage, and the *Christ* and the *S. Vincent de Paul* of M. Bonnat, which hang close by, are thoroughly well placed. These two pictures of M. Bonnat are not only his two ablest works, but they are excellent examples of thoroughly modern treatment; in both we get the purely physical aspect of things rendered with great

power, and an absorbing determination to *faire vrai*.

The modern movement, which has so greatly modified the work both of Classicists and Romantists in France, has not, if we may judge by Makart, Matejko, and Gyula, yet reached the borders of Austria-Hungary. Of the three, Gyula has, perhaps, the most energetic attack, and more temperament and vigour; Matejko shows great sincerity of intention and much solid learning, backed by steady effort; but Makart decidedly knows best how to make an effective display of his varied acquirements. In his *Entry of Charles V. into Ghent* he has used up every resource of painting. The emperor dressed in white and sitting on a white horse occupies the centre, and this central mass of white is dispersed right and left by rows of pretty little half-naked girls, relieved against the masquerade dresses of those come to see the show. There is a general amusing flutter of gay clothes floating in misty *sfumato*. The scene is very cleverly put on the stage, but there is not a bit of really thorough execution anywhere, and the whole thing may be described as *l'ancien jeu*, but it is much more entertaining than Matejko, who I venture to say is really better worth looking at. E. F. S. PATTISON.

THE ROYAL ACADEMY EXHIBITION.

(Fourth and Concluding Notice.)

Water-colours. It is only when one begins to look with some particularity into the Water-colour room at Burlington House that one discovers it to contain, this year, a very tolerable proportion of the good things of the collection. One work is indeed uncommonly fine, and well capable of holding its own against any landscape on the walls. We refer to the *Moonlight Trip on the Thames* of Mr. Andrew MacCallum, which is hung by no means as its merits deserve. This is painted with great richness and strength: the darkness is powerfully dark, the struggling burst of moonlight splendidly brilliant in its rippled reflections. Mr. James Macbeth and Mr. T. Hampson Jones also exhibit landscapes of exceptional excellence. *A Sunny Day in the Highlands*, by the former artist, with a stage-coach progressing through the broadly-lit mountain-land, and the soil green with grass and ruddy with the fast-withering clumps of heather, condenses a great deal of space into very moderate boundary-lines. Mr. Hampson Jones seems to have studied to some purpose the works of Mr. Boyce: he is not, however, in any degree a servile disciple, but goes to nature for himself, and reproduces with great diligence what he sees. *From Winchelsea to Rye, a Summer Afternoon*, is very precise without being hard, and strictly literal yet not merely prosaic. The slope of the grassy bank in front, and the dark shadow which descends from it along the green meadow-land, usurping upon the domain of sunlight, show a hand of advanced and alluring skill. Miss Marcella Walker contributes one of the principal figure-pictures, with the motto:—

"The wanton troopers, riding by,
Have shot my fawn, and it will die."

The young mistress of the fawn holds the dying animal in her arms. This work is painted with a certain largeness of style, and especially with a warmth and right combination of bronzy or coppery hues, which give considerable promise; promise, not performance, is indeed the characteristic of the picture. A smaller work by this lady, *Neighbours*, is comparatively mature, and assimilates closely to the manner of her brother, Mr. F. S. Walker. Another clever lady is Miss Kate Greenaway, whose *Little Girl with Doll* ranks among her best productions—too monotonous, it must be confessed, in type of face, and in general artistic motive.

Mrs. Allingham is charming as usual in *The Robin's Song*; an old cottage-garden with an

apple tree being the principal object of sight. Under the name of *A Sussex Home*, Miss B. Patmore paints two dormice in the hollow of a moss-grown and ivied tree, and shows, as she has done before, a singular exquisiteness of hand for minutiae: the distance is rather too indistinct, and not in complete keeping with the character of all the foreground material. Miss Alice Squire, in *Little Barbara Lewthwaite*, with her pet lamb at its saucer in a wood, partakes of the amiable sweetness of manner proper to Mrs. Allingham and Miss Patmore: this is, indeed, a delightful scrap of rural simplicity, approximating to a still-life quality of execution. Miss Edith Martineau's *Study of an elderly lady* is careful and lifelike; and Miss Evelyn Redgrave paints *The Home Farm* very agreeably, with a pretty effect in the haloed contour of the sheep, as brought out in the lengthening rays of afternoon sun. We observe with interest the first appearance of Mr. A. Foord Hughes, a son of Mr. Arthur Hughes: his *Fire-side* is the work of a beginner, but of a beginner who paints with that grace of feeling and of presentment which his parentage might have warranted us in expecting.

Other superior exhibitors are:—Yeend King, *An Every-day Scene in Brittany*, laundry-work *à fresco*; Harry Hine, *Durham Cathedral*, pleasant and skilful, though some greater force of handling, especially in the foreground, would improve it materially; Pilbury, *The Hour when Twilight dies*, noticeable for aptness of touch in foliage; Holiday, *The Dust*; Curnock, *Driving down the Sheep, the Trefane, North Wales*, a very interesting treatment, with some elevated qualities of composition; J. C. Richmond, *Taranaki, New Zealand*; Thomas Wade, *A Farmyard*, with a somewhat Mulreadyish tendency in painting; Sydney Hall, *The Prince of Wales, with the Gaekwar of Baroda, witnessing the Elephant-fight*, the action of the huge beasts rendered with plenty of spirit; Claude Hayes, *Boat, Parsons, M^{me}. de l'Aubinière*, Hugh Wilkinson, *Towers*, L. P. Smythe, *Hartland*, Muckley, *Bancroft*, J. O. Long, *Bernard Evans*, Catherine Nichols, *Mrs. Backhouse*, Arthur Croft, *Constance Philott*, Aston, *Sherrin*, Lillingston, *Walter Stocks*, and E. R. White. Still-life is well represented by Constance Philip (the *Purple Iris* is really a grand piece of work of its class), Helen Angell (*Roses*), Spiers, *Pitts*, Owen Dalziel, *May Corkling*, and Allchin (*Wild Roses*, exceedingly pretty, though there is not adequate variety in the greens of leafage).

Drawings, Engravings, &c. Here, again, we find one exceptionally fine work, the chalk drawing of *Cyril Flower, Esq.*, by Mr. Sandys, which must, we should think, be alike satisfactory to the sitter, as doing justice to a remarkably correct and well-moulded profile, and to the artist, as showing forth his singular gift in draughtsmanship and accurate handling. The *Dowager-Lady Buxton*, by the same designer, is of equal though not so conspicuous excellence; a handsome face in the late autumn of life, kindly and observant. *Weary*, by Mr. Hanley, is a head of a little girl, very true in expression, and tenderly finished in execution. Etchings by Messrs. C. J. Watson, Herkomer, Ball, Fagan, Priolo, Heseltine, John Watkins, Lhuillier, Slcombe, and Mansel Lewis, should also be observed; the delicate line-engraving by Mr. Sherratt after a rather puerile picture by Mr. Storey; and, amid a very poor show of miniatures, the agreeable specimens contributed by Messrs. C. J. Basébé, E. Tayler, and Turrell.

Architecture. This section is, we think, quite as well filled as usual; the simple fact being that our architecture continues developing in picturesqueness and common sense, and that the Academy walls, as well as the streets of our principal towns, bear witness thereto. There is not, however, much to single out for critical discussion. We may mention—Hicks, *Proposed Cathedral, Truro*, a slightly example of Early Decorated Gothic; Champneys, *Design for Examination Schools for the University of Oxford*, *Elevation in*

High Street; Collcutt, *Wakefield Municipal Buildings, Design for Townhall, Barrow-in-Furness (second premium)*, and the same, *View of Tower*—this is dignified without being pretentious; Seddon, *Queen's College, Oxford*, *Design for Decoration and Furniture, with Old Window Restored*, and the same, *with New Glass Window*, both of them showing much well-considered and homogeneous style; Shaw, *Houses now Building in Cadogan Square*; Pearson, *St. John the Evangelist, Red Lion Square, London*. From the late Sir Gilbert Scott come *Competitive Design for the New Rathhaus, Hamburg*, and the same, *Alternative Treatment*; the first being a very showy but we fear rather mechanically effective Gothic pile; the second a Renaissance design, like an extrapalatial hotel, tormentingly demonstrative. We hope this is not destined to become a substantive fact in Hamburg. *The Temple of Jerusalem, as rebuilt by Herod, restored by Mr. Fergusson*, will excite the attention of Palestinian explorers and scholars; to lovers of the beautiful in architecture its appeal would not be cogently impressive.

Sculpture. Considering that the number of sculptural works amounts to 135, this is, in the aggregate, a decidedly uninteresting show; yet not, we think, so deplorably bad as some of our contemporaries have undertaken to pronounce it. Messrs. Woolner and Armstead, who exhibit, may be relied on to produce some good work, and the contribution of Mr. G. A. Lawson is observable.

Mr. Woolner's principal production is *Sir Thomas White, Lord Mayor of London, Founder of Merchant Taylors' School, executed for the Merchant Taylors' Company*. This colossal marble figure was no doubt a difficult and is a highly laudable achievement; it is not easy to infuse especial interest into a Lord Mayor of a remote period whose bodily semblance (we presume) has not been transmitted to posterity, but had to be conjured up by the artist. The face is firm and decisive; marked, without being peculiar; and, therefore, judiciously invented for such a purpose as the present. All the details of costume have been well attended to, but are not laboured into tiresome prominence; and the Merchant Taylors may certainly be congratulated upon having so becoming a Lord Mayor invented for them, and so seemly a statue to erect in their edifice. Of two busts by Mr. Woolner—*John Simon, Esq., C.B., presented to the Royal College of Surgeons*, and *Professor Huxley*—it would be difficult to speak in terms of overpraise: they are simply admirable as likenesses, outwardly and intellectually characteristic, and are wrought with masculine refinement which, while sparing nothing that is really needed, does not with hyaena-like hunger prowl after details. The statuette of *Godiva* is agreeable, but not of special note among Mr. Woolner's productions. Mr. Armstead exhibits *William Mareschal the Elder, Earl of Pembroke, bronze, one of the four Statues to be placed at the West End of the Inner Temple Hall*. Cased in chain-mail under his surcoat, with downward eyes and slightly-drooped head, the Earl stands, his right hand poised on his shield: his age is fifty or upwards: his face saturnine, war-worn, and brooding. There is great interest in this figure: one seems to know something of the man, as a child attaches a sort of fancied personality to one whom he has seen twice or thrice and who looks out of the common. The figure does not, however, show equally well from all points of view—which may possibly not be of much consequence when it occupies the site for which it is destined: the blank surface of the shield also has a rather unsatisfactory effect—it might with advantage, we think, have received some suitable emblazonment. Mr. Lawson's group *In the Arena*—plaster, bronzed—may perhaps have been partly suggested by Mr. Leighton's *Athlete and Serpent* of last year: the composition, however, is entirely diverse. Here we have a captive in the circus in death-grapple with a panther: with his right hand he strains to

throttle the ferocious beast, the body reaching forward from the toes, and the tension of muscle in the legs and thighs being at its utmost stretch. The panther lies reversed, but arching upwards: his claws tear down the flesh of both arms: his mouth gapes wide and cavernous, while the man's opens to a slight extent, in panting effort: the grip of all the panther's four legs is upon the man, and the tail swerves round touching his back. Such a subject makes of course a great demand upon a sculptor's energy of conception and of execution; Mr. Lawson has responded to the demand, and the measure of his success is certainly respectable, if we cannot say admirable. We might speak in nearly similar terms of *The Woodcutter*, by Mr. Roche, and *Retaliation*, by Mr. Birch—which represents a shepherd who, finding his lamb slain by an eagle, has seized the eagle, and now wields his crook to defend himself from the assault of the mother-bird; we do not see the latter, but the action of the shepherd is sufficiently self-explanatory. *Lot's Wife*, by Mr. Hamo Thornycroft, at the moment of turning to look back, is well represented in action and drapery for the purpose of its subject.

The only other works of invention which we need specify are: Thrupp, *Ten Bas-reliefs that illustrate the Poems of George Herbert*, arranged as it were a door with its panellings; Emmeline Faise, *The Swing, rikevo*, a boy and girl, with an infant on a napkin, a little group of much natural grace and spirit; Simonds, *Perseus the Liberator*, a bust in which the Greek facial type is reproduced in an unmodified form, beautiful though extra-natural, and the winged helmet with its dragon-crest composes very artistically—the dragon itself is so excellent that we almost fancy it must be appropriated by the European artist from some Japanese confrère; Campoverde, *Sleeping Girl*; and Hubert, *La Toilette, Statuette, Terra-cotta*.

Among the remaining busts or portrait-statues we remark—Boehm, *Sir John Cowell, C.B.*; Cheed, *Mr. Gladstone*, unmistakably like; Havard Thomas, *Dr. Carpenter*; Durham, *Thomas Webster, R.A.*, a face of beaming kindness, with peculiarities which lend themselves well to sculptural treatment; Joy, *The late Dr. Graves*; Mulins, *The Rev. James Martineau*, and some others; Adams Aetou, *H. Stacy Marks, A.R.A.*—the rest of the various over-flaunting busts by this artist.

And here we reach the close of what we have to say about the Royal Academy show of 1878; heartily hoping that that of 1879 may evince more vigorous thought, higher aims, and greater stress of work. If associated with these things, the amount of skill, simply as such, displayed in the present exhibition, is amply enough for practical requirements. W. M. ROSSETTI.

FURNITURE AT BETHNAL GREEN.

TO a district inhabited largely by practical furniture-makers, who, as their fathers before them, have spent their lives in turning out the legs of chairs "to pattern" at so much a dozen, it was a good idea to bring a collection of furniture in which the influence of individual thought is seen and the spirit of the artist felt; and it is the greatest merit of this exhibition that there is very little of the furniture composing it of which this is not true. That a collection which extends from the time of Pompeii to London in the nineteenth century should represent all countries and periods is of course impossible, but it is a pity that the pieces which have been brought together should belong mainly to the Italian schools of the sixteenth and seventeenth and the English of the eighteenth century. It must be allowed that both are marked by special genius, the one in exuberant fancy of decoration, the other by originality and beauty of structural design and proper subordination of ornament, and that the two may be profitably studied together; but, at the same time, it

is to be regretted that French furniture should be so inadequately represented, and Dutch, Flemish, and German scarcely represented at all. Nor are the sins of this collection altogether those of omission, as a considerable part of the comparatively small space allotted to it is taken up by objects which, however interesting in themselves, either do not illustrate the progress of design in Europe, or are of little value in connexion with the educational purpose of the exhibition. Japanese and Chinese screens and cabinets, Persian boxes, chests, and backgammon-boards, have no claim to admission; and the marvellous suite of ivory furniture manufactured in India on European models and presented by Tippoo Sahib to Warren Hastings; the table of Charles II., covered with plates of silver *repoussé* work; and the hideous chair of the Master of the Carpenters' Company, are only some out of many examples rather of what to avoid than what to follow.

All this notwithstanding, the collection is very interesting and valuable in all senses, and is especially rich in specimens of the sixteenth and seventeenth centuries. Most of these are Italian, and form part of the well-known splendid collection of later Renaissance work belonging to the South Kensington Museum, with its wealth of carved chairs and cabinets, its elaborately-decorated marriage-chests, its curiously-framed mirrors, and last, but not least in importance, its wonderful bellows from the Soulages and Bernal Collections, which show better perhaps than any other specimens how far the passion for decoration extended in those troublous times of art and crime.

Although the relief is low, there is no finer piece of design or execution than the Italian cabinet attributed to Jacopo di Canova (No. 119). More bold in its carving, and especially remarkable for its fine groups of David and Goliath, and Judith and Holofernes, and the two lithe fantastic griffins which surmount the sides, is the French cabinet (No. 122), attributed to Bachelier of Toulouse. Specially interesting, as English in workmanship if not in design, is the elaborate architectural cabinet (No. 118), with its spirited battlepieces in its panels, and its profuse decoration of marquetry and carving. There is also a finely-carved ebony cabinet, said to be Dutch or Flemish (No. 128); so that in the matter of cabinets of sixteenth and seventeenth-century work the more important nations of Europe, with the exception of Spain, may be said to be fairly represented. All these specimens belong to the South Kensington Museum, which, however, has nothing to equal as an example of Italian marquetry the splendid Florentine cabinet of the Earl of Granville (No. 124).

Before he passes to the later work, the visitor should not miss the extremely fine balustrade (No. 317), which, for completeness and originality of conception and boldness of execution, has no rival in the exhibition, and might have been designed by Rubens himself in an idle moment of inspiration. Interesting from quite another point of view is the rudely-carved coffer (No. 175) lent by Lord Richard Grosvenor, and stated to be "probably Norwegian." Its main interest is in its marvellous inscription, carved in bold capitals, thus:—

"SIDIS PRONABES KUIS KONTER NOS," which is "probably Norwegian" Latin for *Si Deus pro nobis quis contra nos?*

Of the English later eighteenth-century work, so simple and appropriate in its design, so modest and yet so elegant in its decoration, it would take long to speak adequately. The collection contains fairly representative specimens of what may without exaggeration be termed its "great Masters," Chippendale, Sheraton, Heppelthwaite, and Adams. Of the last, the most severe and classic of all, there are two good specimens, a card-table (No. 101), and an exquisite book-case (No. 140), the only book-case in the exhibition. It is a pity that most of the Chippendale chairs exhibited should be of the

heavier inherited Queen Anne type, with clumsy bow legs, and claw-and-ball feet, and that there is no specimen of his elegant wall-shelves and frames, with their pretty and simple pierced and strap work; but the character of his lighter designs may be seen in the charming little table lent by Lady Dorothy Nevill (No. 105). There are also some good specimens of satin-wood, none of which are better than the semi-circular table (No. 103) lent by Mr. Robert Carter, and the very dainty dressing-table (No. 108), with its pretty painted decorations, which once belonged to Mrs. Siddons.

All things considered, he must be a person of very limited taste or feeling who is unable to find much to interest him in so choice and varied a collection. To the archaeologist, the bronze remains of Roman sedilia, the chair supposed to have belonged to Dagobert I., who died A.D. 638, and the classical inspiration of the old Italian work will suffice. To the student of social history there is scarcely a piece that will not recall manners and customs, costumes and characters, long passed away. The artist will find much to admire both in design and ornament; the workman will gain hints; while there is so much that is pathetic in the sight of old furniture that the numerous class of visitors whose interest in art is limited by sentiment can spend a very pleasant morning or afternoon in sighing over Florentine marriage-chests and English "old arm-chairs."

COSMO MONKHOUSE.

NOTES ON ART AND ARCHAEOLOGY.

WE are delighted to hear that the authorities at Trafalgar Square have just been enabled to acquire for the national collection several of the gems of the famous gallery formed by the late Mr. Fuller Maitland, of Stanstead Park. Foremost among these acquisitions must be reckoned the small Botticelli exhibited at Burlington House in 1871, with the enigmatical Greek inscription at the top: this *Nativity*—a nativity, as our readers remember, with the addition of several unusual episodes—is one of the most imaginative, the best-preserved, and in all respects most delightful examples in the whole work of the master.

ERNST WASMUTH, of Berlin, has just brought out the long-expected supplement to the official folio of illustrations of the Olympia excavations for the season 1876-7. This supplement is issued in order to furnish students with the information they have so eagerly desired concerning the statue of Hermes with the child Bacchus, by Praxiteles, discovered in the Heraeum. The text is by Dr. Treu, and the statue is illustrated, not by photographs (the result of an itinerant photographer's attempts not having been considered good enough), but by two sheets of outline lithographs, together with two small cuts from sketches by Dr. Adler. We shall shortly review the publication in detail, as well as the album of photographs and text to which it is supplementary.

THE sale of the second portion of the collection of modern etchings, engravings, and lithographs, formed by M. Philippe Burty, will take place during the ensuing week at Messrs. Sotheby's auction rooms; and this important remainder of the collection has been on view at Mr. A. W. Thibaudau's until to-day. Though "etchings, engravings, and lithographs" are mentioned together, it is the etchings that are the most important, and we may truly say that hardly any contemporary etcher of high rank in the art is unrepresented in M. Burty's portfolios. The greatest of all modern etchers, Charles Méryon, is, indeed, represented but by two or three minor examples of his work—among the least interesting in subject, or the least beautiful in impression—but it will be remembered that the first part of M. Burty's collection, which was sold some two years ago, was extraordinarily rich in examples of the art of this master. Among wholly original etchers of the

first class now living, M. Legros and Mr. Seymour Haden are largely represented in the present portion of the collection. By M. Legros there are several impressions of rare plates: in one case one of only three impressions known to exist, and altogether the assemblage of the work of this etcher may be said to be only inferior to that which was formed by M. Poulet-Malassie, the cataloguer of his work. By Mr. Haden, again—since we are on the point of rarity—there is an impression of a plate which was destroyed after only four impressions were taken; it is styled *The Mouth of a Brook*, and contains by no means the least expressive tree-drawing of the artist. The collection contains the most agreeable examples of the work of Mr. J. P. Heseltine, whose feeling for beauty in simple rural themes is extremely marked. But one of the most noteworthy features of the sale is the abundance with which the etchings of Bracquemond figure in it. Bracquemond, while a skilful copyist or interpreter, is also a vigorous original artist, and it is interesting to see so complete a collection of his works as that which exists in the remaining portion of M. Burty's cabinet. These powerful works in black and white are arranged in the order of their execution, so that it is easy to see, not only the various phases of Bracquemond's talent, but the various stages through which he has passed. It is remarkable that the engraver of the magnificent portrait of Erasmus, after the Holbein of the Louvre, should be also the etcher of the birds nailed to the woodwork of a door—one of the best pieces of still-life it is possible to meet with. Flameng and Jacquemart, Courty and Greux—admirable reproducers of other men's art—are here sufficiently represented. Flameng's line-engraving after the *Source* of Ingres is known to be one of the most exquisite of modern works in line-engraving. By Jacquemart there is a large collection, including selected proofs of the *Gemmes et bijoux de la Couronne*—the most renowned volume from the hand of this artist. Courty and Greux are less known than Jacquemart, but both deserve to be well known in England; and, indeed, both were employed by Mr. Holloway some half-dozen years ago, to engrave from the drawings of Lièvre the "works of art in the collections of England"—the works of art being, not pictures, but "objects of art"—fine metal-work of the Renaissance, Oriental bowls of jade, and other things as precious. These works and other kindred works by Greux and Courty are in the present collection. Courty's reproductions of some modern pictures are also very remarkable. He is excessively skilful in his translations of Gérôme, Hédonin, Fromentin, and other painters of Eastern subjects: nor does his power over the subtleties of light and shade desert him when he is interpreting so great a master of these things as Peter de Hooghe. Of course this list, though it includes the greater number of good modern etchers, does not exhaust the contents of M. Burty's portfolios.

DR. WALDSTEIN'S first lecture on the History of Greek Sculpture will be delivered in the British Museum on Thursday, the 20th inst., at 3.30 P.M.; and the two remaining lectures on Thursday, June 27, and Tuesday, July 2. These lectures are intended for ladies, and will illustrate the history of Greek sculpture from the monuments in the Museum.

THE annual meeting of the Cambrian Archaeological Association will open this year at Lampeter on August 19, under the presidency of the Bishop of St. David's, at one time one of the general secretaries of the association. The local committee will be presided over by the Very Rev. Dr. Lewellin, Dean of St. David's, and Principal of Lampeter College.

A COLLECTION of photographic reproductions of the treasures of the Berlin Gallery is about to be issued by permission of the directors.

THE sculptor Leopold Rau, who has been entrusted with the works that are to decorate the *façade* of the University of Kiel, has just submitted his models for approval. They are for four statues which are to represent the Faculties, embodied by the sculptor as Plato, Solon, Hippocrates and Aristotle. The designs are highly praised, and will probably be executed in marble in lieu of sandstone as first proposed.

A VERY large collection of water-colour drawings, above 200 in number, by one of the ablest Alpine landscape-painters of an old school, Jacques Henri Juillerat, is to be sold in Basel. Juillerat was born in 1777 at Moutier-Grandval, and after studying under Tavannes of Delsberg and Heitz of Basel, became in 1823 Professor of Drawing at the Academy of Bern. In 1828 he went to Rome, and remained twenty-eight years in Italy, returning to Bern in 1855, where he died in 1860. He left a multitude of sketches and small pictures of the Jura, the Oberland of Bern, and every part of Italy from north to south.

THE question of the reconstruction of the Tuileries is again under consideration in the French Chamber. The extra-parliamentary commission which was formed some time ago to consider it has decided that it will be practicable to preserve the ruins, and build up the *façades* and domes as they were before the time of Louis Philippe. When this is done, it is proposed that the palace shall be appropriated to the purpose of a museum of modern art. The expense, of course, will be enormous, amounting it is estimated to more than four million francs, but a project has been laid before the French Chamber upon this basis.

A COMMISSION has also been formed for considering the ways and means of enlarging and isolating the buildings of the Bibliothèque Nationale. It is composed of M. Lockroy, who first drew the attention of the Chambers to the danger from fire, M. L. Delisle, director of the Bibliothèque, and others. This question is far more urgent than that of the restoration of the Tuileries.

AN important historical picture by Prof. Bellucci, having for its subject the recognition of the body of Manfred in the presence of the Duke Charles d'Anjou, has lately been exhibited in Florence. The scene depicted naturally involves a certain amount of theatrical effect, but critics aver that this has been somewhat exaggerated by the artist, who by this means has given his work a somewhat artificial character. It is, nevertheless, a picture of great interest and power, and certainly one of the most noteworthy that Italian art has produced for some time.

AN exhibition of the works of the late German master Friedrich Preller is now open at the Grand-ducal Museum at Weimar. Preller, whose death we briefly recorded a few weeks ago, was an artist who from first to last remained faithful to the pleasant little town of Weimar, where his youthful talent was stimulated by Goethe, and where, with occasional visits to Italy, he continued to reside until his death, which happened last April in his seventy-fourth year. He is best known to the world as the painter of the *Odyssey*, but besides his monumental frescoes, or rather paintings in wax colours, from this poem, he has left a number of other works of various kinds, which are now collected together at the Museum. The catalogue enumerates fifty-five oil-paintings, one hundred and ten drawings and water-colour sketches, ten portraits and twenty-seven etchings. Almost all these have been collected in Weimar itself, for his art was little sought after in the world at large; but here in Weimar it was highly esteemed and the artist himself cherished as almost the last link that connected the present generation with that glorious past when Goethe and his satellites threw their light upon the little town ruled by the Duke Carl August. The last portrait of Goethe, taken

after his death, was, as we have before stated, drawn by the reverent hand of Preller. Strange to say, it was only just before his death that this portrait was made known.

AT Merten, in Alsace-Lorraine, an important discovery has been made belonging to the Gallo-Roman period. It consists of a column, resting on a double pedestal of octagonal form, terminated by a capital, and surmounted by an allegorical group. Both pedestals are ornamented with fine statues and bas-reliefs, and the capital is enriched with sculptured figures. The allegorical group represents Minerva overthrowing a Triton.

SIGNOR AUTOKOLSKY, a Polish sculptor, has exhibited in Florence an *Ecce Homo* cast in bronze by the two brothers Galli, which is favourably spoken of.

THE *Portfolio* offers nothing of special interest this month, but continues its two series of articles on "Turner," and "The Schools of Modern Art in Germany," the latter being illustrated by a graceful portrait-piece of the Gluck family, painted by Herr Flüggen, an artist of the Piloty school, and etched by E. Mohn. An effective etching by Léopold Flameng, from a picture by Carl Haag, forms the frontispiece of the number, and one of Brunet Debaines' peculiar renderings of street scenes illustrates some pleasant "Notes on Edinburgh," written by Mr. R. L. Stevenson. The scene here represented is that of the Queen's entry into Edinburgh in 1878, etched from the picture by W. E. Lockhart, R.S.A.

THE *Chronique des Arts* announces with supreme satisfaction that the much-talked of project of a Museum of Decorative Art is at length likely to be carried into execution—that, in fact, it may now be regarded as definitely founded, the Government having removed the great difficulty of finding a suitable building by offering the magnificent Pavillon de Flore for its occupation at a merely nominal rent. France has been always secretly aggrieved at the initiative taken by South Kensington, which ought, according to all French views, to have been set by Frenchmen. "On se demande," says the *Moniteur Universel*, "comment un tel exemple n'est pas venu de nous;" but as it did not, France for once finds herself obliged in the interests of her art industries to follow instead of to lead. The project for a Museum of Decorative Art after the model of our South Kensington was taken up some months ago with great fervour by *L'Art* and other papers; and now that the Government have provided the building, it will doubtless be carried out with success. Subscriptions will be opened immediately for it.

THE *Gazette des Beaux-Arts* opens this month with a preliminary article on the Universal Exhibition, by M. Louis Gonsse, in which he merely takes, in twelve pages, what he calls a "bird's-eye view" of the whole scene and its chief architectural features. M. Gonsse rightly calls it a "colossal" effort—"un effort de redressement superbe"—for in truth it is marvellous that France, after all she has undergone, should yet have the energy left "to say the last word" on the subject of exhibitions. The valuable series of articles by M. Reiset on the pictures in our National Gallery is, we regret to say, finished in this number; but as M. Reiset's title is "Une Visite aux Musées de Londres en 1876," we may hope that he intends to give us criticisms of other of our art treasures besides those collected at the National Gallery. In this last article the painters under notice are Claude Lorrain and Gaspar Poussin. The other articles of the number are on Gustave Courbet, by Paul Mantz; on Daumier, by M. Dautant, finishing an appreciative critique of that clever caricaturist; and an archaeological treatise on certain pieces of armour, especially gorgets and gauntlets, which have never been described before and the purposes of which have been misunderstood.

MUSIC.

NEW MUSICAL PUBLICATIONS.

AMONG the most interesting of the large number of new songs awaiting notice are those by Mr. O. Villiers Stanford, a young composer, whose works have been more than once favourably noticed in these columns. In "Three Ditties of the Olden Time" and "La Belle Dame Sans Merci" Mr. Stanford has very happily caught the spirit of old English music, and, so to speak, translated it into modern language; while his three songs from George Eliot's *Spanish Gypsy*, "Sweet Spring-time," "Blue Wings," and "Day is Dying" (Novello and Co.) show real feeling, and not a little power of expression. "People's Songs and Ballads," by M. L. Lawson (Stanley Lucas, Weber and Co.) will be best described as attempts to naturalise the German "Volklied." There are seventeen numbers of these songs, many of which are extremely pretty. The composer without doubt has the gift of melody; but the harmonies occasionally need revision, though on the whole they are correctly written. The songs are likely to be popular. Two songs by Willem Coenen, "The Rose" and "Yes" (Novello, Ewer and Co.), are by no means without merit; of the two we much prefer the first, which appears the more spontaneous invention. "A New Year's Burden," "Sweet and Low," and "I arise from Dreams of Thee," three songs by Florence A. Marshall (Novello and Co.), show very remarkable talent. Not only does the lady give evidence of a thorough appreciation of the spirit of the words, and of some inventive power, but the amount of musical skill displayed in the harmonies is, to say the least, unusual, if, as we conjecture, the songs are the composition of an amateur. The second and third named are especially charming. "Lylph's Flower," a song by Eaton Fanning (Stanley Lucas, Weber and Co.), is a piece somewhat unusual in form, being what the Germans call a "durchcomponirtes Lied." It is a kind of vocal scene in several connected movements, which are happily contrasted with each other, while the thrice-recurring refrain in triple time gives unity to the whole. The song is not only creditable to Mr. Fanning's ability, but pleasing, and would in the hands of a good contralto singer prove very effective. "A Leave-Taking," song for tenor or soprano, by Charles Salaman (Novello and Co.), is one of those elegant little trifles in which its composer excels. The hand of the astute musician may be traced in every page. Two songs which may be commended for more than the average of originality are "Beloved, it is Morn," by H. A. Rudall (Stanley Lucas, Weber and Co.), and "Laura's Song," by Mary G. Carnichael (Augener and Co.), both of which are unconventional and pleasing. "Together," song by Mrs. Mounsey Bartholomew (Novello and Co.), is another example of the avoidance of commonplace, the song containing more modulations than are generally to be met with in a piece of its extent. They are, however, so skilfully conducted that the effect is less harsh than might be imagined from a cursory glance at the music. "In our Boat," with violin (or violoncello) and pianoforte accompaniment, by A. C. Mackenzie, Op. 12 (Novello and Co.), is, like most of Mr. Mackenzie's writings, decidedly German in style. It must be added that it is a very good German style; the song is charming, and the treatment of the *obbligato* violin very effective. Messrs. Ashdown and Parry have sent us Nos. 81 to 88 of *The Glee and Choral Library*. Then numbers before us consist partly of reprints of old acquaintances—such as "Mynheer van Dunck," "The Wreath," by Mazzinghi, and "Sally in our Alley" harmonised for four voices—and partly of new compositions by Mrs. Bartholomew, Mr. Henry Leslie, and Mr. J. L. Hatton. The pieces will be found useful to amateur choral societies and glee-parties. But on what authority is Dr. John Clarke's name given as that of the composer of "Sally in our

Alley"? The charming old air is generally attributed to Henry Carey.

Of pianoforte music, "Six Pieces for Piano," by James Lea Summers (Goodwin and Tabb), are interesting, but unequal in merit. All are well written, but Nos. 1 and 2 are not very striking. On the other hand, the Minuet (No. 3), the "Cantabile e Legato" (No. 4), and the middle part of the Mazurka (No. 5), are extremely good. Mr. Summers has decided talent, and a little judicious self-criticism will probably render his next publication even worthier of favour than the present. "Andante with Variations," for two performers on the piano, by H. C. Banister (Lamborn Cock), are elegant and charmingly written. "Valse Brillante" and "Song of the Stream—Impromptu," by Arthur H. Jackson, are both clever; but in the middle of the valse Mr. Jackson's feeling for rhythm seems to have deserted him; the episode in D flat (pages 4 and 5), is very vague. The "Song of the Stream" is a mere trifle—a little Etude of four pages; but it is very pretty. "Caprice in E flat," by Stephen Kemp (Stanley Lucas, Weber and Co.), though obviously Mendelssohnian in style, is so extremely well written and so full of interesting details that it deserves more than ordinary commendation. Mr. Kemp might have taken many a worse model than Mendelssohn. Six "Miniatures" by Bruno Ramann, Op. 43 (Stanley Lucas, Weber and Co.), are by no means destitute of merit, though there is but little individuality of style in them. Like many other writers for the piano, Herr Ramann is occasionally somewhat lax in his part-writing, and allows himself progressions which we feel sure (from the internal evidence of these pieces) he would be too sound a musician to admit in vocal music. "Allegro con forza," in B flat minor, by Frederick Westlake (Stanley Lucas, Weber and Co.), shows considerable originality, and is cleverly and effectively harmonised. Of a "Preludio e Fuga," in D minor, by Franz M. D'Alquen (Brighton: J. and W. Chester), it may be said that the prelude is very good and the fugue very poor.

The following pieces may be recommended for teaching purposes: "Voi che sapete," transcribed by C. Neustedt; "Minuet," by Edwin M. Lott; "Bourrée," by J. Baptiste Oalkin; and "Rigaudon," by J. T. Trezell (all published by Ashdown and Parry). Mr. Trezell's piece is wrongly named, being in triple time, whereas a Rigaudon is a dance in common time. All these pieces are moderately easy. "A Collection of Elementary and Progressive Pieces," by A. Ehmann (Stanley Lucas, Weber and Co.), will be suited for quite young pupils; while Mr. Sydney Smith's duet Fantasia on the *Flying Dutchman* (Ashdown and Parry), without being very difficult, is showy and effective; though it must be confessed that Wagner is not a composer whose works adapt themselves well to ordinary drawing-room transcriptions.

Two transcriptions from Chopin's pianoforte works, for piano and violin by W. H. Grattann (Hart and Son), while skilfully done, illustrate the difficulty of arranging music so especially suited to the genius of the piano as that of Chopin for any other instrument. The two pieces which Mr. Grattann has chosen are the Prelude in D flat from Op. 28, and the Impromptu in G flat, Op. 51. Both are naturally transposed a semitone higher, to suit the violin. It may be fairly admitted that the Prelude in its new form is extremely effective; though much of its dreamy character is lost by transposing it to the bright key of D major. The Impromptu appears to be less satisfactory; the rapid quaver passages cannot produce on the violin an effect at all analogous to that obtained on the piano. The arranger's conscientiousness shows itself in this piece in a manner which cannot be too highly commended. At pages 6 and 7 he has added to Chopin's music a new melody for the violin. The effect is good; and he adds a note which completely relieves him from any charge of

tampering with the original, in which he says, "The violin part of the following twenty-seven bars has been added by the arranger, and may be omitted or played at pleasure." When the fact of an alteration or addition is, as here, frankly confessed, there can be no reasonable ground of complaint; nobody can be misled, and the arrangement stands or falls on its own merits.

The *Organist's Quarterly Journal*, Parts 35-38 (Novello and Co.), contains some very good pieces, and a considerable proportion of rubbish. Among the best of the compositions are those by Mr. Frederic Archer, Mr. Henry Smart, and Dr. Garrett; an "Andante Moderato" in Part 37, by the last-named gentleman, is especially well written.

"Six Transcriptions for the Organ," by George Shinn (Novello and Co.), are apparently designed for players of very limited capacity, and as a whole are not badly done. A protest must, nevertheless, be entered against the barbarous treatment of the slow movement of Beethoven's O minor symphony. Not only is it transposed and abridged, both of which operations may perhaps be excusable, if not justifiable, in a collection of this kind; but the arranger has added full harmony to the opening passage, and—what is still worse—harmonised it incorrectly! If he will look at the 110th bar of the movement, he will see what the proper chords would have been, supposing it necessary to add chords at all—which it most emphatically was not.

"Six Original Pieces, composed expressly for the Estey Organ," by E. C. Essex (Hodge and Essex), though of no great value from a musical point of view, are well-adapted to their purpose, as the stops are carefully marked throughout, and the resources of the instrument are shown off to advantage.

EBENEZER PROUT.

THE Max-Bruch concert at the Crystal Palace, on Saturday last, suffered by reason of the faulty arrangement of the programme. It was an error of judgment to place the most important work in a lengthy selection in a position where it could not expect to meet with due attention from the already satiated audience. The *Frithiof* cantata may be heard under more advantageous circumstances on some future occasion, and it may be as well to postpone detailed remarks until such time. The form of the work is singular. Herr Bruch has selected from Tegner's poem passages which he deemed fitting for musical treatment, but not with any apparent intention to form a connected story; and the want of coherence in the words tells with adverse effect on the music, which in itself is essentially undramatic. The orchestration is interesting, but in the voice parts there is an insufficiency of life and colour. Some excerpts might be cited to the contrary, but the general effect is that of sombre monotony. The Max-Bruch selection comprised, in addition to the cantata, a scene from *Arminius*, Op. 43, sung by Herr Henschel, and the violin concerto in G minor, Op. 26, magnificently played by Señor Sarasate. The Spanish violinist afterwards played a charming trifle entitled *Zigeunerweisen* of his own composition, in which his skill in the employment of the harmonics was little short of marvellous. Mdlle. Friedländer, Mr. Shakespeare, and Herr Henschel were the soloists in *Frithiof*, and the choruses were sung by the male-voice section of the Crystal Palace choir, in conjunction with the German Liederkreis.

MDLLE. OPEDA, a Spanish vocalist, made a highly favourable debut on Monday evening at the Royal Italian Opera in the character of Lucretia Borgia. The opera had not been given for five years in consequence of the difficulty in obtaining a soprano capable of sustaining this and kindred tragic parts. Mdlle. Opeda may be expected in some measure to fill up the void. Her voice is rich, full, and flexible, and her appearance is much in her favour. Without manifesting extraordinary powers as an actress, she went through the part with care and self-possession. Next Saturday she

will appear as Valentine in *Les Huguenots*. The result will enable us to estimate more decisively the position she should occupy in her profession.

THE morning performance of *Don Giovanni* on Wednesday, at Her Majesty's Theatre, showed too clearly the gaps recently made in Mr. Mapleson's ranks. Mdle. Mathilde Wilde is scarcely a satisfactory representative of Donna Anna in place of Titiens; nor can Mdle. Alwina Valleria, useful artiste as she is, be accepted as an agreeable substitute for Mdme. Christine Nilsson as Elvira. On the other hand, Mdle. Minnie Hauk is charming as Zerlina. The music does not test her vocal capabilities too severely, and she acts with appropriate *naïveté*. Signor Rota is too lugubrious as the Don, but he sings the airs artistically. Signor Marini should learn to moderate the tones of his robust voice in such a part as Don Ottavio. His version of "Il mio tesoro" was too boisterous. The opera went smoothly, but the scenery in one or two instances was inappropriate.

At the Philharmonic Concert, on Wednesday, M. Wieniawski introduced for the first time a violin concerto in D minor of his own composition. The form of the work is irregular, and its musical value is small, except as a *bravura* piece for the solo instrument. Mr. Alfred Jaell is not heard to such advantage in a concerto as in pieces without orchestral accompaniment; but though he lacks the breadth of style requisite to give due effect to such a work as Beethoven's concerto in E flat, his exquisite touch enabled him to give the softer passages with much charm. The orchestra was heard in Mr. Cusin's overture *Les Travailleurs de la Mer*, Haydn's symphony in D, No. 7, of the Saloman set, and four movements from Mendelssohn's music to *A Midsummer Night's Dream*. Miss Emma Thursby, in two songs by Mozart and Handel, fully sustained the excellent impression she had created at the previous concert.

HAYDN's lovely trio in E flat (No. 23), one of the finest of his thirty-one, was the opening piece at Mr. Hallé's sixth recital, yesterday week, at St. James's Hall. On the same afternoon Mr. Hallé gave a very fine performance of Beethoven's sonata in C minor, Op. 111. Rubinstein's sonata, Op. 98, for piano and violin, and Saint-Saëns' clever trio in F, Op. 18, completed the programme.

THE last Subscription Concert of Mr. Henry Leslie's choir for the present season was announced to take place on Thursday evening. The programme contained as its most important numbers Samuel Wesley's grand motett for a double choir, "In exitu Israel," which has long been a favourite piece with Mr. Leslie's chorus; R. L. Pearsall's part-song, "Sir Patrick Spens"—a remarkable specimen of part-writing, being in ten real parts—and Mendelssohn's "Hear my prayer," besides a selection of madrigals and part-songs.

THE current number of the *Revue et Gazette Musicale* contains a detailed account of the inaugural concerts given at the Trocadéro in connexion with the Paris Exhibition. The large concert-hall has been constructed on a new plan, the result of elaborate calculations as to the reflection of sounds. It being acknowledged that the laws of the reflection of sound were the same as those which governed the reflection of light, a model of the proposed hall was made on a very reduced scale, and a series of experiments was conducted in it with a lamp and reflectors, in order to ascertain what form of building was most adapted to distribute the sounds equally, and to avoid echoes. The *Revue* says that the calculations have probably been correct, that the sounds as they first reach the ear are of perfect purity and sufficient volume, but that there is, unfortunately, so much reverberation (probably arising from the great size of the hall, which seats nearly 5,000 people), that rapid movements become indistinct. The smaller hall, designed for chamber music, is said to be perfect in its acoustic properties. It is announced that some

modifications have already been rendered necessary in the official programmes of the concerts, mentioned recently in these columns. Two of the foreign orchestras which were expected in Paris—that of Madrid, and that of the Apollo Theatre, at Rome—will be prevented from appearing; the cause in both cases being the illness of their respective conductors.

M. HASSELMANS has resigned the directorship of the Conservatoire at Marseilles, and will be very probably placed at the head of the new Conservatoire about to be established at Rouen. M. Hasselmans will be remembered as having been the conductor of a series of performances of French opera, given in 1875 at the Gaiety Theatre.

SATURDAY, JUNE 22, 1878.

No. 320, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

Through the Dark Continent, or the Sources of the Nile, around the Great Lakes of Equatorial Africa, and Down the Livingstone River to the Atlantic Ocean. By Henry M. Stanley. In Two Volumes. (London: Sampson Low & Co., 1878.)

At this time last year Mr. Stanley was still running the gauntlet of the unknown rapids and savage tribes of the great river Congo, and scarcely five months have elapsed since he set foot again in England, yet here, in testimony to his extraordinary working powers, we have before us, in two broad-backed volumes, the narrative of his latest three years of African travel; three years in which he has added more to our knowledge of the continent than has been accomplished by the united efforts of many explorers in any similar period since Burton and Livingstone began the advance on the great Lake Region.

Most of us are familiar, through Mr. Stanley's letters, with the general outline of his march across Africa, and with the three great problems of its geography which he set out to solve—the question of the doubted unity of the Victoria Nyanza, the problem of the outlet of Tanganika, and that of the destination of the great river Lualaba discovered by Livingstone in the heart of the continent. How these problems have been triumphantly solved, in spite of obstacles which would have turned any other than such an iron will from the task, is related in the volumes before us. Leaving the Zanzibar coast in November, 1874, Mr. Stanley began his march to the interior, his large following of 356 souls spreading over half a mile of the now well-known highway westward to the lake region. As far as the borders of Unyamwezi his route lay near the line which has already been described by Burton, Speke, and Cameron, as well as by Mr. Stanley himself in a former work. This part of his journey has been sketched rapidly in the present narrative, which begins in detail where the old route was left and a new path was struck out northward from it directly towards the Victoria Nyanza. Soon after entering the unknown region occurred the first of those fierce conflicts with native tribes which become so frequent in the latter part of the story; and before the shores of the great lake had been seen, a review of the expedition showed that its numbers had been reduced by war, desertion, and disease by more than a third. The new route, however, brought to light the Shimeeyu river, the most southerly

tributary of the Victoria Lake, and thus one of the farthest head-streams of the Nile. Next follows the circumnavigation of the Nyanza, a feat which we may better appreciate if we remember that the width of the vast lake each way exceeds that of our North Sea between the coasts of Lincoln and Holland. Speke and Grant had only seen its western and northern shores at separate points, and before Mr. Stanley's voyage round it, reports of traders from the east coast and native information gathered by Livingstone had inclined geographers at home to the belief that it was not one great expanse, but a cluster of five or more smaller lakes, and in this dissected form it had begun to appear on the maps of the continent. Now the views of its discoverers have been splendidly and most remarkably confirmed, for the Nyanza proves to have very nearly the same wide outline as that which Speke drew for it on his chart.

We must leave it to the readers of his book to follow Mr. Stanley in his stirring narrative of this adventurous voyage, and to form their own conclusions on the much-debated "affair of Bambirah island," merely remarking that the full account here given puts a very different complexion on the story.

A long stay in Uganda has enabled Mr. Stanley to give us by far the most minute account we yet possess of this wonderfully fertile kingdom of Central Africa, which stretches round the northern shores of the Victoria Lake, and to study the character of its ruler, King Mtesa, who is probably destined to play an important part in the development of this region of the continent. The picture here given of him reminds us of that which was drawn of King Theodore of Abyssinia: a strange mixture of noble and savage qualities, which led Mr. Stanley at one time to view him as "an intelligent and distinguished prince who, if aided by virtuous philanthropists, will do more for Central Africa than fifty years of gospel-teaching unaided by such authority can do; . . . a prince well worthy of the most hearty sympathies that Europe can give him," and, at another page, to "dub him a jealous, vindictive, choleric old pagan, despite his fine features and smooth tongue." A large section of the first volume is given to this account of Uganda, its countries and districts, population and products, and to its history, which shows it to be a monarchy of no small antiquity, its line of rulers being connected far back with Kintu, a mythical priest or patriarch from the north.

From Uganda, accompanied by an army of Mtesa's troops, Stanley marched westward, intending to explore the lakes which lie on that side of the Victoria Nyanza, but after crossing through hostile Unyoro, and reaching the cliff shores of a great lake which he calls the Muta Nzige—the same name as the native one of the Albert Nyanza—his Waganda followers proved faithless to their trust, and he was forced to retire without launching his boat. Till his return to England Mr. Stanley believed that at this point, close to the Equator, he had reached a southern gulf of the Albert Nyanza; but the recent explorations of that basin by the Egyptian Staff have shown its comparatively

small dimensions, and that more than a degree of latitude separates it from the lake on whose shores Mr. Stanley stood. Here, then, an altogether new lake has been made known, and with it a new question of African geography arises for future explorers to unravel. Does the Muta Nzige overflow to the Victoria Lake by the Kagera river? if so, it is a higher reservoir of the Nile than the Victoria itself. Or does it drain to the Albert Nyanza or to the Congo?

Mr. Stanley now turned to the second of the great problems he had set himself to solve, and marching south through the country of the gentle king Rumanika, with whom Speke's memory is still cherished, reached the well-known lake port of Ujiji, and launched out to circumnavigate the Tanganika in search of an outlet. We have now three independent sketch surveys of the Tanganika Lake discovered by Burton in 1858—those of Livingstone, made during his wanderings round its shores; of Cameron; and now of Stanley—and it is curious to compare these. In broad outline they agree, but in detail, as might be anticipated, they differ materially. Mr. Stanley's sketch survey agrees more closely with that of Livingstone than that of Cameron; but we should prefer the last, as the work of a skilled surveyor, to either of the others. Where Cameron shows an almost even coast-line Mr. Stanley's chart almost invariably presents a deeply indented one; where the former shows an open bay, the latter marks a deep inlet, and the same contrast is evident in comparing Mr. Stanley's sketch of the Victoria Lake with the portion of its shores drawn by Speke and Grant. In itself the Tanganika is a geographical puzzle; for, though its waters are fresh, it has no outlet to the sea. Everywhere along its coasts Mr. Stanley found evidences of its rising in recent times: three palm-trees, which stood in the market-place of Ujiji at the time of his visit in 1871, for example, are now about 100 feet in the lake; and yet there are unmistakeable signs all round the southern shores of the water having stood at a higher level than at present. Mr. Stanley suggests an ingenious and very interesting explanation of this problem, by pointing out that the southern half of the Tanganika may have formed at one time a separate lake, at a higher elevation than the present one, overflowing to the westward by the Lukuga creek which Cameron discovered, and which lies in the only depression of the lake shores. Two approaching capes still seem to mark the northern limit of this supposed former lake, which, in consequence of some natural catastrophe, seems to have burst into the basin which now forms the northern half of the Tanganika, lowering the general level of the united lake basins very considerably. The two basins thus formed into one are again gradually being filled up to near the level of the first, so that the Lukuga is about to begin again to perform its old function of carrying off the surplus waters of Tanganika westward to the Congo.

Now there remained the question of the great river in the west. And soon after every corner of Tanganika had been searched, a rapid journey brought Mr.

Stanley to the Arab station of Nyangwe on the Lualaba. This was the farthest northward point of Livingstone's journeys, and here also Cameron was compelled to turn away from the great river, for the Arabs refused to sell him canoes for a voyage which they believed would lead him to certain death. Beyond this point they themselves will not venture, though the cannibal land beyond teems with coveted ivory.

When Mungo Park had reached the upper Niger a second time, and had resolved to follow it to the sea, believing that it would lead him to the Congo, for its delta mouth in the Bight of Benin was then unsuspected, he wrote home to Lord Camden:—

"I shall set sail to the coast with the fixed resolution to discover the termination of the Niger or perish in the attempt; . . . though all the Europeans who are with me should die, and though I were myself half dead, I would still persevere; and if I could not succeed in the object of my journey, I would at least die in the Niger."

In the same spirit Stanley, at Nyangwe, resolved to go on and to follow the great river whithersoever it might lead him. Park passed down into the then unknown Niger, and his fate is to this day a matter of some uncertainty. Had Stanley also disappeared from view, no one can tell how long his destiny might have remained hidden; for though the mouth of the Congo has been known and visited by Europeans since the fifteenth century, its lower cataracts form such a barrier in the way of communication upward, that the knowledge of the existence even of Europeans has not penetrated to any considerable distance inland from the west, and few would have been hardy enough to venture after him down its tide. Fortunately Mr. Stanley has lived to tell us the story of his voyage down the Livingstone to the Western Sea—a story of adventure and hair-breadth escapes which has no parallel in the history of modern exploration. He has also unveiled a great waterway in the interior of Africa which, its rapids once passed, will doubtless be as regularly navigated in future by European vessels as the Niger now is.

As a whole the volumes before us are written in a far higher tone than Mr. Stanley's former works, while retaining all their vigour. The perusal of them leaves us in doubt whether to admire more the indomitable will of the leader, his power of resource and the influence by which he made men and heroes of his followers during their three years of training under him; or the diligence of the observer in amassing such a store of varied information about the lands through which he passed in the midst of circumstances so arduous. This material it appears is not by any means exhausted in these volumes, which are to be followed by another in which the hydrography, ethnology, and natural history of Central Africa are to be more fully discussed.

K. JOHNSTON.

Carthage and the Carthaginians. By R. Bosworth Smith. (London: Longmans & Co., 1878.)

THE title of the work before us may cause perhaps a feeling of surprise that a subject

of such interest has not already found a separate treatment in an English dress. It is true, indeed, that what we know of Carthage is drawn mainly from the story of the Punic wars, and as such forms a part of the chronicles of Rome reproduced in some of the most striking chapters of Arnold and of Mommsen. But the fragmentary notices that may be gleaned of other periods, the details of colonial enterprise or constitutional life, the accounts of the great epoch of the Mercenary war, fall into their fitting place only in a work in which Carthage and her great generals form the true centre. The history itself is full of such strange vicissitudes and dramatic incidents that in the duller narrative it can hardly fail to move the reader. In the author's hands it is not likely to lose any of its natural attractions, for his clear and vigorous style should make it popular with younger students, while there are traces enough of learning and of critical enquiry to give a solid value to the work.

He has, of course, often occasion to correct the partisan bias and distortions of the Roman writers; but he does not allow his sympathies to carry him to any extreme positions in favour of the race whose fortunes he describes, and after dwelling impartially upon the brighter and the darker shades of character he admits that

"A universal Carthaginian empire could have done for the world, as far as we can see, nothing comparable to that which the Roman universal empire did for it. It would not have melted down national antipathies; it would not have given a common literature or language; it would not have prepared the way for a higher civilisation and an infinitely purer religion. Still less would it have built up that majestic fabric of law which forms the basis of the legislation of all the States of modern Europe and America."

Yet in emphatic language he regrets the loss involved in the survival of the fittest, for

"The worst excesses of the Romans, the perfidy and the brutality of their wars in Spain, their grinding and oppressive system of taxation, the destruction of Corinth, 'the eye of Greece,' their civil wars themselves, might have been mitigated or postponed . . . by the salutary knowledge that they had powerful rivals on the other side of the Mediterranean who would not allow them to be judge and jury, counsel, criminal, and executioner all in one."

It is not so easy to agree with the writer when he says that "the Phoenician was so little disposed to understand, or to assimilate himself to, his surroundings." Not only does his uniform success in trade in every quarter imply a flexible and elastic genius; but the existence of the Libyphoenicians in Africa, and of the mixed race which grew under like conditions in the South of Spain, points to some readiness of fusion with more backward peoples; while in the later days of Greece we find Phoenician students and professors playing a prominent part in the chief centres of Hellenic culture. Nor is it easy, again, to understand the author's reasons for regarding the Phoenicians without hesitation as of Semitic stock, while he at the same time identifies them with the Canaanites of Scripture. Nor if the Phoenicians were indeed Semitic, superposed upon an earlier race of Ham, is it likely that they pushed onward to the west so far, "many

centuries before the Greeks had set foot in Asia Minor . . . or had settled down in secure possession of their own territories," for Egyptian records seem to point to the widespread influence of Greek peoples in the Mediterranean at a very early age.

The first Punic War has had scant justice done to it commonly by modern writers, though the narrative of Polybius is clear and full. Mr. Bosworth Smith has devoted ample attention to the period, and has vividly described the changing fortunes of the struggle. In dealing with the second war the difficulties of his task were greater, as the subjects of controversy are numerous, and we may see, but cannot certainly correct, the inaccuracies caused by the national prejudices or party spirit of the Roman writers. But he has shown a balanced judgment in dealing with these points, and without pedantry or parade of learning describes, often in a few cautious sentences, the plan of a campaign or the character of an action which has been for ages matter of debate, and on which much must be read, though little may be said upon each point. It is possible that in dealing with Flaminius his sympathies may have outstripped his caution, for it may be doubted whether there is evidence enough for saying confidently that "he was the worthiest and least self-seeking Roman of his time;" or, indeed, any evidence at all for calling him "a patrician" who "preferred the interests of the citizens at large to those of his own order." As a self-made man, indeed, he fought stoutly for the welfare of the class from which he sprang, and forced on a reluctant Government a partial remedy for the economic evils of his age. He rose probably as Censor above the narrow jealousies of rival factions, and possibly, though there is very scanty proof, endeared himself to the provincials by honest courses, and strove indirectly by the Lex Claudia to protect them against the speculations of the ruling classes. But he was wanting in good faith in his dealings with the Gauls, was rash and unskilful as a general. We are not warranted in saying much of a character of which we know but little, or in assuming that he must have been entirely generous and unselfish because he won the people's love while the nobles hated and maligned him.

It may be possible to find occasional slips, as when Hannibal is made to march along the right bank of the Po and cross over to the left after the battle of the Ticinus; or to hesitate as to the merits of Livy's description of the battlefield of Trasymene; or as to the skilful handling, at an earlier time, of the Roman armies in Etruria, which had just met with a heavy blow before they had the good fortune to cut off the retreating Gauls near Telamon with the fresh legions which met them on their way. But there is no doubt that the author has given us a very readable and useful book, and we ought to recognise the vividness of its historical pictures, the pathos with which the lingering agony of the last death-struggle is described, and the interest of the concluding pages, written almost among the ruins of old Carthage, and fresh with the memories of recent travel.

W. WOLFE CAPES.

An Inland Voyage. By Robert Louis Stevenson. (London: C. Kegan Paul & Co., 1878.)

MR. STEVENSON belongs to a class of writers which has never been numerous, and which is now singularly small in proportion to the enormous literary production of the day. We live in a time when minds are jaded by mere quantity in everything, and ask, in consequence, when they ask for anything at all, for some new stimulant strong enough to awaken their deadened powers of perception. One of the principal publishers in London said to me not very long ago, that, in his opinion, the English public was completely *blasé* by this time, quite incapable of any enthusiastic delight in literature, and in the highest degree difficult to move. In such a condition of the public mind, what is to become of an author whose principal quality is delicacy of perception? He is like some flower with a very faint but very exquisite odour in a room already perfumed with strong essences. I wonder how many people there are in England who know that Robert Louis Stevenson is, in his own way (and he is wise enough to write simply in his own way), one of the most perfect writers living, one of the very few who may yet do something that will become classical? It is just the writers of this small class who are most exposed to the neglect of vulgar people, and even to the contempt of those who are at the same time coarse and energetic. Mr. Stevenson it is true, does not tell the story of his inland voyage in what may be called the athletic manner: he does not tell us how strong his muscles were after a thirty miles' paddle, and now boldly he dashed at a rapid, for, though the book is a narrative of a canoe voyage, the canoeing occupies a subordinate place in the narrative; but may there not be as much real manliness in the complete absence of pretension as in any amount of self-glorification? This absence of pretension is one of the great charms of Mr. Stevenson's manner whenever he has to talk about himself. His candour is often most pleasantly humorous. The note is struck in the Preface:—

"To say truth, I had no sooner finished reading his little book in proof, than I was seized upon by a distressing apprehension. It occurred to me that I might not only be the first to read these pages *but the last as well*."

"To the friend who accompanied me I owe many thanks already—indeed, I wish I owed him nothing else; but at this moment I feel towards him an almost exaggerated tenderness. *He, at last, will become my reader—if it were only to follow his own travels alongside of mine.*"

The travels narrated begin in Belgium, from Antwerp to Boom. Mr. Stevenson and his friend arrived at Antwerp from England with their two canoes, the *Oigarette* and the *Arethusa*. The day was bright but squally, and when the canoes were launched in the broad river the navigators hoisted sail. Mr. Stevenson frankly informs us that it was the first time he had ever been in a canoe under sail, and supposes it was almost as trying a venture into the regions of the unknown as to publish a first book or to marry. He confesses that he had always aged the sheet in a sailing-boat, for which he

deserves severe censure—which is hereby inflicted—and says that in five minutes he had done the same in the canoe. I may suggest to canoeists who do this that it would be only prudent to have the string in question of vulcanised india-rubber, which would yield in a squall. Like true Englishmen, the companions were both good sailors and bad cooks. Here is a specimen of their absurd incompetence in cookery:—

"Half-way between Willebroek and Villevorde, in a beautiful reach of canal like a squire's avenue, we went ashore to lunch. There were two eggs, a junk of bread, and a bottle of wine on board the *Arethusa*, and two eggs and an Etna cooking-apparatus on board the *Oigarette*. The master of the latter boat smashed one of the eggs in the course of disembarkation; but, observing pleasantly that it might still be cooked *à la papier*, he dropped it into the Etna, in its covering of Flemish newspaper. We landed in a blink of fine weather; but we had not been two minutes ashore before the wind freshened into half a gale, and the rain began to patter on our shoulders. We sat as close about the Etna as we could; the spirits burned with great ostentation; the grass caught flame every minute or two, and had to be trodden out; and before long there were several burnt fingers of the party. But the solid quantity of cookery accomplished was out of proportion with so much display; and when we desisted, after two applications of the fire, the sound egg was little more than loo-warm; and as for *à la papier*, it was a cold and sordid fricassée of printer's ink and broken egg-shell."

After this experiment our travellers never tried cookery again, but relied entirely on the meals to be procured in the hosteleries on the way. Their cooking apparatus was shut up in the locker of the *Oigarette*, and remained there during the rest of the voyage. The great difficulty about doing canoe voyages in comfort is that you must either load your little craft unpleasantly or else be dependent on the inns, which in out-of-the-way places on the banks of Continental rivers frequently offer the most wretched accommodation. Besides, however bad the bedrooms may be, you cannot always have them within several miles of the spot where you happen to be caught in the rain or belated. Here is an example:—

"At the same place, the rain began again. It fell in straight, parallel lines; and the surface of the canal was thrown up into an infinity of little crystal fountains. There were no beds to be had in the neighbourhood. Nothing for it but to lay the sails aside and address ourselves to steady paddling in the rain."

Just at the end of the same page from which this extract is quoted, Mr. Stevenson speaks of "a hooded cart which trotted shabbily along the tow-path." I am inclined to think, after a good deal of experience in independent travelling, that the hooded cart, ingeniously arranged, would afford much more real independence than a canoe, because the travellers could sleep in it on a pinch, and take many comforts with them. At the same time, I admit that there is a pleasure in being on a river which can never be equalled on a road.

Near Brussels the voyagers were kindly treated by the members of a boating club, who were in trade during the day, but in the long summer evenings found time to attend to boating. Mr. Stevenson treats us on this occasion to a bit of his philosophy:—

"We are all employed in commerce during the

day; but in the evening, *voyez-vous, nous sommes sérieux.*"

"These were the words. They were all employed over the frivolous mercantile concerns of Belgium during the day; but in the evening they found some hours for the serious concerns of life. I may have a wrong idea of wisdom; but I think that was a very wise remark. People connected with literature and philosophy are busy all their days in getting rid of second-hand notions and false standards. It is their profession, in the sweat of their brows, by dogged thinking, to recover their old fresh view of life, and distinguish what they really and originally like, from what they have only learned to tolerate perforce. And these Royal Nautical Sportsmen had the distinction still quite legible in their hearts. They had still those clear perceptions of what is nice and nasty; what is interesting and what is dull, which envious old gentlemen refer to as illusions. The nightmare illusion of middle age, the bear's hug of custom gradually squeezing the life out of a man's soul had not yet begun for those happy star'd young Belgians. They still knew that the interest they took in their business was a trifling affair compared to their spontaneous, long-suffering affection for nautical sports. *To know what you prefer, instead of humbly saying Amen to what the world tells you you ought to prefer, is to have kept your soul alive.*"

These good Belgians treated the English travellers as brethren, taking their wet clothes to be dried, and assuming such fraternal treatment to be quite a matter of course, saying "Oh! *entre frères!*" In any boat-house in England we should find the same." On this touching expression of simple belief in English cordiality at first sight, Mr. Stevenson quietly remarks in a parenthesis, "I cordially hope they might." These nautical young Belgians were as nice young fellows, says Mr. Stevenson, "as a man would wish to see, but they were a trifle too young, and a thought too nautical for us." He and his companion did not wish to disgrace their native land by exhibiting inferior talents on the water; so they had recourse to flight. "It seemed ungrateful, but we tried to make that good on a card loaded with sincere compliments."

It appears that Mr. Stevenson, when in foreign parts, can never persuade people that he is a Briton. He has actually been cast into prison, an experience which he seems to remember with some bitterness, and he is taken for a spy or a pedlar. "It is a great thing," he says, "believe me, to present a good normal type of the nation you belong to." Unfortunately for Mr. Stevenson, he is, "somehow or other, a marked man for the official eye. He is a born British subject, yet he has never succeeded in persuading a single official of his nationality." His travelling companion, though admitted to be a Briton, was looked upon with suspicion as a Briton of doubtful purposes. He was nearly arrested on a charge of drawing the fortifications, "a feat of which he was hopelessly incapable."

Mr. Stevenson's book is full of sententious observations on the thoughts and feelings of humanity, often really new, and always at least wearing that aspect of novelty which an idea has when it has been coined afresh.

"It is an odd thing," he says, "how happily two people, if there are two, can live in a place where they have no acquaintance. *I think the spectacle of a whole life in which you have no part paralyses personal desire.* You are content to become a mere spectator. The baker stands in his

door; the colonel with his three medals goes by to the *café* at night; the troops drum and trumpet and man the ramparts, as bold as so many lions. *It would task language to say how placidly you behold all this.*"

Yes, people can live happily in a strange place, "if there are two;" but when you are quite alone the situation is less agreeable, and you do not look quite so placidly on the spectacle of life. The sensation of being alone in a small town is simply unbearable, and after a few hours you begin to look at everybody to see whether you cannot find some human being to talk to. Travelling on horseback mitigates the evil, because your beast serves as an introduction to the ostler and you get into friendly relations with him. When at Maubeuge Mr. Stevenson became acquainted with the driver of the omnibus.

"One person in Maubeuge, however, showed me something more than his outside. That was the driver of the hotel omnibus: a mean enough looking little man, as well as I can remember; but with a spark of something human in his soul. He had heard of our little journey, and came to me at once in envious sympathy. How he longed to travel! he told me. How he longed to be somewhere else, and to see the round world before he went into the grave! 'Here I am,' said he. 'I drive to the station. Well, and then I drive back again to the hotel. And so on every day and all the week round. My God, is that life?' I could not say I thought it was—for him. He pressed me to tell him where I had been and where I hoped to go; and as he listened I declare the fellow sighed. Might not this have been a brave African traveller, or gone to the Indies after Drake? But it is an evil age for the gipsily-inclined among men. He who can sit squarest on a three-legged stool, he it is who has the wealth and glory."

This is a curious instance of the contradiction between desire and situation, but sometimes the life of an omnibus-driver is mentally more harmonious. Certainly one of the happiest men I know is an omnibus-driver who goes from a small hotel to a French railway station. One day I felt curious to ascertain how often he had done the little journey. He supplied the materials for my calculation, which a little arithmetic soon brought to the following result. He had driven to that station twenty-three thousand three hundred and sixty times; and during all the years of his service he had not known such a thing as a complete night's rest, for he served both night trains and day trains. He enjoys perfect health, has a splendid appetite, with abundant opportunities for satisfying it; he has saved 1,200*l.*, and married a woman who is a good wife to him and has brought him 800*l.* more. He has never had to learn the Latin grammar, or any grammar; he has never puzzled his brain with mathematics, and he has never

"reasoned high

Of providence, foreknowledge, will, and fate,
Fixed fate, free will, foreknowledge absolute."

Mr. Stevenson and his friend, being English gentlemen, did not quite like to be taken for pedlars, which they were rather frequently, and he remarks:—"But manners and bearing have not a wider currency than bank-notes. You have only to go far enough out of your beat, and all your accomplished airs will go for nothing. These Hainaulters could see no difference between us and the average pedlar." Mr. Stevenson is within the truth.

Manners have not nearly so wide a currency as bank-notes. Gentlemen are really only known to their own class, the other classes judge simply by the display of wealth in what they consider a fashionable style.

The misfortune of such travelling as Mr. Stevenson's excursion is that, although the traveller sees a country externally, and comes into contact with a good many people of the humbler classes, he seldom passes an hour with the really cultivated inhabitants of a place who could tell him more about it than his chance associates in the inn. It is a pity that there is not some system of freemasonry among intelligent and cultivated people all over Europe by which a man on his travels might at once find himself in society suitable for his own intellectual needs. In every French town there are two or three houses—often half-a-dozen—where a man like Mr. Stevenson would be received with delight and treated with unbounded kindness if the people only knew who and what he was; and it is vexatious to think that he and his friend were sometimes treated positively with contumely, as at La Fère, when most probably in the very same place there were intelligent people, suffering from the isolation of provincial life, who would have received him as a patriarch might receive an angel. Mr. Stevenson and his friend were on one occasion taken possession of in this way by an intelligent *juge de paix*, who had the wit to see that in catching them he caught the materials for a pleasant evening. The *juge de paix* gave them a good supper, good wine, and some legal society. Both the canoeists were legal gentlemen, so the captain of the *Cigarette* expounded the English Poor-Laws, and Mr. Stevenson spoke learnedly on the Scotch Law of Illegitimacy, which appears to be his forte. This pleasant evening was remembered with painful regret afterwards at La Fère, where the voyagers arrived drenched and miserable at a comfortable inn, to be repulsed with contemptuous insult.

"The carriage entry was lighted up, not by intention, but from the mere superfluity of fire and candle in the house. A rattle of many dishes came to our ears; we sighted a great field of tablecloth; the kitchen glowed like a forge and smelt like a garden of things to eat.

"Into this, the inmost shrine and physiological heart of a hostelry, with all its furnaces in action and all its dressers charged with viands, you are now to suppose us making our triumphal entry. It seemed to me crowded with the snowy caps of the cookmen, who all turned round from their saucepans and looked at us with surprise. There was no doubt about the landlady, however; there she was, heading her army, a flushed, angry woman, full of affairs. Her I asked politely—too politely, thinks the *Cigarette*—if we could have beds: she surveying us coldly from head to foot.

"You will find beds in the suburb," she remarked. "We are too busy for the like of you."

"If we could make an entrance, change our clothes, and order a bottle of wine, I felt sure we could put things right; so said I, 'If we cannot sleep, we may at least dine'—and was for depositing my bag.

"What a terrible convulsion of nature was that which followed in the landlady's face! She made a run at us, and stamped her foot.

"Out with you—out of the door!" she screeched. "*Sortez! sortez! sortez par la porte!*"

The two Englishmen submitted, and went elsewhere to a poor lodging, but they ought

to have acted very differently. They ought to have gone at once to the *Commissaire de Police* and returned to the hotel accompanied by a *sergent de ville*, who would have compelled the woman to treat them properly and give them bed and board. An inn, in France, is a public-house, and everyone has a right to its entertainment who can prove his ability to pay for it.

Here, though reluctantly, I must take leave of Mr. Stevenson and his book. It is as full of delicate entertainment as the inn at La Fère, and it turns nobody away.

P. G. HAMERTON.

Primitive Property. Translated from the French of E. de Laveleye, by G. B. L. Marriott, B.A., LL.B. (London: Macmillan & Co., 1878.)

THE history of property, says M. de Laveleye, has yet to be written. The admission comes with a good grace from one who has himself contributed so much to fill up this great blank in our knowledge. Sir Henry Maine's work on *Ancient Law* opened a new era in the enquiry; and Blackstone's crude chapter on the origin of property is at present chiefly valuable as a curious *farrago* of pseudo-historical guesses at truth, and as a conspicuous warning of the danger of such rash speculations. The present work is written in a very different spirit, and, as Mr. Cliffe Leslie says in his interesting Introduction, "forms one of the most brilliant examples in literature of the application of the comparative method to historical investigation." In ages and countries most remote from each other, the author finds sometimes scattered traces, sometimes elaborately-developed types, of those forms of what he calls "natural communism" which he concludes were once universal. His historical enquiries are, indeed, subsidiary to a more immediately practical purpose, that of advocating economical principles which many who fully recognise the interest and value of his antiquarian researches will be slow to admit. On the present occasion we shall confine ourselves to the latter. Nor shall we do more than mention that many parts of the subject, already well known to us through the writings of Sir Henry Maine and others, are here expounded and illustrated afresh—the German *mark*, the Swiss *allmende*, the Celtic land-system in Ireland, the Anglo-Indian revenue-settlements, and the long story of agrarian change in Rome, and of an equally prolonged and, in the author's opinion, ominous revolution in England. The following remarks are intended rather to show how, by the careful analysis of communities hitherto less minutely described, and where the materials are adequate for such a description, the author has strongly corroborated the conclusions already arrived at by his predecessors in the same field.

M. de Laveleye does not refer to the speculations of the so-called pre-historic school. Nor does he dwell on the expansion of the patriarchal family into the sept or the tribe. But, assuming the existence of the larger aggregates as a collection of normal family groups, he announces, at

starting, what he prominently represents to be "the universally similar evolution of property in land." His general view may be thus briefly stated, without entering upon certain difficulties which it presents.

During what may be called the hunting-stage of existence there is no thought of appropriating the soil. In the purely pastoral period the tribe claims, and contends for, an exclusive right to its grazing-grounds. Even agriculture, in its incipient and migratory application, is compatible with community of property in the soil, and even of labour on the part of the tribesmen. Later, the nomad habits are renounced: the tribe or sept is disintegrated into village communities, each of which collectively owns its separate domain, and uses the pastures and the forest in common; but assigns to particular families the temporary occupation of lots of arable land, subject to resumption and redistribution by the village authorities. This process becomes gradually more infrequent, and at last ceases; and co-operative family groups permanently appropriate the parcels which were formerly only their transitory lots. "Finally, individual hereditary property appears." But it is still subject to restrictions which recall and attest the older system of collective ownership. Only in a relatively very advanced state of society does the individual become the absolute owner of land.

Cultivation and proprietary right in the soil are developed concomitantly. The rude beginnings of agriculture consist in sowing grain on patches of the tribal domain, previously prepared by burning the vegetation; and, the crop gathered, the land has rest for many years, other portions being annually selected for this rough-and-ready manipulation. A great advance is made when a definite part of the territory is permanently devoted to agriculture, and subdivided into three portions, for a rotation of crops, each portion being alternately sown with autumn or with spring grain, or lying fallow. Further progress is indicated in the improvement of stock, the application of its manure, the hedging of the still common fields, which contain the "parcels," and the construction of roads and ditches. Higher farming follows; and "the full improved value of the land" becomes a legal and commercial common-place. Admitting that separate ownership and better culture have been thus historically associated, our author still maintains that the connexion is not indispensable.

A rather formidable objection to the universality of the view thus sketched is presented by the first aspect of classical history. M. Fustel de Coulanges roundly denies that private property was a novelty either in Greece or Italy, and neither the tribe nor the village appears to him in the capacity of collective proprietor, as M. de Laveleye assumes. Authentic history, in the classical world, certainly opens at a comparatively advanced stage of social development; and quiritary dominion and the validity already assigned to testamentary disposition make the Rome of the Twelve Tables, from our present point of view, a very modern society. But M. de Laveleye, here following especially M. Viollet, discerns many traces of the more archaic institutions which

he has delineated in so many other quarters. Thus the poetical traditions of the Golden Age imply that the land, like the air, was a common possession, and yielded her increase freely to all. Philosophers commemorate the equality of enjoyment or distribution of the land in early times; and historians attest that quite late in the classical period there were outlying Greek settlements which still retained the custom of partition. Mommsen has shown that the early community of land, except in the case of the *heredium*, the garden-plot, curtilage, or *Indicé* "compound," is revealed in the very words *pecunia*, *peculium* and *familia*; wealth, both great and small, consisting in cattle and slaves, not in broad acres. Again, "the origin of individual property is nearly always referred to an original division, effected on the footing of equality, which makes us suppose that before this distribution the soil was collective property." The common repasts of the Spartans and other ancient peoples, and many particulars in the plans ascribed to Lycurgus and other legislators, bear an obvious resemblance to the village or family usages of more modern times. The same may be said of the survival in ancient communities of customs denoting an original prohibition of the alienation of land to a stranger without the public consent, and of the long inalienability of the *heredium*, the family *plant*, and the fulcrum, so to speak, of communal exertion. In early Roman history, however, the *gens* rather than the village is the joint proprietor, as the *gens*, long before the maturity of Roman Law, had become a sort of shadowy background to the agnatic family.

M. de Laveleye's first illustration of the village communal system is also one which has been recently made familiar to English readers by Mr. Mackenzie Wallace—viz., the Russian *mir*, the counterpart of the German *mark*. An institution kindred to the *mir* is found in Java. There, too, are villages, with an elective headman and a council of elders, common land, and more or less frequent distribution of lots. The characteristic cultivation is that of rice. This, requiring extensive irrigation-works, is favourable to co-operative labour. Common property is the result of such combined industry. Private property, however, prevails to a certain extent, and, as in Russia, mostly originates in the reclamation of waste lands. But in many districts it reverts to the community after a time, as a matter of course; and the failure of heirs, of sustained cultivation, or of the render of State dues, causes a similar lapse. As in Russia, there are landless labourers, who, however, are to a certain extent provided for on repartition. By general custom the possession of a yoke of oxen entitles the owner to a lot. The village is, as in Russia, jointly responsible to the State for the prescribed dues, both of produce and of labour. There has been the same difficulty as in India in determining who is the absolute owner of the soil. Of late the State has granted long leases with temporary exemption from land-tax; a plan which the author strongly commends. Reasons similar to those urged in favour of the *mir* are given in behalf of this communal

system; but the inordinately rapid increase of population inclines many to advocate its abolition, from which, however, native opinion seems most averse. While Java was in English hands, Sir Stamford Raffles projected a sort of *ryotwar* settlement, to the exclusion of the claims of the "Regents," the Javanese Zemindars. The Dutch Government seems to shirk a formal utterance on the moot point of "eminent dominion," content to reap the fair fruits of institutions congenial to the people and their surroundings.*

The family community, which forms the proprietary unit of the Russian *mir*, and with which recent researches have so much familiarised us elsewhere, exists in a very complete form among the Southern Slavs. M. de Laveleye describes it minutely and enthusiastically from personal inspection. He attributes its preservation to Turkish conquest and the need of union against Moslem tyranny. The family association is not so strict as in Russia. The authority of the elective *gospodar*, or chief and representative of the *zadruga*, is more limited than that of the corresponding Russian personage; and private property exists, though on a small scale.

M. de Laveleye sees many excellences in these relics of archaic life. Emigration, he says, and the tendency of such institutions to postpone marriage, have hitherto checked the growth of population. (Has political oppression not contributed to the same end?) Yet he admits that they are doomed. For they cannot survive the decay of family feeling. And the growing spirit of personal independence is hostile to the *status* restrictions of the younger members of the group.

The existence of co-operative family communities over the greater part of France during the Middle Ages is clearly established by M. de Laveleye, chiefly on the evidence of Customaries, and the commentators upon them. In feudal days both peasants and lords found their account in the maintenance of such associations. The lord was more sure of his dues, the vassals were better able to render them, and in easier circumstances generally, than under a system of individual villenage. But the increasing impatience of the family bond, perhaps the discordant sentiments generated by the Reformation, and later the influence of the Revolution and the *Code Civil*, have made such communities as that of the Gaults, in the department of Nièvre, exceptional phenomena. The elder M. Dupin visited it about 1840. The family has existed from an unknown date, its archives going back into the Middle

* As we write, an instance of a village community in France of comparatively late formation, and not noticed in the work before us, has been recently described. Charles VII., "le roi de Bourges," it appears, settled the Scottish Guard, under their commander, John Stewart, the Constable d'Aubigny, at St. Martin d'Auxiny, near that city, granting to them the neighbouring forest, and "special privileges, which were continued until the Revolution." Their descendants now number 3,000, and "as a community have maintained their nationality to the present day, the members always marrying among themselves. . . . They devote themselves to the culture of fruit. Each male possesses a small plot of ground." We quote from the *Times* of April 2. But it is to be hoped that we shall have a fuller account of this interesting colony.

Ages. It occupied a hamlet, with a large common hall in the principal house, owning collectively land, whose limits French thrift had extended, cattle and moveables, and a growing purse. Males only were considered proprietors; but, as elsewhere, the daughters received portions on marriage. There was private property, and the dowry of women who intermarried with the Gault men was not carried to the common account. But to the joint property there was no succession, properly so called, the right of survivorship operating, on the death of a member, in favour of the rest. A more detailed description is inserted of similar institutions examined by Legrand d'Aussy, in Auvergne, on the eve of the Revolution. It may be added that in each case there was a "master" of the family, and a "mistress," but that in France the latter was not generally allowed to be the wife of the former.

Mr. Marriott's translation is carefully executed, clear, and generally idiomatic, although Gallicisms are occasionally rather too perceptible. SIDNEY JAMES OWEN.

NEW NOVELS.

On the Banks of the Delaware. A Tale. By the Author of "The Château de Vésinet." In Two Volumes. (London: Chapman & Hall, 1878.)

Viva. By Mrs. Forrester, Author of "Mignon," &c. In Three Volumes. (London: Hurst & Blackett, 1878.)

Post Hiems Ver. By Ada Montague. (London: Harrison & Sons, 1878.)

Sophie Crewe. A Novel. In Three Volumes. (London: J. & R. Maxwell, 1878.)

Bonnie Leslie. By Mrs. Herbert Martin. (London: Griffith & Farran, 1878.)

We are glad to welcome a new work by the author of the *Château de Vésinet*. In the new story, as in the former one, the plot mainly hinges on war and religion. In the *Château de Vésinet* we had the Crimean war and the French Protestants; this time we have American Quakers and the Franco-German war. *On the Banks of the Delaware* is marked by a pleasant style and accurate account of events, characteristic of the writer. Every chapter is well worth reading. Some are exceptionally clever—for instance, the ninth of the first volume, which is headed "Chemical Affinities." The heroine is a well-conceived character, well brought out; and of the minor personages old Abe Townsend and the Abbé d'Allouville are worth particular notice. We must venture to remark on one little drawback to the general excellence of the book. It is scarcely in good taste, when the date of the story is so clearly fixed, to describe Her Majesty's Consul at Philadelphia as little better than a fugitive bankrupt, afraid to return to the States; and it would have been very strange if he and his family could have been starving in Paris in 1871 unknown to and uncared for by the gentleman who, as it is stated, "took the place of both consul and ambassador" during that time.

Viva is an unoriginal novel with a very original binding. On the latter is printed, in gold letters, the warning "Be sure your

sin will find you out." The story certainly shows how the heroine falls into sin, and how that sin finds her out; but, having found her out, the sin seems to give her a very easy time of it, and relegates her to a comfortable life under the fostering care of a loving uncle, and almost entirely free from those pricks of conscience which are generally supposed to annoy the after-life of the evil-doer. The principal male personage—we had almost written hero—has an equally tranquil existence after he leaves the troubled atmosphere into which Mrs. Forrester introduces him. *Viva* will doubtless have many readers—good English, well-drawn characters and a "society" tone will generally ensure a good circulation—but the moral tone of the book is scarcely all that could be desired. The best part, to our mind, is that relating to the fortunes of Otho Desmond and Osyth and Riette Sartoris.

In spite of its dreadfully ungrammatical title, which, repeated as it is at the top of every page, has a most irritating effect, *Post Hiems Ver* is by no means an uninteresting story. We do not think that we could better show our approbation of this volume than by recommending it as an antidote to *Viva*. In Miss Montague's tale the truth of Mrs. Forrester's motto is thoroughly exemplified. We might remind the authoress that the stopping of a runaway horse has more than once before in the annals of fiction brought on a declaration of love. May we presume humbly to warn her against making a house on fire or a mad bull the turning incident in her next book?

"*Sophie Crewe*: a new novel by a new writer: dramatic in plot, domestic in incident, full of interest and fascination." We quote a publishers' advertisement, which we cannot directly gainsay. If an overwhelming hurricane of incidents makes a novel dramatic, *Sophie Crewe* is decidedly dramatic in plot; domestic is an epithet which admits of a very wide interpretation; and the author may well rely on the aforesaid wealth of incident to lend interest and fascination to the story of Sophie, the little waif picked up by a railway guard after an accident, and surnamed Crewe after the station near which the disaster took place. But, *pace* the publishers' advertisement, *Sophie Crewe* is unsatisfactory. The dialogue is dull, the descriptive parts are untrue to nature, and the general effect of the book is exhausting. The most noticeable of the *dramatis personae* is the "dramatic" villain—a clergyman of the name of Meek, who would have been more aptly named "Sly." We cannot help thinking that this character is overdrawn in its intense and profound baseness. Messrs. Mudie, however, will no doubt receive a good many orders for this book, which may rank in the second class as three-volumed novels of the day go.

There is no praise too high for Mrs. Martin's delightful story. It is quite refreshing to turn away from sensationalism and more pretentious works to the natural strain and healthy tone of *Bonnie Leslie*. We were afraid at one point in the story that the "lady-help" was to fall a victim to romantic precedent, and become the wife of the heir of the house; but Mrs. Martin steers clear of such a haven for her heroine,

and gives her instead to a clever husband, with whom she finds a congenial home. Our best wishes go with her.

T. W. CRAWLEY.

Prose and Verse, Humorous, Satirical, and Sentimental, by Thomas Moore; with Suppressed Passages from the Memoirs of Lord Byron. Chiefly from the Author's Manuscript, and all hitherto inedited and uncollected. With Notes and Introduction by Richard Herne Shepherd. (London: Chatto & Windus, 1878.)

THE ordinary British reader of the present day is not exactly enthusiastic about Thomas Moore: we say nothing about the feelings of the Irish reader. The volume before us, of some 450 pages, is proper to a public of enthusiasts: in other words, there is very little in it which anyone would think of reading for its own sake, or unless he were prompted by preconceived liking, of more than common intensity, for the author and his already known performances. It is a volume of scraps and leavings: productions on which the writer could not possibly have staked his reputation—the great majority of which, indeed, he would to all appearance have advisedly consigned to oblivion—and which can only be fished up and put into goodly type on the assumption that whatever was done by Moore—whether "humorous, satirical, or sentimental," whether bad, indifferent, or by some lucky chance good—must be graced by the hand from which it came, and dear to a public to whom that hand is precious. If that assumption fails, the *raison d'être* of this volume, or of nine-tenths of it, is gone.

There is one phrase in the title which the reviewer is bound to reduce to its proper dimensions. This volume does not contain any "suppressed passages from the Memoirs of Lord Byron"—i.e. (for the phrase could not properly mean anything else) passages written by Byron in those Memoirs which he gave to Moore, and which Moore connived at destroying. Were there any such passages, they could, of course, only come into this volume, which professes to be the handiwork of Moore, by a sort of editorial laxity or irregularity, but one no doubt which the reader would be more than willing to condone. But, in fact, there are none such, and the phrase in the title is culpably loose and *ad captandum*. What the volume really does contain are rightly designated in the table of contents as "Notes for Moore's *Life of Lord Byron*:" a very different thing indeed; as different as the relative values of Byron and Moore, or of Byron's autobiography and Moore's biography. Such as they are, however, these notes are by far the most important and interesting item in the volume: indeed, though not of supereminent value, they make the book worthy of preservation by literary enquirers—which, on other grounds, it can but barely claim to be.

A considerable portion of the volume comes from Moore's MSS., commonplace books, &c. It includes his very first printed verses; contributions to the *Edinburgh Review*, extending over twenty years of his life; the comic opera, *M.P., or the Bluestock-*

ing, which had hitherto been left (save as regards a few interspersed lyrics) to its natural fate, death and burial; some party-squibs in verse; a *Letter to the Roman Catholics of Dublin*; a fragmentary tale, *The Chapter of the Blanket*; and a few letters, chiefly to Leigh Hunt. The first printed verses are named "To Zelia, on her charging the author with writing too much on love;" and they reveal but too clearly (if, indeed, we are justified in speaking with any seriousness of the verses of a boy of thirteen) the essential tenuity and artificiality of Moore's inspiration—the purport being that his love-verses are after all nothing but make-believe, Cupid having pledged himself that Moore's muse, or in other words Moore himself, should never be veritably in love. One can hardly imagine a more stupid apology, or a confession of demerit at once more complete and more coxcombically unconscious. These verses come from the *Anthologia Hibernica* for October, 1793. Four other "Juvenile Pieces" are given, poorly versified, and of no literary value. Among the "Satirical and Humorous Poems" the "Ode to St. Patrick" (March, 1813) is neat; the so-called "Police Reports" (referring to some dispute between the American and French nations), fair enough; these are, perhaps, the best out of the total of thirteen specimens. Of the articles contributed to the *Edinburgh Review*, that on "Private Theatricals" is at the present day the most readable.

The letters addressed to Leigh Hunt, ten in number, ranging from 1811 to 1821, are all marked by apparent cordiality, and even *empressement*; compare their tone with that in which Moore wrote about Hunt after the appearance of the book by the latter concerning Lord Byron, or with the feeling shown in the letters which he sent to Byron regarding the project, in or about 1821, for Hunt's co-operating in the *Liberal* magazine. Here is a pretty piece of flattery:—

"The poem to which you were good enough to direct my attention interested me extremely. There is nothing so delightful as those alternate sinkings and risings, both of feeling and style, which you have exhibited in those verses; and you cannot think how gracefully it becomes the high philosophy of your mind to saunter now and then among the flowers of Poetry. Do indulge her with a few more walks, I beseech you."

There is also a letter addressed to Mrs. Shelley, in 1839, on receipt of the collected edition of Shelley's poems. Its tone is complimentary; but it does not contain any expression of admiration of the poems individually.

The notes regarding Byron were no doubt to a large extent worked up into Moore's biography of the poet; but they contain several particulars which one reads with satisfaction here at first hand; among them are a page and a-half of reminiscences furnished by Mrs. Musters (the beautiful Miss Chaworth). Byron, it seems, then hardly beyond boyhood,

"used to pass his time chiefly in riding with Miss C. and her cousin; or in sitting doing nothing, pulling his handkerchief; or in firing at a door which opens on the terrace, and which still (Mrs. M. says) has the marks of his bullets. By the by, Miss Pigot told me that whenever he had

nothing else to say, he would always say 1, 2, 3, 4, 5, 6, 7, 8, 9, 10."

I add a few other items, culled at random:—

"Hobhouse's account of the storm in which B. and Shelley were so nearly lost on the Lake [of Geneva in 1816] . . . B. insisting that he would endeavour to save Shelley, and Shelley refusing. . . . S. as brave as a lion, H. says."

"Mrs. Shelley tells me she heard a heedless girl once say to him [Byron], 'I think you have a little of the Scotch accent.' 'Good God, I hope not! I am sure I haven't. I'd rather the whole damned country were sunk in the ocean. I the Scotch accent!'"

"His mother had his nativity cast when he was very young. Mrs. B. wished to pass for a single woman; but the fortune-teller told her she was married, and had a son who was lame; that he would be in danger of being poisoned before he came of age, and would be twice married, his second wife to be a foreigner."

"Lady Byron, he said, was a great person among the Socinians. Had had many disputes with her upon religion; but on comparing all points together, found that her religion was very much the same with his own. Praised Shelley highly. [This was after Shelley's death, when Byron was in Greece.] . . . 'I am nearly reconciled to St. Paul, for he says there is no difference between the Jews and the Greeks; and I am exactly of the same opinion, for the characters of both are equally vile.'"

"He used to say Trelawny was an excellent fellow, till his *Lara* and *Corsair* spoiled him by his attempting to imitate them."

This last phrase might seem to bewray some confusion of mind on the part of the person who retailed Byron's observation. Byron only knew Trelawny after the roving sea-life of the latter was over; and if the poet jocularly compared him to *Lara* and the *Corsair*, this comparison may have applied to the antecedent sea-life more appositely than to any change in Trelawny's demeanour at a later date. W. M. ROSSSETTI.

CURRENT THEOLOGY.

Ritual of the Altar: the Order of the Holy Communion, with Introits, Collects, Epistles, Graduals, Gospels, Offertories, Secrets, Communion and Post-Communions throughout the Year; according to the Use of the Church of England; together with Rubrical Directions, Secret Prayers, Ritual Music, and the General Rubrics Illustrated. Edited by the Rev. Orby Shipley, M.A. Second Edition, Revised and Enlarged. (Longmans.) This large and handsome volume is a choice specimen of the printing of the Ohiswick Press in black and red. The musical notation is exhibited with beautiful distinctness, and the general appearance of the volume is all that could be desired. Those who are familiar with other efforts of the editor will scarcely be misled by the words "according to the Use of the Church of England" (which stand on the title-page) into the error of supposing that this book bears even a colourable resemblance to the parts of the Prayer Book of the Church of England which relate to the administration of the Holy Communion. It is true that, with a few omissions, all these parts of the Anglican Liturgy are included in these pages, but with such large additions and intercalations of prayers (many of them, too, meant to be said, not *secret*, but audibly), rubrics, &c., from the unreformed service-books that for an English Churchman to find the familiar words of his own office is like looking for an acquaintance in a motley crowd. Mr. Shipley is very considerate in supplying even our bishops with prayers to be said when "vesting for mass." For ourselves we trust that when an Anglican Bishop

says prayers when "putting on his gloves" he will prefer the original Latin to Mr. Shipley's indifferent translation: first, because the allusion to the very disreputable transaction described in Genesis will be the better obscured from the bystanders; and, secondly, because the closeness of the reference to the Bishop's fine "kids" is almost lost in Mr. Shipley's "skins of the goats," while it is charmingly transparent in the words "*quemadmodum Jacob, dilectus tuus, pelliculis haedorum operis manibus,*" &c. In one of the preceding prayers we find the words "*Ure igne sancti Spiritus renes nostros et cor nostrum,*" &c., absurdly rendered "*Enkindle our reins and our heart,*" &c.; the metaphor being that of the assaying of metals, as may be seen by a glance at the Latin Psalter (xxv., 2), from which the words are borrowed. From a liturgiolist's point of view the book is a worthless mixture of the Uses of Rome, England, Sarum, and Shipley. We must not omit to notice a specialty of the volume in the numerous engravings illustrating the postures, manual acts, &c., of the celebrant and his assistants. This seems to us the most valuable part of Mr. Shipley's work. Henceforth any young curate who does not know how to cross his thumbs (the right over the left) and fold his hands with accuracy, will have only himself to blame.

The Explanation of the Apocalypse. By Venerable Bede. Translated by the Rev. Edw. Marshall, M.A., F.S.A., formerly Fellow of Corpus Christi College, Oxford. (James Parker and Co.) We cannot see much advantage in presenting this commentary to "English readers." But as the translator thinks otherwise, more care should have been taken to warn the "English reader" against accepting Bede's interpretations of Hebrew names. In common with those of Augustine and Ambrose and others of the Western Fathers, Bede's Hebrew etymologies are often such as would make Fürst or Gesenius shudder. Simeon, "heard of sorrow," and Jezebel, "issue of blood," deserve a note as much as Gog, "a roof," and Magog, "from a roof." Bede really knew something of Hebrew; but comparative philology, the chief guide in modern efforts of this kind, was then unborn. In dealing with the Apocalypse, mystical interpretations seem more legitimate than in dealing with the books of Samuel. But Bede's greatness is not seen in any part of his Biblical exegesis.

Eternal Hope. Five Sermons preached in Westminster Abbey, November and December, 1877. By the Rev. F. W. Farrar, D.D., F.R.S., Canon of Westminster, Chaplain in Ordinary to the Queen, &c. (Macmillan and Co.) These sermons do not claim to present any scientific treatment of Eschatology; they are merely popular addresses intended as a loud protest against the prevailing belief among Protestants as to the nature of the punishments of the future life. In the Preface Canon Farrar indicates his own dogmatic standpoint. In opposition to the doctrine of "Annihilationism" (or, as its modern Christian supporters prefer to style it, "the doctrine of conditional immortality"), on the one hand, and "Universalism" on the other, Canon Farrar only ventures to entertain the "hope" that all may be finally restored. In an apologetic Preface we are informed that the sermons were not originally intended for publication. And it is only fair that large allowance should be made by the reader who studies the book in cold blood for a style of fervid oratory that cannot fail to seem to him frequently over-coloured and exaggerated, and at times confused and perhaps almost hysterical. After forcing one's way with the crowd at the Abbey, and when affected by the contagious enthusiasm that the good voice and striking presence of the preacher never fails to evoke, we should probably regard the sermons in a different way, and as they were intended to be regarded. Though even with these advantages of circumstance it may be questioned whether the effect of the superabundant

ornament would not be felt as tawdry. To the scientific student of theology the only matter of much interest in the volume is the letter of Prof. Plumptre (*Excursus I.*) on the teaching of Bishop Butler, as suggested by the remarkable passage in the *Analogy* (part i., chap. 3): "Virtue, to borrow the Christian allusion, is militant here, and various untoward accidents contribute to its being often overborne; but it may combat with greater advantage hereafter," &c. It is singular, however, that so careful a student of the *Analogy* as Dr. Plumptre should not have recognised, or at least considered, what had been long ago pointed out by the most acute of all the commentators on Butler, Prof. (now Bishop) Fitzgerald, that "this is an instance of Butler's care to avoid assuming more than his premises will warrant. Butler is here arguing on the foot of reason alone; and as he had before observed that mere reason could not show that probation would terminate with this life, so he speaks here of the supposition (consistent with such a state of knowledge) of its passing through some state or states of militancy hereafter."

Human Life and its Conditions: Sermons preached before the University of Oxford in 1876-1878, with three Ordination Sermons. By R. W. Church, M.A., D.O.L., Dean of St. Paul's, Honorary Fellow of Oriel College, Oxford. (Macmillan and Co.) As different from Canon Farrar's volume as can well be conceived is that now before us. Defective in those features of rhetorical art which are essential to great success (even for a *concio ad clerum*) when a large crowd of listeners is addressed, the sermons of the Dean of St. Paul's will be appreciated more justly after a quiet perusal. They never aim at oratorical display, nor attain any high flight of passionate utterance, yet we are sensible throughout of an earnest though controlled enthusiasm; and every phrase and turn of expression possesses the charm that always attends the genuine outcome of careful and well-defined thought. It appears that it is by mere accident that Canon Farrar and Dean Church have both given us sermons on the text "Are there few that be saved?" To everyone who loves accurate thinking, and is repelled by loose statements wider than knowledge warrants, Dean Church contrasts throughout most favourably with Dr. Farrar. *Apropos* of Dr. Farrar's subject-matter, it is interesting to find the following passage in one of Dean Church's discourses (the fine sermon on "Responsibility for our Belief"):—"I should be disloyal to Him whom I believe in and worship as the Lord of Truth if I doubted that such seeking [earnest and honest seeking] would at last find Him. Even if it do not find Him here—man's destiny stops not at the grave, and many, we may be sure, will know Him there who did not know Him here." Those whose lives are spent in labouring at intellectual rather than practical problems, and who at all practice introspection, cannot fail to be struck with the singular fidelity with which Dean Church describes the subtle temptations and spiritual dangers to which they are peculiarly exposed. Often would it save from foolish courses some men of earnest and single-hearted purpose to keep well before them the distinction so ably sketched (pp. 84, *sq.*) between "following truth" and "yielding to the immediate pressure of an argument;" while the moral dangers special to those who hold fast received beliefs and opinions, and again to those who aim at change—"whether it is a question of change in religion or philosophy, of a Reform Bill or a Budget, of a new trade or a new mechanical invention"—are depicted (pp. 72, *sq.*) with a skill that almost reminds one of Dr. J. H. Newman.

The Life of the Right Rev. Alexander Jolly, D.D., Bishop of Moray. By the Rev. W. Walker, M.A. (Edinburgh: David Douglas.) The subject of this biography was born in 1756 and died in 1838. The period intervening between these two dates saw many changes in the external history of the

disestablished Episcopal Church in Scotland. The Act of 1748 had virtually proscribed the public worship of Non-juring Episcopalians. Dr. Jolly's early religious education was conducted by a clergyman of his native place, who had undergone six months' imprisonment for the statutable offence of officiating in the presence of more than four persons at a time. In the account of the first half of Bishop Jolly's life we get some curious and interesting glimpses of the condition of the Episcopal Church in Scotland during the time of persecution and depression. There can, indeed, be no question that the conduct of the Government was highly efficacious in breaking and crushing the opposition to Presbyterianism, which in the north-east of Scotland, and more particularly in Aberdeen, did not at first occupy the dominant position which it had held in the south-west and south. Those whose notions of bishops are drawn from the prelates of the English Establishment, with their "palaces" and their seats in the House of Peers, may be pleased to see a sketch of the domestic life of a bishop of the sister Church in the early part of this century. The learned Bishop Jolly lived all alone with his books in a large two-storeyed house in the little town of Fraserburgh. He kept no servant, but had what few occasional services were necessary performed by a poor woman who lived a little way down the street. He rose at four o'clock, spent the early hours of the day in devotion, made his own breakfast, and then set himself down to his beloved folios. At dinner-hour a woman was seen coming down the street "with a very small pot in her hand with a wooden cover on it, and something else beneath her apron, which was the whole preparation for the Bishop's dinner." Jolly's studies were chiefly in patristic theology; but he was also much attached to the works of the leading Anglican divines, especially of the Caroline divines. We have no doubt whatever that Mr. Walker is right in considering that the anecdote told of Jolly by Dean Stanley in his *Lectures on the Church of Scotland*, is only an illustration of the dry humour which now and then brightened his usually solemn utterances. "When he was asked," says Dean Stanley, "at the beginning of the stir occasioned by the Oxford Tracts, what he thought of the Reformation, he said 'he had not come down so far in his regular course of ecclesiastical history.'" The "venerable, primitive, and apostolic bishop" (to adopt words applied to him by the late Dean Hook) had a singular power of winning the affectionate esteem of those who knew him; and his simple, unworldly life, and constant piety and self-devotion will make the reader of this brief and interesting memoir henceforward refuse to Bishop Wilson, of Sodor and Man, the title of "the last of the Saints."

The Thirty-nine Articles of the Church of England: a Historical and Speculative Exposition. By the Rev. Joseph Miller, B.D., Curate of Holy Trinity, Darwen. Vol. I. (Hodder and Stoughton.) System is a good thing in any expository work; and we rather like the plan of grouping together the Articles that treat of a general common subject, so far as it confines itself to merely bringing into prominence the divisions into which this formulary of the English Church naturally falls. But the Thirty-nine Articles do not readily yield themselves as a basis for a systematic treatment of dogmatic theology. The definite and somewhat narrow apologetic purpose which they were originally intended to serve did not suggest a complete confession of faith, or general declaration of Christian doctrine. As an illustration of the difficulties of the mode of treatment adopted by Mr. Miller we may notice that Article III., of "The Descent into Hell," and Article IV., "Of the Resurrection of Christ," are grouped under the heading *Eschatology*, while Article XXII., "Of Purgatory," which most naturally would come under that heading, is referred to what Mr. Miller calls "Ecclesiology." And this last ridiculous word (with its smooth breathing), neither Greek

nor English, together with these other horrors, "Armatology," "Stoicheiology," "Prognoseology," and "Prothesiology," makes us gravely question whether this "terminology, adapted," we are assured, "to the present stage of theological progress"—a terminology which, it is hoped, "will perhaps invest the subject with increased interest"—is really worth importing into England. Whether through inadvertence or design Article XIII. does not, so far as we have been able to discover, appear in any group. Surely there ought to be no difficulty in making a long name for it, even if it have to stand all by itself. The accentuation, &c., of the printed Greek in this volume is of a blundering kind; and who is "St. Origen"? We freely acknowledge the powers of the great Alexandrian theologian whom Mr. Miller takes upon him to canonise; but neither Mr. Miller nor any other man is competent to venture the prodigious statement that the *De Principiis* of "this prince of thinkers" "has given rise to more thought in the theological world than any other or all other treatises in Divinity put together." We wish we were able to speak more favourably of a work that aims at and almost succeeds in making interesting a subject left by the best-known of the ordinary text-books in the depths of dulness. This first volume deals only with the first five Articles.

Appendix to the Queen's Printers' Aids to the Student of the Holy Bible or Teacher's Assistant. (Eyre and Spottiswoode.) The Queen's printers have gone the right way to produce a valuable book. They have selected for treatment important subjects, and then entrusted them to the hands of always trustworthy and sometimes even eminent specialists. Thus we have admirable papers on the "Ethnology of the Bible," by Mr. A. H. Sayce; on the "Poetry of the Bible," by Mr. T. K. Cheyne; on "The Plants of the Bible," by Sir J. Hooker; on "The Animals of the Bible," by Canon Tristram; and on the "Money and Weights of the Bible," by Mr. F. W. Madden; and if Dr. Steiner's "Music of the Bible" seem less satisfactory, the extreme uncertainty that must always attend any treatment of this obscure and difficult subject may be regarded as apology sufficient. In addition to the articles named above, this Appendix contains a Chronological Summary of Bible History, and a series of short papers on Jewish Sects and Orders.

Through Rome On: a Memoir of Christian and Extra-Christian Experience. By Nathaniel Ramsay Waters. (New York: Somerby; London: Trübner.) Mr. Oapes's little book, *To Rome and Back*, has suggested the title of this work, which is an interesting and evidently veracious account of the religious history of the writer. Mr. Waters passed from Anglicanism, in which faith he had been brought up, to the Church of Rome, and after eight years' "belief and practice of Catholicism," and a short sojourn in the Theism of Theodore Parker and F. W. Newman, arrived at his present Agnostic position. Mr. Waters's testimony to the value of the confessional is curious. "I am bound to acknowledge," he says, "that the influence of the confessional was in my case salutary. It tempered and restrained the warmth of a youthful constitution; it purged motives of their selfishness; it inculcated modesty and self-denial; it made sin more and more hateful to me, and virtue more and more amiable and attractive. It taught me to know myself." And with equal candour he admits, with sorrow, how after he had given up Catholicism he fell for a while into a licentious way of life. Indeed, we think it must be the animation imparted by this eager ardour of truthfulness which lends interest to a picture of intellectual powers that seem to us somewhat thin and but little capable of appreciating the great complexity of the problem—of recognising the variety and involution of moments that have to be resolved before the solutions which Mr. Waters announces so unhesitatingly can be accepted.

NOTES AND NEWS.

MR. EDWARD ARBER, the editor of *English Reprints, the Transcript of the Stationers' Registers, the Garner, &c.*, has been appointed assistant to the Professor of English Literature (Prof. Henry Morley) at University College, London. Mr. Arber is an old pupil of Prof. Morley's, and it was at the latter's evening classes at King's College that Mr. Arber received the impulse that has made him reproduce the texts of so many of our Tudor and Stuart writers.

MR. JOHN RUSSELL SMITH has, after a labour of some years, just issued his large catalogue of Topographical Tracts and Prints, comprising no less than 1,200 pages, the result of nearly forty years' collecting.

A NEW novel, entitled *Wood Anemone*, by Mrs. Randolph, author of *Gentianella, Wild Hyacinth, &c.*, will shortly be published by Messrs. Hurst and Blackett in three volumes.

A FRENCH translation of Lord Acton's two lectures on Liberty has been published with a Preface by M. de Laveleye, under the title of *Histoire de la Liberté dans l'Antiquité et le Christianisme* (Bruxelles: Muquardt).

MR. F. C. PRICE, facsimilist to the British Museum, who recently executed some exquisite reproductions from the press of Caxton, proposes to edit subscription copies of an important heraldic MS. prepared in 1616 by John Withie, the arms-painter, entitled—

"The names and Armes of them that hath bene Aldermen of the towne of Aldersgate since the tyme of King Henry 6. beginninge at the 30 yere of his Right birth this present yere of our Lord 1616. Which names and Armes were collected out of records 1616. N. M."

London traders were then, to a large extent, the connexions of gentilitious English houses; and the document will, accordingly, have a peculiar value. It will also bear on the Heraldic Visitations of London.

THE following are some of the more important articles promised in the eighth volume of the new edition of the *Encyclopædia Britannica*, which is announced as nearly ready:—"Electricity," by Prof. Ohrystal; "Elizabeth," by the late Mr. Carruthers; "Embryology," by Dr. Allen Thomson; "Emigration" and "Exchange," by Mr. R. Somers; "Emperor," by Prof. Bryce; "Enamel," by Mr. Rader; "Encaustic Tiles," by Mr. A. Maw; "Encyclopædia," by Mr. P. A. Lyons; "Energy" and "Evaporation," by Mr. W. Garnett; "England"—the History, by Mr. Freeman and Mr. S. R. Gardiner, and Geography and Statistics by Mr. F. Martin; "Church of England," by Mr. Perry; "English Bible," by Mr. Blunt; "English Language," by Dr. J. A. H. Murray; "English Literature," by Mr. T. Arnold; "Engraving," by Mr. Hamerton; "Ennius," by Prof. Sellar; "Ephesians," by Prof. Milligan; "Epictetus," by Mr. W. Wallace; "Episcopacy" and "Eucharist," by Canon Venables; "Equation," by Prof. Cayley; "Erasmus," by Mr. Pattison; "Eschatology," by Mr. A. S. Aglen; "Esther," by Mr. Cheyne; "Ether," by Prof. Clerk Maxwell; "Ethics," by Mr. H. Sidgwick; "Ethnography," by Mr. E. Reclus; "Etna," by Mr. Rodwell; "Etruria," by Mr. A. S. Murray and Dr. W. Deecke; "Euboea," by Mr. Tozer; "Euphrates," by Sir H. Rawlinson; "Euripides," by Prof. Jebb; "Europe," by Mr. H. A. Webster; "Eusebius," by Principal Tulloch; "Eve," by Prof. Robertson Smith; "Evidence," "Factory Acts," &c., by Mr. Edmund Robertson; "Evolution," by Prof. Huxley and Mr. Sully; "Examinations," by Mr. H. Latham; "Explosives," by Major Wardell; "Eye," by Prof. McKendrick; "Ezekiel" and "Ezra," by Mr. Sutherland Black;

"Fable," by Mr. F. Storr; and "Fairies," by Mr. W. Hepworth.

MESSRS. RIVINGTON have in the press, forming volumes of their "English School Classics," Southey's *Life of Nelson*, by W. E. Mullins, M.A., Assistant-Master at Marlborough College; and in preparation, Scott's *Rokeby*, edited by R. W. Taylor, M.A., Head-Master of Kelly College, Tavistock.

THE Rev. C. J. Ball is preparing for publication a *Merchant Taylors' Hebrew Gradual*, containing elementary exercises, a selection of readings with notes and references to his *Merchant Taylors' Hebrew Grammar*, and a cento of extracts from Hebrew prose and poetry. Various Jewish sources have been drawn upon for the work, such as the *Pirke 'Abboth*, the Jewish Prayer-book and Hebrew translations of such works as *Faust* and *Paradise Lost*.

MR. THOMAS DUNMAN, Lecturer on Physiology at the Birkbeck Institution, and Physical Science Lecturer at the Working Men's College, has compiled a *Glossary of Biological, Anatomical, and Physiological Terms*, which will shortly be published in a small volume by Messrs. Griffith and Farran.

JOAQUIN MILLER is about to publish, in London, a new volume of poems, to be called *Songs of Far Away Lands*. The volume will be one of some magnitude, and is dedicated to Lord Houghton.

ALEXANDRA COLLEGE, Dublin, the college for women and girls which has had such a great educational success, requires to raise 2,470*l.* for its new College Hall for lectures and vocal music, and other improvements. At present, only 770*l.* has been subscribed. Donations should be sent to Mrs. Jellicoe, the Lady Superintendent, at the college.

AT a meeting of the committee of the Index Society held on Tuesday the 18th inst., several points connected with the printing of the Royalist Confiscation Acts (which are now at press) were discussed. In order to facilitate reference to the long list of names contained in these Acts the printed page has been divided into four portions, marked respectively by the letters *a, b, c, d*, in the left-hand margin. An appropriate device for the Society, designed by Mr. Fenton, was submitted and ordered to be engraved; and an Index to Municipal Corporation Offices taken from the Report of the Commissioners for England and Wales for 1835 was accepted for publication. A Local Index of Engravings, to be arranged according to Counties; a List of References to neglected Biography; and Indexes to Hutchins's *History of Dorset* and Ruskin's *Modern Painters* were suggested.

DR. GROSART, who has just finished printing the text of Chester's *Love's Martyr*, and Dr. Brinsley Nicholson, who has been criticising it, have both arrived independently at the conclusion that in Shakspeare's poem of the *Phoenix and Turtle*, Queen Elizabeth is the phoenix, and Essex the turtle-dove. Though the text of the work has just been issued, Dr. Grosart's Introduction, Notes, and Illustrations to it will not be ready till August.

IT is proposed, with the leave of the President and Fellows of Corpus Christi College, Oxford, to publish the Irish MS. Missal in their library. This missal, which is one of the only four Irish missals in existence, none of which have been hitherto published, was written c. A.D. 1200. It was described in the ACADEMY, on December 15, 1877, by Mr. Warren; on January 12, 1878, by Mr. Bradshaw; on March 12, 1878, by Mr. Gilbert, by whom photo-zincograph facsimiles of some of its pages are now being prepared, under the direction of the Master of the Rolls, for the second volume of *National Manuscripts of Ireland*. The text, reproduced *verbatim*, will be edited with Introduction and notes by the Rev. F. E. Warren, B.D., Fellow of St. John's College, Oxford, in accordance with a general ex-

pression of the desirability of its publication, on the occasion of its exhibition by Mr. Warren before the Society of Antiquaries at Burlington House, on May 16, 1878, provided that not less than 200 subscribers can be procured beforehand. The price of the volume will not exceed half-a-guinea. It is requested that intending subscribers will send their names to the Rev. F. E. Warren, care of Messrs. Pickering and Co., 196 Piccadilly, W.

MESSRS. MARCUS WARD AND Co. are preparing for publication a biographical series to be called the "New Plutarch." The leading features of the series will be that each biography will be that of a man of action, in himself interesting and remarkable, whose career covers and illustrates some important period or episode in history. The volumes at present arranged are the Life of Victor Emanuel, by Edward Dicey; Judas Maccabeus, by Lieut. O. R. Conder, R.E.; Haroun Alraschid, by Prof. E. H. Palmer; the last Emperor of Constantinople, by the Rev. W. J. Brodribb; Coligny, by Walter Besant; Richelieu, by W. H. Pollock; Abraham Lincoln, by Charles J. Leland; Sir Richard Whittington, by James Rice; Harold Fairhair, by Eirik Magnússon; and Hannibal, by Samuel Lee. The editors of the series, which will commence in October and be continued at regular intervals, are the Rev. W. J. Brodribb and Mr. Walter Besant.

THE interest taken in local antiquities in Lancashire and Cheshire has led to the projection of another printing club. This is to be known as the Record Society. It will differ in some respects from the Chetham Society, and will aim at supplying raw material for the local historian rather than the more elaborate work undertaken by the existing association. That it does not arise from any feeling of antagonism is evidenced by the fact that Mr. James Crossley, F.S.A., President of the Chetham and Spenser Societies, has consented to be the first president of the new club. Canon Raines is vice-president, and the council includes Messrs. J. Orston, H. Fishwick, H. H. Howorth, G. E. Cokayne, Colonel Chester, Thos. Hughes, W. A. Abram, J. P. Rylands, and J. P. Earwaker, who is acting as hon. secretary. The documents with which the society will deal include *inquisitiones post mortem*, wills and inventories, subsidy rolls, manor court rolls and guild rolls, family deeds and papers, records of the Duchy Court of Lancaster, Cheshire plea rolls and recognisances, and clerical rolls of various kinds. It is, perhaps, to be regretted that the Chetham Society has not elected to do this work, but as there is no chance of such a consummation we gladly welcome the new labourers in the field. Additional evidence of the popularity of archaeology in the two counties named is afforded by the number and excellence of the departments of local notes and queries in various newspapers. Preston, Warrington, and Manchester, and other places have adopted this plan, and in some cases the matter has received greater permanence by being reprinted in book form. This is, or is to be, the case with the antiquarian columns of the *Manchester Guardian*, *Manchester Courier*, *Manchester City News*, and *Leigh Chronicle*.

THE new volume of the Papers of the Manchester Literary Club has just been issued. It has illustrations from original drawings by R. G. Somerset, William Meredith, Christopher Blacklock, Walter Tomlinson, and Elias Bancroft. The contents include contributions on "Lancashire Mathematicians," by Morgan Brierley; "Tennyson's *Palace of Art*," by the Rev. W. A. O'Connor; "Six Half-Centuries of Epitaphs," by R. M. Newton; "Baptismal Names in Lancashire and Yorkshire," by the Rev. O. W. Bardsley; "Canon Parkinson: a Biographical Sketch," by John Evans; "Geist," by Henry Franks; "The Provincial Mind," by George J. Holyoake; "*Hamlet*," by the Rev. W. A. O'Connor; "Armstrong and George Fox," by Walter Tomlinson; "John

Owens," by Joseph C. Lockhart; "A Trip to Lewis," by Arthur O'Neill; "Christmas in Wales," by J. Mortimer; "Dryden as Lyrist," by G. Milner. It will be seen that the club, while not unmindful of the general field of literary criticism and research, rightly devotes much time and attention to papers on local matters. Among the latter we may indicate the remarks of Mr. Bardsley on the baptismal names of Lancashire and Yorkshire, in which the strong influence exerted by Puritanism is very evident. Eight out of ten names in remote villages are still taken from the Bible, including even Pharaoh, Tamar, and Er. Archimedes Muff is a curiously discordant appellation. Titles are sometimes given, as Sir Isaac Newton; while Earl, Marquis, Squire, Lord, and Major, are frequent. Mr. Evans' sketch reminds us that he is engaged upon a new edition of *The Old Church Clock*, in which Canon Parkinson has dealt in a very pleasant manner with the story of "Wonderful" Walker, the Minister of Seathwaite Chapel, and the subject of one of Wordsworth's sonnets. Mr. Brierley's paper is an important contribution to our knowledge of a very remarkable class of men who pursued mathematical studies under circumstances of great disadvantage.

DR. HERMANN BREYMAN, of Munich, has published (München: Ackermann) a lecture recently delivered by him in that town in aid of the Diez Memorial Fund, which contains an excellent account of the life and works of the founder of Romanic philology.

THE *Landbote* of Winterthur, the daily journal which was edited by the late F. A. Lange, the author of the *History of Materialism*, announces that a prize has been offered by the Swiss Verein für proportionale Vertretung for the best essay on the "Representation of Minorities." It may be written either in French or German, and must contain about twenty-four pages in pamphlet-octavo size. Brevity will be regarded with special favour by the judges. The general aim of the essay is to enlighten persons who have hitherto been strangers to the idea of proportional representation; it must set forth in clear and concise form the injustice and disadvantage of the existing electoral system, and the justness and fairness of the proportional participation of the entirety of the electors of a commune, an electoral district, or a State in all public concerns. It should also indicate the practicability of a representation of minorities, and suggest the simplest and most appropriate method of carrying out a just and fair election.

THE Bucharest correspondent of the *Bund*, who is a Roumanian, mentions with natural pride that the most popular of the living national poets of Roumania, Alexandri, distanced all his competitors at the late Congress of the Latin Nationalities at Montpellier, and was unanimously adjudged the first prize. He states that the principal works of Alexandri have already been well translated into German by the reigning princess, Elizabeth, and that some of his poems have been rendered into other modern languages.

FRIEDRICH BODENSTEDT, the author of *Mirza Schaffy*, is engaged upon a translation of *Omar Khayyam*.

WE learn from the *Publishers' Weekly* that the firm of Greenwood, of New York, have arranged to bring out an American reprint of the *Saturday Review* within twelve days of its issue in England.

MR. NEWMARCH's elaborate paper "On the Progress of the Foreign Trade of the United Kingdom since 1856, with especial reference to the effects produced by the Protectionist Tariffs of other Countries," in the *Journal of the Statistical Society* for June is a treatise of much statistical and economic value. The immense growth of the foreign trade of the kingdom, in the face of the obstructions of foreign tariffs, is only one of

several important results the causes of which it investigates. There is a collateral enquiry, however, without which the real significance of the growth of British foreign trade may be much misunderstood, and which we venture to commend to Mr. Newmarch's consideration—namely, how far, since the abolition of protection, has foreign trade only taken the place of home trade, and how far is it, on the other hand, a substantial addition to the total trade of the kingdom? Mr. Newmarch satisfactorily accounts, as other writers have done, for a considerable normal excess in the imports of the United Kingdom over exports. But he does not explain the abnormal amount of the excess in the last three years of commercial depression. On the effects of the gold discoveries on prices Mr. Newmarch concludes that the course of events has amply vindicated the opinion he expressed in 1853 against the doctrine of depreciation. There are many persons who, looking to the altered prices of meat, butter, and other animal food, and the rise of money wages, especially in remote parts of the country, will not assent to Mr. Newmarch's conclusion. But the principal omission, in both his view and that of his opponents, such as the late Prof. Cairnes, is the neglect to take into account the much greater rise of prices in many parts of the Continent, which were formerly considered "cheap" places, but are now "dear" places. It was abroad, not in this country, that the new gold mines had their greatest effect.

THE *Deutsche Rundschau* for June, beside continuations, has two excellent articles. One is by Prof. Vogel on the "Present Achievements of Photography," in which the writer traces the history of photography, its various difficulties, its steps in advance, and the new purposes to which it has been from time to time applied: he points out that immense progress may be expected during the next generation from an art which in its infancy has made such rapid strides. Herr Fiedler writes an extremely suggestive paper on the "History of Architecture." He regards the legitimate development of architecture as broken through by the Gothic, which, though deserving admiration from its earnestness of purpose, was still a deviation from the path along which art had to travel. The Romanesque architecture of the eleventh and twelfth centuries supplied the beginnings of a new architectural principle, and Herr Fiedler holds that progress is only to be made by recurrence to the point where legitimate tradition ceased. Modern architecture, he truly observes, is either laboriously imitative, or its novelties consist only of arbitrary combinations of old forms without any guiding principle of beauty. Prof. Weber, of Berlin, publishes a number of letters of the Körner family written from Dresden between the years 1804–1815; they are of considerable interest for the literary history of that period in Germany.

THE *Nuova Antologia* for June 1 has an article by Signor Finali on Luigi Carlo Farini, which is a valuable contribution to the modern history of Italy. Signor Toschi gives the first instalment of an article which would certainly create much controversy if it were published in English, on the "Physiology of the Painters of the Fourteenth Century." He examines the current theory among art critics of the school of Rio and Taine, that the charm of the early Italian painters is due to the deep earnestness of their religious impressions. Against this Signor Toschi contends that the fourteenth century was not remarkable for deep religious feeling or simplicity and purity of life; that its most distinguished painters are recorded to have enjoyed life in a very unascetic manner; that some of the most pure and ethereal pictures in the history of art have been painted by men of doubtful lives and characters; and that the types of face and figure produced by many painters of undoubted piety and earnestness have been rather coarse and sensual. After this destructive criticism Signor Toschi proceeds to discuss the peculiarities of the Giottesque painting, and he refers

the boldness of design and simplicity which characterise it to the fact that it was not founded on studies from nature at all, but was the result of a progressive development of the old Byzantine types, which were improved upon by increased capacity of observation; it consequently displays the play of unfettered fancy, and is free from the difficulties which study and learning necessarily bring.

THE *Rivista Europea* has a lively historical article by Signor Lore on Marie Antoinette and Cardinal Rohan; the writer has, however, nothing new to bring forward. Prof. Barbaglia publishes a lecture on Paracelsus delivered before the University of Pisa; he points out the important discoveries made by Paracelsus, and claims him as the founder of medical chemistry.

MESSRS. M. H. GILL AND SON will publish in a few days a *Compendium of Irish Biography*, by Alfred Webb.

THE most noteworthy original articles in the later numbers of the *Revista Contemporanea* are, in that for February 28, a vehement denunciation of the Austrian dynasty in Spain, by Pompeyo Gener; and, under the title "The Philosophy of Aristocracy," P. Estasen has a most ingenious application of the doctrines of Darwin to justify the existence of aristocracies in society. March 15: P. Nanot-Renart praises rather too indiscriminately the historical works of M. Thiers, and Revilla gives a critical estimate of Perez Gald's, whom he declares to be the first of living Spanish novelists, and a follower of English rather than of French models, of irreproachable morality, and fit reading *pueris virginibusque*. His most recent production, *Marianela*, is also favourably noticed by the same critic in the number for April 30. Among the contents of March 30 are two articles about Columbus: the first, by G. Llana, points out some errors and omissions in Washington Irving's and other biographies; the second, by Rodriguez Ferrer, argues, in spite of recent pretended discoveries, that his bones really rest in Havanna, and not in San Domingo. There is also a remarkable unsigned article on the present crisis, "Inglaterra en Oriente," to which we invite special attention; a delicate little love-poem, "Eclipse," by M. del Palacio should not be overlooked. In the two numbers for April the series of chapters on "La Biblioteca de Autores Españoles" is brought to a close. The first gives a list of all Spanish authors deemed worthy of a place in such a collection; the latter suggests an appendix of Luso-Castellan and Catalan writers. The whole series of these articles forms a most useful guide to Spanish literature. Other contributions touch on subjects of the day; but the articles on "El Ateneo de Madrid," from the pen of M. de Labra, give an account of an institution of the greatest importance for the recent literary and scientific history of Spain.

OBITUARY.

SIR THOMAS DUFFUS HARDY.

THE death of the Deputy Keeper of Public Records, which took place on Saturday last after a short illness, has occasioned a blank which cannot be easily filled. His loss will be lamented not only in his own office, where he was a popular chief and colleague, but by a large circle of English and Continental scholars who looked up to him as an authority almost without peer in his special department of learning. He was the son of Major Hardy, an officer in the Artillery, and was born at Port Royal in 1804. At the age of fifteen he obtained a junior clerkship in the Record Office at the Tower, of which his relative Mr. Henry Petrie was Record-Keeper, and thence worked his way upward to the highest official rank. His earliest publication was a contribution to the *Excerpta Historica* issued by S. Bentley in 1831. Under the Record Commission he was employed as editor of the *Clause Rolls* (from 1204

to 1227) published in 1833 and 1844; of the *Patent Rolls* of the reign of John, published in 1835; of the *Norman Rolls* (1200-1205 and 1417-1418), and the *Oblata and Fine Rolls* of the reign of John, both published in the same year; of the *Charter Rolls* of John, published in 1837; the *Liberate Rolls* of the same reign, published in 1844; and the *Modus Tenendi Parliamentum*, published in 1846. These works are not only models of careful editing, but the introductions prefixed to them contain an amount of lucid information concerning the technical phraseology and palaeographical character of the records to which they relate that has given them an enduring value. The Itinerary of King John appended to the Introduction to the *Patent Rolls* is a noteworthy example of the editor's painstaking accuracy.

Upon the death of Mr. Petrie, the compilation of the *Monumenta Historica Britannica*, which that gentleman, in conjunction with the Rev. J. Sharpe, had undertaken to edit for the Government, but left unfinished, was entrusted to Mr. Hardy; and he wrote the Introduction to the work, which appeared in 1848. For the English Historical Society he edited the *Chronicle of William of Malmesbury* (2 vols.) in 1840. He also issued a Catalogue of the Lords Chancellors, Masters of the Rolls, and other officers of Chancery, in 1848, and edited and continued the *Fasti* of Le Neve in 1864.

Mr. Hardy was a leading witness before the Parliamentary Committee for investigating the state of the Public Records in 1836, and took part in the pamphlet controversies that preceded the dissolution of the Record Commission. Under the new scheme put in operation by the Public Record Office Act of 1 & 2 Victoria, he was appointed Assistant-Keeper of the Branch Record Office at the Tower, and filled that post until the consolidation of the Record Offices in 1858. In 1861 he was appointed to the Deputy Keepership, vacant by the death of Sir Francis Palgrave. His régime was marked by great activity and enterprise. He gave a wider scope to the plan proposed in 1855 of calendaring the *State Papers*, and vigorously prosecuted the publication of the *Ancient Chronicles and Memorials of the United Kingdom*, which had been commenced in 1857. To the success of this last work he largely contributed by compiling the "Descriptive Catalogue of Materials for the History of Great Britain and Ireland," which he undertook in 1862. This compilation, of which three volumes have appeared and a fourth was in progress at the time of his death, is a monument of patient scholarship, upon which alone he might have been content to rest his fame. He also edited for the same series the *Register of Richard de Kellawe, Bishop of Durham 1311-1316*, in four volumes (1873-1878). To the series of *State Papers* he contributed a syllabus of the documents in Rymer's *Foedera* relating to English history. Of this work two volumes have been published and the third is in the press. Among his minor contributions to historical knowledge may be named his Reports upon the Peveril and Durham Records, the Carte and Carew Papers, and the documents in the archives and libraries of Venice.

The publication of *Domesday Book* and other records in photozincographic facsimile, which has widely circulated a knowledge of their character and interest, was also due in great measure to the Deputy Keeper's energy. He was mainly instrumental in procuring the abolition of fees for searches at the Record Office, which has made that department deservedly popular with the general public. Historians and men of letters have still more reason to thank him for having suggested the formation of the Historical Commission in 1869, which has thrown open unsuspected treasures of the highest value.

A public recognition of his reputation and services was made in 1869, when, at the recommendation of Mr. Gladstone, the honour of

knighthood was conferred upon him by Her Majesty, and in the following year, when the University of Oxford granted him the degree of D.C.L.

Outside his peculiar department of historical archaeology Sir Thomas Hardy's works are of less note. The biography of the late Lord Langdale, which he published in 1852, was written in performance of his obligations as a friend and literary executor. A pamphlet which he issued in 1860 upon the controversy relative to the "Old Collector's" Shakspeare requires merely passing mention. His more recent Reports upon the version of the Athanasian Creed contained in the Utrecht Psalter are better known, but it may be doubted whether the decided opinion which he pronounced upon the question in dispute is entitled to as much weight as that of the eminent manuscript authorities which were arrayed against him.

The unfailing readiness which Sir Thomas showed to communicate the vast stores of his knowledge to all scholars who solicited his aid, and his urbane courtesy of manner, made him a general favourite. As the chief of a large public department, he had a difficult part to play, for which his studious habits to some extent disqualified him, and he was perhaps unduly sensitive to the petty annoyances which any obscure person, if sufficiently noisy and pertinacious, has the power of inflicting upon a man of highly-wrought nervous temperament. As a colleague, he was genial and sympathetic, especially to the younger members of his staff. His strong affections occasionally led him astray, and an impulsive temper betrayed him into hasty acts and words which sometimes provoked animosity, but he was always ready to make an *amende* or to accept overtures of reconciliation, and his essentially generous and kindly nature could not be misapprehended by those who knew him well.

HENRY G. HEWLETT.

WILLIAM CULLEN BRYANT, who died last week in his 84th year from the effects of an accident, was one of the most distinguished of American men of letters, and his long, consistent and dignified career might be selected as typical and exemplary by those who believe that the course of things in the New World is an anticipation of what the Old World is coming to. He was the son of an able and popular physician, and paid his father's profession the compliment of a dissertation on homoeopathy. He received the ordinary sensible, if meagre, New England education, which few well-regulated minds undergo without acquiring a slightly pragmatist bias. We need not think that this bias corresponded to his temperament. He was as precocious a versifier as Pope, and his poetical reputation was established by the volume that he published at the age of twenty-seven—fifty-seven years ago. At that time America was only just beginning to have a literature, and this told two ways: sanity, decision, maturity, elegance, commanded a reputation among all who cared for pure literature for its own sake much more rapidly and surely than they can do where literary training and literary interests are widely diffused; but the literary career was visibly connected with "poverty and scorn." Bryant tried honestly to give up poetry, and succeeded in becoming a practical journalist. For more than half-a-century he was on the editorial staff of the *New York Evening Post*, one of the few American journals which can be read with pleasure by an educated Englishman, and which had the distinction of inspiring men of business with confidence. He never quite ceased to write poetry; at the time of the Civil War he brought out two new volumes; in his old age he translated Homer. He may be said in this case to be the precursor of Prof. Longfellow and Prof. Lowell and Bayard Taylor, who all made poetry a stepping-stone to a position in the world without discarding it when the position was attained. He anticipated another tendency which

has been growing stronger for some time in recent verse: almost all his subjects are taken from actual and contemporary life. What is peculiar about him is that they are conceived in an entirely rational way; he is quite innocent of romanticism, he has no vague feelings of nameless exaltation to make him hunt the wide world over for objects to transfigure. Most poets when they come down to modern life think it incumbent upon them to prove that it is much more wonderful than the past was supposed to be. His style is remarkably clear, simple, and finished; occasionally, perhaps, a little bald—a fault which he shares with all the Greeks but the greatest, and with Cowper as well as with less unaffected writers of the eighteenth century. As long ago as 1848 Prof. Lowell, in his *Fable for Critics*, had compared him to Cowper, whom he certainly resembles in the seriousness, refinement, and sincerity with which he handles common themes, intending to rebuke the American fashion of styling him the American Wordsworth; but there is a distinct affinity in Bryant to the didactic side of Wordsworth's mind, and his sublimities are rather like reflections of the sublimities of the *Excursion*. One traces the reflection as clearly in the later poems as in the earlier; while the *Agas* is almost the only poem which shows signs of the influence of Byron, being in truth little more than an echo, very spirited and musical, of the stately historical sentiment of *Childe Harold*. Of course it would be absurd to rank Bryant with Wordsworth, but he is something more than a copy on a small scale of one side of a great poet. He sees that what is the whole of life to Wordsworth is only a part of his life and of the life of the world. And his preoccupation with death and with the transitoriness of life gives him an originality of his own. Some of his best poems were written in old age, on the departure of youth, which he does not regret, having within him a hope full of immortality. The *Cloud by the Way* might be read after Mr. Rossetti's *Cloud Confine*, and would hold its own. *Waiting by the Gate* might gain by being read after Miss Procter's *Golden Gate*; and the *Dried-up Fountain* is more musical as well as more natural than the poem where the author of *Thyrsis* explains that art is too often perfected after inspiration has departed. If one had to choose between losing *Thyrsis*, or *Obermann*, or even *Tristram and Yseult* or *Zohrab* and *Rustum*, and losing all that Mr. Bryant has written, it is probable that the public, which supposes itself cultivated, would elect without hesitation to sacrifice Mr. Bryant; while the public at large would elect to save him. But his date and his nationality save him from being classed with English minor poets: they are always straining at the unattainable or else sinking back in conscious depression: whereas the sober dignity natural to Bryant was sustained by the consciousness that all his life he was one of the first poets of his age and country.

G. A. SIMCOX.

NOTES OF TRAVEL.

THE International African Association at Brussels have received a telegram from M. Wautier, the lately appointed leader of the Belgian expedition, announcing the arrival of M. Dutrieux at Zanzibar, and stating that the porters required for the journey have been collected at Saadani, where M. Cambier is superintending the preparations. MM. Wautier and Dutrieux were to join him there on June 1, and it was proposed to start for the interior about June 7. The caravan will comprise about 350 persons in all.

MR. RICHARD FREWEN has just returned to England from South Africa; and we regret to learn that he was unable to carry out his plan of making a journey across the unexplored country between the Zambesi and Lake Bangweolo, to which allusion was made in the ACADEMY of April 13.

UNDER the title of *Colonies Nationales dans l'Afrique Centrale sous la Protection de Postes Militaires*, M. Emile Reuter has published a brochure at Brussels (Dehou), in which he discusses the advantages likely to accrue to Belgium by the formation of industrial, commercial, and agricultural establishments in Central Africa, and the favourable influence they would have on the abolition of the slave trade. He maintains, however—and he quotes Col. Ohallé-Long, of the Egyptian Staff, in support of his opinion—that such national colonies cannot be successfully maintained without the support of a chain of military posts to protect the colonists from all chances of attack by the natives.

We understand that Commander V. L. Cameron, R.N., C.B., of African fame, is contemplating an Eastern expedition. Should he carry out his present plan, he will probably make his start from Iskenderun, at the north-east corner of the Mediterranean, and cross northern Syria to Kurdistan, whence he will make his way through Mesopotamia, Persia, and Beluchistan to Kurra-chee, but we believe his line of route is not yet definitely fixed.

MR. JAMES FERGUSON'S useful little *Geography of Northumberland*, to which we referred on January 12, has met with so much encouragement that the author has found it necessary to issue a second edition (Morpeth: G. Flint). This is improved by a map of the county and some few alterations suggested by the author's friends. We believe that it was the evident usefulness of little works of this nature which induced Sir W. O. Trevelyan to offer the prize for a model county geography, to which we referred on June 15.

Notes on Individual Equipment for the East (W. Mitchell and Co.) is the title of a useful brochure which Captain F. Fraser, R.E., of the War Office, has drawn up from personal experience for the benefit of soldiers suddenly ordered on foreign service, and of travellers who may wish to start at short notice on journeys of exploration in distant countries. Prefixed is a formidable list of necessities and luxuries for camping and exploring, and we are fain to confess that it is a matter for wonderment how any given article therein is to be found on an emergency.

SOME interesting information has been received from Samarkand respecting the territory of Karategin, formerly belonging to Kokan, but now ceded by Russia to Bokhara. Karategin, with the smaller districts of Darwaz, Wakhan, and Shighnan, borders on the plateau of the Pamir Steppe. Karategin, which is completely isolated in winter, and keeps up communication with the border countries only during summer, has never yet been trodden by the foot of a European. The customs and manner of life of its inhabitants are represented as of a highly primitive nature. They have no idea of measures of length or weight, have neither markets, caravanserais, nor any institutions of a public life. Theft is unknown among them. They carry on cattle-breeding, but little agriculture. Everything is common property. If the stores of one family are exhausted, it is a matter of course for the neighbours to dispense some of theirs.

MAGAZINES AND REVIEWS.

THE Chinese Encyclopædia lately purchased by the Trustees of the British Museum forms the theme of the opening article, by Mr. Mayers, of the current number of the *China Review*. The active part which Mr. Mayers took in acquiring this celebrated work has already been described in these columns, and in his present article he gives a sketch of its contents, as well as a brief account of the different compilations of the same kind which have preceded it. The untimely death of the writer, which we announced a short time since, is a melancholy commentary on the words "To be Continued" which are appended to the

article, and this reminds us how great is the loss inflicted by that event upon the editor of this as of other China periodicals. It is not easy to fill the pages of a monthly Review with valuable, and at the same time readable, material on Chinese matters, and the loss, therefore, of a contributor from whose pen flowed an almost constant stream of articles which were both valuable and readable will be seriously felt. Following Mr. Mayers, Dr. Legge continues his lectures, delivered at Oxford last year, on "Imperial Confucianism," and in the present paper explains from the fourth to the seventh of the Maxims of the Emperor K'ang-hsi. It was the doctrine of Confucius that the State should, in the first instance, ensure prosperity to the people, and that it should next provide them with the means of education, for he held that it was only when a people was both prosperous and educated that right principles might be expected to prevail. Following out this association of ideas, the Emperor K'ang-hsi, in the Maxims we are considering, begins by advocating the importance of (4) Industry, and (5) Thrift, as means of obtaining prosperity, and then dwells on the importance of (6) Intellectual training, the result of which should be that (7) the correct doctrine should be exalted to the exclusion of such "strange principles" as Buddhism, Taoism, Christianity, &c. Several articles of less importance are continued from preceding numbers, and the present closes as usual with "Notes and Queries," two of the most interesting notes being from the pen of Mr. Mayers.

THE *Indian Antiquary* for May, 1878, brings the remaining plates for volume v., and a goodly show they make, amply justifying the support which has been accorded to this valuable journal. It has already published so many of the post-Buddhistic grants that the dynastic lists of mediæval Indian history can be entirely rearranged, and the series of inscriptions, when completed, will be the most trustworthy source for a history of the obscure period between the fall of Buddhism and the advent of the Muhammadans. We have also in this number a further instalment of Mr. Walhouse's archaeological notes, some new remarks by Mr. Sinclair on the well-known Buddhist and Jain remains in Bijapur, papers on Rājmañi philology by Mr. Swinton, and on Polyandry by Dr. Stupnagel, and the usual short reviews and miscellaneous notes on antiquarian subjects.

Belgravia for June is a good number. It opens with a new novel by Wilkie Collins, called "The Haunted House," which will evidently unfold a plot of the thickest entanglement. But the two most attractive papers are that entitled "The Great Tropical Fallacy," and an examination of Dickens's half-told tale "The Mystery of Edwin Drood." The former of these is signed J. Arbuthnot Wilson, in which name we seem to trace a *nom de plume* of one not unknown in magazine literature. Whoever the author may be, he defends his position with great ingenuity and wealth of expression. We are not altogether convinced, but we feel that the paradox could not have found a stronger advocate. The less said about the poetry of *Belgravia* the better.

PARIS LETTER.

Paris: June 10, 1878.

Ste.-Beuve was a true son of Voltaire, whose centenary France has just celebrated. The second volume of the *Correspondance de Ste.-Beuve* (Lévy) altogether confirms our estimate of the first. It shows the same often morbid susceptibility which seems inherent in very delicate literary organisations, and also the same simple goodness, the same passion for what is just, and above all for what is true. All that consists of mere phrases, all charlatanism and affectation, he attacks relentlessly. When he wishes to arrive at the truth on some point of historical detail, he spares neither time nor trouble, as is apparent in the

innumerable letters and notes which he wrote to M. Chantelauze on the subject of Cardinal de Retz. A mind so just and penetrating could not confound with the pursuit of truth the affectations of contemporary realists, but Ste.-Beuve was able to recognise the merit of certain among them. A letter of his to M. Zola in 1868, after the publication of *Thérèse Raquin*, will remain one of the best criticisms on this powerful and unequal novelist, whose exaggerated realism sinks every moment into the fantastic, "qui peint de tête, et non d'après nature." He ends with a remarkable prediction:—

"Vous avez bravé dans cette œuvre et le public et aussi la critique. Ne vous étonnez pas de certaines colères; . . . de tels conflits se terminent quand un auteur de talent le veut bien, par un autre ouvrage, également hardi, mais un peu détendu, où le public et la critique croient voir une concession à leur gré, et tout finit par un de ces traités de paix qui consacrent une réputation de plus."

M. Zola has waited for ten years before following this advice, and writing this work *un peu détendu*. He has in the meanwhile multiplied his works of a violent, exaggerated, and revolting character, and won, if not the admiration, at least the attention of the public by force of talent and scandal. His *Assommoir*, in particular, was for two months the subject of universal conversation, and no one could fail to recognise the rare qualities of writing and of observation which it displayed. But at last he decided to write a novel which he himself calls "une œuvre de dami-teinte"—*Une Page d'Amour* (Charpentier). He has not wholly renounced his favourite methods, description à outrance and the abuse of physiology. Even in this book, which is comparatively pure and lofty in tone, and in which the majority of the characters are not, as in his earlier novels, madmen, rogues, or idiots, there are still some needlessly gross or revolting passages. The subject is very simple; a still young and beautiful widow, Hélène Grandjean, lives alone with Jeanne, her little daughter of eleven, a child of a passionate and nervous nature, who loves her with a jealous and morbid love. Hélène is devoted heart and soul to her daughter, but she falls in love unconsciously with a physician who has saved little Jeanne's life. The latter thinks herself neglected, falls ill from pure jealousy, and at last dies without a smile for her despairing mother. This development of unconscious jealousy in an impressionable child is analysed with striking vigour; and the involuntary impulse which renders Hélène's noblest sentiments subservient to her fall is described with no less talent. The novel may be divided into a certain number of scenes which are almost all remarkable for the variety and brilliance of their colouring. The scenes of Jeanne's illness, the reception of M^{me}. Deberle, the children's ball, Jeanne's funeral, Hélène's visit to the cemetery, are pictures admirable in truthfulness, and in observation which is profound, witty or even poetical. But the two finest passages in the book are the scene in which Hélène, seated at her window with the old Abbé Jouve, confesses to him her still innocent love; and that in which Jeanne, left alone by her mother during a storm, gazes on Paris drenched with the rain, and feels herself devoured by jealousy which is the more cruel as it is the more unreasoning. The landscape of Paris as seen from the Trocadéro accompanies every incident of the novel. It is an ever-changing background: it is seen in spring and in autumn, in sunshine and in rain: and though these descriptions are excessive, and become monotonous in the long run, they give great reality to the novel by localising it with precision. M. Zola may call himself a realist, but no one has more completely subordinated nature to art. He composes his novel in a series of tableaux where everything is combined for the central effect. We do not find in him the disorder, the complexity of nature—that unfinished and incomplete element in human

things which Turguëneff renders with so much realism. With him everything has well-defined outlines, and he often daubs on his colours. His art is massive and weighty, but it is potent and profound. He sometimes attains to extraordinary poetical effects, and in his last novel he has shown sobriety and an elevation to which he had not accustomed us. If M. Zola is not spoilt by his spirit of system and by a vanity which endures no criticism, he will take rank among our great modern novelists, not far from Balzac and above Flaubert. His enemy is that spirit of system which assumes the form of charlatanism. When he gives us the genealogical tree of the Rougon-Macquart family, and declares that all the personages of his eight novels already published, and of the twelve which he promises us, have their character and their destiny predetermined by the laws of heredity, physiologists can but smile as linguists used to do when he declared that he had worked as a philologist in *L'Assommoir*.

The worst of exaggerated writers like M. Zola is that they have imitators who throw their defects into relief, and show the fatal results to which their influence may lead. M. Ricouard is one of these clumsy disciples. M. Zola's laurels have evidently interfered with his repose, and he has written a book, *Claire Aubertin* (Ollendorf), which was insured a few days' *succès de scandale* by its alternative title of *Vices Parisiens*. Thanks to a few flattering reviews, we were induced to believe for a brief space that a rival to M. Zola had arisen. But those who were led by curiosity to buy the book were sadly disappointed. A vulgar story such as those which figure in our police columns; adventures distressingly flat and commonplace, related in bad newspaper-style; neither invention, nor observation, nor wit—such were the characteristics of a book which ran through two editions in a week. If anyone wants realism, let him read the pretty collection of M. Heusy's Belgian novels (Librairie Générale): *Scènes de la Vie Cruelle*, little sketches of the sufferings of lower-class life, described in a sober and nervous style, and in which, beneath the patience of the genre-painter, you feel his keen emotion and his love for the unfortunate subjects of his brush. M. Heusy's *début* seems to promise us a painter and a novelist. I must mention, too, M. Pouvillon's *Nouvelles réalistes* (Lemerre), which have nothing realistic save the name, but it appears that realism is in fashion, and that it must be used as a label to promote the ready sale of wares of the kind. M. Pouvillon is not a member of the school of Courbet, but of that of Daudet, minus emotion. He is a lover of the picturesque, of Nature, of precise and trifling details regarded from the point of view of a painter and a poet. Daudet in his tales brings Provence before us. M. Pouvillon gives us a picture of Languedoc, with the precision of a native, but with the art and subtlety of a literary man who knows his language to perfection. He has imparted to his style a pleasant savour of the soil; but he never falls into *patois*, and always remains essentially French. His *début* is, like that of M. Heusy, full of promise.

M. Zola is not only a dangerous model, he is also a master whose advice would be fatal to those who sought to follow it. Nothing can be more unreasonable than the theories put forth by him in the dramatic *feuilleton* of the *Bien Public*, or in the literary correspondence which he contributes to a Russian Review. Because he began life himself as an under-clerk at Messrs. Hachette's, where his abilities were considered commonplace, and formed himself by writing in the papers, he maintains that a regular course of study is useless, and that journalism is the best school of style. At this rate a man might become a good painter by making caricatures and drawings for the illustrated papers. We hold, for our part, that the study of the great masters, and above all of the early great masters, remains the best school for painters as

well as for writers; and therefore we warmly approve the reforms which are introducing into our *lycées* the study of the sixteenth century, and even of the masterpieces of the Middle Ages. An excellent manual has just appeared of sixteenth-century literature—MM. Darmesteter and Hatzfeld's *Le Sixième Siècle* (Delagrave). This literary partnership between a philologist of high rank, to whom we are indebted for two excellent studies on *La Formation des mots composés* and *La Formation des mots nouveaux en Français* (Vieweg), and of a highly cultivated man of letters has proved very successful. In a volume of almost 700 pages we find essential ideas on the literary history of the sixteenth century; a remarkably concise study of the language of the sixteenth century; a vocabulary and syntax; and selected specimens in prose and verse. The selection has been made with due regard not only to the literary merit of the various specimens, but also to the ideas expressed in them, so as to give a sketch of the theories and the passions by which that great age was animated. The only *lacuna* that we have discovered in this admirable volume is the absence of a chapter dealing specially with metre. Ronsard and his school were great innovators in this respect. Our modern poets are their pupils, and have revived all their metres, which had been forgotten for two centuries. It would have been interesting to determine precisely what they received from the fourteenth and fifteenth centuries, and what was of their own invention. One of the most carefully executed and most original parts of MM. Darmesteter and Hatzfeld's volume is that dealing with the stage. They have clearly pointed out the two currents which were then contending for the mastery: the mediæval tradition of the mysteries, farces, and moralities, still in possession of popular favour, and the classical and Italian influence which, supported by the literary classes, by the Court, by good society and the Parliaments, finally triumphed in the seventeenth century. To complete the information derived from this work, the reader must turn to M. Sepet's two books on the mediæval drama—*Le Drame chrétien au Moyen-Âge* and *Les Prophètes du Christ* (Didier). There he will see how from a partially dramatised liturgy issued little by little a religious dramatic literature which for several centuries supplied in France the popular need of the emotions of the theatre. The tragical events in which Jewish history abounds, the scenes of the New Testament and even the parables, such as that of the Wise and Foolish Virgins, furnish material for numberless performances, to which the painting of popular manners contributes an element always living, contemporary and varied. M. Sepet, who is an earnest Catholic, and as such a fervent admirer of the Middle Ages, mistakenly believes that, had it not been for the Renaissance movement, a drama at once religious and national would have proceeded from the mediæval stage, and that France in the seventeenth century, instead of having a Corneille and a Racine, would have had two Shakespeares. He does not see, in the first place, that the religious element in the mediæval drama was not susceptible of development. The drama can only subsist on human passions, while dogma and sacred history have an absolute and immutable character which deprives the dramatic author of the liberty which is to him the breath of life. The only portion of the mysteries which was susceptible of development was their human side, their popular or purely historical scenes. This very historical and popular element was in England the starting-point of the Shakspearean drama. But is the Renaissance to be accused of arresting this development? By no means. The Renaissance movement was as powerful in England as it was in France. But in France it acted on minds in which good sense, the love of order and of rule, prevailed over the poetical and dramatic sense—minds better fitted for psychological, philosophical and moral analysis than for passionate and living synthesis. Even in

the Middle Ages, the French mysteries are much more reasonable, more measured, more regular than the English mysteries; the religious and dogmatic element plays a much more important part. This natural tendency of the French spirit to well-ordered simplicity, to psychological development, was strengthened by the predominant influence on our literature exerted by the Court and good society, while in England the theatre preserved its popular character. The French genius is essentially Latin, the English spirit essentially Germanic—here is the true reason for the different development of the two dramas. M. Jusserand, in a brightly-written book which shows considerable research, *Le Théâtre Anglais jusqu'aux prédécesseurs immédiats de Shakspeare* (Hachette), has given an excellent summary of the various elements which formed the Shakspearean drama, and has clearly shown how the Renaissance movement acted on that drama without altering its popular and national character. M. Sepet, again, always falls into the error of comparing the mediæval with the Greek drama. He forgets that in Greece religion was national, or even local, and the poets modified it as they pleased. The Christian religion is no more French than it is English or German; and its dogmatic and immutable character renders it but ill-fitted to furnish material for dramatic creations.

While M. Jusserand was studying the origin of the Shakspearean drama, M. de Griay was beginning an important study on *La Comédie en Angleterre* (Didier) immediately after Shakspeare, to be followed by a second volume on *English Comedy in the Eighteenth Century*. M. A. Büchner, too, has given us a very interesting pamphlet on *Hamlet*, in which he traces the origin of the drama.

Not only English literature, but likewise English history, is at the present moment attracting the attention of students in France. M. Wiesener has just published a large volume on *La Jeunesse d'Elizabeth* (Hachette). This book will possess deep interest for Englishmen as well as Frenchmen; for it is based on manuscript and printed sources, and is more complete than any previous work on the subject. It rectifies on many points not only Mr. Froude's impassioned narrative, but also the careful researches of Miss Strickland. Although M. Wiesener, one of the first defenders of Mary Stuart, is deeply hostile to Elizabeth, he has made great efforts to be impartial, and his book shows us, in all its grandeur, the imposing figure of her whom

"L'Europe a mise au rang de ses grands hommes."

But at the same time he shows in its true light the conduct of Mary Tudor towards her sister; he corrects many errors regarding Elizabeth's captivity at Woodstock, and especially regarding Elizabeth's relations with Philip II. He entirely demolishes the two romances long current as to Mary Tudor's alleged passion for Courtenay, and Philip II.'s equally imaginary passion for Elizabeth.

G. MONOD.

P.S.—Allow me to recommend to those who wish to form an accurate idea of the present state of French politics a book by M. Oh. Bigot, entitled *La Fin de l'Anarchie* (Charpentier). It is perhaps a little too optimistic; but as a whole it is strictly true. It is the work of a wise and impartial mind, as well as of a highly-cultivated writer.

CORRESPONDENCE.

THE TREASURE OF MYCENAE.

Westbury-on-Trym: June 15, 1878.

In view of Prof. Forchhammer's theory respecting the Asiatic origin of the Mycenaean treasure, I venture to call your attention to a resemblance, which is at least curious, between the costume of certain female Rutennu depicted in the wall-paintings of various tombs at Thebes and the costumes of the female figures engraved on the famous golden signet discovered at Mycenae in the tomb south of the Agora.

The female captives of the Egyptian wall-paintings (see cut No. 342, p. 391, and cut No. 353, p. 416, vol. i., Wilkinson's *Ancient Egyptians*, Edition 1871) wear a robe which consists of three skirts of different lengths, so presenting the appearance of a dress with three deep flounces. This dress is confined at the waist by a girdle and at the throat by a collar; and is sometimes shown with loose sleeves, sometimes with sleeves fastened at the wrist, and sometimes with a kind of cape. From the back of the head-dress hangs a pendant ornament like a cord and tassel.

Of the six female figures engraved on the Mycenaean signet (see cut No. 530, p. 354, Schliemann's *Mycenae and Tiryns*; Murray, 1878) three wear robes closely resembling the above; two of these robes being made apparently in five skirts or flounces, and one in three flounces. Pendant ornaments, described by Dr. Schliemann as "tresses," hang in like manner from the back of their head-dresses. Three of the women wear necklaces or collars; two seem to wear loose sleeves; the sleeves of another are distinctly shown to fasten at the wrist; and the dresses of all appear to be girdled at the waist. It is impossible to place these illustrations side by side, or to compare the descriptions of them by Sir G. Wilkinson on the one hand and Dr. Schliemann on the other, and not to be struck by the close identity subsisting between the costumes of the female Rutennu and the unknown females of the Mycenaean gem.

It has been said that if Prof. Forchhammer's

explanation be correct, and the treasure of Mycenae formed in truth part of the booty allotted to the Mycenaean after the victory of Plataea, these antiquities might represent not only Persian, but possibly Assyrian, Babylonian, and Bactrian art. Now, the correspondence between the costumes of the Rutennu and the costumes depicted on the signet would square perfectly well with this supposition; for the land of Rutennu, Upper and Lower, comprised Phoenicia, Palestine, the Hauran, Mesopotamia, and, in fact, all Syria as defined by Strabo; and Mesopotamia belonged successively to the Assyrian, Egyptian, Babylonian, Persian, Macedonian, Syro-Grecian, Parthian, and later Persian empires.

AMELIA B. EDWARDS.

"ROUGH AND READY."

Lexington, Va., U.S.A.: May 25, 1878.

A passage in *Beowulf* (ed. Heyne, iii., 122) throws a curious light on the familiar collocation *rough and ready*. The passage, which is describing Grendel's visit to Hrothgar's broad-pinnacled castle, reads thus:—

grim and graedig
 reob and rēðe,
 brittig pegna."

"Viht unhaelo
 gearo sōua vās,
 and on raeste genam

May not this passage show that there is a confusion between our two words *ready*? The Swedish *rådas* means to fear, adj. *rädd*, fearful, as in the phrase *Bli icke rädd*, be not afraid; Danish *raede*, scarecrow, and *raed*, frightened, timorous. The other word is also Norse (see Oliphant, *Standard English*, p. 90), and means always *prepared*. *Reob* and *rēðe*, rough and ready, would then mean *rough and fearful*, which is the only meaning the context will allow. The tendency of alliterative duplicates is to perpetuate themselves (cf. *might and main*, and the non-alliterative *let and hindrance*, *mail-bag*, *pea-jacket*, *down-hill*, *cock-boat*, and others) long after the meaning of one of them has faded. The change or obscuration in meaning would in this phrase be no more singular than that undergone by Caedmon's and Chaucer's *Ord and ends* (see Bouterwek's *Caedmon*, 3680, &c.), popularly corrupted from *beginning and end* to *odds and ends*. Numerous examples of *rēðe* are given in Bosworth, Bouterwek, Heyne's *Beowulf*, and Mr. Sweet's recent *Anglo-Saxon Grammar*. I find no recent examples in Mr. Skeat's admirable *Specimens*, nor any reference to this etymology.

Mr. Skeat may be interested to learn that his and Dr. Morris's joint labours have given a great impetus to the historical study of English in America.

JAMES A. HARRISON.

THE RELIGION OF SHAKSPERE.

8 St. George's Square, N.W.: June 13, 1878.

My statement in the ACADEMY of June 8, that Shakspeare, in the intense feelings expressed in his *Sonnets*, "uttered not one word of a life hereafter, or the ordinary consolations or resources here of so-called religious folk," was made from memory only, and under the strong impression that he never hinted at seeking, in his troubles, relief from prayer, or consolation from the thought that in a future world he and his friend Will would meet, and all clouds between them be cleared away. Having since read through the *Sonnets* again, I find that my impression above stated was right, but that Shakspeare does speak very much more clearly about Doomsday and immortality than I had recollected. Though there are in sonnets xiii., 12, xxx., 6, &c., phrases like "Death's eternal cold," "Death's dateless night," yet in lv., 10-14, Shakspeare says to his friend:

"... Your praise shall still find room,
 Even in the eyes of all posterity.
 That wear this world out to the ending doom,
 So till the judgment that yourself arise,
 You live in this, and dwell in lovers' eyes."

Again in cxvi., l. 11-12, he says:—

"Love alters not with [time's] brief hours and weeks,
 But bears it out even to the edge of doom."

In lxxiv., l. 7-8, the following words may fairly bear a wider meaning than is there given them when Shakspeare speaks of his own death and his friend's surviving him:—

"The earth can have but earth, which is his due;
 My spirit is thine, the better part of me."

In cx., l. 13-14, he says to his friend:—

"Then give me welcome, next my heaven the best,
 Even to thy pure and most most loving breast."

But the clearest expression of Shakspeare's belief is in that noble sonnet of remonstrance with himself, or the spirit of his dark mistress, that is found in the set addressed to her:—

CXLVI.

"Poor soul, the centre of my sinful earth,
 [Hemm'd by] those rebel powers that thee array,
 Why dost thou pine within, and suffer dearth,
 Painting thy outward walls so costly gay?
 Why so large cost, having so short a lease,
 Dost thou upon thy fading mansion spend?
 Shall worms, inheritors of this excess,
 Eat up thy charge? Is this thy body's end?
 Then, soul, live thou upon thy servant's loss,
 And let that pine to aggravate thy store;
 Buy terms divine in selling hours of dross;
 Within be fed, without be rich no more:
 So shalt thou feed on death, that feeds on men,
 And, death once dead, there's no more dying then."

This, and the passages above quoted, justify the orthodox in claiming that, at the time Shakspeare wrote them, he held, or accepted, the doctrines of a coming judgment and the immortality of the soul. That his later belief was less definite, and is represented by Prospero's, I still hold; but I am very sorry that my bad memory failed to do justice to his earlier creed when I spoke on Mr. Hargrove's able paper.

F. J. FURNIVALL.

APPOINTMENTS FOR NEXT WEEK.

MONDAY, June 24.—8.30 P.M. Geographical.
 TUESDAY, June 25.—3 P.M. Statistical: Anniversary.
 8 P.M. Anthropological Institute: "Ethnology of the Islands of the Pacific," by the Rev. S. J. Whitmee; "Palaeolithic Implements from the Gravel of N.E. London," by Worthington G. Smith; "Some Archaic Structures in Dorsetshire and Somersetshire," by A. L. Lewis; "On a New Method of finding the Cephalic Index," by G. M. Atkinson.
 WEDNESDAY, June 26.—4 P.M. Society of Arts: Anniversary.
 THURSDAY, June 27.—8.30 P.M.—Antiquaries.
 FRIDAY, June 28.—8 P.M. Quckett: "On the Influence of Diffraction in microscopic Vision," by Frank Crisp.

SCIENCE.

Catulli Veronensis liber: iterum recognovit, apparatus criticum, prolegomena, appendices addidit R. Ellis. (Oxford: Clarendon Press, 1878.)

THE great and apparently still increasing interest in Catullus is due to well-defined causes. A better appreciation of the beauties both in form and thought to be found in his poems, the almost romantic history of the text, the allurements for the scholar's critical powers of a field till lately comparatively neglected, the probabilities of further rewards of investigation, have all contributed to this result. And editions such as these of Mr. Ellis create as well as satisfy the student's interest.

The first edition of the text appeared in 1867, after eight years' work on the subject: a Commentary was published in 1876, which is now followed by a second edition of the former work. In bulk and plan the present volume presents little change; in detail there are some alterations. A new Preface severely criticises the edition of Catullus by Bährens, defends the orthography of the text, and estimates again the value of the Oxford MS. (O) and its relation to others. In the Prolegomena some

aragraphs on this last point have been rewritten, the first discovery, though not publication, of a proof that Catullus was read in the thirteenth century is vindicated by Mr. Bywater, and a description is given of what is undoubtedly the (re-discovered) Codex Cujacianus. The Apparatus Criticus is also substantially the same as before, except that the last-named MS. has been collated throughout, not so much for its intrinsic importance as to convince those who have hitherto acquiesced in Scaliger's high estimation of it. Corrections have also been made in the record of the readings of O. Unfortunately, the Prolegomena and part of the text were printed off as early as 1875, and Bährens's text and Mr. Munro's *Criticisms and Elucidations* (1878) were too late to have their effect on the notes of that part of the book, except by the use of Addenda. For the first time a most satisfactory facsimile of a page of O is made public, and a verbal index to the poems is added.

There are many points which make Mr. Ellis's work by far the best critical edition of his author that has yet appeared. That no pains are spared to give the reader the fullest materials for his judgment, even where he may differ from the editor, is obvious to the general reader; a thorough revision is necessary before justice can be done to the immense reading, the power of grasping and grouping facts, the minuteness of attention, and subtlety of appreciation, which distinguish the present text and the commentary. A long period of work on a single author can hardly pass without solid and good result, but it may narrow or warp the judgment; while Mr. Ellis has studied Catullus from almost every point of view, and from none without throwing new light on the subject.

The doubts which at present disturb students of Catullus are almost entirely concerned with criticism and not interpretation: such are, what is the prænomen of the poet? what are the real value and relative positions of the MSS. O and G (the Sangermanensis)? how far are the others independent of these? It may be worth while to consider Mr. Ellis's views on these points. The history of our MSS. is well-known: a *Florilegium Carminum Latinorum* of the ninth or tenth century at Paris contains the sixty-second ode of Catullus (Codex Thuanæus, T); in the middle of the tenth century Rotherius, Bishop of Verona, used a codex of Catullus now lost: from that time till the thirteenth century there are no certain traces of a MS. being known. A celebrated epigram commemorates the re-discovery and transference to Verona, probably early in the fourteenth century, of a copy also now lost (Codex Veronensis), from which all our existing copies except T are derived, and the supposed readings of which Mr. Ellis prints in red ink in his Apparatus Criticus. Yet, strangely, our earliest MS. (G) is dated 1375, while the next in date (O) was perhaps not written before 1400. A large number of fifteenth-century copies exist, generally much interpolated, among which D and a few others seem to rise above the rest in value.

The question of the prænomen of the

poet will, perhaps, not long be in dispute. Mr. Ellis, but Mr. Ellis alone among living scholars who have studied Catullus, supports Quintus. The sole authorities for it are a passage in Pliny, where Mr. Ellis himself shares the general opinion that it should be omitted, and four MSS. of some weight: no one, however, supposes these to have found it in their Veronese archetype, and they may have derived it from Pliny: the emendation in lxvii., 12, is not so certain as to be evidence. For Caius are a passage in Suetonius quoted by Jerome where the name is written at length, and one in Apuleius—both direct, clear and unshaken testimony. It may be noted, also, that very few Quinti Valerii will be found in Italy before the Empire,* while Caii and Publii Valerii abound.

The next point is more difficult: the position of L. Müller, who in his edition of 1870 and reprint of 1874 will not mention the Oxford codex or the other new MSS. collated by Mr. Ellis, is of course now untenable: but is Bährens right in placing O and G as the only independent copies of the archetype? The superiority of the two to all others is now acknowledged, but this fact has only in this second edition been clearly stated by Mr. Ellis. So far as the printed evidence goes, the *vera antiquitas* of O, so separable from questions of the date of transcription, was not before fully recognised. The changes in the "stemmata codicum" (Proleg., p. xli. in the first edition, p. xxxv. in the second) abundantly show this, though even in the last the isolated character of G is hardly conceded. Mr. Ellis has the great honour of having first made public a collation of O, and having assigned a high position to it: but what we know from recent numbers of the ACADEMY to have been his private opinion from the first—viz., that it has changed the position of Catullian criticism—would not have exposed him to the charge "codicem arrogantius venditari" (cf. Praef., p. vi.), even if it had at once been as boldly expressed as it was rightly conceived. Unfortunately also, the collation was not perfect. Enough has been said on this point by Bährens, who exaggerates what was in itself serious; but we must strongly deprecate the use of such language as "impudentissime mentitur" (Praef., p. xi.) from an English scholar to a fellow-worker in classical studies. What is of primary importance for the literary world is that between the English and German editors the MS. is thoroughly collated at last, though many of the corrections have to be supplied from pp. 358-360 of Mr. Ellis's edition, having been discovered too late for insertion in their proper place.

The question follows—and it is the hardest to answer satisfactorily—of what value are the fifteenth-century MSS.? It is disappointing to find that textual criticism cannot at present thoroughly solve the problem. We have the means of restoring nearly every word of the Veronese archetype; we know that all existing MSS. except T are derived from it; we have T itself to give

* For instance, in Smith's *Dictionary of Biography* there are but two, both in the third century B.C.: in the Berlin *Corpus Inscriptionum*, vol. i., there are none.

evidence to an earlier state of an important part of the text; lastly, we can lay our fingers on the Italian interpolations. Yet, even thus hedged about with evidence, scholars seem unable to discriminate thoroughly the relations of the majority of copies. The most natural course of events appears in this case to be also the truest, though opposed to the general opinion. The known references to Catullus in the fourteenth century point to rarity of the MSS., but still to a spirit of enquiry about him, due in great measure, no doubt, to Petrarch. In such circumstances it is hard to believe that no copy was made of the Veronese codex until 1375, when G was written: indeed, Mr. Ellis has made it probable that neither G nor O was transcribed directly from their archetype, but from different apographs of it. In the fifteenth century numerous copies were made, no doubt from all available existing codices. We should expect, then, a remarkable similarity in the genuine readings of the mass of MSS., since they all came from a copy itself a century before unique. Yet since no codex is ever precisely like another, within a limited range there would be a few well-marked differences. This seems to be the actual case: beside O and G, from the dead level of similarity certain readings in the Datanus, in the Hamburgensis, in the Bononiensis (D, H, B) and less notably in some others, stand out as peculiar. Most of the examples in the Proleg., p. xxix., may be taken as good instances of this; the short hundredth poem alone will supply several. Mr. Ellis's judgment on these points, founded on extensive study of the minor copies, seems to us entirely worthy of confidence.

A few notes and corrections may occupy the rest of the space allowed to this article. In Proleg., pp. i. and xlvi., an argument is based on a supposed omission of lxii., 30, in T, for which there seems to be no authority: on p. xxiv., the space of five lines in O before lxi. may well be due to the wish of the scribe to begin a long and important poem and division of the poems on a new page: on p. xxxvii., *uidimus* is for *uidebimus*, see p. xlvii.: on p. lxi., confusion is caused by one A being omitted and one which should be in red being printed in black. In the Text, p. 6, in the margin of an Aldine edition a new reading is plausibly suggested for ii., 8, *Corde ut tam grauis acquiescat ardor*: on p. 18, O reads *cum*, not as Ellis *cui*: on p. 21 before xi. there is no space in O, and on p. 168 before lxviii. there is: on p. 87, the Cod. Laudensis has the reading in lxi., 40, which Lachmann suggested: on p. 102, the conjecture of Mr. Mowat in lxii., 6, *consurgere* (see p. 330), is the reading of Cod. Bodl. Canon. Lat. 33, and apparently also of H: on p. 108, in lxii., 73, two different readings are ascribed to O, the latter of which seems to be wrong: on p. 109, in lxiii., 5, the reading *iletas* clearly comes from the following line *relicta sensit*, as D, a, P show: on p. 157, in lxvi., 41, the conjecture *quid ... adiurarim* is found in Cod. Bodl. Canon. Lat. 34, which also has lxviii., 47, marks a lacuna after lxviii., 143, and seems to have been before Alex. Guarinus when he was preparing his edition. The Index, though useful, is on the old

strictly alphabetical plan, and not quite complete; another to the first lines of the poems would have been useful to the student. The misprints in the book are few and seldom important, and the style of the printing most creditable to the Clarendon Press.

The points on which we have ventured to disagree with Mr. Ellis should not be allowed to obscure the solid merits of the book. Appendices such as the learned and laborious ones on the strophic system of Catullus's odes, and on the orthography of certain words, are of a class not too common in England, and worthy to rank with the best work of Germany. F. MADAN.

SCIENCE NOTES.

ANTHROPOLOGY.

Skulls from New Guinea.—It occasionally happens that the two halves of the frontal bone in the human skull, instead of uniting in infancy, remain separated throughout life. This abnormality is known to craniologists as *metopism*. A metopic skull shows therefore a seam or joint running down the middle of the forehead, which joint is termed the *medio-frontal* or *metopic suture*. In studying the large collection of Papuan skulls in the Museum at Florence, M. E. Regalia has found that 4.3 per cent. are metopic. The results of his interesting studies are published in the last number of the *Archivio per l'Antropologia e l'Etnologia*. The collection under examination contains 200 Papuan crania, of which nine exhibit metopism, namely, eight adults (one female and seven males) and one skull of a boy. In the collection of 135 skulls from New Guinea, in the Dresden Museum, Dr. Mayer has found only three metopic forms. Some of the cranial characters which have been generally observed in correlation with metopism are not exhibited by the Papuan skulls. The persistence of the frontal suture has been attributed to hypertrophy of the frontal lobes of the brain, or to hydrocephaly. By some anthropologists it has been regarded as indicative of man's origin from the lower animals, and it is said to be more frequent in ancient than in modern races. Other anthropologists have taken an opposite view, and although it can hardly be denied that the possession of two frontal bones instead of one is an animal characteristic, have held that the fusion of the two in the human subject is prevented by the development of the anterior portion of the brain, and that it is more common in the higher than in the lower races. Among European peoples cases are said to be more frequent than among Negroes. Metopism has, however, been observed in individuals of very low intelligence, and even in idiots. In the same number of Prof. Mantegazza's valuable journal we find another paper on Papuan skulls, both memoirs representing work done in the National Museum of Anthropology at Florence. In this communication Dr. Paolo Riccardi gives the results of his studies with reference to the presence of intermaxillary bones and other cranial anomalies. Wormian bones, those small ossifications which are developed between the larger bones, are very common in these Papuan crania, but their occurrence does not support the view held by some anthropologists that they are most numerous in brachycephalic crania. In fact, out of sixty-nine adult New Guinea skulls in which Wormian bones occur sixty were decidedly dolichocephalic. Neither does his investigation confirm the opinion that the presence of such ossicles is a mark of cranial superiority, by increasing the size of the brain cavity.

Finnish-Ugrian Antiquities.—Some time ago we called attention to the appearance of the first part of M. Aspelin's great work on this subject. We have recently received the second and third parts,

in Finnish and in French, illustrated by upwards of 800 woodcuts (Helsingfors: G. W. Edlund; Paris: C. Klincksieck). Although the interest of much of the work is necessarily local, there are many chapters which bear upon general questions of interest to archaeologists in all parts of the world. For example, the specimens figured and described from the cemetery of Ananino deserve special attention, since they exhibit a gradual transition from the use of bronze to that of iron. This necropolis is situated on the left bank of the River Kama, in the Government of Viatka, and its exploration, which at present has been only very partial, has brought to light forty-six human skeletons, associated with numerous bones of horses, and with a large number of relics of human workmanship. These relics include bronze celts, spear-heads and arrow-heads, in both bronze and iron, and various iron weapons of types which are characteristic of the bronze age. Indeed, it appears that on the banks of the Kama civilisation advanced, with gradual and interrupted step, from the age of bronze, across the iron period, to historical times. The character of the ornamentation on some of the bronze ornaments may lead to the assignation of an approximate date for their manufacture. Archaeologists will not fail to compare the cemetery of Ananino with that of Hällestatt, in the Salzkammergut, where the researches of M. Ramsauer showed beyond doubt that a transition might be traced from the bronze-using to the iron-using period.

Superstitions attaching to Stone Implements.—When the recollection of the stone age passed away, men looked with superstitious veneration on the unknown objects which they occasionally found on the surface of the soil, or turned up in ploughing and digging. These superstitions have been diligently collected by M. E. Cartailhac, the editor of the well-known *Matériaux pour l'Histoire de l'Homme*, and have recently been published, together with much other valuable information about stone implements, in a work entitled *L'Age de la Pierre dans les Souvenirs et les Superstitions populaires* (Paris: Reinwald). No belief has been more widely spread than that which assigns a celestial origin to these worked stones. Almost everywhere the peasantry still speak of them by names equivalent to our "thunderbolt." That their origin is human, few admit; that it is superhuman, they readily believe. And having thus an extra-terrestrial origin, it is only natural that they should be venerated, as was the case in the ancient worship of the hatchet. In the north of England, at the present day, a stone hammer may occasionally be found in the cattle-trough to purify the water and prevent disease. Flint arrow-heads have been found mounted in bronze or silver or gold setting, evidently to be worn as talismans; and occasionally stone implements are discovered with mystic characters engraved upon them, as in the well-known case of the polished jade celt, or *ceraunia*, in the Christy Collection, inscribed with a Gnostic formula in Greek. M. Cartailhac has collected a large number of instances in which stone objects have been found in deposits indicating their comparatively recent burial; but he shows that in most cases they are clearly not of contemporaneous origin. Either they have been derived from more ancient deposits, as in the soil used for the construction of burial mounds; or they have been preserved as amulets and have been deposited with the dead on account of their sacred character or their magical virtues.

The Evolution of Morality, being a History of the Development of Moral Culture. By C. Staniland Wake. In Two Volumes. (Trübner and Co.) Most students of anthropology look with favour upon any attempt to extend to the sphere of morals that doctrine of evolution which has been applied of late years with such signal success to the study of material nature. Mr. Wake, moreover, is well known to anthropologists from his connexion with several of the metropolitan

societies devoted to the study of Man. Originally connected with the Anthropological Society of London, he became a prominent officer of the Institute which was formed by the union of the two old societies; and he afterwards associated himself with the London Anthropological Society—a small body which seceded from the Institute; while recently he has been active, we believe, in a local society at Hull. The author's familiarity with ethnological details has stood him in good stead in his present enquiry, and has given him a great advantage over the ordinary student of ethics. This is especially seen in that part of the work where, in tracing the development of the moral faculty, he examines the phenomena presented by the more uncivilised races of mankind. It is, of course, only fair to assume that as we descend in the scale of humanity we shall approach closer and closer to the condition of *primæval man*; though it may be questioned whether the ideas of the lowest existing races reproduce, with anything like exactitude, those of the earliest members of the human family. Mr. Herbert Spencer, in referring to the genesis of the moral sentiments, has said that in the past experience of the human race smiles and gentle tones have habitually accompanied pleasurable feelings, while pain has been associated with knit brows, set teeth, and grating voice. "Much deeper down than the history of the human race must we go to find the beginnings of these connexions." Mr. Wake, in seeking these beginnings, goes lower down than even the level of the lowest mammal, and does not despise the lessons to be learnt from creatures of such humble organisation as the spider. Among the lowest animals there are two actions which are the most ready to call forth expressions of anger: one of these is interference with the food which the creature has obtained; and the other, interference with the female to which it has become attached. And the moral ideas of people who have reached only a slight degree of culture are, in like manner, closely connected with the rights of property—these possessory rights themselves being traceable to the instinct of self-preservation. In tracing the lines of moral development Mr. Wake reviews the principal systems of religion—Hinduism, Buddhism, Mithraism, Christianity, and Positivism.

The Dawn of History: an Introduction to Prehistoric Study. Edited by O. F. Keary. (Moxley and Smith.) This little book by Mr. Keary and the Misses Keary is an attempt to bring together a general account of the new acquisitions of knowledge as to prehistoric man, the science of language, and the growth of civilisation. It only aims at being a popular introduction, and, being very pleasantly written, will no doubt arouse the interest of a large circle of readers who have never had these subjects presented in a form so suited to their needs and their previous education. We naturally compare the book with Clodd's succinct little *Childhood of the World*. The present volume contains far more matter, and that well put, though Mr. Clodd worked out his principles all round in a way that Mr. Keary has not compassed. Indeed, a defect in the present book is that its points of departure are so unevenly taken as sometimes to give wrong impressions. Thus, the first chapter recognises the early Drift-men as savages, and so starts man's career with savage life. But other chapters begin quite in a different place, as those on "Religion" and "The Other World," which hardly know of anything more rudimentary than the beliefs of the civilised Egyptians and Aryans. Mr. Clodd's disregard of orthodox ideas told somewhat against his general popularity. Mr. Keary will attract many parents and guardians whom Mr. Clodd would have frightened. The principle laid down at page 110 will suit not only some of our own theologians, but also those of the Buddhists and Parsis, that we must, "making up our minds only on such points as appear to be decided by revelation,

accept on others the results of present researches as still imperfect and liable to be modified," &c. In the first chapter a suggestion is made which we do not remember to have seen before, that the drawings of reindeer, mammoths, &c., by the ancient Cave-men may have been intended, like many modern savage pictures of animals, to act magically on the creatures themselves, that the hunter may come up with and slay them.

BOTANY.

The Clydesdale Flora.—An *In Memoriam* edition of Roger Hennedy's *Clydesdale Flora* has been published. In spite of the fact that this is the fourth edition, the book has been little known south of the Border, and its great value to Scotch students of botany has been comparatively unknown outside the class which used it. It was undertaken by Prof. Hennedy simply as a field-book for his students in the Andersonian University, and the result was a flora (on the model of Babington's *Manual of British Botany*) which, in point of acknowledged accuracy, ranks with our best local floras, and is of far greater use than the most. The rich vegetation of the Clydesdale has naturally been the subject of much research, and Prof. Hennedy's book undoubtedly owes much to Sir William J. Hooker and Dr. Walker-Arnot's work, but the laborious task of collecting much additional matter and bringing the whole up to contemporary standards has been Prof. Hennedy's alone. The difficulties he met with in this work, and in his earlier study of botany, are recounted in a biographical sketch by his friend Mr. William Simpson, the well-known artist. We get in it (beside a most interesting biography) a glimpse of the earnest character of his work. The volume now issued is clearly printed and in a handy form for a field-book. It contains an Appendix by Mr. R. H. Paterson (Prof. Hennedy's successor), about which we can only say it had been much better omitted. It professes to give a number of additions to the Clydesdale flora, but when we come to examine the localities of some they are found to be quite beyond the limits of Clydesdale. Added to this, we find a young plant of *Pteris aquilina* (the common brake fern) described as a new species under the name of *Pteris gracile*, Paterson. Such additions are scarcely worthy of the memory of Roger Hennedy.

Splenic Fever.—Dr. Ossar Ewart has lately been conducting investigations into the life-history of *Bacillus anthracis*, the cause of the splenic fever. The starting-point in his cultivation was made at the condition in which the *Bacilli* were found in the spleen of a mouse which had just died of splenic fever induced by inoculation. At this stage the *Bacilli* are rod-shaped and motionless. In a few hours (the temperature being at 33° C.) a large number of these rods began to move actively in a wriggling manner. After continuing in this motile state for some time the rods either suddenly or gradually settled down again. After settling down they lengthened out into spore-bearing filaments, and a mouse inoculated with the spores thus obtained died forty-eight hours after of splenic fever, thus showing clearly that the experiment was accurate as regards this important phase being that of *Bacillus anthracis*. The spores are formed in a similar manner to the chlamydospores of *Mucor*. Koch and other observers describe these spores as germinating at once and reproducing the rods, but Dr. Ewart found this process often preceded by the division of the spore into four sporules, all of which closely adhere at first, but are ultimately freed and settle down in colonies. These sporules then germinate, and produce again the rods. The most important morphological conclusion at which Dr. Ewart arrives from these and other observations is that the *Micrococcus*, *Bacterium* and *Bacillus* forms, and the spore-bearing hyphae are simply phases of the same life-

history. His experiments have not only all the appearance of accuracy, but they have been confirmed in great part by competent observers. It would be very unwise to push the suggested analogy between *Bacillus* and *Mucor* too far, since the true *Mucor* is a member of the group of the most highly organised Fungi and *Bacillus* is a member of undoubtedly the lowest. The rest of the experiments are of more medical than botanical interest. The detailed account of these valuable experiments is to be found in the *Journal of Microscopical Science*.

Simple Lessons in Botany, with Questions for Examination, by G. T. Bettany, M.A., B.Sc. (Thomas Murby), are very simply and accurately written. It is a pity the woodcuts are so rough.

An illustrated (fourth) edition of *The Fern Paradise*, by Francis George Heath (Sampson Low and Co.), has just been published. Neither the illustrations nor the additional matter are equal to the rest of the book.

It is said that the Board of Works intends to plug with concrete the wounds of the old trees in Hyde Park.

The Microgonidium.—Dr. Arthur Minks has written in the *Flora* (May) an account of some astonishing lichenological observations. The systems of gonidia and of hyphae he names respectively the *Gonidema* and the *Gonohyphema*, and goes on to tell how in *Leptogium* the rôle of the *Gonohyphema* is to become ultimately transformed into *Gonidema*.

PHILOLOGY.

In the *Neue Jahrbücher* (vols. cxvii. and cxviii., part 3) O. Henze completes his favourable review of Christian Muft's *Chorische Technik des Sophokles*. Bergk continues his original and suggestive "Lese-früchte," which on this occasion contain notes on Thucydides and Herodotus; on a Ohian inscription of the Sullan era; on the Greek verb; and on Aristotle's *Poetics*. In the last-mentioned paper Bergk supports Bernays' *ἀνώνυμος ὁβρα* by arguments drawn from the usage of the Byzantines. Notes are contributed by Rauchenstein on the *Agamemnon*, by Hoffman on the usage of *opus* and *usus est*, on Caesar by E. Grammer, by Golisch on the *Antigone*, by Heydenreich on Cicero's *Aratea*, by Oberdick on the *Scriptores Historiae Augustae*, and by Schrader on Eutropius. G. Meyer reviews Zacher's treatise on Greek nouns in *-uos*; and E. Ludwig the second edition of Neue's *Formenlehre*. An account of the recent festivities at the philological seminary in Erlangen is given by H. Heerwagen. In the following number Ludwig has notes on Musaeus and the Sibylline oracles, Meiser on Boethius' translation of the *Περὶ Ἐρμηνείας*, Hasper on Cicero's *Philippics*, Prinz on the recently-discovered letter of Harpocration, Fleischer on the continuations of Caesar, Römer on the *Iliad*, Sprenger on the *Odysssey*, Eysenhardt on Vitruvius, and Heydenreich on the Scholia to Germanicus' *Aratea*. A valuable note on *vestibulum* is contributed by F. Weiss, and some interesting miscellanies by Hertz, who proposes to read *ροπίονibus* for the MS. *sopitionibus* in Petronius, 22. Wecklein has a favourable review of Prinz' edition of the *Medea*, and Schwabe of Ellis's commentary on Oatullus. In the educational section of the first of these numbers Metzger concludes his remarks on Biblical instruction in the Gymnasia, and Radtke his account of the Latin school at Goldberg. In the following number R. Menge has an interesting and sensible paper on the illustration of classical instruction in schools by drawings and models of ancient works of art. P. Didolf continues in both numbers his critical remarks on the resolutions of the Berlin orthographical conference. The next meeting of German scholars and schoolmasters is to be held at Gera from September 30 to October 3 of this year.

WE have before us four numbers of the *Zeitschrift für die Oesterreichischen Gymnasien*, beginning with January last, which, owing to some accident, have only reached us lately. In the January number Schenkl treats the seventh ode of the first book of Horace; Zingerle has an interesting paper on the way in which the Roman poets have treated the myth of the piling-up of Pelion, Ossa, and Olympus by the Titans; and Rohrmöser has notes on Xenophon's *Hellenica*. In the following number (March) Zingerle communicates a collation of the *Hercules Furens* from an Innsbruck MS. of the tragedian Seneca. The MS., which is assigned to the fifteenth century, appears to be of no special value. Bitschofsky begins some notes on Macrobius, which are continued in the May number. In the April number Cwilinski has notes on Thucydides, and Klimscha on Sallust. In the May number Carl Ziwsa ("Der ägyptische mythus im *Phaedrus* des Platon") contends that Plato's writings were intended as an introduction to his oral teaching, not *vice versa*. Zingerle has notes on Livy, and Gomperz an important and interesting paper on a lost work of Cleanthes *Περὶ στήλης τῆς Διογένης*. The word *στήλης* he proposes as an emendation in vol. Herc. viii., col. 13, v., 18, in place of Wachsmuth's *στροφῆς*. Among the numerous reviews in these numbers may be mentioned (in the January number) that of Schönbach on Müllenhoff's edition of the first volume of Lachmann's minor works; in the March number, that of Scherer on the recent literature of German grammar; in the April number, those of Zechmeister on Fäsi's *Iliad*, xiii., xviii., and of Scheindler on the new edition of Stein's Herodotus; in the May number, those of Rzach on Dindorf's *Scholia in Iliadem*, and of Hirschfeld on Schmidt's *De seviris Augustalibus*.

MEETINGS OF SOCIETIES.

ROYAL ARCHAEOLOGICAL INSTITUTE.—(Friday, June 7.)

G. T. CLARK, Esq., in the Chair. The Rev. W. J. Loftie read a paper on Meydoun, the "Haram el Kadab" or "false pyramid" of the Arabs. This remarkable building, bearing the oldest surviving local name in the world, was probably the monument of Sneferoo, the last king of the third dynasty. The series of sepulchral mounds containing tombs in brickwork were severally described. From one of these came the striking statues of Ra-hotep and Nefert now in the museum at Boulak, and probably the earliest known examples of portrait sculpture.—Mr. O. Morgan exhibited a beautiful and accurate model in silver of the first Eddystone Lighthouse, erected in 1696, by Winstanley, and destroyed in 1703, and read a paper on its construction and on those subsequently built by Rudyard in 1706, and by Smeaton in 1759 and 1774. Notes were given from Winstanley's narrative, who, over-confident in the stability of his lighthouse, perished therein in the great storm of 1703. The model, which appears to have been made in Plymouth, after a rare print, is seventeen inches high, and is valuable, not only as accurately representing a remarkable structure, but as an interesting example of provincial plate. The chairman spoke of the difficulties of Winstanley's achievement and the boldness of his work, and paid a high tribute to the great genius of Smeaton, as shown in the lasting character of his lighthouse, now standing since 1774. It was to be regretted that the work was in danger from the undermining of the rock by the action of the sea.—A paper by Mr. C. W. King, on an Antique Cameo, 2 inches by 1½ inch, representing a bear, and lately found at South Shields, was read. The author attributed this work to the early part of the third century, and considered that it represented, not the great white bear of the Polar kind, as the colour of the cameo might seem to imply, but his carnivorous and savage black brother, who then inhabited North Britain. It was this species of bear which the Romans carried to Italy to make sport in the arena. He did not think the Romans were acquainted with the Arctic bear, and the brown bear of the Alps was a vegetarian and timid, and useless in the arena. This was the only

cameo-bear known to Mr. King. It was no doubt used for fastening the great military cloak, possibly by some Gothic or Frankish "Ursus," in allusion to his name. Mr. Soden Smith spoke of the extreme interest and value of the work, and mentioned that large camei were used on battle standards and horse trappings. Prof. Bunnell Lewis thought it not unlikely that the Romans were acquainted with the Polar bear, quoting from *Juvenal* to that effect.—Mr. C. F. Penrose gave an account of the Roman Portico lately discovered in Lincoln, the architecture of which savoured of Doric; it was apparently the work of engineers and not architects.—Mr. W. T. Watkin sent some notes upon the same subject, and on an inscription lately found at Bath—apparently a portion of one discovered in 1790—on a hoard of coins just discovered at South Shields, and on some recent Roman discoveries at Templeborough.—Mr. O. Morgan also gave an account of an ancient vessel found near the mouth of the river Usk, and proved from the nature of the oak to be Danish.—Mr. E. James exhibited a Norwich cup and cover, an Elizabethan silver-mounted jug, and other examples of English plate.

PHYSICAL SOCIETY.—(Saturday, June 8.)

PROF. W. G. ADAMS, President, in the Chair. The Secretary read a paper by Prof. Hughes on the "Physical Action of the Microphone." That instrument renders it possible to introduce into an electrical circuit an electrical resistance which varies in exact accord with sonorous vibrations, so as to produce an undulatory current of electricity from a constant source, whose wave length, height, and form is an exact representation of the sonorous waves. Prof. Hughes has found that when an electrically-conducting matter in the form of powder, filings, or superposed surfaces, is put under a certain slight pressure, far less than that which would produce cohesion, and more than would allow it to be separated by sonorous vibrations, a remarkable state of things occurs, the electrical resistance being caused to vary by rearrangements as regards the form, number in contact, or pressure of the molecules. It is essential that the instrument be so arranged as regards pressure between the touching surfaces as to be adapted to the particular vibrations employed: thus a box suitable for a man's voice is not adapted to observe the tramp of a fly. But in all cases a perfect undulatory current can be secured throughout a certain range; and, when speaking to the instrument, a galvanometer should be interposed in the circuit, and the pressure between the surfaces gradually increased from a minimum until the needle remains stationary, when a maximum of loudness will be attained: beyond this point the sounds die out gradually until there is complete silence. Prof. Hughes then proceeded to consider the probable cause of the observed phenomena, taking as an illustration the very simplest form of instrument, two blocks held together by an insulated adjusting screw, the lower block being fixed to the board, by means of which it receives the sonorous vibrations. From numerous experiments he inclines to the belief that the whole block increases and diminishes in size at all points, both in the centre and at the sides, in accordance with the form of the sonorous wave, and that this increase in size varies the resistance by changing (1) the pressure at the surface of discontinuity, and (2) the extent of the molecular surfaces in contact. Of these changes he considers that the latter has the greatest effect, since some of his best results have been obtained by using two surfaces of solid gold, and not by such an elastic conductor as metallised silk, which would be most affected by the first-named change. Prof. Hughes is now mainly anxious to find some efficient insulator for sounds, as, until such is available, it will be impossible to isolate and study many objects which require investigation from this new point of view. Prof. Hughes himself then exhibited some of the remarkably simple appliances he has used in his investigations. A very small clock placed on a small drawing-board which carried a microphone was used to interrupt a current passing through a telephone, and the tick was immediately audible through the whole room. A very remarkable effect was then shown. The microphone attached to this board being still connected with the telephone which, being provided with a bell-mouth, enabled the audience to hear the sounds produced, a second telephone was introduced into the circuit and laid on the board, whence a continuous sound was at

once produced. This, Prof. Hughes explained, would last as long as the battery continued in action, and its explanation is as follows:—The act of placing the telephone on the board set up a vibration in the microphone; this passing through the bell-mouthed telephone set the second telephone in action, was returned to the board, and again passed through it to the microphone. Hence the action is self-supporting, and it solves in a most perfect manner the question of a relay for the human voice in telephony; for it becomes only necessary to provide such an arrangement at each station for a speech to be both received and transmitted to any number of succeeding stations. The system is perfectly duplex, for if two correspondents speak into microphones and use telephones for receiving, each can hear the other, but his own speech is inaudible, and if each sing a different note no chord is heard. Experimenting on deaf persons he finds that they can be made to hear the tick of a watch but not human speech, and his results have led him to conclude that we only hear ourselves speak through our bones, and not through our ears. Finally, Prof. Hughes illustrated Sir Henry Thompson's method of probing for shots, splinters, &c., by finding a very small shot in the midst of a piece of wash-leather.—Sir John Conroy, Bart., M.A., read a paper "On the Light Reflected by Potassium Permanganate." The colour of a surface, obtained by rubbing the crushed permanganate into a surface of ground glass with an agate burnisher, was found to vary with the nature of the light and its angle of incidence, and it further varied as the surface was immersed in benzene, bisulphide or tetrachloride of carbon. With light polarised perpendicular to the plane of incidence the dark bands in the reflected spectrum are far more distinct than when unpolarised or polarised perpendicularly to that plane.—Prof. S. P. Thompson exhibited and described a cheap and efficient form of optical bench. It is formed of two oak bars about two metres in length, clamped together as in a lathe-bed, and a number of slides, which carry various appliances, slide easily without shake, and can be fixed in any position by wedges. The several frames carrying the diffraction grating or edges, the eyepiece (with an engraved glass micrometer), &c., are so made, in wood, as to be adjustable in any plane; the instrument can also be employed for making photometric and other measurements, and the total cost does not exceed 3*l*.—The Secretary then read a paper by Prof. Ayrton, of the Imperial College of Tokio, Japan, "On the Electrical Properties of Beeswax and Lead Chloride."

LONDON MATHEMATICAL SOCIETY.—(Thursday, June 13.)

PROF. H. J. SMITH, F.R.S., V.-P., in the Chair. Dr. Hirst, F.R.S., communicated a paper by M. Halphen on "The Characteristics of Systems of Conics." Mr. J. J. Walker read a paper on "A Method in the Analysis of Plane Curves." This latter contained the development of a method of treating the intersections of a transversal with a plane curve which occurred to the author some years since. The method was applied to the discussion of the problem of the inflexion-tangential curve for the quartic, and the determination of the tangential point in terms of the coordinates of the corresponding point of inflexion. Mr. Tucker (hon. sec.) communicated the following papers:—"On the Calculus of Equivalent Statements."—II. Mr. Hugh McColl: "On the Decomposition of certain Numbers into Sums of two square Integers, by continued Fractions." Mr. S. Roberts, F.R.S. (the paper was connected with a note by Prof. Smith, "On the Theory of the Pellian Equation and of Binary Quadratic Forms" printed in the *Proceedings*): "On the Flexure of Spaces," Mr. C. J. Monro ("Flexure of a space of any number of dimensions is sufficiently defined by the condition that lines in it shall change curvature; pure flexure by the further condition that the shortest distance between every two points shall remain constant"). Conclusions arrived at were that plane space of three dimensions might be bent in plane space of four dimensions into forms analogous to developable surfaces; but that in general, space of three dimensions would not admit of pure flexure in space of four dimensions: on "A new Method of finding differential Resolvents of Algebraical Equations," Mr. R. Rawson. Questions were put by Prof. Cayley, F.R.S. ("Has a proof been given of the statement that in colouring the map of a country, divided into counties, only four colours are necessary to be

employed, so that no two adjacent counties should have the same colour?"); by Mr. Merrifield, F.R.S., on the uniform distribution of points in space; by Mr. Tucker, in connexion with a statement of Fermat (that $2^{2^m} + 1$ is a prime, proved to be wrong in one instance by Euler, and recently in a second case by a Russian clergyman).

ROYAL ASIATIC SOCIETY.—(Monday, June 17.)

SIR H. C. RAWLINSON, F.R.S., President, in the Chair. Mr. R. N. Cust read a paper "On the present State of Linguistic Research in India, and on the chief Living Anglo-Indian Scholars," in which he reviewed at great length all that had been done recently, and was still doing, for the promotion of Oriental literature, mentioning for each district under his survey, beginning from Bombay to the south-west to Bengal and Assam on the extreme east, all the grammars, dictionaries, or vocabularies with which he became acquainted, representing, probably, on the whole, not fewer than 180 dialects or languages. His object was to collect information as to the modern dialects and languages, rather than as to the Sanskrit; and, at the same time, to mention the names of every scholar of eminence in India and Europe, and the particular lines of study or which each one had been engaged, with the results thus obtained for the general history of Oriental languages.

FINE ART.

THE EXHIBITION OF WORKS IN BLACK AND WHITE.

THE exhibition at the Dudley Gallery, if not of the first importance, at least offers the attraction of a variety of interest; and, moreover, the level reached by much of the work exhibited is higher than that attained in last year's show. There is less of the undeniable feebleness which is the bane, we were about to say, of our minor exhibitions—but is it not also sufficiently visible at the Royal Academy? It is still, of course, open to question, as has been suggested elsewhere, and as we had occasion to urge last year in the first place, whether, in view of the comparative ignorance of the large public as to the achievements of the best masters of our own generation in the arts of Black and White, the Dudley Gallery would not do well to make a point of including in each of its "Black and White" exhibitions some of the capital achievements of our best living men, or of men not very long dead, so that the attention of a large public might the more easily be fixed on the great possibilities open to this seemingly limited art. The large public has never had too many opportunities of seeing the best work in chalk, in pencil, with the graver, with the etching-needle. That which is thrust somewhat prominently forward is by no means sure to be the worthiest; and it is only by sight of the worthiest that just ideas can be formed of the real capacity of the mediums and methods employed.

But, be that as it may, we have here an interesting exhibition for the student who brings to bear, so to say, upon the reading of this particular book an old and familiar knowledge of the language in which it is written—the literature to which it belongs. And even the visitor not very well acquainted with the conditions under which this work is done—with the limitations it must accept; the laws of selection and abstraction and translation to which it must conform—will find in the gallery much pleasant and interesting and simple work, and will find it of many kinds. We are sorry that the severe and determined economy of the Dudley Committee in utilising every inch of space not actually on the ceiling or on the floor should have permitted the intrusion of a good deal of work which would be too flatteringly described as *second-rate* work. For, though not so many as last year, there are still too many wavering designs, some simple, some ambitious in aim, which the committee would in the end have profited by excluding. In

he end, no one is the gainer by the exhibition of feebleness; and one has a right to ask of a committee what one has not a claim to exact of a dealer, a private speculator, that a good level shall be always, and not often, maintained in the work shown.

And first—as regards the drawings—it is greatly to be wished that a larger number of artists of high rank could be prevailed on to exhibit studies or actual work, such as those of *Atalanta's Race*, nanfully contributed by Mr. Poynter. In drawings in black and white, finish is not the important matter. The important matter is significance, and three strokes of the master in a good school are worth, both for pleasure and instruction, more than the most elaborate results of stipple and stump from the pupil in a bad school. It is the practice, we believe, of few first-rate men who draw in black and white to carry their work to the stage of laborious completion. Much work in black and white should frankly be accepted, as it has undoubtedly been executed, by way of skilled and significant preparation. With etchings, of course, the case is different. Etchings are done for their own sake, and must realise what amount of completion may be necessary to the just expression of the design of the artist. And that will be infinitely various, from the *Sir's Bridge* of Rembrandt to the *Abode* of Méryon.

Even in drawing, however, there are certain artists who find in black and white the most congenial medium for definite and final and even elaborate expression. Of these are Mr. Joseph Knight and M. Léon Lhermitte: the one, an artist of sentiment; the other, an artist chiefly occupied with pleasant contrasts and combinations of light and shade, with arrangements—in fine, with patterns in black and white. The pastoral sentiment of Mr. Knight—an affection not for the “elegant pastoral,” but the homely and simple in country life and landscape—finds excellent representation in his blackish-brown drawing, *O'er the Moor* (No. 56), a wide stretch of scantily-peopled country, with its few figures of shepherd and flock. M. Lhermitte has a most happy example of his adroit arrangement of light and shade in No. 51, *Mont St.-Père au Printemps*. These admirable drawings, albeit widely different in aim and execution, are alike in displaying a mannerism—a mannerism of course only to be perceived in presence of, or with remembrance of, many other works by the same hands. There is a drawing by Mr. Arthur Marsh which will rightly compel attention, so excellent is the accord between the sentiment of the figures and that of the landscape, and so vigorous is the expression of both. We are referring to the drawing of *The Beacon Light*: a dramatic and noteworthy scene—a picture of incident in which a capable artist has dealt with human character and feeling, not in trivial moods, but in moments of “passionate extreme.” Not strength of sentiment, but beauty of line, grouping, and feature are things hardly less successfully sought for in the work of an artist of whose previous performances we have no recollection—the *Waiting* of Mr. Lionel Smythe. The scene is the quay and the steps of the quay of a French fishing-port, and the incident is the return, or the expected return, of fishing-boats which bring back husband and lover and substantial gain. Where freedom and boldness can be looked for in the execution, as in the near masses of boat and water, freedom and boldness are found; but a finish almost too dainty has been bestowed on each attractive face under its kerchief or cap of white, and if the young women are really all so pretty in that port—of which the artist has concealed the name—it must be a pleasant place for the young men. But we should be disposed to doubt it. What, however, Mr. Smythe has presented with unflinching veracity are the attitudes of the waiting crowd. These are not the less picturesque because the forms are rough, and their roughness, as well as their more occasional gentleness, has been well presented. In its presentation, Jules Breton and

more recently his pupil, Billet, have taught a lesson which has hit hard the sentimentalities of emaculate gesture which were long prevalent in popular English art. An excellent little sea-piece (No. 111) is contributed by Mr. Frank Powell, an often justly-admired exhibitor in the gallery of the Old Water-Colour Society. Mr. T. Graham sends the drawing for the *Philosopher's Breakfast* (No. 466)—a stalwart and vigorous damsel with one leg lifted to the philosopher's doorstep, and the attenuated and weary philosopher at the opening door in act to receive his scanty portion. Truth of character and freedom of gesture are noticeable in this frank and masculine sketch. Mr. F. W. Lawson sends an agreeable and skilled blending of landscape and sentiment in the *Bargeman's Child* (No. 480), a large and noticeable drawing in which the child lies out amid such surroundings as recall the craft and daily ways of its father. Mr. Lawson's *First Parting*—a scene in a children's hospital—belongs to a more purely popular order of art, but its expression is strong enough to justify a subject that might easily fall into common sentimentality. Mr. H. S. Marks has a very humorous and finished drawing of birds in conclave. The expression, so intensely human—so much what we associate with the human expression of sagacity, caution, astuteness, and the like—cannot avoid caricature; but of its skill and liveliness there can be little question. Mr. Du Maurier sends several pen-and-ink sketches, one of which (No. 340) may fairly be singled out from the rest as an example of graceful design and arrangement. A charcoal study for a picture by Mr. W. G. Addison (No. 366) must be named as a faithful and wisely elaborate study of landscape, carefully carried out from the river reeds and water-lily leaves of the foreground to the weird alders of the middle distance and the faint foliage of trees on the hill-top. The subtlety of gradation in this landscape is especially to be noted. Among large drawings of the head, either portrait or idealised model, are to be named Mr. David Carr's *Morning* (No. 383)—a head of carefully treated distinction, though slight in workmanship—and Mr. Alfred Ward's red chalk portrait of Miss Carmichael (No. 316), which has much character and interest.

In etchings the exhibition is in many ways rich, but not rich in its display of the work of the most prominent artists. Mr. Edwin Edwards makes a large contribution with a whole series of landscape etchings and etchings of curious bits of old-world English towns, with whose quaintnesses he has keen sympathy. M. Chauvel's *Avant l'Orage aux Environs de Moret* is the most dramatic and passionate landscape here exhibited among the etchings. Mr. Hubert Herkomer's biggest contribution is not his best; but there can be no question but that his delicate little dry-point called *The Orphans* (No. 266) would suffice to place him at once in the rank of etchers from whom much is to be waited for. The dainty and delightful and pathetic design is executed with prompt understanding of the conditions of the art which Mr. Herkomer has but recently tried. Mr. Macbeth's *Morning Post* is a charming and piquant performance—a subject happily found and vividly rendered. Dr. Evershed sends interesting and adroit studies; Mr. C. J. Watson sends a very vivid little print of the neighbourhood of Charing Cross with view of the statue of Charles I. (No. 170); and two or three leading students at the Slade School make highly promising essays. But besides the work in etching that claims to be original, and to which the merit of originality is conceded, there remains some work which has just as great a claim to be deemed original, and some other which is frankly work of copying, translation, or reproduction. To speak of the last first, M. Rajon, who devotes himself almost wholly to reproduce with the etching-needle such pictures as had been used to be reproduced by the tool of the line-engraver, is not as well represented here as on one or two previous occasions. M. Lhuillier reproduces the melan-

choly and sentimental pictures of Mr. Frank Holl, which, though by no means without their own merits, do not allow to the etcher the same opportunity for brilliant expression of varieties of light and texture and keenness of expression as he has previously enjoyed. In setting himself to etch the lovely *Source* of Ingres—one of the few distinctive and genuine creations of modern art in the nude—M. Léon Richeton undertook a redoubtable task, in which another now even better known than himself—M. Félix Bracquemond—had on the whole failed. Absolute purity, precision and softness of line, are the first requisites for the translation into black and white of the subtle undulations of the admired masterpiece of Ingres; and Bracquemond and Richeton leave the *Source* of the great classicist an attractive figure from which they have removed the high distinction and the supreme grace. Only the line-engraving of Flameng has been able to grapple successfully with the difficulties of this nude.

It has been too much the tendency to class all etchings from the “still-life” of gem or silver, bowl of jade or cup of Sèvres or Vincennes porcelain, as work of pure reproduction, and not original. Their originality or the reverse depends entirely on the spirit and understanding with which they are done; and when they are done by such artists as Jacquemart they are profoundly original. Jacquemart has understood and has made us understand the quality and charm of precious objects. He has so far revealed them as to confer on us the pleasure of an awakened sense for these things. It is not the object itself in its bare outline, but the very subtlest suggestions of its beauty of tone and texture—almost of colour even—that Jules Jacquemart gives us. He composes these things, and so orders their lines and lights—so sees them and so etches them—as to be comparable not with any pure copyist but only with artists as original as the interpreters of natural landscape. M. Félix Buhot, who sends a contribution of similar subjects to the present Black and White—from which the great and permanently interesting art of Jacquemart is absent—can perhaps claim, like Greux and Courty, only a measure of such originality.

FREDERICK WEDMORE.

THE INTERNATIONAL EXHIBITION, PARIS, 1878.

(Third Notice.)

THE number of works exhibited by the French is enormous, and a more limited and careful selection would have produced a better effect. The many important pictures appear less important, and seem a mere handful by comparison with the vast quantity of ordinary and even inferior paintings by which they are overwhelmed. This is not only a disadvantage to the credit of the national school, it is a disadvantage to the credit of individual reputation. As the eye ranges over some fifteen or sixteen canvases hanging side by side, all by the same hand, one thinks of the terrible posthumous exhibitions which are so fatal to great reputations—exhibitions of the work of a lifetime, into which has been put all the energy of a brilliant talent, yet the result does not make a whole, does not constitute an *Œuvre*. Only call to mind how terribly disappointing in this respect was the gathering of that which had been left to us by Eugène Fromentin, and remember the skill, the thought, the varied acquisitions, the ability, the delicate taste which it represented, and yet how utterly incoherent was the mass. To have produced an *Œuvre* it is necessary to have formed a character. It is not sufficient to have worked a great deal: the labour must have been steadily directed into a main channel, it must have been consequent throughout a life, for it to have acquired that well-defined and consistent character which brings the whole into due relation.

Among those who stand this trial well must be reckoned M. Laurens. He exhibits thirteen works, all of which are remarkable for grave sense of drama, distinctness of conception, and great

sobriety and vigour of treatment. The dates of these different works show how steadily M. Laurens has advanced in his own path. Take in order *St. Ambroise instruisant Honorius* (1870); *Le Pape Formose et Etienne VII.* (1872); *L'Interdit* (1875); and *L'Etat-major autrichien devant le Corps de Marceau* (1877). It is impossible not to see in each the gathering strength and definiteness of a ruling purpose. The situations which most deeply interest M. Laurens are invariably tragic, and, at first, in their presentation he confined himself strictly to their dramatic aspect. His admirably forcible rendering of the scene in which Stephen VII. anathematizes the dead body of his predecessor is a work of this class. With unquenched hate, Stephen on his election caused the remains of Pope Formosus to be dragged from the tomb, and enthroned in papal state, wearing the pontifical robes and ring; at his side he placed an advocate, hired to reply in the name of the dead to the furious questions of the living. M. Laurens has put this ghastly duel before us with sombre energy. The mad fury of Stephen, who, before many months were out, expiated his savage violence by a terrible death at the hands of the man whom he had outraged, is rendered with a power of seizing the larger features of fanatical frenzy which removes the episode from the field of that which is only hateful and ridiculous, and gives to it a terrible and sinister character. All the surroundings, the types of the assistant ecclesiastics, the very concentration of the light, seem to give greater force and depth to the gloom of the black-robed advocate standing motionless beside the motionless dead, who sits wrapped in the horror and silence of the tomb face to face with the fruitless passions of life. The *Interdit* (1875) is perhaps, as regards sense of drama, a work even more perfect and complete in itself. The walled court outside the gates of a great cathedral is here lying in deep shadow, peopled only by dim shapes of the dead—shrouded corpses who await the rites of burial. The gates of the cathedral are not only closed but the very opening of the porch is filled with thorns and briars. No living thing comes to relieve us by its presence from the weird terror of the unseen. The last picture exhibited by M. Laurens, *L'Etat-major autrichien devant le Corps de Marceau*, showed not only all the qualities which distinguished his previous works, not only the instinct with which he selects the very pith of a dramatic situation, but a capacity for the analysis of varying shades of emotion which was, indeed, suspected to be his by those who studied the remarkable series of illustrations for the *Imitation* which he exhibited in 1876. This picture, which hangs in the centre of the group of works exhibited by M. Laurens, is the last in order, and the most important (ACADEMY, vol. xi., p. 445). Not only is the situation selected with a deep sense of that which is essentially necessary to the command of lasting interest, and conceived with great dignity and pathos, but it is rendered with a master's hand. The way in which the various attitudes are discriminated as implying various shades of feeling shows great power of keen observation; the grouping is skilful, and the colour, method and touch are in harmonious keeping with the character of the ideas which they express. This last is a rare merit, and it is the sign of a master.

Among the elder men Meissonier is in this respect specially distinguished; his execution is, in most of his work, of a quality perfectly analogous to the order of his conceptions. Two especially among the sixteen pictures which he exhibits, *Petit Poste de Grandgarde* and *Les deux Amis*, are marvels of exquisite fitness of workmanship. The two friends, well-mounted officers, meet and part on the eve of battle, in gay sunlight under a blue sky, covered with floating white clouds; the mounted out-post keeps its watch in chill autumn weather under leafless trees, through whose bare branches the barren landscape is seen brown against the grey sky. These two small episodes

of martial life are treated by M. Meissonier with a sobriety and simplicity which is full of grandeur. In the *Petit Poste de Grandgarde* nothing interferes with the impression of silent expectation, with the watch which waits on the movements of the one who is seen riding away to reconnoitre from a neighbouring hill; nothing breaks the stillness of the plain except, perhaps, the way in which the immediate foreground is broken up and disturbed by tangles of long grass trampled beneath the horses' hoofs. If we wish to see the full wonder and beauty of this work we have but to compare M. Meissonier with himself. We must go and look, for example, at his large *Portrait du Sergent*, which attracted so much attention when sold last autumn at the Hôtel Drouot, and before which there is now always more or less of a crowd. The element of comedy is, I think, at the bottom of the disproportionate interest which this work seems to excite. For the heads of the personages who figure in the *Portrait du Sergent*, the artist, the model, and the amused lookers-on, are mere faithful studies, are wooden images if compared with those of the horsemen in the *Petit Poste*. There we have the inexhaustible interest of life itself, with all its variety of expression and play of feature rendered by a touch which is a marvel of felicity, and which gives to the surface a beauty and richness of quality which makes us feel that to every one of these men movement is a possibility, that, in fact, they do move and breathe in the thin veil of air which lies between us and them.

Something of this same exquisite quality is to be observed in the *Meta Sudans* of M. Emile Lévy. M. Lévy is not so powerful a master as M. Meissonier, but he has his own vein of talent and his own forms of expression. The subdued and delicate style of his work is little calculated to arrest attention, but the elegance of his drawing, the meaning and *fineness* which he puts into every look and gesture, cannot be appreciated without careful study; his choice of forms and types is refined, and yet thoroughly personal, and the physiognomy of his actors, although marked by peculiar character, is never exaggerated. Add to this that his compositions are invariably studied with great care, and that his colour, if not striking, fresh, or original, is often in exquisite harmony with the nature of his subject, and it will be seen that M. Lévy's work affords more than average sources of interest. The popular hero, the famous athlete who quits his bath, supported by two admiring friends, and an object of interest to every class and every age, is really original in character. The gay draperies of his attendants, which at present attract the eye rather too much, M. Lévy, I believe, intends to rehandle when his picture returns to him; but nothing could be more spirited and complete in its way than the group of two lean little boys, who, fired with emulation, wrestle passionately just in the steps of the great man. It has been the fashion with some people of late to say that M. Lévy is not *en progrès*, but we have only to examine *L'Amour et la Folie*, one of M. Lévy's most charming and successful works, and to compare it with *Meta Sudans* in order to see that the very reverse is the case. Now, of M. Leroux this statement might unfortunately be made with justice, if, indeed, it is true that his *Vestal Truccia* is an early work, for it has a freshness of tone and sincerity of character which, to speak moderately, does not characterise the majority of the series which he exhibits. The vestal, standing at the edge of a landing-place on the shores of the Tiber, raises water from the river in a sieve which she uplifts, saying: "Puissante Divinité, si j'ai toujours approché tes autels avec des mains pures, accorde-moi de remplir ce crible de l'eau du Tibre et de le porter jusque dans ton temple." Her gesture is not wanting in elegance, her dark purple drapery is in harmonious contrast with the clear greys of the waters and the sky, and the lively interest with which her proceedings are watched by some

idle bystanders well explains the situation. Altogether *La Vestale Truccia* is a far more agreeable and real work than *Un Miracle chez la Bonne Déesse* exhibited, I think, in the Salon of 1876; and *Un Miracle chez la Bonne Déesse* is infinitely superior to M. Leroux's *Danaïdes*, which appeared at the Salon of 1877. When one looks at this long double file of uncomfortable phantoms slowly arriving from the distance, and peeping over into the uncompromising well in the foreground, it seems scarcely possible to believe that a French artist can be the author of so stupid a composition. As a rule, if the motive selected is not very entertaining, the excellence of the treatment suffices to give it interest.

It is, indeed, curious to see how rarely anything like story or point is felt to be necessary by the French, even in pictures of manners, or scenes from modern and popular life, where English practice makes it almost indispensable. In dealing with rustic subjects now and then a master like Millet seizes on a profoundly suggestive theme, such as he treated in his *Angelus*; but for the most part the mere movement of daily life, the round of seasonable toil, furnishes sufficient incident. The interest for the public of M. Jules Breton's noble figure *La Glaneuse* is derived solely from the character of the type selected, animated as it were with the very life of the nature in which she moves, a daughter of the earth and air. It is sufficient that he should set her before us in the grandeur of her strength, lending all the grace and power of a master's knowledge to the expression of her free movement and to the play of forms finished by the very sun and wind of heaven. Millet, I believe, used to say of Breton that he painted always the village girls who would not remain in their village, the women who would forsake their fields for Paris; and the two girls of *La Fontaine* are, indeed, of this type. The desire of the unknown looks from their eyes, and perhaps some of the great interest which the public take in this fine work is aroused by the expression of the faces which speaks these women of kin to the dwellers in cities. But M. Breton does not always suffer this too-human craving to intrude and disturb the peace of his children of the soil. *La Glaneuse*, and, again, the family group of *La Sieste*, are harmoniously at one with the life in which they are set. *La Sieste* is, I think, exhibited publicly for the first time. The grouping of the figures is a daring experiment. Under the thick shade of wide-spreading branches they all lie round on the grass in a circle, so that their heads are brought together in the centre of the picture, and the fore-shortening of the girl who stretches herself out straight away from us in front is a little too obvious an example of skill, and therefore, one is inclined to think, not perfectly successful. *Les Pêcheurs de la Méditerranée*, a sunlit bit of southern coast animated by a lively group of fisher men and women busily dragging in a great seine net, is an example of a quite novel phase of M. Breton's talent. The group is full of character, and the sea brilliantly fresh, but as a whole the tone of the picture seems rather crude, and impresses an eye accustomed to the Mediterranean coast rather strangely, for we rarely have a sky so grey, and a sea so brightly, beautifully blue. The days of clear grey sky generally show water much deeper in tint than M. Breton's waves, and the mere fact of the effect which he has chosen being a little unusual causes it to seem a little false in spite of a master's masterly rendering, in virtue of which the picture keeps its place as a part of M. Breton's work, and worthy of his name.

The contributions of M. Delaunay are all stamped by the peculiarity of a strong individuality. M. Breton by his very choice of subject, his method of treatment, and his manner of expression, appeals directly to the modern public: but M. Delaunay with his *Diane*, with *La Mort de Nessus*, with his strange *David triomphant*, and the terrors of *La Peste à Rome*, has little chance

of arousing popular sympathies. This selection from his works must though, with one exception (a very unsuccessful portrait of Mme. T.), increase his reputation and deepen the sense of the unity of his talent. *La Peste à Rome* is really impressive. The grey gloom deepens over the palaces of the great city; the huddled shapes of poverty-stricken misery shrink to right and left wrapped in dark garments of woe, and gaze out upon us in unspoken anguish and despair as suddenly in the midst God's angel appears, white-winged and crimson-robed, and bids a ghastly shape, the Devil's messenger, to strike upon the doors of the doomed blow upon blow, and for as many blows shall be as many deaths. Delaunay has a forcible quality of tone and colour, which heightens the grave and energetic character of his work, a peculiar quality which none of his own contemporaries—with the exception of Luminais, who commands a far more varied scale—possess. *En Vue de Rome*, by Luminais, has something of this grave aspect, and is a virile and vigorous work, which strikes the eye at once with a sense of meaning, of strength, and dignity. The groups of Goth chieftains profiled against the sky, riding away from us over the edge of the hill, strong in calm and proud anticipation of sure possession as they catch sight of the fair Eternal City and know that her beauty and her glory is theirs—this group impresses the memory with the suggestiveness of truly historic character.

Among those whose work looks thoroughly individual must likewise be counted M. Henner. He also must be reckoned as a colourist, although he would seem to possess one, and one only, charming harmony. *Le Soir* and *Les Naiades* are fine examples of beautiful tone. In each we get flesh-tints of exquisite value showing against the deep grass by waters which mirror in the deepening shades the blue of the sky above them; in the treatment of the figures in both cases there seems to be an equal indifference to give anything more than mere value of tone, which is the more curious if compared with the thorough and complete rendering which distinguishes M. Henner's very remarkable portraits. Both *Les Naiades*, which is very happily arranged, and *Le Soir* have, however, a poetic charm of the preciousness of which one becomes the more sensible after looking at work such as M. Bertrand's *Jeune Fille*, a beautiful study of girlish form, a thoroughly accomplished rendering of a graceful movement, excellent in every respect, but lacking something of imaginative charm.

But of colourists one may not speak and omit Regnault's last work, a sketch in oils, *La Sortie du Pacha à Tanger*. The gay crowd waiting in the walled court for the outcoming of their ruler form a bouquet of the loveliest flower-like hues bright in sunlight against the white shining palace; and above the edge of the walls there is a poem in a touch which gives us a little fort, pure white against the blue sky and the tall dark cypresses rising at its side. A sketch, but of what value, of what power!

For the last I keep the name of Gustave Moreau, because he stands wholly outside the ordinary preoccupations of the school and of the day; yet none the less for that he is an artist of the rarest type. It is unlucky, I think, that he has exhibited his *Moïse exposé sur le Nil*, a large canvas, in the foreground of which floats and sleeps the unfortunate infant regarded rather askance by a Sphinx lurking in the shadows; yet even here there is something which only Moreau could give. The look of this Sphinx is very different from the look of the Sphinx in M. Ingres' masterly *Oedipus*. The Sphinx of M. Ingres lifts her paw, and says familiarly, "Well, shall I give him a pat or no?" but the intentions of M. Moreau's Sphinx are inscrutable; her eyes are full of mystery. M. Moreau, one is told, lives and works alone, he admits no one to his studio; and there is certainly a danger, even to the strongest natures, if this sort of isolation is carried on too long. The man who works for himself alone

runs the risk in the end of having worked for no one else. There are, however, among his contributions several which one would think might be approached by the public without too great effort. *Le Sphinx divin* does not, for instance, present the same difficulties as *L'Apparition*, the water-colour, the hanging of which at the Grosvenor last year showed such culpable ignorance of the character of the work. *Le Sphinx divin* is also a fine example of perfect workmanship, of painting exquisite alike in its delicacy and its force; it shows the learning and the science of the skilled master, as well as the vision of the seer. Who is there beside Gustave Moreau who could have seen and made noble in our eyes the mortal anguish of the unriddled Sphinx, the horror of her eternal plunge into the yawning abyss; bleeding she falls in cruel descent, her beautiful throat upturned, the outspread purple of her wings shimmering in the grey mists which float around crags peopled with the corpses of the dead? And he, the victor, resting upon his spear, fair-shining in the light of the morning! But M. Moreau's water-colours must not be forgotten: *Une Péri*, a lovely page—meant, I believe, to be executed in enamel—a page of delicate harmonies worthy of a Persian painter; *Un Massier* riding, wrapt in his crimson cloak, on a white horse, and bringing before us by his steadfast pose and look all the ruling force of the princes of Middle-Age Italy; and then the marvellous decorative sketch called *Phaeton*. As a mere blot of colour, this drawing is a pure feast for the eye, and not so only, for here also are masterly passages of rendering. Nothing could be firmer than the handling of the figure of the hapless driver as, aghast with fright, he throws back his arms and the folds of his drapery fly from him and reveal the chiselled beauty of his form.

E. F. S. PATTISON.

PAINTINGS ON CHINA.

THAT Messrs. Howell and James are doing a good work in their efforts to encourage the art of painting on china is a matter beyond dispute, and that these efforts are most happily succeeding their third annual exhibition now on view at their galleries in Regent Street, Pall Mall, conclusively proves. The employment of women in this branch of art not only opens up to a number of them a pleasant and profitable career, but it is a benefit to the whole sex by revealing its capacity to produce original and beautiful work of a class which was formerly thought to be outside, not only their province, but their power. It is also of much benefit to the cause of art itself in encouraging original design, and in extending the sphere of ornamental painting in a new direction with unexpected and delightful results.

Mrs. Sparkes' *Do you like Butter?* is the most forcible of the works of its kind in the present exhibition, though it arrived too late for competition. The figures, one of which is holding up a buttercup to the chin of the other, are set in a pretty landscape, and drawn with great truth and character. Very close to it in technical merit, and having a peculiar charm of its own, is Miss Linnie Watts's *The Way to the Woods*, the principal fault in which is undue redness in the faces. To this the first prize for landscape (professional) has been awarded. The defect in flesh-tint is not apparent in a larger—many will think, a finer—example of the same artist called *On the Downs*, which has unfortunately been cracked in the baking. But for landscape without figures there is nothing which is superior to Miss E. Lewis' view *Near Inveroran* (691).

The gold medal for the best work by a lady amateur, presented by the Crown Princess of Prussia, has been awarded to the Countess of Warwick, for a profile portrait of her daughter, Lady Eva Greville, with a background of sky-blue and apple-blossom. The drawing and colour are alike good, and the general effect delightful. Still

finer of their kind are the three tiles by Miss Ada Hanbury, *Fruit and Blossom of the Horse-Chestnut*, and *Lebanon Cedar Cones*. For fineness of drawing and power of colour, these compositions, simple as they are, would be remarkable in any collection of any kind of pictorial art.

Out of an exhibition of 941 specimens it is impossible to select for notice all that are worthy of it, but the labour of the critic is luckily rendered very light by the previous labours of the judges, who have affixed initials of comparative commendation to a large number of the pieces. The visitor will, therefore, be provided with a "marked" catalogue, and the critic has more space for general remarks.

The greater portion of the plates, or dishes, or plaques, or whatever may be the proper title for these china canvases, are painted with flowers in every gradation of style, from the most conventional and decorative to the most natural and pictorial, and it is difficult to know what kind of treatment is most appropriate for plates which are to be suspended from the wall, and dishes the beauty of which would be entirely destroyed by putting anything into them. Many of the examples here are nothing more or less than pictures on plates, and others, discarding the pretence of decorative intention, are flat and rectangular, not plates, or dishes, or even tiles; while their subjects and the treatment of them would be quite as suitable for ordinary sketches in water-colours or paintings in oil. Good as examples of this class are the landscapes and sea-views of Captain Talbot Coke, highly-finished drawings in sepia on china, the *Five Fancies* of Miss Fletcher (475), and the landscape of C. Challis (269), which aims at the same effect as an etching.

Some may be inclined to quarrel with this movement as the invasion of one branch of art into the provinces of others, but few who see the wonderful copy of Turner's *Caligula's Palace and Bridge*, by Miss Jay (680), and the charming landscapes by M. Marx (674 and 683), and others, will fail to admit that the experiments are justified by their success, or to see that the special ceramic qualities of lucidity of ground and limpidity of glaze may enable artists to realise certain qualities of light and air to which the opacity of paper or the best-grounded canvas and the inferior transparency of varnish oppose obstacles. On the other hand, the defects generally visible in paintings on china, the indulgence in brilliancy of colour, transparency of effect and spurious finish, at the expense of natural truth, are seldom apparent in this collection, while the difficulty of obtaining due variety of colour and gradation of tint seems to be in a fair way of being completely overcome. If the permanence of the ceramic process, and the comparatively small outlay at which the best works may be secured, be considered, it is not difficult to account for the great and increasing popularity of this branch of art.

But in what will be generally thought the more legitimate office of painting on china—viz., decoration subordinate to the shape and use of china "articles"—this exhibition shows how much advance has been made of late years. The artists employed by Messrs. Doulton are well known, and they are well represented here, especially Miss Hannah Barlow, who has never done a small thing better than her *Study of Mice* (882). The large plate decorated by her, though remarkable as all her work for vigour of drawing and careful selection of line, seems to prove that her peculiar method is not so well suited for a plane as a rounded surface. The same may be said of the "last new thing" in china, the painting *pâte sur pâte*, of which there are specimens by a French artist, E. J. Landry. It is the "missing-link" between painting and modelling, and for breadth and solidity of effect is unrivalled. It must be considered as yet in its infancy, but great results have already been obtained, and it has evidently before it a long and distinguished future.

The amateur work, though not generally so

complete in its technical proficiency as the professional, yet holds its own well, especially when it is considered that it starts with the great disadvantage of being painted over instead of under the glaze. Some of the amateur-work is of its kind unrivalled, and this in qualities where it might have been expected to be least successful. In, for instance, the special ceramic quality of pure and lustrous ground-colour there is nothing in the professional work to excel the turquoise blue behind Miss L. H. Busby's *Daisies* (283) or the green which sets off Miss A. Gresley's *Marguerites* (95), while these specimens are equally remarkable for the drawing of flowers treated decoratively without conventionality. Miss M. Dummere deserves scarcely less praise for her *British Ferns* (427).

A final word of praise must be given to the paintings of Mr. Leonce, which, whether they have for subject the beauty of flowers or the humours of ducklings and chickens, are equally admirable, and prove him to be an artist of exceptional power whom only accident or preference has led to devote his talents to painting on china.
COSMO MONKHOUSE.

THE GLASGOW FINE-ART LOAN EXHIBITION.

THERE is at present being exhibited in the Corporation Galleries in Glasgow such a collection of modern pictures—lent by gentlemen resident in and connected with that city—as clearly proves that the liberal arts are no longer regarded with apathy there. Two hundred and sixty-six oil pictures, and one hundred and eighty-eight water-colour drawings are displayed. No one entering the rooms can fail to be impressed with a sense of the equality of excellence which characterises the exhibition. Fortunately, in the hanging, no rigid "line" has been adhered to, and the pictures are in no case hung at that inconvenient height which entails a craning of the spectator's neck, and a subsequent "gallery headache." All the pictures may be inspected with the greatest comfort, and all, with a few trifling exceptions, are worthy of careful and repeated inspection. The general excellence of the exhibition has, no doubt, resulted from the manner in which the collecting of the pictures was gone about. The committee charged with the task of borrowing pictures did not leave it with the owners to select, but they desired to be allowed to make a selection for themselves. The owners most handsomely acceded to the request, and deputations from the committee inspected each separate private gallery, and were permitted to exercise their own option. A most judicious choice has thus been made. So varied are the examples exhibited of the different styles of modern art that, however strongly biassed towards this or that any visitor may be, he cannot fail to find himself every here and there opposite choice specimens of his favourite artists. One of the features of the exhibition is an entire wall covered with pictures lent by Mr. John Graham, of Skelmorlie Castle. In the centre is a charming Gainsborough, *The Two Sisters*, flanked on one side by Turner's *Wreck Buoy*, and on the other by his *Antwerp Cathedral and Harbour*. On the same wall are an important work by Baron Leys, *Christmas Day at Antwerp during the Spanish Occupation*, Rosa Bonheur's *Highland Raid*, Holman Hunt's *Christ in the Temple*, a beautiful example of Ed. Frère, entitled *The Snail*, a capital picture by P. J. Clays, representing *A Storm*, Gérôme's *Nile Boat*, John Linnell, sen., *Landing of Ulysses*, two important examples of Ary Scheffer, and pictures by Müller, Stanfield, Cooke, Etty, Cox, Creswick, Landseer, Fred. Goodall, and Pat. Nasmyth. Works by British artists at present in their prime form connecting links in time with works painted by MacIise, F. R. Pickersgill, Horatio McCulloch, Phillip, Roberts, and Stanfield, when they were in the zenith of their power. Foreign art is well represented throughout the rooms, and pictures

by artists of the Edinburgh School are numerous. Among the water-colours are many important drawings by Cox, Prout, Turner, De Wint, Alma-Tadema, &c., all of which are high-class specimens of the styles of the various artists.

Any special criticism of particular pictures is here purposely avoided. The primary object for which the exhibition has its existence is to raise money for the Glasgow Royal Infirmary, which, through circumstances operating during dull times in great commercial centres, has found itself in want of funds. Where owners generously exhibit their pictures for charitable purposes they are probably entitled to expect that no comparisons shall be made, or remarks be published, calculated to lower the worth of a picture either in the eyes of the owner or of others. It is sufficient to say generally that the exhibition consists of the finest assemblage of pictures ever brought together in Scotland. Its educational value at the present time in Glasgow cannot be over-rated. An impetus given to picture-buying acts very much as does an impetus given to the market for any ordinary commodity, with this difference, that in picture-buying, the momentum is greatly intensified by the element of fashion. When it becomes fashionable to buy pictures, discrimination in the purchase gets overlooked. Thus on the walls of many Glasgow houses third-rate and very inferior "works of art" are often to be found crowded in lavish profusion. If the Loan Exhibition opens the eyes of some rich and injudicious Glasgow picture-buyers, and arouses them to the consciousness that there are such qualities as good and bad in art, and that they have been busily indulging in the acquisition of examples of the latter kind, immense good will have been done.

JAMES MUIR.

NOTES ON ART AND ARCHAEOLOGY.

THIS week an unusual number of visitors have been attracted to Messrs. Broadwood's, the well-known pianoforte-makers in Great Pulteney Street, to see the magnificent instrument and seat just completed by them for M. Alma-Tadema. Their general design is Byzantine in character, massive but finely proportioned, and relieved by a great variety of elaborate but still "severe" ornament. The whole—for the two form part of one design—may be described, so far as colour is concerned, as a "harmony" in ivory and oak, but the decorations include bold mosaics in tortoiseshell, mother-of-pearl, ebony, rosewood, mahogany and white woods, besides gilding and some fine brass-work. The instrument, to speak technically, is a "concert short iron grand," and the curved side of the case is divided into three panels, bearing figures of larks, owls, and cuckoos, with their special notes represented in the old style of musical writing. The animals and their songs are incised in the wood and gilt. On either side of the key-board is a scroll ornamented with acanthus leaves finely carved out of a solid piece of the finest ivory. The tusk which could yield such large blocks must have been of very unusual size. The designs for these remarkable works were made by Mr. Fox and embody the ideas of M. Alma-Tadema, but the merit of the execution belongs solely to Messrs. Broadwood and their staff of artificers.

THE paper on Mural Decoration read by Mr. Armitage at the recent meeting of the Conference of Architects has given rise to considerable discussion. The practicability of fresco-painting being employed successfully under the conditions of our English climate is a subject on which artists greatly disagree. Mr. Cave Thomas, writing upon it in the *Builder* of last week, takes exception to the term "decorative" as applied to express "a kind of art which, from its slighter and less perfect description, could be executed at a cheaper rate than the best." He points out, rightly enough, that the sculptures of the Parthenon and the frescoes of the Sistine were strictly decorative

works, though of a completeness requiring the utmost skill to effect; and that the tendency of modern decorative art "to reduce mural painting to a kind of stencilling which may be supplied wholesale and retail by the art manufactories" is a dangerous fallacy. Mr. Cave Thomas is, as is well known, one of the chief advocates for fresco in England, and in this letter he again seeks to set forth its advantages. "When we talk," he says, "about the humidity of the climate affecting fresco under fair conditions, it is mere nonsense, for the basis of fresco is good mortar, and we know that good mortar has remained perfectly sound from the time of the Roman occupation until now."

AMONG the many efforts that are being made at the present day to promote a taste for art and to make it a means of culture even in the poorest homes, may be mentioned a series of so-called "Cottage Wall Pictures," now being published by Messrs. Sampson Low and Co. These cottage pictures consist of good-sized photographs from some of the most admired paintings by our English artists. They are printed by the permanent Woodbury process, varnished so that they can easily be kept clean, mounted on thick cardboard, and set in a decorative border of Renaissance design by way of frame. Thirty-seven photographs from Sir Edwin Landseer's works have been thus prepared, as well as eleven from Turner, six from J. D. Harding, and either one or more examples from Hogarth, Reynolds, Gainsborough, Morland, Constable, Wilkie, Lawrence, Martin, Mulready, Collins, Stanfield, Leslie, MacIise, Newton, Etty, and other of our artists. The cost of these pictures (eighteenpence each), is perhaps too great for them to find their way, except as gifts, into the homes of the very poor; but they will be appreciated, we imagine, by many who, while liking to have pleasant pictures on their walls, yet cannot afford the expense of frames.

THE works of the celebrated French marine painter Gudin are being exhibited for a short time at the Cercle of the Place Vendôme. Many of these have never been seen at the Salon.

THE Exhibition Diploma, designed by Baudry, the painter of the French Opera House, is now on view in the vestibule of the Exhibition. It is intended to be given to all exhibitors who obtain prizes.

MR. W. F. YEAMES, painter, was elected R.A., and Messrs. Frank Holl and E. Crofts, painters, A.R.A.'s, at a general assembly of the Royal Academy on the 19th inst.

THE *prix de Rome* for architecture has been awarded to M. Redon, pupil of M. L. André, and to M. Lecomte, pupil of M. Vandremere. Second prizes have been given to M. Rutz and M. Jourdain.

THE Exhibition of the *Envois de Rome* is now open in the Ecole des Beaux-Arts. The works of the pupils are not exhibited as usual in the grand court of the building, but in the corridor, the new director of the school, M. Paul Dubois, having represented to the Minister of Instruction that there was danger of the works being injured by exposure in their former position.

A SERIES of articles by the eminent French architect M. Viollet-le-Duc, on "The Buildings of the Universal Exhibition," is now appearing in *L'Art*. They began with "Un aperçu général" in the number for May 5, illustrated by a large etching of the Palais du Trocadéro, followed in the next number by a view of the avenue of the foreign sections. The articles are, perhaps, a little technical, being more especially addressed to architects, but the general reader will find them perfectly intelligible, and they certainly present to those who are not able to visit the Exhibition a clearer idea of that vast construction than can be gained from the ordinary descriptions and illustrations with which most journals are at present flooded.

BESIDES the articles on the Universal Exhibition, *L'Art*, in its last numbers, gives also an admirable view of the Salon by reproducing some of the artists' own sketches for their pictures. Many of these are of large size, and very skilfully and carefully executed, the spirit of the work being in most cases well preserved. The criticism is written by M. Eugène Véron, the editor of *L'Art*, who, against the practice of English critics, sets landscape first in his review, as in truth he may well do, for in French art, as in English, landscape painters at the present day seem to be in the ascendant. The "sentiment of nature" is strongly felt by modern artists, though, instead of trying to idealise her beauty, as many of their predecessors did, they content themselves for the most part with simply reproducing her effects. This is seen in most of the landscapes, both of the Salon and of our English exhibitions, which generally attempt no more than to convey a faithful picture of the scene depicted. In some few, however, there is added to this faithfulness of portraiture the charm of poetic interpretation, and it is probably this charm, more apparent in the Salon, perhaps, than in the Royal Academy, which causes M. Véron to place landscape first in his critique.

THE jury of this year's Salon have awarded the chief prizes as follows:—The *privé du Salon* to M. Hector Lemaire, for his *Samson trahi par Dalila*; and the *médailles d'honneur* to M. Barrias, for *Les premières Funérailles*, and M. Delaplanche, for *La Vierge au Lys*. It is noteworthy that the three chief prize-winners are sculptors.

MUSIC.

DEGREES IN MUSIC AT THE UNIVERSITY OF LONDON.

THE announcement that the Senate of London University has at length decided to grant degrees in music is one that will doubtless be received with universal satisfaction. A copy of the recently published regulations with regard to these degrees lies before me; and it is a document of such importance and interest that no apology will be needful for making a few remarks upon it.

Two degrees, those of Bachelor and Doctor of Music, will be conferred by the university, to obtain either of which two examinations must be passed. As it has been rightly felt that something more than merely musical knowledge should be required from those who would take a university degree, the passing of the Matriculation Examination at London, or the taking of a degree in arts either in the University of Sydney or in that of Melbourne, is made a necessary preliminary to admission for any musical degree. The importance of this regulation, as tending to raise the educational standard of members of the musical profession, can hardly be overestimated, and it will surely meet with general approval.

The two examinations for the B. Mus. degree are to be taken at intervals of not less than a year apart. Of these the first is mostly scientific, the second more practical. The former has for its chief subjects the laws of Vibrations, Harmonics, Compound Sounds, the theory of Musical Intervals, Scales, Temperament, Consonance and Dissonance, the principles of the Construction of Chords, and the History of Music, so far as it relates to the growth of Musical Forms and Rules. Before presenting himself for the second examination, the candidate must send in an exercise for five voice-parts, with accompaniments for a quintet string band. If this be approved he will be examined in Harmony, Counterpoint in not more than five parts, Canon, Fugue, Form, Instrumentation, and arranging for the piano from a full score.

For the degree of Doctor of Music the candidate must have previously taken the Bachelor's degree; and the two examinations for the higher honour may then be taken either in the same or in different years, as may be preferred. The first of the two

examinations is, like that for the B. Mus., almost entirely scientific and historical; it is similar in its scope, but much more comprehensive, covering, it is scarcely too much to say, the whole range of musical science. The exercise required to be sent in before the second examination is passed must be for eight-voice parts, with solos, and with accompaniments for a full orchestra. The subjects for examination are Advanced Harmony, Eight-part Counterpoint, Canon and Fugue, Musical Form, Vocal Writing, Instrumentation for full orchestra, Musical History, and a detailed acquaintance with the chief classical masterpieces.

Such is a brief outline of the proposed scheme for the degrees—a scheme in many respects admirable if judiciously carried out; but which yet appears open to some objection. I should be the last to undervalue a scientific knowledge of music; but the great test of musicianship is after all practical, and in this scheme as it stands there seems to be an altogether undue amount of importance given to the merely philosophical part of the art. A mathematician who barely knew his musical notes, and who had no idea whatever of composing, would probably pass the first B. Mus. examination with ease; while it is almost a certainty that Haydn, Mozart, or Beethoven would have utterly failed to satisfy the examiners. It would be invidious to mention names of living men; but it is a fair question to ask how many of the most distinguished musicians of the present generation, either on the Continent or in this country, could show a competent knowledge of all the subjects mentioned in the regulations. I admit at once the importance of including the scientific portions of the subject in the examination; but I doubt the wisdom of so exclusive an attention to the merely theoretical, leaving the practical, in the first examinations both for Bachelor and Doctor, almost entirely out of sight. After all, music is eminently a practical matter; and the most intimate knowledge of Compound Vibrations, Partial Tones, Over-tones, Harmonics, &c., &c., will not make a man one whit a better composer, performer, or teacher. But besides this, these requirements seem to be putting a real hindrance in the way of the taking a degree by precisely the class of musicians who would not only derive the most benefit from it, but do the most credit to the university. I allude to the many promising and talented students at our musical institutions, such as the Royal Academy and the National Training School of Music. I speak from personal knowledge of both these institutions when I say that there are students in each who could easily qualify themselves for the more practical examination—the second B. Mus.—but who could not, without the expenditure of a much larger portion of their time than would be at all advisable, master the scientific branches of the subject to the extent required. I cannot but think it worthy of the most serious consideration on the part of the Senate, whether it would not be well to modify the examination for Bachelor of Music by giving it a far more practical character; and, while not altogether giving up the scientific part of their programme, making this at least of secondary importance, and reserving it chiefly for the higher degree.

There is one more suggestion that is worth making with regard to the preliminary Matriculation Examination. That everyone taking a degree should be an educated man is a point as to which there can be no dispute whatever; but the present matriculation examination at London includes among other things three foreign languages. It should not be forgotten that many of the most talented musicians are men who have not been so far favoured by circumstances as to have had the benefit of a public school or college education; and that the time involved in the acquirement of three languages is more than it would be possible for them to spare while engaged in training for the musical profession, and still less when they

have entered upon its arduous duties, and are probably engaged several hours every day in teaching. Would it not be advisable, at least for the first few years, while still retaining so much of the examination as to make it a fair test of a good general education, to modify it in the case of musical candidates by reducing for them the number of languages required? It would be well to insist upon French and German, for both will be found extremely useful to the musician; but it is worth considering whether Latin and Greek, which will be of very little practical service, might not be dispensed with.

Against the subjects of examination for the Doctor's degree there is not a word to be said. To obtain the highest musical honour conferred by the university the candidate ought to submit himself to the severest tests that can be applied. Here the scientific examination spoken of above is in its proper place. There is only one point in the regulations to which exception can be taken. It is that by which a successful candidate shall be required to conduct at his own expense a public performance of his exercise in a manner satisfactory to the examiners. As the exercise is to be written for eight-part chorus and full orchestra, the lowest possible estimate of the expense would be from eighty to a hundred pounds, while, unless circumstances were exceptionally favourable, it would probably be considerably more. How many professional men are in a position to afford such a sum, or even if they have the money to spare, would be justified in spending it in such a way? In the large majority of cases the effect of this regulation will be to put an absolutely prohibitory tariff upon the degree. A Doctor of Laws, of Science, or of Medicine, is not saddled with such an expense; why should a Doctor of Music be made an exception, especially as musicians, in general are by no means among the most wealthy members of the community?

I earnestly hope that it will not be supposed that in the above remarks I am actuated by any unfriendly spirit. On the contrary, being myself a graduate of London University, I naturally feel a warm interest in my Alma Mater; and it is just because I should rejoice to see the members of my own profession taking advantage of the opportunity offered them to graduate that I have ventured to indicate what seem to be the weak points of the scheme. What is chiefly wanted is a proof of practical ability, such as in the case of the Bachelor's degree is furnished by the second examination; and just in proportion as the tests are made practical, they will, I am convinced, meet with the approbation of the musical profession.

EBENEZER PROUT.

It is not surprising that the managers of our Italian Opera houses should endeavour to secure the services of an acceptable dramatic soprano, even at the cost of many failures in the attempt. After repeated disappointments, a measure of success has been attained at both establishments. The American vocalist, Mdle. Pappenheim, who appeared as Valentine in *Les Huguenots* at Her Majesty's Theatre on Saturday last, has a fine voice, and is evidently a painstaking, conscientious artist. Her acting and by-play were throughout commendable, and apparently the outcome of careful study. It cannot be said that she evinced much skill as a singer, but Meyerbeer's heroine demands histrionic rather than vocal qualifications, and nervousness may have exercised a sinister effect on her powers in the latter direction. The general performance of the opera called for serious animadversions. Herr Behrens, as Marcel, was very unsatisfactory, the chorus sang carelessly, and the lack of refinement in the orchestra at this theatre was even more apparent than usual.

On Monday Mdme. Gerster added the character of Violetta to the list of her successful impersonations. There are not wanting indications

that the popularity of Verdi's offensive opera is on the wane. The fact that *prima donna* deem it necessary to impart a false and unnatural refinement to their conception of Dumas' frail heroine is sufficient evidence of the increased fastidiousness of the public. While it is impossible to grant that such a view of the character is correct, M^{me}. Gerster may have whatever credit is due to a singularly charming presentment of an objectionable part. Vocally it was little short of marvellous, and histrionically it was in the highest degree praiseworthy, if, indeed, praise may be fitly awarded in such a case.

DR. HANS VON BÜLOW has made but a brief sojourn in London. On Tuesday he played at the Musical Union *matinée*, and on the next day took his departure for Germany. His performances at St. James's Hall have been marked by the characteristics with which musicians were already familiar. Side by side with much that was in the highest degree commendable, he betrayed defects painful to the cultured listener. For example, in Beethoven's Sonata in C minor, Op. 111, the first movement was given with singular eccentricities of tempo and exaggeration of style, but the rendering of the Arietta was a marvel of excellence. Seldom, if ever, have we heard this wonderful movement interpreted with such poetical feeling and purity of technique. Again, Mendelssohn's capriccio in F sharp minor, Op. 5, suffered greatly by reason of the furious pace at which it was taken, and the faulty mechanism of the player; but, on the other hand, the same composer's fugue in E minor, Op. 35, received a masterly exposition. Dr. von Bülow's selections from Chopin were, in nearly every instance, happy; and not the least interesting feature of the second recital was the performance of four Giggles, respectively by J. S. Bach, Rameau, Mozart, and Handel.

A PIANOFORTE concerto in G minor by M. Saint-Saëns, played by the composer at the New Philharmonic concert of Saturday, merits passing attention. The French composer has departed from the customary form of a concerto, the three movements of his work being an *Andante*, a *Scherzo*, and a *Presto finale* in the tempo and rhythm of a Tarentella. If we cannot trace the workings of inspiration in the music of M. Saint-Saëns, he manifests in place thereof much inventiveness, artistic perception, and the evidence of cultured thought. These qualities are, perhaps, more apparent in the present concerto than in any of his works with which we have made acquaintance. The *Scherzo* especially is a remarkably piquant and effective movement, and the symmetry of the construction not less than the scoring displays the hand of the musician.

At the Musical Union, on Tuesday, a sonata in C minor, Op. 82, for violoncello and pianoforte, by M. Saint-Saëns, was introduced for the first time. It is a well-written work, fairly elaborate, and containing many effective passages for both instruments. The other concerted pieces were Haydn's quartett in F, No. 82 (the last which the veteran composer lived to complete), and Beethoven's trio in B flat, Op. 97. Signor Papini led, and Dr. Hans von Bülow was the pianist, the *ensemble* being remarkably fine. The solos selected by the German player were Mendelssohn's capriccio in F sharp minor, Schubert's impromptu in G, Op. 90, and Rubinstein's galop in B, Op. 14, all of which he had previously performed in his Recitals.

At Mr. Charles Halle's seventh Recital at St. James's Hall, yesterday week, the programme included Schumann's "Märchenerzählungen," Op. 132, for piano, clarinet, and viola; Brahms's four Balladen, Op. 10, for piano solo; Gade's sonata in D minor, Op. 21, for piano and violin; and Rubinstein's quintett for piano and strings, repeated by desire.

MESSRS. NOVELLO, EWER AND Co. have just issued a new edition of Mendelssohn's "Lieder

ohne Worte," which is a marvel both of beauty and cheapness. Its price is only half-a-crown, and it possesses the advantage, as compared with other editions, of containing the seventh and eighth books, of the copyright of which the publishers are the proprietors for England. The type, though small, is remarkably clear and beautiful. The same publishers have also sent us their octavo edition of Mozart's sonatas, which in appearance is a companion volume to that just noticed, and which has been edited and fingered by Miss Agnes Zimmermann. Such cheap reprints as these are a substantial benefit to the musical public.

WAGNER'S *Siegfried* was produced at Munich on the 10th inst. with brilliant success.

No. 321, New Series.

THE EDITOR cannot undertake to return, or to correspond with the writers of, rejected manuscript.

It is particularly requested that all business letters regarding the supply of the paper, &c., may be addressed to the PUBLISHER, and not to the EDITOR.

LITERATURE.

The Great Frozen Sea. A Personal Narrative of the Voyage of the Alert during the Arctic Expedition of 1875-6. By Captain Albert Hastings Markham, R.N. (Late Commander of H.M.S. *Alert*), author of "A Whaling Cruise to Baffin's Bay and the Gulf of Boothia" and "The Cruise of the *Rosario*." (London: Daldy, Isbister & Co., 1878.)

CAPTAIN MARKHAM is already favourably known as an author. His pleasant *Whaling Cruise to Baffin's Bay and the Gulf of Boothia* went into a second edition; and he now gives us a narrative of the Arctic Expedition of 1875-6, in which he served as Commander of the *Alert*. More than eighteen months passed between the return of the expedition and the publication of Sir George Nares's narrative; in that time, with the exception of a few papers in magazines and a blue book not very accessible to the general reader, no detailed account of the expedition had been given to the public. In his Preface Captain Markham tells us that his book was written a few months after his return to England, but its appearance has been purposely deferred until the publication of the work of Sir George Nares. Whether this was in obedience to professional etiquette, or from a feeling on his part that he would be wanting in respect and good taste if he brought out his book before his chief published his, we must confess that it is somewhat aggravating to learn that so graphic and interesting a narrative has been withheld from us for more than a year. It was of the nature of Sir George Nares's book that some considerable time should be taken in its preparation, and it is so essentially different in its character and its object from that of Captain Markham that we do not think the earlier appearance of the latter work could have interfered with the success of the former. While we regret the delay, we must give Captain Markham credit for much delicacy of feeling, and we trust that neither the lapse of time, nor the greater events which have since occupied public attention and roused public curiosity, will prevent his book being as widely read and as justly appreciated as it deserves. A more charming record of travel and adventure we have seldom met with; the author writes easily and naturally, he can be lively without being flippant, and serious without being dull.

The book is dedicated with some graceful expressions to the memory of Sherard Osborn, the chief and most influential promoter of the late expedition, whose name is

so unaccountably omitted in Sir George Nares's Introduction.

Many will remember May 29, 1875, the day on which the Arctic Expedition sailed from Portsmouth. In crossing the Atlantic gale followed gale; and the same stormy weather attended the expedition on its return. The *Alert* was both *lively* and *excessively wet*, two qualities which did not contribute to the comfort of those on board. Up to the entrance of Smith's Sound in August Captain Markham passes over the voyage quickly, and his narrative then takes the form of extracts from his full and carefully kept diary. From this period till the *Alert* was placed in winter quarters, her whole course is a record of the most skilful navigation:—

"The crow's-nest was never deserted. In it Captain Nares might almost be said to live, rarely coming on deck, even for his meals; as for a night's rest, such a thing to him was quite unknown. From the 'nest' the motions of the ice were closely scrutinized, the tides and currents were studied, and the influence of the wind on the pack ascertained. No opportunity was lost, and it was entirely due to this unceasing watchfulness that the expedition succeeded in advancing, although it was only inch by inch."

It was at the end of August, in Robeson Channel, that the ice assumed a totally different character from any that had been seen before from the *Alert*, being infinitely more massive and heavy:—

"The thickness was estimated at from eighty to one hundred feet; whilst the hummocks formed along the shore and round the edges of the floes were fully twenty-five and thirty feet in height. These large hummocks received from us the name of 'floe-bergs,' the term being intended to convey the idea of masses of ice more bulky than ordinary hummocks, and formed in a different way. Some of these huge fragments that fringed the coast-line were fully sixty feet in height, yet they were *aground* in some ten and twelve fathoms of water! This will give some idea of the massive nature of the ice with which we were contending. The region of icebergs, the creation of land glaciers, had been passed, and in their place were substituted these floe-bergs, the production of a floating glacier."

This peculiar form of ice had already been seen by former expeditions on the shores of Prince Patrick's and Banks's Islands, and off the north coast of North America; the discovery of its origin and formation is one of the most important results of the expedition of 1875-76. Between this ice and the shore Captain Nares was able to force his vessel still further north, till he attained the latitude of 82° 27', where he wintered. This was the most northern latitude yet attained by anyone, except Parry, whose *furthest* of 82° 45' reigned supreme for forty-nine years till it was dethroned by Captain Markham in his sledging expedition.

The sun was last seen on October 11, not to return till February 29. The darkness reached its greatest intensity on December 21. The last day on which it was possible for the best eyes to read a leading article of the *Times* newspaper at midday was November 6. For a fortnight on either side of December 21 the difference in the light between noon and midnight on a clear day was almost, and on a dark day quite, imperceptible. Let the reader endeavour to realise what it must be

to be deprived of daylight for 141 days, that is, for more than a third part of a year! This absence of daylight, the longest ever experienced by human beings, was doubtless the principal cause of that depressed state of the system to which the unexpected outbreak of scurvy in the following spring is to be attributed. As the expedition experienced the greatest darkness, so it marked the greatest cold (−74°) ever registered. This occurred on March 4, after the sun had re-appeared. Captain Markham mentions a very interesting observation respecting the temperature at elevations; the difference between the summit and the base of Cairn Hill, the height of which was 450 feet, was 5½°, the thermometer rising as the hill was ascended and falling again as it was brought down. The fact that vegetation on hills suffers less from frost than that in the valleys constantly excites the surprise of the unlearned in our own country.

The officers were fully alive to the necessity of providing constant occupation and amusement for the men, and shutting out the melancholy and despondency so likely to be engendered by the depression of the long night. The Royal Arctic Theatre was reopened, after a lapse of twenty-one years; lectures on interesting topics were delivered; Captain Markham displayed a magic-lantern, and performed the part of a conjuror; there were games, dancing, and music; and a certain amount of daily exercise was insisted on. Nearly the whole of the ship's company attended school; and Captain Markham mentions, as an illustration of the improvement in the education of the men in the last half-century, that, whereas in Parry's time it was quite the exception to find a man who could read or write, only two men out of fifty-five on board the *Alert* were ignorant of those accomplishments.

It might have been expected that everything that past experience or modern science could have suggested for the welfare and comfort of the expedition would have been provided; but this was not entirely the case. In one most important particular former expeditions were better off. They had been supplied with Sylvester's warming apparatus; the want of this, or of some other like contrivance beyond mere simple stoves, for warming and ventilating *between decks*, was a source of constant discomfort to all on board the *Alert*. It was impossible to prevent the accumulation of moisture from condensation, which produced an incessant drip, so that all books had to be removed from the shelves, or from any position where they were in contact with the ship's side or the beams overhead; and the officers could only make certain of a dry night's rest by taking the precaution of nailing a blanket over the bed, or sloping one as an awning.

The chief interest of the Arctic expedition of 1875-6 centres in the sledging journeys, and by them the most important results were obtained. It was in these journeys that those noble qualities, both in officers and men, of which their countrymen must be proud, were displayed. In these journeys—

"Officers and men shared alike in everything;

they had the same provisions, their costume was identical, they shared the same couch and tent, and each showed the same zealous desire to bring to a successful issue the service on which they were employed."

On the officers, however, rested the heavy burthen of responsibility, and from this they never shrank. And though all outward differences of rank were removed, the most perfect discipline was maintained. The courage and perseverance, the skill and readiness, the patience and self-denial, displayed by all engaged, were truly admirable. We purposely abstain from quoting any part of Captain Markham's sledging journal: we feel convinced that it will be read with deep attention; from the first setting out in high spirits on April 3, through the unforeseen and ever-increasing difficulties and sufferings so heroically endured, to the sad return on June 14, when, out of the fifteen men who at starting manned the two sledges, three alone had strength even to walk. Will anyone say that their privations and sufferings were borne in vain? To our mind it seems one of the great results of such an expedition as the Arctic one of 1875-6 that the qualities of our sailors are tested; that we are assured that the spirit which animated the service in former years is still alive; and that, should occasion arise, we may rely with perfect confidence on the skill, the energy, and the self-reliance of our officers, and on the courage and obedience of our men.

WILLIAM WICKHAM.

Le Lettere edite e inedite di Messer Giovanni Boccaccio, tradotte e commentate da Francesco Corazzini. (Firenze: Sansoni, 1877.)

SIGNOR CORAZZINI has done a valuable service to literature by this edition of the letters of Boccaccio, of which unhappily only a few have been preserved. Some of those which had survived were printed in various introductions to his works, or were hidden in appendices to biographies, or, again, appeared as literary episodes among the letters of Petrarch. This is the first collection of Boccaccio's letters, and though it can only be regarded as a gathering-together of fragments, yet the fragments are the more precious through their rarity. It is, indeed, to be regretted in the case of all collections of letters that as a rule only those have come down to us which were carefully written, revised, and put together by their writers with a view to literary survival. The type of character illustrated by the famous collections of letters is much the same in all ages, and we feel that a special value attaches to the scraps that remain to us of those who wrote spontaneously and without thought of fame.

We feel this especially in comparing these few letters of Boccaccio with the elaborate correspondence of Petrarch. In one we have entire simplicity, in the other a constant striving after effect. Petrarch was so profoundly conscious of his own greatness that he never suffers us to forget it; Boccaccio thought little of himself, and his letters take us artlessly into his confidence. He submissively recognises the superiority of Petrarch, and looks up to him with humility as his master. He is jealous of

Petrarch's fame, whereas Petrarch looks down on him with lofty patronage. Boccaccio's last letter is a lament over Petrarch's death, a generous admission of his great debt of gratitude, and an indignant answer to those who disparaged the *Africa*, which he says that Cicero, Horace, and Virgil, if they were to rise from their graves, would not venture to find fault with. The frank admiration of Boccaccio for Petrarch, and his touching loyalty, show us that he was a man of genuine feeling and warm heart, entirely free from vanity and self-seeking.

Of the twenty-six letters which Signor Corazzini prints, the great majority have been printed before; but they have now been carefully collated, and an Italian translation has been appended to those which were in Latin. Six of them are epistles dedicatory to his works, and few of them contain many individual details. Six, however, are now published for the first time, and are of special interest. The first, addressed to a Calabrian Abbot, is very characteristic of Boccaccio: he complains of having been invited to pay a visit to the monastery and finding that his host had discourteously gone away instead of waiting to entertain him; yet his good nature forgives even this act of churlishness, and he returns good for evil by telling the news of the death of Urban V. and the election of Gregory X., whose favour he advises the abbot to seek at once, and only asks in return for the loan of a Tacitus which had been promised him. The next, to Maghinardo Cavalcanti, is an exquisite specimen of Boccaccio's geniality and humour even under the most adverse circumstances. With admirably humorous pathos he gives an account of a severe attack of congestion of the liver, from which he had suffered at Certaldo; though the burning pain made him fear the fate of Phaethon, yet he could not help being amused by the ludicrous attempts to console him on the part of his rustic maid, the only person near: even the rough blistering of a village doctor, though it makes us shudder to read of it, is laughingly described. In a second letter he heartily thanks Cavalcanti for his sympathy with him in his sufferings, and for the magnificent gift of a gold cup full of gold pieces which had accompanied his condolences. But his friend's kindness threatened to go too far; he told Boccaccio of his intention to read aloud the *Decameron* to his wife in the winter evenings, which were rapidly approaching. The simple goodness and integrity of Boccaccio are touchingly shown in his entreaties that he will not carry out his plan. Illness has made the novelist more serious, and he acknowledges that there are many things in his book which ladies had better not hear.

"If you do not wish to spare the modesty of ladies," he says, "spare at least my honour, since you love me so much as to shed tears over my illness. For if they hear you they will think me to be an impure man, a scurrilous reviler who takes pleasure in relating the crimes of others. For there is not everywhere one who will rise and say in my excuse—'He wrote it when he was young, in obedience to the command of a superior.'"

In another letter, to Niccolo Orsini, he thanks him for a pressing invitation to take up his abode with him, but expresses his intention

of spending his old age in peace at Certaldo. "I have a little farm which my father had before me, and am satisfied with my little store; the years that remain for me are few, and for them labour cannot be long nor poverty insupportable." Simplicity of character and entire contentment no less than genuine modesty mark the man, for in the next letter he gently reproves a young and enthusiastic admirer, whose praises of him he thinks have surpassed his deserts. "If I am not altogether unlettered, still my watchfulness in study has not been so great as to merit such laudations." Two things only trouble him in his old age, as we learn from a letter to Piero da Monteforte: one is that copies of his works are circulated, without his knowledge or revision, which are incorrect and inexact, and he does not wish to bear the blame of faults which are not his own; a second thing which grieves him is that the work *De Genealogia Deorum* should be regarded as unchristian and profane.

We have quoted enough to show the interest of these letters, and the light they throw upon the character of Boccaccio. If among the great Italian writers of the fourteenth century Dante seems too stern and awful, and Petrarch too affected and effeminate, in Boccaccio we have the cultivated natural man, genial and simple, broad in his sympathies and true in his instincts. The lives of such men are generally little known, for in truth there is not much to tell. Signor Corazzini's industry has not been able to gather together in his Introduction anything that is new or striking about the life of Boccaccio. But his life lay in his works, and these letters only give us a few vivid touches of the same characteristics as are impressed upon Boccaccio's writings. It is not Signor Corazzini's fault that his harvest has not been more plentiful, for he has gleaned with diligence all that he could, and has arranged and illustrated with exemplary care all that he could gather.

M. CREIGHTON.

Modern Frenchmen. Five Biographies. By P. G. Hamerton. (London: Seeley, Jackson & Halliday, 1878.)

To borrow the term which Mr. Matthew Arnold has applied to certain passages of Homer, this is a "tonic" book. Mr. Hamerton has written, in brief but sufficient compass, the histories of five Frenchmen of this century, who were distinguished, indeed, but in England are comparatively little known. It happens that the Frenchmen about whom we hear most are, perhaps, the Frenchmen who differ least from ourselves. The lives of poets and critics, like De Musset, for example, and Gautier, are perfectly familiar; and yet their lives have little to teach. Neither of these illustrious men was very like an Englishman; but neither of them possessed in very great measure the peculiar virtues of the French. All Mr. Hamerton's five chosen subjects are peculiarly French in their excellence. It is where they are strongest that they are most unlike the ordinary sort of Englishman. They differ from each other in opinion, in profession, in mode of life: one has little or no reli-

gion; one is almost a gentle fanatic; one is a youth, who gave his life for France at Buzenval; one is a morbidly sentimental lover. They are all unlike each other; but all are simple, averse from luxury, industrious, affectionate, and not afraid to put their affection into words. There is a common quality of nobility in all of them, and the tale of their works and days, told in Mr. Hamerton's strong, simple, and pellucid style, reminds one of the histories of Plutarch's men.

Austerity, content, indifference to the impediments of life, are perhaps the most noteworthy features in all these five characters. Victor Jacquemont, for example, the scientific traveller in India (1801-1832), was constantly struck by the elaborate and troublesome comfort of English life. He himself was sent on a scientific expedition, with an income of about 240*l.* a year, and he lived with the highest English magistrates in India. Fortunately for the Spartan Jacquemont, Runjeet Singh presented him daily, for some time, with a purse full of rupees, and other native patrons of science endowed this wandering champion of research. Even so he was excessively poor, in a country where wealth is rather a necessary of life than a source of superfluous enjoyment. In his letters to his father and brother at home, letters which contain the story of his short career, he says:—

"I do not conceal my opinion that the system of English life is nothing but a succession of errors, all fatal to happiness. They talk of *home* without ceasing, and this *home* which they like so much is the material side of existence, their sofas and easy-chairs. Our home, which we do not talk about, is in the heart. I tell them that the poor in our country have more pleasures—and pleasures sweeter and nobler, than the rich in theirs."

There is some truth in this, enough to make us reflect, though, in spite of our "fatal errors," we are not all unhappy, nor absolutely the slaves of those gentle masters, easy-chairs. The passage reminds one of what Mr. Stevenson says about the French labouring class, in his *Inland Voyage*:—

"They scorn to make a poor mouth over their poverty, which I take to be the better part of manliness. . . . The good people began to brag of their barge and their happy condition in life, as if they had been Emperor and Empress of the Indies."

This contented spirit is the charm of Victor Jacquemont. In spite of his Spartan principles he was quite happy in the palaces of the Viceroy and Runjeet Singh. He jested with the Catholic bishop, who "lived in poverty and simplicity," unlike our gorged colonial prelates, who wallow, as all the world knows, in punkahs, brandy pawnee, gorree wallas, dobies, and the other luxuries of Oriental civilisation. A Scotchman was present at Jacquemont's amusing interview with the Bishop, and did not see the joke. He said "Eh, mon, it's jest awfu," no doubt, though Mr. Hamerton does not report the exact language of his remonstrance. "The story is very like a bit out of *Don Quixote*, except that Cervantes could never have invented the Scotchman." Here one of the race has a complaint to bring against Mr. Hamerton. The creature who could not see the good missionary's joke

(he compared his diocese to a pan: "*La caldaja è molto grande; ma . . . la carne molto poca*") is a Scotchman. Jacquemont's three chief friends, Kennedy, Nicol, Fraser, are called *Englishmen*. Kennedy was "a humorous Englishman who loved a joke;" Fraser was a lonely Englishman, who struck up a sudden and painfully eager friendship with Jacquemont, from whom he was soon compelled to part. As to Nicol he buried the poor Frenchman, who died of disease of the liver, in spite of all his temperance. One asks Mr. Hamerton if Nicol, Fraser, and Kennedy are peculiarly English names, or if they do not rather breathe of Morayshire and the kingdom of Galloway? The charm and value of Mr. Hamerton's book is increased by his attacks on "international caricature" and international prejudice. In Jacquemont he has shown us a Frenchman who was, above all things, a good fellow, who could suffer all things gladly, except stupidity. He was a free-thinker, and "criticises the way in which the femur of the camel is articulated in the pelvis." Mr. Hamerton says this seems "presumptuous," but that Mr. Palgrave does not seem presumptuous when he severely criticises the camel's mind. This is not hard to explain: We are all taught to think that we are responsible for our spiritual nature, but not for our femurs, which we cannot modify. Therefore, when Mr. Palgrave assails the camel's mind he is no more presumptuous than Mr. Hamerton when he, in sympathy with Jacquemont, calls dull people, the overwhelming majority of the race, "the Philistines" (p. 99).

Mr. Hamerton's account of Jacquemont is so full of incident and adventure, and matter inviting comment, that one insensibly lingers over it. We ought to pass from this free-thinker (whose last words and thoughts on earth were so pure, confident, and tender) to Henri Perreyve, the liberal French preacher. Liberal for a French preacher this priest was, though he calmly observed that the soul of Michelet had rejected God. It is not uninteresting to read of a modern Frenchman who found that "these beautiful Chablais mountains insensibly led him to admire the beauty of the Virgin Mary." Beautiful mountains have led Lélia and Obermann to thoughts so unlike Perreyve's that Alpine scenery has really become scarcely proper. It is a comfort to find that natural beauty is not necessarily the consolation of despair, and nothing else, except "a joy of wild asses," and tourists personally conducted. Everyone will have his favourite among the five biographies, and the writer must confess that Perreyve pleases him less than Jacquemont, less than Rude, the sculptor, whose life, to all the other charms of an artist's history, adds much eventful interest and the picture of a character beautifully sincere. All these Frenchmen took for their watchword *devoir*, "ce mot austère et saint," as Perreyve calls it. If Mr. Ruskin is really, as Mr. Hamerton thinks, persuaded that *la gloire* has taken the place of *devoir* this book should convert him, and people who think with him. Rude, for example, the blacksmith's son, and the successful sculptor, never tried to leave the class in

which he was born. *Σπάρτην ἔλαχες ταύτην κόσμει* was his motto.

"All his life he maintained the doctrine that art is its own reward; that the artist should harass himself as little as possible about any other; that if he has just means enough to enable him to work, he ought to find his happiness in that, which is itself an inestimable privilege. He was, therefore, in the highest sense an *amateur*, as all the greatest and noblest artists are. He did not work for money; he accepted money when it came, because he was not born rich, and could not follow so costly a pursuit as sculpture on his own means; but the money was not his object, except just so far as it enabled him to work."

How "un-English" Rude was, how wise, and how worthy of imitation! One must quote this story about one of his earliest works in marble. He had executed a bust of Lapeyrouse:—

"The Government had given the marble, which was larger than necessary, so Rude cut a piece off which had the shape of a prism. The possession of this piece of marble was a constant stimulus to the poor sculptor. 'Make something of me!' it said to him continually; and the answer was always: 'What can I make of such an oddly-shaped block as thee?' At length, after much pondering, it occurred to Rude that there was just room in it for a little Neapolitan fisher-boy, playing with a tortoise; and as soon as this idea had suggested itself he determined to carry it into execution. The work made him, in a fortnight, the most popular sculptor in France."

There is rather a curious contrast between Rude and Henri Regnault, whose name is far better known in England, and is honoured as it deserves to be. Rude was drawn in the conscription in his youth, but a M. Fremiet paid for a substitute—"it seemed to him that a great gift for art ought not to be lost to the world." Regnault, on the other hand, was exempt from service, as he had won the *prix de Rome*. In spite of his exemption, he gave up a life full of promise and replete with enjoyment, and laid down his "great gift for art" at the feet of his country. Mr. Hamerton compares him to Sir Philip Sidney: "in both cases a man of genius, adorned with all knightly and graceful accomplishments, admirably fitted for the enjoyment of life, threw life away for his country." One must read Mr. Hamerton's biography to understand how much Regnault voluntarily resigned, winning in return a death more desirable than the life of Titian. Yet as one of these painters was to be memorable by his death, the other by his deeds, we may think it wisely ordered that Regnault fell, and that Titian "lived out all the length of all his days." The thing to notice is that Rude could do, being a peasant, what Regnault could not do. He could allow a substitute to take his place, while honour and duty compelled Regnault to throw himself away in the hopeless sally, the impotent endeavour at Buzenval.

Readers of Mr. Hamerton's other books will understand that the central moral interest of these biographies is not too prominent (as might be guessed from this brief notice), but that whatever frames life and relieves it—landscape, air, the buildings of ancient towns, the wells and woods, the chance passing of a girl or a child across the page—is touched with a certain and accomplished hand.

A. LANG.

Word for Word from Horace. The Odes literally versified by William Thomas Thornton, C.B. (London: Macmillan & Co., 1878.)

THE particular object which this new translation of Horace's Odes keeps in view—the rendering of the original text word for word—while it distinguishes it at once from such versions as Mr. Martin's or Lord Lytton's, makes the task of estimating it rather less difficult. For such a translation *ex hypothesi* avoids those prettinesses and redundances of expression which can make a pleasing poem of what is unsatisfactory as a close representation of the original. Judged by this standard, Mr. Thornton's translation is an interesting, though scarcely a very successful, experiment. In literary finish it will not bear comparison with Conington's often felicitous and invariably accurate version; in closeness it is at least not superior to Sewall's nearly-forgotten attempt. Its chief strength seems to lie in its mannerism, which recalls the versification of the seventeenth century, as may be seen in the following extract:—

"For nothing more
The gods I weary. Rich enow
With my own single Sabine plot,
To my great friend I clamour not
For larger gifts. Day thrusts on day,
New moons wane hastily away;
Yet, though the grave before you yawn,
You give out marble to be sown:
Oblivious of the sepulchre,
Build houses: nay, as though you were
Not rich enough while cramped within
The coast-line, strive new sites to win
By throwing out the Baian shore
To where the sea noised heretofore."

The following is not unlike the style of Andrew Marvell:—

"Ye, lads, Apollo's native Delos praise,
And Tempe ye, with no less numerous lays:
His shoulders, likewise, decked with dire
Quiver, and with his brother's lyre.
He tearful war, wan famine, pestilence,
From princely Caesar and his people, hence
To Persia and to Britain's isle
At your petition will exile."

Among the less pleasing peculiarities of Mr. Thornton are the too frequent omission of the article, a laxity in rhymes, and the highly objectionable custom of reducing Greek and Latin proper names to a barbarous Anglicised form by dropping the final syllable. The first of these gives a rough tone to passages otherwise unobjectionable.

"And fondling arms of love-pledge are divested."

"Rage was final cause

Why palmyest town
Hath perished utterly—whose walls o'erthrown
Insulting foe with hostile plough hath pressed."

"Me Colchian, far Gelonian, Dacian, who
His fear of Marsic cohort hides, shall know."

The second, though perhaps caused by that purposed avoidance of Popian rigour which constitutes part of the merit of the work, is too frequent not to offend; few ears will acquiesce in such rhymes as *sea—Africa, when—campaign, heat—it, sought—grot, enriched—unimpeached, stream—swim*; and they are scattered too thickly through the volume. As to curtailments like *Oric, Magnese, Algid, Megill, Armeny, the Adrian, Gelones, Aufid*, the sooner they vanish from the list of things permissible in translation the better. Even *Telephus* loses half his

charm when abridged to *Teleph*, a word which recalls Israelitish rather than Greek associations. Not that Mr. Thornton is without very considerable precedents in so doing; but the philological tendency of our age, however inferior it may be to the past in the higher qualities of greatness, is very susceptible on this subject of names—and, we feel pretty sure, rightly. If *Pompey* is slowly but surely recovering the syllable of which France has curtailed him, our countrymen will certainly resent a reduction which, like *Teleph*, not only is no gain enphonically but transforms a pleasing Greek into a somewhat barbarised Jew.

Mr. Thornton's sapphics will please those who are contented to see classical metres reproduced without anything like a real knowledge of the rhythms as constructed by the ancients. Those who understand the rhythm, as represented, for instance, by Mr. Swinburne, will find Mr. Thornton's verses very faulty.

R. ELLIS.

The Townley Hall MSS.—The Spending of the Money of Robert Nowell. Edited by the Rev. A. B. Grosart. (Printed for Private Circulation, 1877.)

ROBERT NOWELL (1517?–1568-9) was the younger brother of that celebrated theologian (1507–1602) who is said to have written the Catechism in what Walton, in 1658, expressively called "our good old service-book;" whose "meek spirit, deep learning, prudence, and piety" are commemorated by the same delightful writer; and whose portrait hangs in the Chetham Library among contemporaneous Lancashire men of the same high character who played able parts in the eventful history of their time. Robert was born at Read Hall, Lancashire. He was educated at Middleton School in the same county; afterwards at Brasenose College; and in view of his destined profession he entered Gray's Inn. At a later period he lived the life of a country gentleman on his estate at Hendon, near the Brent, in Middlesex, eight miles from St. Paul's. In 1561, being then a Counsellor of his Inn, and over forty years of age, he was appointed Attorney of the Queen's Court of Wards, a position of considerable emolument. This court was then of high judicial importance, as it took cognisance of wards (properly so called) and their property, idiots and fools natural, and certain marriage-licences. Nowell, who seems to have enjoyed the friendship of the lettered men of his day, died at his chambers, Gray's Inn, February 6, 1568-9. The remembrance of his early struggles after knowledge at a time when knowledge itself was struggling into light, occupied his thoughts on his death-bed. He said to his brother: "Forget not Myddleton Schole and the College of Brasen-nose, wher wee were brought upp in our youth;" adding a solemn charge that he would deal fairly with him and distribute all his goods to the poor. Between the brothers there appears to have existed a tender affection. The younger was by disposition inclined to enter into the benevolent aims of the elder, who was a sort of almoner-general to his age. Of both it might have been written by the angel in the dream, that they were "those who loved

their fellow-men." The Angler Dean bestowed the tenth part of his revenue, "and usually all his fish," upon the poor, saying often that "Charity gave life to Religion." Robert took care that those whom his private bounty had relieved, or those over whom his extra-judicial watchfulness extended, should not be forgotten at his death. Besides Alexander, the dean, another brother, Lawrence (the learned Dean of Lichfield, 1516-76), and John Towneley, Esq., a brother-in-law, were constituted almoners of Robert's munificent and well-directed charities. Towneley, being a Roman Catholic, is in the shrewd lawyer's will specially enjoined "to be good to my ij brethren if the world chaunge, and if they stand in neede of hym."

The publication of the MS. containing the executors' accounts is one of the fruits of the Royal Commission on Historical Manuscripts. The Commissioner who is entitled to the credit of first making it known is Mr. R. B. Knowles, the greater part of whose Report is fittingly embodied in Mr. Grosart's Introduction. The account of the family of Nowell, in the same part of the book, has been carefully drawn up by Mr. Abram, the Blackburn historian, and it modifies the existing pedigrees of the family. Mr. Abram's other contributions to the volume evince the same patient study, and have imparted to it, in spite of its connexion with matters of a wider importance, a distinct Lancashire tone. The will of Robert Nowell is a document which in a number of places throws light upon the accounts.

The executors seem to have faithfully carried out the wishes of their benevolent relative as expressed in his dying request and in his will. To a great degree, however, they may have followed the course of action which Robert himself pursued in dispensing his gifts. The arrangement of the funeral and the payments of the legacies occupied their first attention. The curious entries connected with the former, which took place in St. Paul's, introduce us in fancy to the "poms" of death: we gaze on "the disguises and solemn bugbears, and the actings by candlelight, and proper and fantastic ceremonies, the minstrels and the noise-makers." The collective sum paid for this costly ceremony reached nearly 119*l*. Clarencieux and his attendants charged 23*l*. 16*s*. 2*d*. for their pains. The great dinner cost about 75*l*. Quarters of beef were 1*s*. a stone; partridges about 1*s*. a piece; larks 1*s*. a dozen; and a hogshead of wine was 3*l*. 6*s*. 8*d*. The butcher who "cut out the meat" received 6*d*.

Nowell's charities extended from Lancashire to Wiltshire. A vast number of gowns, adapted by their price or material to the different classes of society, were distributed, the names of the recipients and the quantity of cloth being methodically recorded. Spenser, as a scholar of Merchant-Tailors' School, receives 12½ yards at 6*s*. per yard. There are alms to the sick and the poor, and gifts to decayed gentility. Numberless gifts went to the Nowell family, and to those who "claimed kindred there, and had their claim allowed." Presents at marriages are in the record. Studious and deserving youths were helped forward to active life by the

bestowal of money or gifts. Under the last head centres much of the interest of the MS., which affords distinct glimpses of the school or college-life of many remarkable men. But it is an error of judgment to couple these gifts, as Mr. Grosart does in the case of Hooker (p. xxv.), with "poverty and straits;" and worse to view them with "infinite pathos." The simple matter-of-fact may be that the youths were a little short of pocket-money.

As an aid to the study of literature, life, and history, the MS. is most instructive, its special interest being that it relates to the England of Shakspeare and Elizabeth. It is a document that calls for the sustained labour and the piercing eye of a sage antiquary. Mr. Grosart, who has exhibited that kind of knowledge which Fuller has justly reprehended—a mere indical knowledge—has not in all respects brought out its full value; and it still needs the further elucidation of those who in the pursuit of special subjects will bring their knowledge to bear upon it. The artificial bigness of the book, which has put it out of the reach of many, is due to the arrangement of the pages, by which a defined space is left to be filled up. Shoals of notes are in consequence introduced of an unnecessary and trivial nature. Meanwhile essential notes are missing, as in the case of the names of members of Brasenose College, to which the Nowells belonged. The annotation is altogether of a very unequal character. The explanations of words, &c., are faulty. Many of the original notes betray considerable research, and are in all respects what is to be looked for in books of this class. Many are often the reverse; and our digestion of an ample feast is spoiled, and our gratitude for a good book weakened. The notes on the university names and others are in the main necessarily drawn from Wood, Newcourt, the Parker Society, Mr. Thompson Cooper, Dr. Bloxam, &c. But the details annexed to the names are in general more than is required, and they have grievously suffered in the process of transfer. Errors in dates, hasty conjectures, over-confident statements, &c., together with the absence of a List of Errata, continually provoke the reader's investigation; and blunders and omissions arise that amaze him by their number and variety. Mr. Cooper is often made responsible for what he never wrote. The long and very "painful" note on Thomas Drant, page 159, wants more than the careless acknowledgment at the end, the interjection of "our Nowell's friend" (line 13) making, as it seems, a further editorial claim to it. Among the errors in this note, "the see of Chester," in line 21, should be "see of Chichester." Newcourt and the Parker Society volumes can supply very much more information than has been derived from them. Poor Tony Wood, to whom also the editor is under heavy obligations, is likewise unfairly treated. The frequent notes, "Not in Wood," "Not known," "Not to be identified," placed against far too many names, are often incorrect; and their curtness and confident tone tend to discourage or impose on the unwary or humble investigator. Errors are set down to the Oxford antiquary that would bring scandalous expletives to

his lips. With regard to the note No. 20 on page 201, to the effect that Wood tells nothing of the father of Richard Allein, it might be retorted that Mr. Grosart does "his bitterest best" to slander Wood, as a reference to the *Athenae* will show. The same carelessness is manifested in regard to an entry (at p. 224) on which hang matters of singular interest. The executors pay 5l. "too Mr. Raynarde Woulffe for Cathachismies in greake & Latten, to gyve poor scholers." The wellnigh incredible comment is that Woulffe is "not in Wood"! Now he is there (see the *Athenae*), and no less than five times. But in this case Wood was the wrong authority to consult. The proprietor of the Catechisms was the celebrated King's printer, Reynold Wolf, the learned antiquary who befriended Leland and compiled Holinshed's *Chronicles*, as to whom the editor should have examined Dibdin's *Typ. Antiq.*, iv., 1-36; Herbert's *Ames*, i., 595-612; Johnson's *Typographia*, 529-531; Rymer's *Foedera*, vol. xv., 150; and the *Stationers' Hall Registers*. The "Cathachismie" is, of course, Nowell's (*Excusum Londini apud Reginaldum Wolfium, anno Domini 1573, 8vo.*), translated into Greek by William Whitaker and dedicated to Sir William Cecil (Dibdin, iv., 34; Churton's Nowell, 179-80; Jacobson's *Catechismus*. . . . *Auctore Nowell, Oxf. 1844, pp. xvi.-xvii.*). Defective bibliographical knowledge is also exhibited in a note in slipshod language annexed to a poor woman named Anne Basket, thus:—"Reminds of the early publisher of the English Bible."

The student is assured (p. x.) that as to the transcript he "may rely on the fidelity of the text to the original." But there are several places where suspicion is excited, as, e.g., p. 198, note 32, where Robert Lovenden should be Robert Hovenden, B.A., July 5, 1566; and John Coldinge, note 33, should be John Goldynge, B.A., May 31, 1568. The contracted *p* for *pr* is left *p* in the transcript, with the result, e.g., that all the Cowpers or Coopers are indexed as Cowps and Coops! The editor's facsimiles belie his assurance; for not only is there some doubt about his rendering of Spenser's schoolfellows (Facsim. No. 1, and p. 28), but there are four or five mistakes in the last specimen (No. 5, and p. 220). It may be questioned whether the corrections in this last example are really in Dean Nowell's handwriting. JOHN EGLINGTON BAILEY.

Schopenhauer's Leben. Von Wilhelm Gwinner. (Leipzig: Brockhaus; London: Kolckmann, 1878.)

THE human mind, under the sway of various ideas at different periods of its history, has been compared to Luther's drunken peasant who inclined now to this side, now to that, incapable of maintaining his equilibrium. The comparison is not flattering, but we fear it is just. In reaction from the immoderate optimism of the eighteenth century we are now passing through a stage of pessimism, which, aided by science, will, we trust, land us eventually in some happy mean as yet but dimly perceived. In England this phase is only superficial and confined to a minority. In Germany, on the other hand,

it has assumed such proportions as to alarm the thoughtful; for such a creed, consistently carried out, must end in stagnation and destruction for all Eduard von Hartmann's evasive mediations. Fifteen years ago Dr. Gwinner presented us with a graphic, concise, and excellent memoir of Schopenhauer, who was at that time not recognised beyond a small select circle, and whose interesting personality and grand ethical thoughts he wished to make known to a wider circle, who, qualified to appreciate the "soul of goodness in things evil," could sift the precious grain from the chaff. Now, after this lapse of time, Dr. Gwinner awakes to the fact that Schopenhauer has become a prophet, and his doctrine a cult. His charming style, a phenomenon in his native land, has brought him within reach of the masses; and the more easy comprehension of the vulgar mind for evil, and certain social conditions in the new Empire, are largely responsible for his present popularity. Now Dr. Gwinner holds that Schopenhauer's doctrines, ill understood, act like poison to the mind; and to the fear lest his too laudatory sketch of the philosopher's life and doctrines should have contributed to the present mood we owe the book before us. "An expiation," he names it. It is certainly a work to enforce respect for the disinterestedness and high-minded honesty of its author. The world will be grateful to Dr. Gwinner for at last protesting with the authority he can bring to bear against the fashionable veneration for Schopenhauer's pessimism, serviceable at most as an antidote, while his idealism and spiritual tendencies are overlooked. In this new volume, then, which is an entire reconstruction of the former one, enlarged by more than one-half, Dr. Gwinner dwells on Schopenhauer's intellectual deficiencies and faults, as he before insisted on his strength when the world was ready enough to concede the one but ignore the other.

It is not, however, a fuller analysis of Schopenhauer's theories that has so greatly added to the bulk of this volume, but, what is far more interesting, new biographical material. It in no wise changes our previous conception of the morose recluse of Frankfurt, but in filling up the blank history of his youth it brings him more within the life-round of common men, and explains much of his Ishmaelish temperament. In later years isolated and solitary, we here behold him beloved and loving, and, though his youthful friends nicknamed him Jupiter Tonans, they seem to have liked him none the less for his autocratic and oracular mode of enunciating his opinions. Dr. Gwinner further confirms the eventual mental derangement of Schopenhauer's father, and traces further symptoms of mental disease in the family which physiologically account for much that otherwise appears perverted in the philosopher's life. He also gives us a more detailed account of Schopenhauer's English sojourn, when he acquired his accurate knowledge of the language and his admiration of the people and institutions, combined with a fierce hatred of English bigotry. He was at the boarding-school of a certain Rev. Mr. Lancaster, who appears to have somewhat over-dosed the boy, ac-

customed to the broader habits of Continental life, with Sabbatarianism. He complains of this in bitter tones to his mother, who twits him with his former unwillingness to do anything sensible on Sundays because it was the day of rest; now he no doubt enjoyed days of rest enough. It was the memory of this that made him afterwards annotate his copy of *Pickwick* at the passage where Weller senior pays off Mr. Stiggins with blows:—"The author showeth here allegorically how the English nation ought to treat that set of hypocrites, impostors, and money-graspers, the clergy of the established humbug that devours annually 3,500,000*l.*" This annotation, like most of Schopenhauer's private notes, is in English. He habitually employed the language as the most practical, and because of his partiality for England and Englishmen. While he was at Wimbledon his mother exhorted him to take life more seriously, and not waste it with *dilettantism* and reading of nothing but poets and romance-writers—an exhortation that reads comically enough to us. His early bias towards melancholy is, however, confirmed by the mother's diaries. The aspect of human suffering or misery touched him keenly, and embittered all his enjoyments. Some of his boyish poems read like translations of Leopardi's most despairing cries uttered when sickness and ill-fortune had utterly shattered his elasticity, while Schopenhauer was a very spoilt child of fortune. At Weimar he enjoyed intercourse with Goethe, who induced him to investigate his theory of colours, and whose letters to Schopenhauer on the subject are here given at length. Goethe took a lively interest in the youth and predicted his future eminence, and though he could not feel in sympathy with him, he nevertheless urged Schopenhauer to write to him:—

"Let me hear from time to time what are your occupations; you will always find me interested, for although I am too old to appropriate the ideas of others, yet I like much, so far as it is possible, to keep myself historically informed of that which they have thought and think."

This letter is dated 1816; the poet was then sixty-seven. Some exceedingly interesting English letters from Schopenhauer are also printed, from which it appears that he entertained the project of translating Kant into English, considering that the rare combination found in him of a good knowledge of English with a thorough knowledge of the Kantian philosophy, in whose study he had grown grey-headed, peculiarly qualified him for the task. He points out how Kant's crabbed and abstruse style renders a more than verbal acquaintance with German requisite in his translator, and the fact that we are still without a correct and readable version of Kant evinces the justice of his remarks. But Schopenhauer's advances met with indifference and supercilious contempt, a circumstance that cannot be sufficiently deplored. These letters, and the specimen of his translation appended, should be read by all interested in Kantian philosophy, and so should the letter of Mr. Francis Hayward, whose qualifications, as he states himself, at that time hardly equalled his courage as a translator. The practical common-sense and keen business faculties that Schopen-

hauer combined with genius are amusingly demonstrated in Dr. Gwinner's present work. It was well known that Schopenhauer by his promptitude and energy saved the bulk of his fortune out of the ruin of the merchant house where it was invested. How he accomplished this is here told in detail in his masterly, decisive, and luminous business letters addressed to the firm, who urged him to accept the composition of thirty per cent. offered to and accepted by the rest of their creditors. The money was his due; it represented his freedom, his power to live where and how he liked; he was not going to be balked of his patrimony, he would wait, he said, till he could be paid in full, but paid in full he would be. To complimentary appeals he replied that he would not let himself be flattered out of his due; to threats he replied with counter threats, and the long and short of the matter was that, while most men would have acceded and swerved from their firmness, and while the other creditors, many of them men of business, had to rest content with receiving only a portion of their due, the philosopher carried the day and was duly paid in full after the expiration of some little time. "You see," he wrote to the principal of the firm, "it is possible to be a philosopher without on that account being a fool."

This new biography clears Schopenhauer of an ugly charge, that of having maimed an old woman whom he found intruding in his rooms. Dr. Gwinner states the case in detail. It appears he neither ejected her with violence (and he only ejected her when remonstrance had failed), nor did he injure her. The annuity he was forced to accord her came from legal mismanagement and false swearing on the part of the old woman's friends. The doctor who examined her for the case could find no injuries, and it is probable that had Schopenhauer not been absent from Berlin when she appealed against the first decision, given in his favour, the whole disagreeable story would never have furnished a handle to his enemies.

The only new trait in Schopenhauer's character here given is his extreme indecision about matters of everyday life. As an example of how he overcame this Dr. Gwinner prints the schedule which Schopenhauer drew up for himself when uncertain whether he should fix himself permanently at Mannheim or Frankfurt. It is, as usual, in English:—

"FRANKFURT.	MANNHEIM.
Healthy climate.	Fine weather (intolerable heat).
Fine country.	Silence and no throng (throng at the play and dinner).
Comforts of large cities.	More consideration.
Charges of large cities.	Better foreign book-sellers.
Better reading-room.	The Harmony and its library.
The natural museum.	The Heidelberg library.
Better plays, operas, concerts.	A truly sociable establishment.
More Englishmen.	Better baths in summer.
Better coffee-houses.	Spares much in books.
No bad water.	Less danger of thieves.
The Senckenberg Library.	In later years a servant to keep.
No inundations.	Nothing is <i>περιμάχητον</i> (the play).

Less noticed.

The gaiety of the place and all about it.

You are more at large, and not so beset with company given by chance and not by choice, and more at liberty to cut and shun whom you dislike.

An able dentist, and less bad physicians.

Not such intolerable heat in summer.

The physical museum.

With suchlike matters of interest to all who feel attracted by Schopenhauer's strange personality Dr. Gwinner's volume abounds. It is as admirable in style and construction as its forerunner, and must meet with as warm a welcome. By no means its least interesting feature is a portrait of Schopenhauer in his twenty-first year, in which we trace with difficulty the more familiar features of the septuagenarian. The flashing eye and lofty brow are the same, but the curly-headed dandy is not easily identified with the arch-pessimist Arthur Schopenhauer.

HELEN ZIMMERX.

NEW NOVELS.

By Proxy. By James Payn. In Two Volumes. (London: Chatto & Windus, 1878.)

Eliot the Younger; a Fiction in Freehand.

By Bernard Barker. In Three Volumes. (London: Samuel Tinsley & Co., 1878.)

In the Spring of My Life. By Princess Olga Cantacuzene. Translated by Eugenia Klaus. In One Volume. (London: Samuel Tinsley & Co., 1878.)

GIVEN your motive, the question is, How best to handle it? The art is a difficult art, and, though its professors are many, it is only to a few of them that one could go for anything like instruction. Mr. James Payn, author of *Lost Sir Massingberd*, *A Perfect Treasure*, *The Best of Husbands*, *What He Cost Her*, and a score of pleasant books besides, is happily one of these. An individual humourist, with a happy gift of observation and a no less happy knack of characterisation, he is also a story-teller, and a story-teller of mark. It is for other craftsmen to ruin themselves by excess of ingenuity, or to lapse into nothingness by dint of doubt, or to break their shins over situations they have found but cannot clear. He, at least, knows how to do justice to a good motive; and, if he gets one, he is always certain to handle it as it should be handled—easily, rapidly, masterfully, with the assurance that comes of intelligence, with the success that is born of practice and skill. In *By Proxy* he has produced what seems to me, from this story-telling point of view, his best work. With a motive of singular force and freshness to serve as the *neus* of his story, he has had the audacity to start from a situation of extraordinary moment, and the skill to work from it to his *dénouement*—and to work, not backwards, but forwards—without allowing the interest to flag or

falter for a single page. *By Proxy*, indeed, is an excellent specimen of the art of story-telling. There are plenty of faults in it, but they are not faults of narrative. Mr. Payn has done the work that he is best fitted for with the tact and temper of a genuine craftsman, and if one look for the blemishes that needs must show in everybody's results, it is not here that one will care to discover them. The intrigue of *By Proxy* is based on a misconception of a point of Chinese law, and is therefore an impossible intrigue. But with this question of potentialities one need not busy oneself at all; one has only to ask whether the impossibility is properly and plausibly done, and if the answer be an affirmative, the impossibility ascends at once into higher regions than can be trodden by the mere critic of facts. The Ralph Pennicuck of *By Proxy* would not have had an opportunity of availing himself of the law's delay, for Buddhism is not the State Church of China, and his crime, though it might have exposed him to the fury of an exasperated populace, would not have brought him into contact with officials of any sort. He would have been torn to pieces, and the story would have been at an end. Mr. Payn has erred, whether wilfully or the reverse, and one is very much obliged to him for the error; for *By Proxy*, as it stands, is a novel that very few will be able to read otherwise than at a single gasp. Its weaknesses are weaknesses of characterisation and psychology. Ralph Pennicuck in the earlier scenes is admirably adroit and vigorous, but he loses presently his force and humour, and becomes a mere name and a symbol of remorse. The young lady of the novel is too absurdly scrupulous and sententious to be of much value; and this is all the more to be deplored, seeing that Mr. Payn's girls are often such pleasing young creatures as to give an air of freshness and naturalness to all their surroundings. The young gentleman is worthy of this young lady, but not much else, and Arthur Conway, the young lady's father, the unfortunate hero of the intrigue, makes a very good third. The best thing of this sort in the book appears to be the character of Mrs. Conway, the young lady's mamma, which, though only a sketch, and a disagreeable sketch, is very bold and able work indeed; and after this, there remains in my mind a memory of the ample geniality of Mrs. Wardlaw, which is deserving of much praise. It should be added that Mr. Payn has rendered his *Flowery Land* with remarkable vigour and precision, if with an occasional something too much of the humoristic in his manner. The English of the book, as was to be expected, is very pleasant and forcible English; for "*réchauffé* cutlets" seems to be one of those solecisms that are the privilege of printers, and the deplorable pun on page 50, unjustifiable as it is, is hardly enough to damn the whole book. The illustrations are of a mixed order, one or two being really rather good, several indifferent, and more than one extremely bad.

If Bernard Barker be not the Earl of Desart himself, he is assuredly a gentleman who has read the Earl of Desart rather well than

wisely. Whoever he may be, he is not a great novelist. *Elliot the Younger* is, on the whole, a poor book; and none, I think, who has read it once will care to turn to it again, either with his memory or in fact and deed. It relates the adventures of a certain Dick Elliot, who is rusticated for a debauch at college, goes to London, is starved nearly to death, is rescued, writes a wonderful comedy, and marries at last the girl of his heart—a young lady in whose face there was "that rarer higher beauty of expression, that rarer and more eloquent beauty of soul, which made her seem, beside the conventional model, as the Rhodian girl Balaustion might seem beside a portrait of Sir Peter Lely's." They who care for the chit-chat of barmaids, ballet-girls, burlesque actresses, naughty peers, brilliant journalists, and such gorgeous creatures, may possibly find it amusing. I confess that my own sympathies are elsewhere, and that I have found *Elliot the Younger*, not only offensive and unreal, but also dull in no mean degree.

Of *In the Spring of My Life* but little is to be said, and of that little nothing in praise. It is harmless enough, but bitterly affected and as bitterly dull. What small merit it may have originally possessed would seem to have been lost in the process of translation. The English is so cruelly, so hopelessly French that the poor little book acquires from it an air of unfinishedness and slovenliness that makes it almost pathetic. The sorrows and sentimentalities of Agnès de Morangis are poor enough in themselves. Thus rawly presented, their record reminds one not a little of a toupzed and undressed waxen dummy, staring into vacancy from great meaningless eyes, and simpering fixedly the sickly simper of an artificial and affected old-maidhood. W. E. HENLEY.

CURRENT LITERATURE.

A Handbook on Gold and Silver. By an Indian Official. (Longmans.) The author of this book speaks of his subject as a "big" one, and in point of fact, under a single title he treats of several big subjects—the introduction of a gold currency into India, the revision of the English land laws, the suppression of drunkenness, prevention of the waste of English capital in foreign loans and investments, and the relief of trade from its present depression. It would not be easy to establish a clear connexion between all these; and it is not surprising that the author has failed to do so. His proper subject is really the first—the substitution of a gold for a silver currency in India. Could it be effected, there can be no doubt that a considerable saving to India on the maintenance of its currency would be obtained, in addition to other and wider advantages. Gold could be imported from Australia, whereas silver has to be brought from Europe, and ultimately from Mexico, a heavier freight on the bulkier metal for a much longer voyage being thus incurred. Gold could be coined in India at less cost than silver in proportion to the smaller number of coins required. The cost of carriage of large sums of money through an immense country, often in bullock-carts and over bad roads or no roads, would be lessened in proportion to the smaller bulk and weight of equal values in gold. The wear and tear of fewer and harder coins would be less. But it would be robbery of the natives of India to demonetise silver at once. For a time a bi-metallic currency would be necessary; and to regulate the proper relative value of the gold and silver coinage while the value of silver in the market

fluctuates as it has done for the last two years would be impossible. Sir Charles Wood and his advisers must bear the reproach of not having introduced a *bona fide* gold currency while it was easily practicable. Some of the author's expressions seem at first sight adverse to the policy of free-trade; but he does not really advocate a return to protection, and there is considerable truth in his proposition that "England began her career of free-trade with certain advantages for a profitable foreign trade, and surrendered these advantages by the exportation of British capital through finance companies, and in loans to foreign governments." The Appendix to the book is a repertory of useful information respecting the precious metals, currency, and prices. On the whole, although the work cannot be put on a par with Mr. Wilson's *Resources of Modern Countries*, it will be found a useful companion to that instructive collection of essays.

Lectures on Mediaeval Church History. By Richard Chenevix Trench, D.D., Archbishop of Dublin. (Macmillan.) When a writer to whom the British public is already under no small debt of obligation publishes a volume like the present, the exercise of the critic's function becomes somewhat embarrassing. These lectures, we learn, were delivered "a good many years ago;" they were addressed to "a class of girls," and the task of their recent revision has been interrupted and hindered by a severe accident. Such being its antecedents, it would be easy to dismiss the volume with the observation that considered with reference to the date of its conception and its original design, it appears well adapted for its purpose; that it is felicitous in expression and lucid in arrangement, and brings out many important points in mediaeval Church history with considerable skill. Archbishop Trench, however, expressly states in his Preface that he is of opinion that "there is no need to break the bread of knowledge smaller for young women than for young men;" and we are, therefore, bound to say that we think there is some doubt whether the *ex cathedra* manner in which his decisions are delivered, the obvious platitudes and truisms that meet us on almost every page, the complacency with which after referring to two opposing theories he almost invariably sums up by assuming a position exactly half-way between the antagonists, will be accepted by real students as a satisfactory treatment of an important subject. Of what possible use, for example, can it be to the learner to find his instructor concluding a brief and very inadequate estimate of Erasmus with the statement that after all he is "sure that it is easy to say things about Erasmus which shall be bitterer and more full of reproach than the actual facts of the case, if duly weighed in the balance, would warrant"? This pregnant sentence reminds us, indeed, very forcibly of Macaulay's comment on a similarly meaningless piece of criticism, that "it would be no very flattering compliment to a man's figure to say that he was taller than the Polish Count and shorter than Giant O'Brien." What, again, when compression is so much needed, can be the motive for suggesting, at the commencement of the chapter on "The Papacy," the question whether that institution "grew up by Divine permission," and then observing that "it is a question not easy to answer"? The most serious defect of the volume consists, however, in the way in which it leaves unnoticed the very different character of the data on which our knowledge of successive periods rests. Events and characters in the century and a-half following upon the pontificate of Gregory the Great are discussed in the same tone as those of the age preceding the Reformation. It is surely of primary importance for the historical student that he should be taught at the outset to recognise the comparative value of the evidence on which he will have to ground his conclusions, and the degree of credit or suspicion attaching to different sources. But, in fact, the treatment throughout is

far too much of a kind which is rapidly giving place to one more suited to modern requirements. In the couple of pages in which, at the conclusion of the chapter on the Crusades, the lecturer sums up the reflex action of those expeditions on Europe, his tone is singularly optimistic. He is of opinion that we "may well believe" that "the faithful discerned, as they never had discerned before, what treasures of wisdom and of grace were laid up in the Church's faith." A pleasing belief, which, we fear, can only be cherished by those who choose to remain in comfortable ignorance of all that Michaud, Dr. Brewer, and M. Wallon have written on the subject. "The conversion of the Saracens," says the second of these writers, "had not been secured; it seemed much more likely that the converters would become converted." A like deficiency is observable in the criticisms, towards the close of the volume, on the Reformers who preceded the Reformation, pages which really convey nothing that was not equally well known half-a-century ago. At the same time not a few of these lectures have the merit of bringing the more important points of their respective subjects very clearly and concisely before the reader—that on the Papacy being especially noticeable. At pages 65–67, again, there are some excellent observations on St. Boniface and his work in Frankland—by way of rejoinder apparently to the hostile criticisms of August Werner and his school—which make us all the more regret that circumstances have not allowed of the whole volume being made more worthy both of the subject and its distinguished author.

In a pamphlet entitled *A Short View of the History and Consequences of Primogeniture in England* (Cambridge: Deighton, Bell and Co.), Mr. C. J. Cooper has combined in a happy manner the results of the researches of Maine, Nasse, and Stubbs. He shows that the custom of primogeniture, or the descent of land in case of intestacy to the eldest son, is a comparatively recent growth in the history of jurisprudence; and he argues with much ingenuity that the custom sprang up as a corollary to the theory of hereditary office. The latter part of the pamphlet, concerning the consequences of primogeniture in England, contains suggestions rather than a well-considered statement.

In *Amours of Great Men* (Tinsley Brothers) Mr. Albert D. Vandam has written under a very ugly title a book which is not itself of a very attractive kind. Mr. Vandam has taken in hand Abelard, Petrarch, Dante, Memling, Marot, Raphael, Lope de Vega, Molière, Rousseau, Mirabeau, and Swift. The loves of these men as recorded in history or legend he has recounted at very great length, and he has subjoined to the whole an allegoric vision, in which by dint of much Schopenhauer he endeavours to make out a theory of "love in the abstract." We cannot congratulate him either on his plan or on his execution. Not only does the general subject need great delicacy as well as originality of handling to make it tolerable, but the separate themes thrice told, or rather a thousand times told, as they are, require some special gifts in the writer. He must have some new facts to communicate; he must be a genius of the kind that can handle any subject with advantage; or he must be content to rely on grace of style and literary attraction for his success. We do not see that Mr. Vandam is in any one of these three positions. He has nothing new to tell us, unless his Memling legend be partly of his invention. He is scarcely remarkable for the brilliancy or originality of his views; and his style is the style of a man who sets down the first thoughts that come into his head in the first words that come to keep them company. We doubt the possibility of writing a book in two large volumes and some eight hundred pages on such a subject, but whether or no it be possible, Mr. Vandam is not the magician. His allegory or vision at the end, spoken chiefly by Paradox, a mule begot by Pegasus on

Balaam's ass, reminds us forcibly of a description which we have lately read of such things as "unskilful, obvious, poor, and not any more amusing than if their matter had been set forth without any attempt at fanciful decoration." His attempts at catching titles, such as *Plato or Priapus?* for a discourse on Rousseau, and *Love's Impenitence* for the story of Abelard and Héloïse, do not impress us more favourably. With the exception of the chapter on Swift, which really does contain some matter which in more skilful hands might have been worth putting, there is nothing in these big volumes which will repay a moderately instructed reader; while the awkwardness of the style will repel readers instructed and uninstructed alike. We are sorry to pronounce so harsh a verdict on Mr. Vandam, who is evidently a well-meaning person possessed of considerable reading and (as these volumes and his recent adaptation of a Dutch novel show) industrious withal. But, unfortunately, industry, reading, and good intentions do not suffice. A writer should have something to say and should know how to say it. Mr. Vandam has little to say and says a great deal about it in one of the worst possible manners. On so difficult and delicate a question as the relation of the sexes we should prefer to listen to a somewhat more weighty authority. On subjects so sacred as the loves of some of the world's greatest men we should prefer to listen to a more skilful artist.

The Effects of Machinery on Wages. Being the Cambridge Cobden Prize Essay for 1877. By J. S. Nicholson. (Deighton, Bell and Sons.) Mr. Nicholson has followed an inductive method in his treatment of his subject. The deductive method led to opposite views respecting the effects of machinery. One school of economists, among whom Bastiat and Chevalier held a high place, starting from the principle that whatever diminishes effort and increases production must be advantageous to the whole of society—and that the steam engine and the powerloom simply render on a great scale benefits of the same kind, in relieving the human hand and multiplying its produce, that the handloom had rendered in an earlier age, and the bone needle in one still earlier—arrived at the conclusion that machinery must be beneficial to all classes, the labourers included. Another school, setting out from Ricardo's doctrine, that the sudden conversion of circulating into fixed capital may both diminish the amount of wages and supersede labour, have been disposed to regard the great recent increase of mechanical invention and power as on the whole detrimental to the working classes. Mr. Nicholson admits an element of truth in both views, but applies himself chiefly to the investigation of the actual effects, as ascertained by observation, of the progress of machinery. His conclusions from this point of view are of a mixed kind. On the one hand, he thinks there is evidence that machinery has given rise to more sudden and extensive fluctuations, and to greater precariousness of wages, than was the case in a simpler and more stable state of society. On the other hand, the tendency which he discovers in the history of machinery is that "these radical changes, these discontinuous leaps, tend to give place to advances by small increments of invention." The main danger of machinery to the working classes is one incident to the system of production on a large scale, it being impossible to adjust supply accurately to the changing conditions of a world-wide market. But the inference he draws is not the one Lancashire weavers have lately been contending for:—

"Let working men," he says, "instead of attempting the impracticable task of regulating supply, consider the remedies which lie within their reach; let them imitate the masters in saving when times are good, and let them use their political influence towards the improvement of international relations, for it is international disturbances that the most serious disturbances are due."

The essay throughout deserves the study of both

the working classes and their employers, as well as of theoretical economists, and is creditable to the younger generation of economists growing up at Cambridge.

NOTES AND NEWS.

THE works of Prévost-Paradol are being translated by Miss Clara Peirse, daughter of Charles Peirse, Esq., and will be issued with a Preface by Admiral Peirse.

SPIELHAGEN is engaged upon a new novel, which will be published in September. *Plattland* is the title of this new work, the scene of which, like that of *Sturmfluth*, will be laid in Prussia Proper.

WE understand that Ross Neil, the author of *Elfinella*, is Miss Isabella Harwood.

THE Index Society has received a donation of one hundred guineas from one who is interested in the objects of the society, and wishes to further them by timely assistance.

MESSRS. RIVINGTON are about to issue a *Short History of England for Schools*, by F. York Powell, M.A. This book is intended for the use of scholars in the middle and upper forms of schools, who, while they have outgrown the stage at which primers are useful, are not yet able to cope with larger and more complete histories.

THE same publishers have also in the press two volumes of their "Historical Biographies:" the Duke of Marlborough, by Louise Creighton; and the Duke of Wellington, by Rosamond Waite.

THE Pali College established in Kandy by Sumangala Unnanse, the learned chief-priest of Adam's Peak in Ceylon, has proved a greater success than was at first expected. The number of students has now grown to eighty, who go through a five years' course of Sanskrit, Pali, and Elu studies; and at the anniversary celebration on May 20 the Governor of Ceylon personally distributed the prizes for the year. It is worthy of notice that the distinguished principal of the college, who is probably the most influential member of the Buddhist Church in Ceylon, distinctly prides himself on the college being entirely unsectarian; and two of the prizes were won by Christian students. The aim of the supporters of the college is to revive and perpetuate among the native Singhalese a knowledge of the ancient literature of their island, which is now beginning to attract so much attention in the West. We are glad to see that such an aim meets with the enlightened support of the Governor, and that the college funds are supplemented by a Government grant.

A MEETING of the Council of the Library Association was held on Wednesday week, to discuss the arrangements for the first annual meeting of the association, to be held at Oxford in the autumn. The use of their rooms has been granted by the Oxford Union Society; and the meeting has been fixed for the last week of September or first week of October. A local committee is being formed at Oxford, and the council are now prepared to receive offers of papers or suggestions.

THE Library Association are issuing a circular of enquiries as to the existence and condition of parochial libraries, addressed to the rural deans. Mr. Shaw, of the Hartley Institution, Southampton, has undertaken the labour of correspondence, and of digesting the returns with a view to laying the results before the Oxford meeting of the Library Association.

THE forty-eighth Annual Meeting of the British Association for the Advancement of Science will commence at Dublin on Wednesday, August 14. Mr. William Spottiswoode, the President Elect, will deliver his address at 8 P.M. on the evening of that day. On August 15, at 8 P.M., there will be a *soirée*; on August 16, at 8.30 P.M., a Dis-

course, by Mr. G. J. Romanes, on "Animal Intelligence;" on August 19, at 8.30 p.m., a Discourse, by Prof. Dewar, on "Dissociation, or Modern Ideas of Chemical Action;" on August 20, at 8 p.m., a *soirée*; on August 21, the concluding General Meeting will be held, at 2.30 p.m. Excursions to places of interest in the neighbourhood of Dublin will be made on Thursday, August 22. The Assistant General Secretary is Mr. G. Griffith, of Harrow.

THE death is announced, on the 14th inst., at the age of forty-five, of the Swedish entomologist, Dr. Carl Stål.

M. POLITES, whose work on Modern Greek Mythology (*Νεοελληνική Μυθολογία*) was reviewed in the ACADEMY for September 18, 1875, has re-issued as a separate pamphlet his article on the myth of the Gorgons (*Ὁ περὶ τῶν Γοργόνων μῦθος*) which appeared in the April number of the *Parnassos* of Athens. In this he gives an interesting account of the beings to whom that name is attached by the modern Greeks, and of the superstitions connected with them. At the present day they are malevolent spirits of the sea, greatly dreaded by sailors; and the author points out the maritime character of the Gorgons in antiquity, and traces the points of correspondence between the ancient and modern conceptions, showing at the same time how the story of Scylla enters into the composition of the myths of the present day. One curious feature in these is the introduction of Alexander the Great, who occupies so prominent a place in mediæval Greek mythology. The fate of ships is often made to depend on the favourable or unfavourable answers the sailors return to questions addressed to them by the Gorgons on the subject of the fate of that hero. M. Polites publishes here for the first time an interesting popular story from the island of Paros, in which the Gorgon, who demands as her tribute one of the crew of every ship that passes through a certain strait, describes herself as having the sea for her mother, and Alexander for her father. The subject is illustrated with much learning from various sources.

IN the *Library Journal* Dr. J. S. Billings has a paper on the "National Catalogue of Medical Literature," from which it appears that Congress is now being asked to print the Catalogue of the Surgeon-General's Library. This comprises about 50,000 volumes, and includes 75 per cent. of all medical periodicals. The Catalogue contains 400,000 subject entries, and will make seven volumes royal octavo of 1,000 pages, with three more if an author-catalogue is added. But it seems a pity that if so extensive a compilation is to be printed, it should not, by co-operation with other medical libraries, be made absolutely complete, so as to represent an entire literature, and not merely a particular collection.

IN the *Revista Contemporanea* of May 15, Juan Valera, the poet and novelist, gives the second and last part of a *Zarzuela fantástica*, which recalls sometimes one of the poems in Moore's *Lalla Rookh*, at others one of G. Bequer's *Indian Tales*. J. Heredia y Garcia commences a study on Independent Ethics: in the present section he points out the frequent opposition between religion and morality. De Labra continues his history of "El Ateneo" of Madrid.

AN interesting little specimen of "Rhaeto-Romanisch" literature, elegantly got-up, has just come from the press of the Brothers Oasanova in Chur. It is in the dialect of the Graubünden Oberland, and is the work of a man equally renowned in the politics and the literature of his little fatherland, Alt-nationalrath Dr. J. Arpagans. The book is entitled *Fablas e Novellas, dedicadas alla giuventetgna romanscha*, da G. Arpagans, and is divided into five small portions: (1) *Poesias*, (2) *Proverbis*, (3) *Legns*, (Riddles), (4) *Fablas*, and (5) *Novellas*. The latter are novels in the earlier sense of short tales. The greater part of the

proverbs are of purely "Romanisch" origin, and it is almost a pity that Dr. Arpagans should have increased the bulk of this section by introducing mere translations of popular German proverbs. Among the "Poesias" are many imitations of well-known German songs, as "La matta estra," ("Das Mädchen aus der Fremde") and "Il matt," after Heine and Schiller. Dr. Arpagans has also introduced a few original lyrics, as "Il Maig" (the month of May) and "La sera" (Evening).

WE have received three pamphlets, extracts from the *Journal* of the Asiatic Society of Bengal, containing translations, with notes, of the Moallagh of Zuheyr, and of several other short pieces from the *Hamasah* and the *Kitab el Aghani*, by C. J. Lyall, C.S. We are glad to see any attempt to make these grand old poems of the desert more accessible to the ordinary reader, for they are as a rule very remarkable productions, and but for the unfamiliar language in which they are written would no doubt enjoy a considerable amount of popularity in Europe. Unlike the florid Persian poetry, they are for the most part simple and unaffected in style; and although they deal almost exclusively with the incidents of petty tribal warfare, cattle-lifting raids, and carousing, they contain many sentiments that are truly noble, as well as touches of real natural poetry. The *nasib*, or love-song, was in great esteem among the ancient Arabs, and one poet of great celebrity among them, Omar ibn Abi Rabiha, wrote nothing else; but for all that the softer sentiment did not find much expression in their verses, if we except the filial, paternal, or fraternal love displayed in some of their elegies. In the little collection before us there is a piece in which a father speaks with pathetic tenderness of his daughter, and prays for her death—

"Yes, death, the gentlest and kindest guest to visit a maid"—

rather than that she should be exposed to unkindness or poverty after his own decease. But as this ebullition of feeling in all probability accompanied preparations for performing the barbarous ceremony of *wa'd el bendt*, or "burying daughters alive," the sentiment counts for little. Another very striking poem is the death-song of Abd Yaghith, in which the author, who improvised the verses with a wine-bottle by his side and the veins of his arms severed, amicably addresses his captors and murderers, and contrasts his present uncomfortable position with his former renowned and stirring career, but without a trace either of despair, regret, or even petulance. The translations are very fairly correct, and the notes concise and apposite. The former are in a kind of unrhymed verse, the rhythm of which, though not unmusical, considerably puzzled us until we found from the translator's own account of them that two at least were attempts at imitating the metre of the original. It is true that many of the verses have the same number of long and short syllables in the English as in the Arabic, but there all resemblance ceases, as unfortunately not one single rhythmical accent falls correctly if they are read from that point of view, nor do they in the faintest manner represent the cadence of the Arabic metres.

MR. DAVID STEVENSON, C.E., author of the *Principles and Practice of Engineering*, &c., has in the press a Life of his father, Robert Stevenson, the projector and builder of the Bell Rock Lighthouse and other works. It will be published by Messrs. A. and C. Black.

NOTES OF TRAVEL.

THE most important paper in *Petermann's Mittheilungen* for July is a picturesquely-written preliminary account of his journeys in the Caucasus during 1876 by Dr. Gustav Radde. Mr. Birgham describes two of the Leeward Islands of the Hawaii or Sandwich group in the Pacific—Kauai and Nuhau—which have scarcely been visited

before; and Dr. J. van Bebber contributes a study of the distribution of rain in Germany in the four seasons, illustrated by charts. Herr Hugo von Kappenfels, who spent the years between 1873 and 1876 in elephant and gorilla hunting on the equatorial West African coast south of the Ogowé river, writes now to Dr. Petermann from Corisco Bay advocating very strongly the employment of trained elephants in African exploration.

IN the third part of the *Journal* of the Geographical Society of Berlin we find a most valuable study of the ethnography of Epirus by Prof. H. Kiepert, who has made himself so completely master of all that concerns the geography of the Balkan Peninsula. The accompanying part of the *Proceedings* of this society is enriched by a learned critique of the result of Col. Prejevalsky's recent journey to the Lob-Nor and the Altyn-tagh, by Baron Richthofen.

IN *Oregon: There and Back in 1877*, by Wallis Nash (Macmillan), we find a very pleasantly written account of a journey through this far-western State of North America. It fills an altogether new place, for, strange to say, this great territory, larger than Britain and only twenty days distant from Liverpool, possessing so many attractions of climate, soil, and beauty of scenery as to make it a most suitable field in all respects for English emigration, has never yet been popularly described. We can very cordially recommend this little work to anyone who is in search of a new land in which to try his fortune.

AT the request of the Commissioners appointed by the Cape Government for the representation of the Colony at the Paris Exhibition, Mr. John Noble has drawn up an historical and general account of *The Cape and South Africa* (Cape Town: Juta; London: Longmans). Within a little over 200 pages he has contrived to give a most compact sketch of the history of the colony, its physical aspects and climate, its geology and fauna, its political and civil institutions, agricultural and pastoral resources, revenue, commerce and native tribes. Mr. Noble is already well known as an able authority on matters connected with the Cape from his former works; in this handbook he brings accurate information down to the latest date.

WE regret to learn that after all the trouble which Captain H. W. Howgate has expended on the elaboration of his polar colonisation scheme, the United States Congress have refused to pass the bill authorising the despatch of an Arctic expedition, although, as we have before stated, it had been favourably reported upon by the committee to which it had been referred.

IT is announced that a Congress of Commercial Geography will be held at the Trocadéro Palace in September next, under the authority of the French Government, and foreign geographical societies have been invited to send representatives to it.

CAPTAIN RICHARD BURTON proposes to communicate to the British Association a paper on his recent work in Midian.

MR. G. J. MORRISON, to whose journey overland from Hankow to Canton we referred on June 15, has recently been engaged in examining the country along the Grand Canal of China, between the River Yang-tze, opposite Chinkiang, and Tientsin, on the Pei-ho.

AT the April meeting of the Russian Geographical Society a brief account was given of two projected expeditions, which are to be undertaken with the assistance of the Society, and both of which it is hoped will result in the collection of materials that will be useful in the establishment of future international polar stations. M. Tiaguine, who is at the head of a station formed last year at Novaya Zemlya for the purpose of assisting shipwrecked sailors, has offered his services for the collection of scientific materials, and it has been arranged

that he shall pass the whole year in the Arctic regions. He is to be supplied with instructions, instruments, &c., and will doubtless be able to forward interesting information respecting the physical geography of the country. The second of the expeditions will be in connexion with Prof. Nordenskiöld's voyage in the *Véga*. Lieut. Oscar Nordquist, of the Imperial Russian Guard, having volunteered his services, will take part in the general work of the expedition, and will besides collect and record all information likely to be interesting to the Russian Geographical Society. At the same meeting it was announced that M. Moukétow is about to undertake another expedition to the Tien Shan for the purpose of making geological researches in the southern portion of that range. As the northern part was carefully examined by him in 1876, we shall now have a complete knowledge of the geological formation of this chain of mountains.

MR. JESS YOUNG, the astronomer of Mr. Giles' late Australian expedition, has published at New York, in pamphlet form, a communication which he recently made to the American Geographical Society, entitled "Recent Journey of Exploration across the Continent of Australia; its Deserts, Native Races, and Natural History."

Now that so large a share of public attention is directed to Africa, Père Brucker is opportune in issuing as a *brochure* (Lyon: Pitrat aîné), under the title of *Découvreurs et Missionnaires dans l'Afrique Centrale*, the essay which he recently contributed to *Les Etudes Religieuses* on the subject of the geographical discoveries of the sixteenth and seventeenth centuries.

COL. PREJEVALSKY writes to a correspondent:—

"St. Petersburg: June 6/18, 1878.

"I deeply regret that I cannot send you further particulars of my travels. All the materials are in an unfinished state in my journals, and at present I am prevented from working at them, not having yet recovered from a severe illness which overtook me in the deserts of Dzungaria.

"By the advice of my physicians I am obliged to take complete rest and try the water-cure. Both one and the other I shall find on my estate in the Government of Smolensk, for which I start in a few days. There I shall remain until the beginning of October, and then return to St. Petersburg, and in December again start for Post Zaisan (Semipalatinsk district), whence I shall depart for Hami and Sha-chau en route for Tibet. Upon my return thence, probably at the end of 1880, I shall set to work on the materials I have collected."

THE COPYRIGHT REPORT.

THE suggestions for improvements in the law of copyright and the right of representation of stage plays embodied in the report of the Royal Commissioners are probably destined to undergo some modifications before they assume the shape of legal enactment; and the report, it is to be observed, is accompanied by an unusual number of separate reports from individual commissioners, dissenting in part from the document to which their names are appended, or pointing out what changes the writers would have preferred if they had not been outvoted by a majority of their brethren. Substantially, however, the recommendations of the commission constitute a valuable scheme of reform, not merely from the author's point of view, but from that of the public interest, which is justly regarded as the ultimate test of these, as of all other questions involving legislative action. It is something to have reduced to simple form and clear method the whole body of copyright and stage-right law, exhibiting in the same orderly way the points in which it is wanting in completeness or in exact definition; and the report undoubtedly shows how by the abolition of unnecessary distinctions, and the observance, as far as possible, of a uniform principle, it may be rendered intelligible to all within the compass of a short manual. The separately printed evidence

on which the report is founded is very voluminous, and much of its matter, it must be confessed, fails to add anything to our knowledge of the subject; but there is nevertheless a large body of information to be found in the answers of the forty-nine witnesses examined, more especially on the difficult questions of international and colonial copyright; and when the indispensable aid of an index shall have been furnished to the questions, nearly six thousand in number, the equally numerous answers, and the various documents which occupy the appendix, the volume will form a useful work of reference, and a ready means of testing the soundness both of the proposed reforms and of the suggestions of the protesting commissioners.

Perhaps no more pertinent illustration could be cited of the careless and inefficient nature of the provisions of the present copyright law than their failure to take adequate precautions for securing to the public the benefit of lapsed copyrights. The patent laws, which have been devised in a far more scientific spirit, are particularly explicit upon this point. Registration of patents is as absolute a condition of protection as clear and definite statement of claims; and the very day when a patent expires, either by the fulfilment of the term accorded by law or by failure to follow up any one of its stages, may be ascertained in a moment without even payment of a fee. In the case of books, plays, and works of art there is, on the contrary, absolutely no system of this kind. A superstitious regard for vested interests of an indefensible nature has induced our law-makers to leave the important task of registering this immense property, in which the public have a reversionary interest, in the hands of the irresponsible and necessarily apathetic Stationers' Company, an ancient City guild, which, like other mediæval civic combinations "in restraint of trade," has long ceased to have much more than a nominal connexion with the art and mystery which it affects to represent. It is notorious that a search at Stationers' Hall is, especially for negative purposes, not worth the fee upon fee which is so jealously exacted; and this not only because the books are ill-digested and without proper cross references, but because only an infinitesimal number of publications is ever registered at all. So carelessly is the Act of Parliament worded that it has been decided that, at least in the case of literary works, no one is under any obligation to register unless he is going to law to protect his interests. When a book has been published, therefore, must be gathered from the title-page, which is often misleading, or from contemporary records which are no less uncertain. To render the matter still more complex, copyright and the right of representation on the stage are contingent, not only upon a term of years, but on the lifetime of the author; and on this point not the least help is afforded. The illustrious dead present, of course, no difficulty. Everyone knows when Dickens and Thackeray died, and when the copyright of one of Dickens's works expired the other day, the publishers were not slow to put forth a popular edition at something scarcely above the price of print and paper. But even in the case of famous authors there is no clue afforded when the writings have been published anonymously and not subsequently acknowledged. The American editions of Thackeray's works comprise many essays of interest, reprinted, I believe, chiefly from *Fraser's Magazine*, and attributed to him on internal evidence only. But the vast majority of writers are not illustrious; and the attempt to ascertain the dates of their deaths after forty-two years would in the majority of cases present considerable if not insurmountable difficulty. It is obvious that if to know the date at which copyrights expire were of no practical importance, copyright might as well be perpetual as limited. Yet certainly no adequate provision exists for making known in whom copyright is vested, or when a copyright work falls, like an expired patent, into the domain of public pro-

perty; while in the case of the first performance of a play, though the term accorded dates from that performance, there is absolutely no registration at all. It is so clear that a strictly public duty of this kind ought to be entrusted, like the function of keeping the patent records and the registry of designs, to a public officer, responsible to Government and having no direct interest in fees, that it is surprising to find that a suggestion to this effect in the report is met by a separate protest from three of the commissioners, and a sentimental plea for mercy towards "an ancient company." The Stationers' Company, it may be observed, never was, and never pretended to be, inspired by zeal for the public interest. Its ancient functions were to keep a register of the property of a close fraternity of booksellers who, before the famous decision of the House of Lords in 1774, supposed themselves to have acquired, as remote representatives of Jaggard, Simmonds, and other forefathers of the publishing trade, a perpetual monopoly under the common law in such writers as Shakspeare and Milton. In more recent times their chief interest in literature has arisen from their right to exact a fee of five shillings for every entry and every certified copy—a privilege which since the establishment of international copyright has become more and more valuable, and which, if registration were compulsory, would bring them a revenue out of all proportion to any service rendered to authors or the public.

It may be assumed that in any bill drafted upon the basis of this report the establishment of systematic registration, with simple intelligible indexes open to all on payment of a trifling fee, will be duly provided for. It is no less clear that in the interest of the public, which has hitherto been so strangely overlooked in this matter, registration should be not optional but compulsory. Up to this point, indeed, the commissioners are as one; their only ground of difference being the mode in which registration shall be enforced. The report recommends that delay in registering shall so far destroy the rights of authors and their assignees that no damages shall be recoverable in respect of infringement before registration; and this is actually the law in respect of copyright in art works other than engravings. But Mr. Anthony Trollope and other dissentients have with good reason objected on the ground, among others, that while the danger of piracy would in most instances be too small to ensure uniform registration, a mere oversight of a publisher might in the case of a popular writer lead to the infliction of a penalty altogether out of proportion to the offence of delaying to register. It is more important to observe that the system proposed has, in the case of works of art, failed, after long trial, to secure anything approaching to complete and uniform registration. Really, all that is wanted is to enforce rigidly, under a penalty, the obligation to deliver a copy of every publication to some public officer. This is actually the duty of the British Museum officials; and the simple solution of the difficulty seems to be that the office for delivery of the copy due to the national library shall be also the office for registration. Unfortunately, the British Museum authorities, under the influence, it would seem, of that instinctive dread of more work which seems to be the normal condition of mind in public offices—at least when the suggestion comes from without—has rather curtly declined either to undertake this charge or to confer with the commission. Yet if the books of the Museum Library are properly kept, and the powers of the trustees duly enforced, the register of their receiving clerk ought to be already a full and complete register at least of titles of copyright works issued in any given year.

The question of registration is likely to provoke less discussion than the suggestion that the present term of literary copyright—namely, the lifetime of the author and seven years' grace, with the pro-

viso that the term shall in no case be less than forty-two years—should be abolished in favour of a simple term of thirty years from the death of the author, or, in the case of anonymous works, from the date of publication. The wish to get rid of the double element of calculation is consistent with the principle of the report, which is that of simplicity; but there is great force in the objection that the change proposed still imposes on the public the duty of finding out when an author dies. Some witnesses, it is true, attach so little importance to this element of uncertainty, that they have proposed that copyright should be extended to the lives of authors' children, in which case a dozen certificates of death of sons who might be scattered over the globe, or of daughters who had concealed their identity under the names of husbands, would be needful before a copyright could be known to have lapsed. The counter suggestion that the right should extend only to a fixed term from the date of publication has clearly an advantage in this respect. Nor ought the objection that an author might in that case be annoyed by finding an early work reprinted without his consent to weigh much, if the term presumptively is sufficient to provide an adequate incentive for the production of good books. Perhaps it would be better to say that the somewhat remote risk of annoyance from this cause is no more than the literary and artistic class may fairly be asked to encounter for the sake of establishing a rule so clear and simple, and so obviously advantageous to the public. Fifty years has been suggested as a uniform term, applicable to literature, the drama, and works of art. Under such a regulation the copyright in Mr. Tennyson's juvenile pieces would be now on the point of lapsing; and it is easy to understand that the reprint without his leave of poems, some of which he has long rigidly suppressed, would be distasteful to their author. This, however, would be a comparatively rare instance; and it is to be remembered that the right of suppression is in such a case only accorded to the author for seven years beyond the limit of life. It would perhaps be hard to say whether an author's fame is likely to suffer more from unauthorised publication while he is alive to protest, to confess shortcomings, or to explain and qualify early opinions, than it would be when he is no longer able to combat the misapprehensions, foreseen or unforeseen, to which their republication might give rise. Even the immature works of genius have an interest for the biographical, and often for the literary student; it is certain that eventually editions of Mr. Tennyson's writings will be published comprising both that which he approved and that which he disapproved. On the whole the alternative suggestion of a fixed term seems likely to commend itself most to those who have given most attention to the subject.

Under the same head of home copyright the commissioners recommend that while the term in contributions to cyclopaedias and periodicals should, as now, be identical with that in books, the right of republication where no special contract has been made, should revert to the author at the end of three instead of twenty-eight years. The printed evidence appears to furnish abundant justification for this change. The present system is anomalous and even absurd; for it vests the right of republication neither in one party nor in the other, while it deprives the author of any remedy for piracy committed by an outsider. Thus affairs in the case of periodical contributions are brought to a dead-lock. A magazine three years old is, as a rule, worth so little that infringement of its copyright would certainly inflict no appreciable damage. On the other hand, the author, unless secured by a special arrangement, is not at liberty to collect his scattered writings, though they might have the permanent value of the contributions of Mr. Mill and Lord Macaulay to the *Westminster* and the *Edinburgh Reviews*. It is difficult to see what injustice could be done

by limiting the magazine proprietor's share in the term of copyright to three years, unless, as in the case of the Agricultural Leases Bill, the parties should think fit to except the case by special covenant from the operation of the law. The report very reasonably suggests that meanwhile not only the author and the magazine proprietor, but every other person, shall be expressly forbidden to reprint, and that further the author shall, from the first, have a remedy for piracy.

By a strange oversight the report proposes to perpetuate the ambiguity of the Copyright Act with regard to posthumous works, which are to belong "to the proprietor of the author's manuscript and his assigns." To part with a manuscript, and to part with the right of multiplying copies, are so obviously two different things that it is difficult to understand why copyright should not be vested in the author's family, even though no autograph copy should be in their possession. To take an example: Keble's sacred poems—though they subsequently proved to be a most valuable copyright—were long withheld by the author from the press. More than one copy in his own beautiful handwriting had, however, been presented by their accomplished writer to friends. Should an author die under these circumstances, it would be impossible to say to whom the copyright would belong. Again, in the case of letters it is a well-established principle that the correspondent of the writer has no property in anything but the letter itself; but under the existing law, and the law as proposed, it would seem that every possessor of a letter would be invested with the copyright therein on the writer's death. The importance of this point will be at once perceived when it is considered how important a material for the biographer is the correspondence of a distinguished person.

There are so many other matters referred to in the report and the evidence in connexion both with home copyright and colonial and international questions, that I must crave leave to extend these observations to another paper.

MOY THOMAS.

CONGRÈS INTERNATIONAL DE DÉMOGRAPHIE.

AN International Congress of Demography will be held at Paris, from July 3 to 9, with the view of collecting together the *savants* of all countries who may wish to discuss the theoretical and practical questions connected with the progress of demography and medical geography; and Governments, scientific societies, &c., are particularly invited to depute delegates to represent them at it. The organising committee recommend the study and discussion of the following questions:—"Recensement de population; registres de la population; enregistrement des actes de l'état civil et constatations médicales des naissances et des décès; mort-nés; méthodes de calcul de la mortalité; statistique militaire; géographie médicale; organisation de bureau de statistique; projet d'une publication démographique récapitulative dans chaque pays; émigration; programme d'enseignement de la démographie." It is announced that a more detailed programme of the matters to be brought under the consideration of the congress will be issued immediately.

SELECTED BOOKS.

General Literature.

- LIBELL** of English policy. 1486. Text v. W. Hertzberg. Mit. e. geschichtl. Einleitg. v. R. Pauli. Leipzig: Hirzel. 4 M.

CORRESPONDENCE.

THE "MADONNA DEI CANDELABRI."

Florence: June 18, 1878.

Perhaps you will give me a corner to say something about the *Madonna dei Candelabri* and copies of it. It is impossible not to experience extreme surprise on reading that a picture which takes so secondary a place as this one does among the works of Raphael should be withdrawn from sale at the enormous price of 19,000*l.*, or that any one should have been found to offer so vast a sum for such an example. When it was at Lucca the Duke was very unwilling to allow it to be copied, but he was persuaded; and then, as usual, copies were made from the original copy, and others from these second editions, and again duplicates of these to the tenth generation, just as copies of copies are prepared of the *Madonna della Sediola* for English buyers, who never tire of spending money on such trash, and who are the most facile victims of Italian ingenuity in the world, the Americans excepted.

Many copies were made of the *Madonna dei Candelabri* in this way; in fact, many were fabricated by the help of the engraving from the picture, being coloured from memory. These do quite as well as any others for the exquisite judges who send home ship-loads of copies. With regard to old copies I have not seen many of this picture. With the one in Edinburgh I am of course acquainted. Should it be brought forward I have no doubt that the circumstances which attended its purchase simply as an old copy will be frankly stated. I have sometimes purchased an old copy of a famous picture for a small sum of money for a friend; but I should feel much surprised if any one of these was brought forward in any but its real character, or if it should be suggested that I had made a mistake, and given for a trifling sum a picture of great value.

If the cheerful writer in the *Illustrated News* means that he has seen a great number of old copies of this Raphael, now made so famous by the rejection of so immense a price, I venture to say that he is mistaken; if he merely means that he has seen a great many copies, he is no doubt quite right, for their name is legion. I may mention on this subject that modern copies of popular pictures are sometimes attached to old panels purchased on purpose. These copies are carefully and very skilfully prepared to resemble old works; seals and inscriptions are forged on the back of the panels, and every trouble is taken to make the imposition complete. I know of the sale of a pretended old copy of the *Madonna della Sediola* for 2,000 crowns, which was thus prepared. There are plenty of victims whose confidence in their own judgment is invincible, who are admirable customers of dealers in modern imitations of old art of every class, and I suppose that it will always be so.

C. HEATH WILSON.

THE SARACENS IN PORTUGAL.

Oporto : June 20, 1878.

May I beg you to allow me to answer a very grave charge of inaccuracy in the review—in last week's *ACADEMY*—of a paper of mine upon Portugal in the *Cornhill* for June?

Your critic represents me as saying that *Alaude*, a lute in Portuguese, is taken more directly from the Arabic *Al ud* than the shortened Spanish word *Aude*. *Aude*, he says, is not Spanish. It is quite true: in fact, *aude* is a misprint for *laude*; I wrote *laude*, and the printer had dropped the initial *l*. Again, your critic contends that I ought to know that *guitar* comes from *cithara*. It does, and I know it well; but its etymology had no bearing whatever on what I was contending for, which was that *guitar* (the thing, not the word), as used in about the thirteenth century, though it had a Romance name, was an Oriental instrument—was a sort of lute, and not a lyre.

The third charge of your critic against me is that, "to judge from expressions" in my paper, I must imagine the Saracens to have begun their education of the Christians of Spain and Portugal immediately after the battle of Guadalete. If there is any phrase in my article which conveys that impression—I can find none—it conveys an impression which neither is nor ever was in my own mind. As your critic says, the Christian Goths were at the time of the invasion far the more civilised people of the two, and the invaders learnt a good deal from them. The warmest advocate of Moorish culture has never denied this; but, as time went on, during the long period when the various Christian kingdoms of Spain were slowly emerging into being, and fighting at first for existence and at last for supremacy against the Infidel, the Christians had greatly degenerated in civilisation, and the Saracens had reached a most surprising degree of culture in all the arts of peace and war. They imparted much of this culture to the Goths during the long centuries when a chivalrous warfare was maintained between the two races; and it was my contention, in the article in the *Cornhill*, that it was chiefly in consequence of the imparting of this culture that Christian ascendancy was finally won.

Perhaps I should have made more of a point of the gradual nature of this process, but I had done so very fully in a previous paper, and I did not care to repeat myself. At any rate, in my view of the matter, as I have now developed it, I am certain there can be no serious divergence of opinion between myself and your able critic.

J. L.

THE SITE OF THE ROMAN CITY OF VOLUBILIS.

London.

In my travels in Morocco last summer I had the honour of being attached to the Portuguese Embassy to the Sultan. His Excellency the Ambassador, Señor Joseph de Colaço, was anxious to turn the occasion to account, and the opportunity was thus afforded of visiting some places not accessible to the ordinary traveller.

The identification of an ancient city is always a matter of great interest, and with this object in view I carefully examined the remarkable ruins called *Kassar Pharaon* (Pharaoh's Castle), situated about twelve miles north-east from Mequinez, and about twenty-eight miles north-west from Fez. The ruins lie out of the direct road to either of these places; but the fact that they have been so seldom visited by Europeans is due not so much to this circumstance as to the extreme jealousy with which the adjacent Zaouia or sanctuary of Muley Edris is guarded.

Rohlfs, who travelled as a Mussulman, and was thus able to enter the sanctuary, makes no mention of the ruins. He says, in connexion with his visit, that he was "always looked upon with distrust—to ask directly about any place would not do at all, I should have been at once denounced

as a spy."* Following Leo Africanus, he supposes the town of Muley Edris to occupy the site of Volubilis. I shall have more to say on this subject hereafter.

This Muley Edris was the father of him of the same name by whom the city of Fez was founded. The town in connexion with the sanctuary is placed on the southern declivities of two cone-shaped elevations of a mountain called Zarhoun. At a distance of about two miles from the town the ruins stand upon a level platform, in part supported by a wall, beyond which the ground slopes abruptly towards the south. To the west of the ruins blocks of hewn stone are scattered over a considerable space, with here and there Roman carved work in scrolls and egg and tongue patterns, &c. All these stones, as well as those of the standing portions of the buildings and of the tombs, are of the same material—namely, grey limestone.

The ruins appear to belong to the late Roman period. One of them consists of the remains of a building which measured externally thirty-six yards in length by twenty yards in breadth. Two large archways still exist in the portions of the walls that formed the ends of the structure. The southern wall, of which most remains, is about forty feet in height. It is interesting to find that Windus—who visited the place 166 years ago under the same circumstances as myself, having accompanied an embassy—gives a drawing and a short description of the ruins.† He describes the ruin now under consideration as the "good part of the front of a large square building; . . . parts of the four corners are yet standing, but very little remains, except these, of the front." Since Windus wrote, the whole of the front and the corresponding wall at the back have entirely disappeared, except so much of them as is almost on a level with the ground. No cement appears to have been used, and the stones in the standing walls in some places show spaces of an inch or two between them. In other cases the blocks are in such positions as to threaten to fall out of the edges of the walls. It is plain that these effects could only have been produced by a rocking movement in definite directions. It is almost certain, therefore, that a succession of earthquake shocks acting in the direction of north and south have prostrated the front wall described by Windus, and at the same time shaken the stones of the end walls loose in the manner described by myself.

At a distance of one hundred yards towards the north on the same platform, and facing in the same direction, but at a slightly diverging angle, stand the remains of an arch. The archway was twenty feet wide, and from the massiveness of the structure, and both sides being alike, it was probably a triumphal arch. This was the opinion of Windus, whose drawing of it represents the arch as unbroken. Underneath it he found six fragments of stones that contained portions of inscriptions (also figured by him), which, he says, "were fixed higher [on the arch] than any part now standing." A portion of one of these fragments was identified by me. The remainder probably lie buried in the debris of the fallen arch.‡ A mutilated bust in bas-relief, figured by

* *Adventures in Morocco*. By Dr. Gerhard Rohlfs. (London, 1874.) Pp. 120, 109.

† *A Journey to Mequinez, &c.*; on the Occasion of Commodore Stewart's Embassy thither for the Redemption of the British Captives in the Year 1721 (London, 1725), p. 85.

‡ The fragment I saw contained slender-shaped letters about six inches in length. All the portions of inscriptions figured by Windus were too fragmentary for anything to be made out of them, and he made no attempt of the kind. Sebaste, the Greek rendering of Augusta, appeared on one of them, and the repetition of the letters *MAX* indicated that the inscriptions were connected with something imperial, probably the record of a triumph. Windus says of the ruins: "Which the Moors call *Kassar Pharaon* (i.e. Pharaoh's Castle), who they told us was a Christian, but could not give any further account

Windus, is also still to be seen. Many fragments of pilasters and pillars and of Corinthian capitals are strewn about the platform. Besides fragments of buildings the abrupt slope previously mentioned has upon it several tombs apparently still intact. Two of these bear inscriptions of which Windus makes no mention. The larger one is covered by a slab almost on a level with the soil. Before describing this I have to make a few observations.

It was a curious coincidence that the inscription on this slab, copied from a German journal, was inserted in the *ACADEMY* at the same time (August 4) that a letter of mine on the same subject was already in type for insertion. The latter was, however, not published. Circumstances prove that the long-neglected inscription in question was copied independently within a very few days by members of the German Embassy to the Sultan and by myself, assisted by the Portuguese Ambassador and Mr. C. Murdoch.

The thick slab in question is about five feet long by three feet wide, and is badly fractured longitudinally. The inscription is contained within a border of scroll-work ornament. Here is an exact copy of that made with much care by myself. The lines are numbered for convenience of reference:—

1. QCAECILIOQFILIO
2. DOMITIANOCLVDIA
3. VOLVBILIANODICV
4. RIONIMUNICIPII
5. VOLVBILIANIAN
6. NORVMX QCAE
7. CIIIVSS ACRA
8. CIIISIICM
9. ANTONIANI
10. IISIIIIIOIII
11. IOS

Note, in lines 7, 8, and 10, the repetition of the letter *I* occurs because all that is apparent about certain letters is that they possessed upright lines. It is easy, however, in the majority of the cases to make out the letters to which these lines undoubtedly belonged. The reading of this by Prof. Mommsen, as given in the *ACADEMY*, August 4, is:—

"Q(uinto) Caecilio Q(uiti) filio Domitiano Claudia Volubiliano, decurioni municipii Volubiliani, annorum XX, Q(uintus) Caecilius (et) Antonia N(ata)lis filio pii(ssimo) posuerunt."

This agrees with my reading and interpretation, with the following exceptions. It is, however, to be observed that the exact copy of the inscription sent to this eminent authority is not before us.

Line 3. A letter is omitted: it is "Volubiliano," not "Volubiliano."

Line 5. The same omission occurs.

Line 6. I could not decipher the letter which succeeded *X*, owing to the fracture of the stone. The hiatus is filled in the German copy by a second *X*.

Line 7. In my copy after "Caecilius," *S* occurs, and with a hiatus of two or three letters, owing to the increased damage from the fracture; the

thereof. A draught of which, with the Inscriptions of several stones found in the Ruins, I have taken, for the Consideration of the Curious." I have found another view of the ruins, in the same state as when drawn by Windus, in a work entitled *Several Voyages to Barbary* (2nd ed., London, 1736, p. 141). The only reference to the plate is contained in the following passage. Speaking of slaves at Mequinez, it is stated:—"One of them, Capt. Henry Boyd (since deceased), having taken a plan of that place, with some sketch of the slaves' employment there, we thought fit to insert it, together with three other Draughts of his, viz., a coast chart, some Roman ruins, and a plan of Alcasar, which possibly may be acceptable to the curious, tho' not immediately relating to the present subject."

letters "acra" are quite readable. This portion of the inscription is not included in the reading by Mommsen given above. But he says: "I cannot decipher the cognomen and position of the father; perhaps there stood something like 'Gracilis leg[ionis] I.'" Evidently these words were conjectured by reading the antepenultimate letter of line 7 as G, and making up the remainder from the letters and portions of letters in line 8, except the last letter; this is plainly M.

Line 9. Both copies agree with the exception of the last letter, which I make I, and Prof. Mommsen conjecturally A.

Line 10. The letters are very imperfect, but from their arrangement and general appearance, and comparison with other inscriptions, no doubt can be entertained that, as stated by Mommsen, the words "Filio piissimo" were inscribed.

Line 11. The same remarks apply to IOS, which is certainly to be read "posuerunt."

The circumstance that the monument is in memory of a native of Volubilis, and one of its municipal officers, affords strong presumptive evidence that it was placed at Volubilis.

The other monumental inscription is on the perpendicular face of a block of stone about two feet square. There are two holes in the top of the stone, which seem to have been intended for attaching something to it, possibly a statue. The inscription is as follows:—

MFABIOLIILCI
ROGATOANXVII
LEABIVSCRISPVS
PATER
FILIOPIISSIMO
POS

"M(arco) Fabio . . . Rogato An(norum) XVII Leabius (sic) Crispus Pater Filio piissimo pos(uit)."

That Volubilis was an important place may be judged from the ruins described—assuming, as I believe, that they belonged to that city—and from the mention of it by many ancient authors. Pliny says:*

"Ab Lixo XL. M. in Mediterraneo altera Augusti colonia est Babba, Julia Campestris appellata; et tertia Banasa, LXXV. M., Valentia cognominata. Ab ea XXXV. M. pass. Volubilis oppidum tantundem a mari utroque distans."

There can be no doubt that the Lixus river of Pliny is identical with the modern El Kus or Lucos river. But as the positions of Babba and Banasa are open to doubt, the distances given here can help us little in fixing the position of Volubilis. But the distance of the sanctuary of Muley Edris from either sea—that is, from the Mediterranean and the Atlantic—as shown on the best map of Morocco,† accords well with Pliny's statement. The map shows that Volubilis was somewhat nearer to the Atlantic than to the Mediterranean, if we place it close to Muley Edris. But if it be assigned to the site of the modern city of Fez it would be considerably nearer to the Mediterranean than to the Atlantic. Ptolemy mentions Οὐλοῦβις in his tables of the positions of places,‡ but it is impossible in this case also to fix that of this city by his aid.

In one edition of Pomponius Mela Volubilis is mentioned as one of the principal cities of Mauretania Tingitana;§ in another edition the word Dubritania is substituted.||

The question arises whether the site of Volubilis was not that of the modern city of Fez as alleged by some authors. If the distances given in the *Itinerarium Antonini* could be trusted, Fez must be adopted as the site. He states that

Volubilis was "*Mill. pass. xvi.*" from Aquae Daciae.* Hot springs were known to have existed here, and at about the distance mentioned from Fez is the hot sulphurous water of Ain Sidi Yussuf, which is unquestionably identical with Aquae Daciae. But from the many known errors with regard to distances in this author, it would be rash to accept his statement as a proof.

Hemso says:—

"Volubilis, o Volobilis, da molti creduta Fas, ma più precisamente la Tiulit, e Gualili dei secoli di mezzo, e la Zauiat Mula-Driis dei nostri giorni."*

In all that concerns Morocco, no author is so much quoted as Leo, who wrote in the sixteenth century; and his statements may in general be relied on. He asserts that the town which contained the sepulchre of Muley Edris, on Mount Zarhoun, was called Gualili, and was built by the Romans. Some author, struck perhaps by the possible transmutation of Volubilis (not mentioned by Leo) into Gualili, concluded that the modern town had succeeded to the ancient one. This statement has been often repeated without question. But a reference to Leo's work† will show that he also speaks "of a certain town called the Palace of Pharaoh," as being also founded by the Romans, and about eight miles from Gualili. The distance here given, even supposing the miles to be of the shortest description, makes it improbable that Leo visited the place. After combating the idea that the town was built by Pharaoh, King of Egypt, he says: "I am rather of opinion, by the Latine letters which are engraven on the walles, that the Romans built this towne."

My enquiries lead me to believe that the name Gualili is not known in connexion with Muley Edris at the present time. And while I think it highly improbable that an important city like Volubilis would be placed on the steep declivity of a mountain, it seems to me reasonable to suppose that from the proximity of the two places the now obsolete name Gualili, assuming it to be derived from Volubilis, would easily be transferred by mistake or otherwise from one place to the other.

The position of the ruins is one admirably adapted for an important city. It commands a fine view over an extensive and fertile plain. It is central as regards the northern portion of Morocco, and on the direct road to many of the remoter parts. Even as they are, the ruins and inscriptions are of particular interest, because they are the most westerly remains of the far-extending Roman Empire.

SCIENCE.

British Barrows: a Record of the Examination of Sepulchral Mounds in various Parts of England. By William Greenwell, M.A., F.S.A. Together with Description of Figures of Skulls, and general Remarks on prehistoric Crania, by George Rolleston, M.D., F.R.S., Linacre Professor of Anatomy and Physiology. (Oxford: Clarendon Press, 1877.)

WITHIN the present century, almost within the present generation, the science of

archaeology has assumed an attitude and aspect never attained by it before. It is no longer disguised and smothered by the dogmatic assumptions of utterly defective knowledge, supported by nothing better than hasty deductions from evidence alike imperfectly collected and mistakenly interpreted. The mere fact, to mention but one, that careful, accurate, scientifically-conducted and recorded investigations of drift-matters and cave-relics have gone far enough to establish on a, to all appearance, firm and steadfast basis the inevitable conclusion of inter-glacial, even if not of pre-glacial, human occupation of different parts of the earth's surface, and notably of several different parts of our own country, is of itself sufficient to place one large section of that great subject-matter which it is the business of the archaeologist to handle on an entirely new footing. As long as it was held that we had scarcely to go back beyond a score or two of centuries, at the uttermost, in order to come across the "Aborigines," the very ground of enquiry itself was, by the hypothesis, completely removed. Now it is different: for it has been demonstrated that there is ample reason for assuming that, like as within the realm of History race has succeeded race in the occupation of given districts of the world's space, subject usually to a slow succession of gradual change, not unlike in principle to the changes produced by the dissolving-view apparatus, so also in the far-away, dim, mysterious ages of pre-historic times, and down to the very verge of History, race has followed race, seldom, if ever perhaps, with exterminating action or efficacy, but surely with active power and influence, each in its turn, to modify, probably to improve, and certainly to incorporate itself with, rather than to absorb or be absorbed by, its immediate predecessor: excepting, of course, and always, the cases wherein some mighty cosmic change, of many of which significant traces yet abide, may have involved, at least for the time being, an utter removal—for we can hardly assume a series of geological changes so great and so hurried as to imply the destruction—of the existing living occupants of the space or spaces affected.

But it is not only that a recognised field of enquiry of the utmost interest, though unhappily, in comparison with the existing or probable means and materials of investigation, only too boundless and impossible adequately to occupy, has been opened up. It has been now for a good many years a recognised fact that it is not too late or too difficult to make out something in the nature of history—shadowy, it may be, and very fragmentary, and altogether unsatisfying, but still of the real essence of history—in connexion with the race or races, hitherto regarded as unknowable as well as pre-historic, which have, through given epochs—probably long ones—occupied such and such portions of the world. And with such a view, and specially with reference to our own country, it has been fully and generally recognised that what was wanted for the purpose was as large a collection as it might still be possible to make of facts, and careful and accurate observations, all religiously recorded, and bearing upon the

general enquiry who and what our prehistoric predecessors in the occupation of our country really were. And one great field and opportunity for making such a collection, a field and opportunity second to no other, was presented by the—alas! comparatively few—graves and grave-mounds of our long-ago ancestors still left in being. Comparatively few: for, to give one instance out of many like, in the district best known to the present writer, a great portion of it being yet unreclaimed, the sites of a score of barrows of large size, which have been bodily removed, may be pointed out; five or six times as many more have been ruthlessly rifled and defaced, leaving only in some instances their secondary interments for the more careful and reverent seeker; besides probably hundreds of smaller mounds destroyed for the sake of their stony materials; and not a single shred of record of the contents of any one of them, or their structure or other noteworthy features or characteristics, preserved. Yet, when even from these ruins it has been found possible to rescue a long and interesting series of sepulchral memorials, who shall say what may have been the amount and the value of that which has been irretrievably lost?

In this connexion Mr. Greenwell's book will be hailed as most timely, as well as of more than ordinary interest and value. For the most cursory inspection of its contents will suffice to show how great a mass of facts, equally authentic and instructive, he has succeeded—and in multitudes of instances only just been in time to succeed, in the progress of the destroying plough—in noting and treasuring up during the past fifteen years, and now at length in putting on permanent record for the study, use and information of the large class who take interest in all that belongs to their race, and are willing, therefore, to study the development and culture and habits, so far as they can yet be traced, of our remote skin-clad, semi-savage, or, perhaps, even wholly-savage, predecessors in Britain.

No living man probably has had the same opportunities as Mr. Greenwell, and probably, also, no other man has to so great a degree created them for himself, not only by the resolute, untiring zeal with which he has followed out each as it arose, but by the self-attesting care and thought and exhaustiveness of his explorations, and the equally evident fidelity, accuracy and completeness of his records. These characteristics, patent to all observers as the explorations proceeded, are equally patent in every page of the present book; and, although some may be found to dissent from some of Mr. Greenwell's conclusions, it is quite certain that none will be able to cavil as to the completeness of the investigations recorded, or the fidelity with which every notable circumstance as well as every prominent fact has been handed over to the reader to use, if he will, in forming his own conclusions.

The book divides itself into three portions: first, an Introduction of some hundred and forty pages, in which Mr. Greenwell deals with the general subject and states in detail his views and conclusions; next, the detailed record of the opening of above three hundred barrows, principally situate in York-

shire; and lastly, a very able and elaborate paper by Dr. Rolleston in description of the skulls figured, and examination of the phenomena presented by the scientific exploration of the various long-barrows met with by Mr. Greenwell and himself in different parts of the country.

From a variety of considerations there can be little or no doubt that the opinion freely stated by Mr. Greenwell, and rather assumed as valid than simply stated by Dr. Rolleston, that the "long barrows are the earliest sepulchral mounds to be met with in England;" that the remains found in them are the remains of an "earlier people" than any of those found in any other sepulchral abiding-place, is a thoroughly well founded one. And there appears to be equal reason for assuming as proved that the long-barrow-age was a pre-metallic age, and that of the round barrows one which witnessed, even if it were not ushered in by, the introduction of bronze. But, beside noticing these two epochs or ages, we have to think of the fact that, while a long-barrow on some lofty hill may be under examination by the antiquary, "the sides and bottom of such hill may contain in their gravels the implements, if not the bones, of still earlier races;" and of the further fact that there was yet another period "called the late Celtic period, and intervening between the close of the bronze age (or that of the round barrows) and the establishment of the Roman power in this country"—facts such that, without a measure of attention allotted to them, it is impossible to estimate rightly either the scope of such a book as *British Barrows*, or the realised additions to knowledge made in its pages.

Dr. Rolleston, at the outset of his remarks on the series of prehistoric crania submitted to his examination, states that he prefers speaking of the crania of the long-barrow period as belonging to the "Silurian"—not the "Iberian"—type, and of the brachy-cephalic crania of the round-barrow as belonging, not to a "Ligurian," but to a "Cymbric" type; and his reasons are weighty and apparently conclusive, especially when taken in connexion with his own qualification, that it is necessary "to keep in mind that a division of skulls into skulls of a Silurian and skulls of a Cymbric type is, probably, not coincident with that division of the Celtic race into Gaels and Cymry which is, I suppose, the division usually adopted by historians and literary antiquarians." But dealt with as they are in the vividly descriptive manner so characteristic of the writer, these two types of skull are not merely presented to the reader in their striking diversity of form, but he is made to see the marked contrast in head, face, figure, stature, and muscular development characterising the two races, testifying to the superior physical and mental endowments of the Cymbric round-heads, and so tending to explain and authenticate Mr. Greenwell's conclusion that the Silurian long-heads were out-mastered and subjugated by an invading tribe or tribes, quite as much as the assumed, and all but certain, possession by the latter of weapons of metal, in opposition to those of mere stone and bone owned by the former. Certainly it is a fact

that only long-headed (dolicho-cephalic) skulls are found in the long barrows, with shorter and weaker bones appertaining to the trunk, and no metal, no implements, no pottery (save a few sherds), and but one single ornament so far recorded: in the round barrows, on the other hand, skulls of both shapes, as might be expected on the assumption of a victorious occupation of the country by an invading and therefore necessarily smaller body of people, but mightier, notwithstanding, by reason of their natural gifts and their acquired metal. They would intermingle with, but not extirpate, the inhabitants they conquered, and the sepulchres of the epoch would of necessity attest the fact.

Not that the theory is unattended with difficulty. Mr. Greenwell refers to the fact that in the extensive district of Cleveland a very large number of barrows have been systematically and carefully opened, and that the examination of these barrows has shown that, without exception, the interments have been made after cremation, and that no article of bronze or other metal has been discovered with any of the sepulchral deposits, with one single exception, which occurred near Egton. In other words, we have the descendants of a metal-using people throughout an extensive district with no more trace of metal in their possession than the people of the long-barrows. The explanation may be that metal must have been most costly at first; that the introducing people, after becoming occupiers of the country, might most easily multiply much more quickly than a costly matter of import could; and that in a few generations the occupants even of a wide district—that district being a remote one, and of extremely difficult access from the very distant port through which, it is believed, bronze long continued to be imported, and, above all, a very poor district—might come to be practically, if not literally, unacquainted with the use of metal.

Mr. Greenwell's most instructive "Table of Barrows, Interments, and Articles deposited with Interments," ought by no means to be passed by without comment, but space forbids detailed notice. More may be learnt from it at a glance than by the perusal of most other books on the subject. So, also, his general conclusions, based on a careful survey of all the facts collected during his systematic work of years, as to the condition, habits, food, social status, arms, implements, stock, agriculture, funeral customs, and ideas of a future state, of the people of the barrows, are such as to be of great interest even to the general reader; but this, too, with the inferences as to the fauna and flora of the districts mainly affected, and the physical appearance of the people themselves, can only be glanced at. It would, however, be unfair to the book itself, as well as to those employed in its material production, not to devote a few words to the clearness of the typography, as well as to the profuseness of the illustrations—all, with scarcely an exception, attesting the noteworthy care, accuracy, and skill with which they have been selected, designed, and executed. On the whole, it is a book for almost unmingled commendation.

J. C. ATKINSON.

Varuna und Mitra. Ein Beitrag zur Exegese des Veda. Von Dr. A. Hillebrandt. (Breslau: G. P. Aderholz, 1877.)

THIS essay will be welcomed by the comparative mythologist as a careful collection and arrangement of such passages from the Veda as define the powers and attributes of two of the ancient Vedic gods, Varuna and Mitra. Varuna, "the encompassing," is the personification of all-enveloping space, the *ὀυρανός* of the Greeks; and the Vedic bards are irresistibly led to attribute to him powers as extensive as the idea he represents. Enveloping the whole creation, he sees all, knows all, and produces all; and this leads to his recognition as the creator and ruler of the universe, both physically and morally. He rules over both the day and the night, and the sun and moon are his two eyes. As ruler over the day he is often associated with Mitra, who controls and accompanies the sun; and the sun is also his tongue, his foot, and his messenger. It is, however, chiefly in the ancient hymns that he is connected with the day, and the night is considered as an indication of his anger; in the later Vedic literature he rules over the night alone, as Mitra does over the day. Varuna also controls the waters, because rain falls from the sky; for the same reason he is associated with the storm-gods; and the rain-clouds being likened to cows he becomes specially interested in cattle. The "bonds of Varuna" is a term frequently applied to the evils of night and death; also to the disease of dropsy, when Varuna personifies water; and its meaning seems sometimes to be further extended to the rainy season, which may, by a bold metaphor, be considered as a dropsy of the earth.

Mitra is a personification of all the beneficial properties of the sun, but cannot be identified with the sun itself, nor solely with its light. He is rarely mentioned alone in the Vedic hymns, but is nearly always coupled with Varuna, of whose attributes as ruler over the day and rain he seems to partake. In the Avesta of the Zoroastrians he is more minutely described as the angel Mithra created by Ahuramazda, and as much to be revered as the creator himself. But he finds no place in the earlier Zoroastrian scriptures, and his appearance with the other angels, in the later writings, denotes a partial relapse into idolatry.

Whether any reference to Varuna can be detected in the Avesta is doubtful. Any resemblance his attributes may bear to those of Ahuramazda seems due to the fact that such attributes must be ascribed to all personifications of the creator and upholder of the universe. That he is called an Asura (the Sanskrit equivalent of the Avesta *ahura*) does not go far towards identifying him with Ahuramazda, because other Vedic gods have the same appellation. The identification of Varuna with Varena (the fourteenth of the settlements of the primitive Iranians as detailed in the first chapter of the Vendidad) is also quite as doubtful. All we are told about Varena is that "Ahuramazda produced Varena, which is four-cornered; at which was born Thraëtaona (Frédun), the slayer of the destructive serpent (Azhi Dahák);" and that the evil

spirit introduced "untimely illness and non-Aryan invasions of the country." We also know, from other passages, that Thraëtaona was a son of Athwya, which tends to identify him with the Vedic Trita whose surname was Aptya. Hillebrandt supports the hypothesis that Varena was a reminiscence of Varuna, "the heavens," on the grounds that the names are identical, that they are both called "four-faced" or "four-cornered," and are both connected with Trita. The identity of the names is very probable, but requires proof, as it is not confirmed by the few available examples of similar words, such as Sans. *taruna*, which is equivalent to Av. *tauruna* (not *tarena*). The term "four-cornered" does not necessarily refer to the points of the compass, and is quite as applicable to a city as it is to the heavens. And the Vedic connexion of Trita with Varuna is much vaguer than his association with other gods. Moreover, there is something to be said on the other side of the question; for the Vendidad mentions Varena merely as one of a number of districts known to the Iranians, many of which can still be distinctly identified, and the whole account of them seems prosaic enough; why we should import the mythic haze of the Veda into the plain common-sense of the Vendidad seems incomprehensible. Again, we sometimes find the Varenian Devas (demons or idolaters) mentioned in the Avesta, either coupled with the Mâzainyan Devas (Mâzandarân idolaters), or with spiritual demons, as though they themselves were earthly demons. All this points to the conclusion that Varena was a district in the vicinity of Mâzandarân, and the name clearly indicates Gilân as the most probable locality. The few details given by the Avesta writers show that they considered both these provinces as overrun by idolaters and enemies of the Zoroastrian religion.

If Hillebrandt would extend his researches to the other Vedic personifications of natural phenomena, or to the more practical delineations of the Avesta, with a firm determination to arrive at the ideas of the original writers, free from all the dreamy metaphorical haze which has accumulated, and still continues to accumulate, about them, his essays would furnish a firm foundation of facts for comparative mythologists to build upon. If he would also print his Sanskrit and Avesta quotations in italic type, he would be doing a kindness to those who may wish to use his essays as books of reference.

E. W. WEST.

MR. R. DAINTREE, F.G.S.

EARLY in the week our daily papers announced the death of Mr. Richard Daintree, a geologist who did so much good work in Australia that the event should not be allowed to pass without a brief recognition of his labours. Born of a good Cambridgeshire family only six-and-forty years ago, he was but a stripling when the Australian gold-fever first broke out. Unable to withstand the *auri sacra fames*, the young undergraduate exchanged his cap and gown for the pick and shovel, and sailed from England for "the Golden Colony." There his scientific tastes soon asserted themselves, and some years later he found congenial occupation on the staff of the Geological Survey of Victoria. It was in the colony of Queensland, however, that he was destined to

leave the enduring mark of his hammer. The Queensland Survey was, in fact, organised and for some years conducted by Mr. Daintree. When he had accumulated a vast amount of information on the structure of this little-known country, he returned to England, laden with specimens—some of which, to his great discomfiture, did not escape the perils of the deep. In London he devoted a good deal of time to working-up his collections, and the results of his studies were presented to the Geological Society in the shape of an elaborate memoir "On the Geology of Queensland"—a paper which will probably long remain our standard authority on the stratigraphical structure, the fossil relics, and the economic products of this colony. In working-up his palaeontological materials he was assisted by Mr. Etheridge and by Mr. Carruthers; but the chemical examination of the rock-specimens he undertook himself in Dr. Percy's laboratory, where he also entered on an investigation with the view of throwing light on the genesis of gold in nature. When the microscope was introduced to the petrologist, as a new and valuable auxiliary, Mr. Daintree took up the subject with characteristic enthusiasm, and examined a large number of rocks and auriferous veinstones from Queensland. As these lines are being written in a country inn, far from works of reference, it is impossible to give dates or cite the exact titles of his papers. Mr. Daintree's valuable collections illustrating Queensland geology were exhibited at several of the International Exhibitions at South Kensington; and so intense was his interest in the Colonial Annexe that when his health broke down he insisted on being carried in upon a couch, and continued to direct the arrangements, though so weak that his instructions were sometimes scarcely audible. For several years Mr. Daintree held the important office of Agent-General for Queensland, and it was probably in his anxiety to forward the interests of the colony that he over-taxed his physical powers. Although thoroughly saturated with a scientific spirit, he was at the same time a methodical man of business. Whatever he took up he spared no pains to carry through to completeness; and this thoroughness was perhaps the most striking characteristic of his work. Those who knew Mr. Daintree personally feel that they have too early lost a true and warm-hearted friend; and the regret expressed in this country will speedily be echoed at the antipodes.

F. W. RUDLER.

SCIENCE NOTES.

PHYSICS.

New Spectroscope.—A form of spectroscope on an entirely new plan has recently been devised by M. Thollon. An account of it is given in the *Journal de Physique*, vii., 141. M. Thollon claims the following advantages for his instrument:—1. It is absolutely a direct vision spectroscope. 2. It is of perfect symmetry, and may readily be adapted to a telescope. 3. The prisms, which are the only moveable parts of the apparatus, are moved by an arrangement rigorously geometrical, in such a way that a ray of light passing along the axis of the collimator traverses two systems of prisms at the angle of minimum deviation before entering the observing telescope. 4. The theory on which its construction depends admits of its dispersive power being varied within considerable limits. 5. Finally, it is adapted to the most exact spectrometric measures. The space between the object-glasses of the collimator and telescope is occupied by a pair of right-angled prisms placed back to back. A ray of light having traversed the collimator enters one of these prisms normally, and passes out after total internal reflection in a direction perpendicular to the axis of the instrument, say to the left. It then traverses a system of four prisms, each of 30°, and after total internal reflection from another prism, passes to the right of the instrument, where it

encounters a system of prisms and reflector precisely similar to that on the left. Thus the second right-angled prism in the centre of the instrument is reached, and the ray, after being bent through 90°, enters the observing telescope parallel to its original direction. A micrometer screw enables the two sets of prisms to be moved symmetrically together, so as to bring any desired ray of the spectrum into the position of minimum deviation. The length of spectrum obtained is about one and a half metres.

Earth Currents due to Terrestrial Magnetism.—A very simple experimental arrangement, due to Prof. Leroy Broun, for exhibiting the action of the currents of electricity which pass round the earth, is described in Silliman's *American Journal* for May, 1878 (see also *Phil. Mag.*, June, p. 475). A coil of insulated copper wire was wound round a rectangular frame of wood, the sides of which were about 40 and 30 inches respectively. The extremities of the wire projected a short distance from one of the shorter sides of the frame. This frame was then so suspended in a horizontal position by wires attached to an ordinary hydrostatic balance (the beam of which moved in the plane of the magnetic meridian) that the longer sides were at right angles with the beam—that is, magnetic east and west. By adjusting weights in the pans the index of the balance was brought to zero. The projecting terminals of the coil dipped into mercury cups which could be connected with a battery. When the current from the battery passed round the rectangle from east to west on the northern side, and from west to east on the southern side, by the theory of terrestrial magnetism the northern side of the rectangle would be attracted and the southern side repelled; and that this was so, the corresponding deflection of the balance rendered visible. When the current was reversed the deflection was in the opposite direction. By breaking and closing the circuit at the proper intervals, to augment the oscillations, the large frame was readily made to oscillate through an arc of five degrees. By using (the author remarks) a rectangle containing a larger number of coils of wire attached to a very delicate balance and a constantly-acting battery, the variation in the magnetism of the earth might thus be advantageously observed.

Electric Experiments with Crystalline Selenium.—The change in the electrical conductivity of crystalline selenium when exposed to the action of light has been long known, and important investigations in connexion with it have been carried out by Dr. W. Siemens, Prof. Adams, and others. In the June number of the *Philosophical Magazine* will be found an account of some recent experiments of Mr. R. Sabine, which have added materially to our knowledge of the behaviour of selenium in a galvanic circuit, and increased the interest previously felt in the subject. Mr. Sabine's object in the first instance was to remove some of the difficulties which he had found in the way of constructing constant resistances of crystalline selenium. His experiments, however, made it evident that selenium is totally unsuited for such purposes. The experiments were made with several pieces of selenium, some of which were provided when in the amorphous state with platinum wires; in other specimens the wires were laid upon a small piece of mica and the melted selenium dropped upon them. It was found to be necessary to distinguish between the resistance of the selenium and that of the junctions; for instance, in one experiment a plate of selenium with platinum wire connexions, having a resistance of twenty megohms, was found to have only fourteen megohms resistance when the butt-ends were in contact with mercury. With regard to the influence of variations of temperature on the resistance of the selenium and that of the junctions, it was found that both were equally affected. Prof. Adams and Mr. Day had noticed the fact that the current strength in the circuit of a bar of selenium and a battery is

subject to change when the direction of the current is reversed. Mr. Sabine sought to determine the seat of this change, and came to the conclusion that it is at the junctions and not in the selenium itself. On increasing the strength of the current the apparent resistance of the selenium was not found to diminish steadily, as had been previously stated, but sometimes diminished and sometimes increased. Another set of experiments led to the conclusion that the effects of light and heat upon the surface of selenium are identical. In conclusion, Mr. Sabine, while admitting that much experimental work remains yet to be done with selenium before any theory of its behaviour can be advanced with confidence, is of opinion that the effect of light is such as to cause a modification of the surface tension of selenium, and possibly an expansion of the crystalline surface. He thinks that the superficial crystals expanding and pushing against each other, so as to improve the doubtful points of contact previously existing between them, may account for the observed increase of conductivity in the light.

MEETINGS OF SOCIETIES.

ENTOMOLOGICAL SOCIETY.—(Wednesday, June 5.)

H. W. BATES, Esq., F.L.S., F.Z.S., President, in the Chair.—Mr. J. A. Finzi exhibited a remarkable hermaphrodite specimen of *Anthracis cardamines*.—Mr. Rutherford exhibited a series of large cocoons from Mount Camaroon, formed by the larvae of a species of Bombyx allied to *Anapha panda*, Bdv. These cocoons varied in diameter from four to seven inches, and each one contained from 130 to 150 smaller cocoons, all of which were tenanted by a larva or chrysalis in various stages of development. It would appear that *Anapha panda*, like some other species of Bombycidae, is social, and that the larvae unite to form an aggregate cocoon of sufficient strength to withstand the attacks of enemies and probably extreme change of temperature. Mr. Rutherford also exhibited a specimen of a *Papilio* as a case of so-called "hermaphroditism" with asymmetrical markings of the wings, which approached respectively *Papilio cynorta* and *Papilio Boisduvalianus*, thus creating an impression that those two forms were but the sexes of one species. These specimens were from the collection of Mr. F. J. Horniman.—Mr. Meldola exhibited photographs of two species of tropical Orthoptera sent to Mr. Darwin by Dr. Zacharias as an illustration of protective resemblance in the very perfect leaf-like appearance of the fore-wings; and some small beetles of the genus *Spermophagus* and their cocoons, which had been found in a packet of seeds of *Cassia neglecta* sent from Brazil by Dr. Fritz Müller to Mr. Darwin. The full-grown larva had emerged from the seeds, leaving the latter in a damaged condition, and had spun the small cocoons from which the beetles had issued, the insects having reached this country alive. Mr. Meldola also exhibited the proboscis of a sphinx moth caught by the narrow tube-like nectary of a pale yellow *Hedychium*, which had likewise been received from Dr. Fritz Müller, who states that sphinges are frequently found caught in this manner.—Sir Sydney Saunders communicated notes by M. M. Lichtenstein on "New Ideas as to the Life Cycle of Aphidians," giving the results of considerable breeding experiments.—The secretary read a paper from Dr. Fritz Müller entitled "Notes on Brazilian Entomology," in which the author gave the results of his observations on the odours emitted by butterflies and moths, as well as facts bearing on various other subjects more or less connected with the theory of evolution. In reference to this paper the wings of *Antirrhoea archaia* from Brazil, and of *Mycalopsis drusia* from the Nicobars, were exhibited in illustration of the author's theory of "scent-fans."—The following papers were also communicated:—"On some Longicorn Coleoptera from the Hawaiian Islands," by Dr. Sharp; "On the Larva of the *Tenthredinidae*, with special reference to Protective Resemblance," by Mr. Peter Cameron; and on "*Macropsidium Cottenilli* and other new Species of Coleoptera from Lake Nyassa," by Mr. H. W. Bates. The author exhibited the remarkable Longicorn beetle above designated, which possessed some prominent characters of the Prionidae.

ANTHROPOLOGICAL INSTITUTE.—(Tuesday, June 11.)

JOHN EVANS, Esq., D.C.L., F.R.S., President, in the Chair. Dr. John Beddoe read a paper on "The Bulgarians," referring more especially to the skull form, on which he quoted Virchow and Kopenicki, but gave also some observations of his own.—Miss A. W. Buckland read a paper on "The Stimulants of the Ancients and of Modern Savages." The paper commenced by stating that all races have acquired the use of stimulants in some form, but that the stimulants of the lower races, such as the Australians, consist merely of leaves and roots chewed for their strengthening and invigorating properties, this being only a slight advance upon the instinct which prompts the inferior animals to seek out certain plants for medicinal purposes. The first step toward the manufacture of stimulating drinks is seen in the kava of the South Seas. This art of producing fermentation by the masticating process can be traced in a line across the Pacific from Formosa, where rice is the ingredient thus employed, to Peru and Bolivia, where maize is used for the same purpose, the manufacturers being always women. The next advance is that acquired by agricultural races, who make a kind of beer from the chief cereal grown by them. This liquor probably reached our shores from Egypt, where it was very early known, through the lake-dwellers, and still forms the principal drink of all African races. Pastoral tribes meanwhile use the milk of their flocks and herds and the honey of wild bees in the manufacture of their fermented drinks, hence the celebrated *koumiss* and *mead* of Scythic nations, the same liquors reappearing among the Kaffirs in South Africa, the vessels used in both countries being the skins of animals, which were also employed for storing wines in the East and later in Greece and Rome. Mead was a favourite beverage of the Scandinavians and Anglo-Saxons, and there seems to be a shadow of the Scythic *koumiss* in the Devonshire liquor known as white or grout ale, while both liquors may be traced more distinctly in the famous *Aurita* and *Lonia-wine* of the Vedas. Various plants and fruits have been used in all civilised and semi-civilised countries from very ancient times in the manufacture of wines, but grape juice had formerly a circumscribed range, having been confined to Western Asia, Egypt, Greece, and Rome, while it was forbidden in China, where the vine was extirpated. The religious ceremonies and prohibitions attached to these various beverages were briefly noticed, as also the deification of plants on account of their medicinal properties, and the form and material of drinking-vessels, while alcohol, the latest and most pernicious development of the art of manufacturing stimulants, was only mentioned as not having been included among the beverages of the ancients not known to savages until introduced by Europeans.—Mr. Sanderson read a paper on "Polygamous Marriage in South Africa."

ROYAL ASTRONOMICAL SOCIETY.—(Friday, June 14.)

PROF. CAYLEY, V.-P., in the Chair. Prof. Adams explained on the black-board the result contained in a note communicated by him to the society, "On a Remarkable Property of the Analytical Expression for the Constant Term in the Reciprocal of the Moon's Radius Vector," or what is commonly called the constant term of the moon's parallax.—Capt. Tupman read a paper on the measurements of the photographs of the Transit of Venus obtained by the Government Expeditions. Photoheliographs of the same pattern, made by Dallmeyer, were used at the different stations, the images of the sun being enlarged by secondary magnifiers to about 3.9 inches in diameter. The measurements for determining the distortion of the photographs at the parts of the plates where the limbs of the sun and of Venus were represented, showed that there was very little difference in the distortion produced by the different instruments. The photographs of the transit were prepared for measurement independently by Mr. Burton and Capt. Tupman, and there was hardly any difference in their estimates of the direction of the centre of Venus in reference to that of the sun; but when they came to compare their measurements of the distances between these centres, the discordances were found to be so great that it was evident that their measurements would be quite useless for the purpose of determining the sun's parallax. The Astronomer Royal said the preliminary investigations for determining the corrections due to any constant sources of error in measur

ing the photographs had been very carefully carried out, the errors of the scale of millimètres made by Mr. Simms had been determined, and the effects of distortion in the photographs had been ascertained by means of a scale of equal parts, sixteen feet long, which had been lent by Mr. De la Rue, and which had been photographed in various positions. So far all had gone well, but when the photographs of the transit had been measured he was obliged to say he was grievously disappointed. The Astronomer Royal proceeded to explain: "When I was officially called upon to express my opinion on the propriety of incurring the expense of the photographic work, although, as I then stated, I had some doubts about it, yet I expressed myself favourably to it, and I hold myself responsible in some degree for having incurred so much expense and labour. But I can only say that the results have been most disappointing. The images are very troublesome, partly owing to difficulties arising from irradiation, and partly to other causes—one of which is the very excessive brightness about Venus, which makes it look somewhat like a flat with a brim round it; and another is the excessively gradual degradation of light at the limb of the sun. When the measures were made there was some doubt as to the scale to which they ought to be referred; the scale I adopted as the best I could get was to take the sum of the measures of the diameter of the sun and of the diameter of Venus, thus getting a quantity affected by two opposite kinds of irradiation, for the diameter of the sun is increased by the action of irradiation, while the diameter of Venus is diminished by it, and we might suppose that the two opposite effects would annihilate each other; but it appears they do not, and no doubt this is one of the sources of uncertainty. By means of the eye-observations, Capt. Tupman, after a most careful discussion, fixes upon something like 8".83, but from the reduction of the photographic measures, treated as well as we can, we get a parallax of 8".2, a parallax which would be utterly irreconcilable with the eye-observations, and I do not see at the present time any sufficient explanation of the great difference." Several papers referring to the late transit of Mercury were read or announced.—Mr. Christie was called upon to give an account of a paper on the bright lines or interspaces between dark lines in the solar spectrum near the G line, which have been attributed by Prof. Henry Draper, of New York, to the presence of oxygen in the sun. Mr. Christie showed a drawing of that part of the spectrum as it was seen in the half-prism spectroscopic of the Greenwich equatorial, and said, that when this region of the spectrum was examined with a spectroscopic of high dispersion, the bright lines appeared very broad in comparison with the dark ones and did not appear to fade away at the edges, as might be expected if they were really bright lines and not merely parts of the continuous spectrum cut out or left by dark lines. He found, moreover, that there were certain fine dark lines near the middle of each of the bright lines or spaces, and he considered that this rendered the hypothesis that they were really bright lines still more difficult. Another point to which he wished to draw attention was that, since there were no dark lines in the solar spectrum corresponding with lines in the spectrum of oxygen, it was evident that the oxygen lines must all fall upon interspaces between dark lines, and, therefore, no weight ought to be placed upon the mere fact of their coincidence with them. Mr. Ranyard questioned the sufficiency of Mr. Christie's objections. It was not necessary that lines which did not correspond with the dark lines should all fall upon, and exactly coincide with, interspaces; they might, and, if taken at random, probably would, partly overlap such interspaces and partly the dark lines. But, according to Draper's photograph, which, unfortunately, was not on a very large scale, the ten or eleven bright lines of oxygen there shown appeared to coincide centrally with the interspaces, and, moreover, they appeared to agree in relative brightness. The agreement of these lines in the solar spectrum with the oxygen lines was, therefore, a matter of a very high degree of probability. Dr. Schuster laid great stress upon Mr. Christie's observation that the bright bands near G did not fade off at the edges, and thought that the fact pointed very much against their corresponding with the oxygen lines, as none of the latter were sharp lines.—Mr. Knobel showed a chronograph-tracing made by the chronograph of the Washington Observatory.

The straightness of the lines joining the marks of corresponding seconds during a period of two hours showed a remarkably accurate performance of the instrument.—The titles of several other communications were read, one of them being by Prof. Harkness of Washington, "On the Measurement of the Inequality of the Pivots of Transit-Instruments by means of the Spherometer-Caliper."

ZOOLOGICAL SOCIETY OF LONDON.—(Tuesday, June 18.)

ARTHUR GROTE, Esq., V.-P., in the Chair. The Secretary read extracts from letters addressed to him by Mr. E. L. Layard, containing remarks on two species of New-Caledonian Birds, and a statement that there was an example of the recently-described Woolly Cheestah (*Felis lanea*) in the South African Museum at Cape Town.—Mr. E. R. Alston read a paper "On the Squirrels of the Neotropical Region," in which he recognised twelve out of fifty-nine described species, and re-described two, *Sciurus rufoniger*, Pucheran, and *S. pusillus*, Geoffroy, which had been recently overlooked.—Mr. Slater exhibited and made remarks on a third collection of birds from Duke of York Island, New Britain, and New Ireland, which he had received from the Rev. George Brown. Among them was an example of a new Fruit-pigeon, which it was proposed to call *Carpophaga melanochroa*.—Communications were read from Dr. M. Watson, containing a description of the male generative organs of *Chlamydomorphus truncatus* and *Dasyptus sexinctus*; from Prof. Garrod on certain points in the anatomy of Levaillant's Darter (*Plotus Levaillanti*); from Messrs. Garrod and Turner on the gravid uterus and placenta of *Hyomochus aquaticus*; from Mr. F. Moore, containing the descriptions of new Asiatic Butterflies of the Family Hesperidae, and a list of the Lepidopterous Insects collected by the late R. Swinhoe, Esq., in the Island of Hainan; and from the Marquis of Tweeddale, being the tenth of his contributions to the ornithology of the Philippines. The present paper gave an account of the collection made by Mr. H. Everett in the Island of Bohol. The collection contained representatives of forty-seven species. Although all these were previously known, seven of them had not been before recorded as being inhabitants of the Philippines.—Dr. O. Finsch read the description of a new species of Starling from Lake Marka-kul, in the Chinese High Altai, which he proposed to name *Sturnus Poltaratzkyi*, after General Poltaratzky, Governor of Semipalatinsk.—Communications were read from Mr. W. H. Bates, containing descriptions of new species of Coleopterous insects (*Geodephaga* and *Longicornia*) taken by the late Dr. Stoliczka during the Forsyth Expedition to Kashgar in 1873-74; from Dr. G. Harilaub, in which he gave the description of a new species of *Notauges* (*N. Hildebrandti*) of Cabanis, M., discovered by Mr. Hildebrandt at Ikanga in Ukamba, Eastern Africa; and from Lieut.-Col. R. H. Beddome, giving the description of a new Batrachian from Southern India belonging to the family *Phryniscidae*, which he proposed to call *Melanobatrachus indicus*.—Sir Victor Brooke, Bart., exhibited and made remarks on a fine head of the male *Gazella Granti*, originally described from sketches made by Captain Speke during Speke and Grant's expedition. The present specimen had been shot by Mr. Arkwright about eighty miles from Ugogo in Eastern Africa.—Communications were read from Prof. J. V. Barboza du Bocage, containing a list of the Antelopes observed in Angola; from Mr. Carl Bock, in which he gave the description of two new species of shells from China and Japan; and from Mr. Edgar A. Smith, containing the description of five new shells from the island of Formosa and the Persian Gulf, with notes upon some known species.—Messrs. Godman and Salvin read the descriptions of some apparently new species of Butterflies from New Ireland and New Britain, received from the Rev. G. Brown.—Mr. O. Salvin read the twelfth of a series of reports on the collection of birds made during the voyage of H.M.S. *Challenger*. The present paper contained an account of the *Procellariidae* collected during the expedition. Eighty specimens had been obtained, belonging to twenty-two species.—Mr. Slater read some supplementary notes on the Curassows now or lately living in the Society's Gardens.—Mr. J. Wood-Mason read a paper on the structure and development of the trachea in the Indian painted snipe (*Rhynchaea bengalensis*).

METEOROLOGICAL SOCIETY.—(Wednesday, June 19.)

C. GREAVES, Esq., F.G.S., President, in the Chair. The following papers were read:—"The Climate of Lundy Island, by J. H. Crespi. Lundy Island from its geographical position might be expected to have a mild, damp climate, with cool summers and warm winters, and a small diurnal range of temperature; and so no doubt it has, although certain local circumstances, in addition to its peculiar configuration, make the climate remarkably inclement, windy and unpleasant. The island runs nearly due north and south, having an extreme length of four miles and a breadth of from 200 yards to 1,600 or 1,800; there is a nearly flat tableland or "top" running due north and south, having an altitude of 450 feet. Shelter there is none; every current of wind sweeps the whole tableland. From the edge of this tableland the ground slopes away to the sea; sometimes the descent of the side-land is extremely abrupt, at other spots more gradual, while the sidelands are deeply cut by caves, precipices, small bays, and glens. All round the island the water is deep a few hundred yards off, while the currents are formidable, and tremendous seas break upon the rocks almost every day in the year. The one drawback of the place is the wind, so furious and continuous are the blasts, first from one quarter then from another, for days and even weeks. When gales occur, as they generally do at short intervals, the force of the wind becomes incredible: walls are torn down, gates and doors wrenched out of their fastenings, and the few buildings which can be blown down are more or less injured. Fogs are remarkable for their frequency and density, and are nearly always drenching. The rainfall is nearly fifty inches per annum. February and March are said to be the coldest, and August the hottest months; the mean temperature of the year is about 50° or 51°.—"On the Auroral or Magnetic Cirrus," by the Rev. S. Barber.—"Contributions to the Meteorology of Natal," by Dr. R. J. Mann. This paper is a discussion of the observations taken at Maritzburg (2,095 feet above sea-level) during the six years, 1860-65; from it we learn that the summer of Natal is a season of copious rain, and the winter a season of relative dryness; also that the former is a time of abundant and frequent cloud, and the latter a time of preponderant sunshine. The summer is consequently cooler in a material degree than it would otherwise be, on account of the frequent prevalence of cloud and the abundance of the rainfall; and the winter has its temperature materially raised from the constant occurrence of clear skies and bright sunshine. The mean annual rainfall was 31.13 ins., of which amount nearly twenty-eight inches came down during the six summer months (October to March), and scarcely more than two inches during the four midwinter months (May to August). Thunderstorms are of frequent occurrence, the average exceeding seven per month from October to March. The thermometer rarely rises above 85° in the shade even in the summer season, unless a hot wind is blowing; it then mounts to somewhere between 85° and 97°, according to the strength of the sirocco. The degree of humidity indicated by the dry and wet bulb thermometers when a hot wind is blowing varies from 25° to 52° of moisture. The highest temperature recorded during the six years was 97° 6, the lowest 29° and the mean 63° 3.—"Note on the Mean Relative Humidity at the Royal Observatory, Greenwich," by W. Ellis. In this paper the author gives the mean relative humidity in each month of the year at 9 a.m. and 9 p.m., and the mean of twenty-four hourly values derived from the photographic records of the dry and wet bulb thermometers for the twenty years, 1849-68. The 9 a.m. value is smaller than the mean in summer and larger in winter; and the 9 p.m. value is larger than the mean throughout the year, but most in summer. The mean monthly values change little from April to August, and from October to February; and there is a great decrease between February and April, and a corresponding great increase between August and October. The mean for the year is 80.7.—"On a Method of sometimes determining the Amount of the diurnal Variation of the Barometer on any particular Day," by the Hon. R. Abercromby.—"On the relative Duration of Sunshine at the Royal Observatory Greenwich, and at the Kew Observatory during the Year 1877," by G. M. Whipple. The author having instituted a comparison of the amount of sunshine recorded at these two observatories, finds that the totals show that for the whole year the excess

in the number of hours the sun shone at Kew over the number at Greenwich amounted to 171. This difference is no doubt due to the direction of the wind; for Greenwich lying to the south-east of the chief part of London, and having also large manufacturing establishments on its northern side, is greatly shaded by cloud, probably in a great measure due to smoke, when the wind blows from the west, north-west or north; while Kew, which is situated to the west of London and is remote from factories and shipping, enjoys a larger percentage of sunshine with those winds. With winds from the north-east, south, and south-west, Kew has but slight advantage over Greenwich. With easterly and south-easterly winds the London smoke is driven over Kew, and its presence in reducing the transparency of the air is evident in the diminished amount of sun recorded, the quantities being only 81 and 65 per cent. of those registered at Greenwich.—“Account of the Atmospheric Disturbance which took place in Lat. 21° N. and Long. 25° W. on Jan. 27–28, 1877,” by J. H. Cardew.—“Notes on some remarkable Cloud Formations accompanying sudden and frequent Changes of Temperature and Wind,” by Capt. W. Watson.

ROYAL SOCIETY OF LITERATURE.—(Wednesday, June 19.)

W. KNIGHTON, Esq., LL.D., in the the Chair. Papers were read contributed by Mr. Baynes, “On a Gold engraved Ring found by Dr. Schliemann at Mycenae,” and by Mr. C. T. Newton, “On Two Greek Inscriptions from Kameirus and Ialysus in the Island of Rhodes.”

ROYAL SOCIETY.—(Thursday, June 20.)

SIR JOSEPH D. HOOKER, K.C.S.I., President, in the Chair. The following papers were read:—“Notes on Physical Geology, V. Mr. George H. Darwin's Comments on Note III,” by the Rev. Dr. Haughton; “On the Acceleration of Oxidation by the Least Refrangible End of the Spectrum. Note II,” by Capt. Abney; “A Tenth Memoir on Quarcies,” by Prof. Cayley; “On the Osteology of the Polyodon Folium,” by T. W. Bridge; “On Astrophira Permira, an Echinoderm form intermediate between Ophiuroides and Asteroidea,” by W. P. Sladen; “Experimental Researches on the Temperature of the Head. Parts II., III., IV.,” by Dr. J. S. Lombard; “Note on the Effect of Various Substances in Destroying the Activity of Cobra Poison,” by Dr. Lander Brunton and Sir Joseph Fayrer; “The Life-History of Bacterium ternis and Micrococcus, with further Observations on Bacillus,” by J. C. Ewart; “On the Life-History of Spirillum,” by P. Geddes and J. C. Ewart; “On an Easy and at the same time Accurate Method of Determining the Ratio of the Dispersions of Glasses intended for Objectives,” by Prof. Stokes; “On the Reversal of the Lines of Metallic Vapours. No. III,” by Prof. Liveing and Prof. Dewar; “An Experimental Determination of the Values of the Velocities of Normal Propagation of Plane Waves in Different Directions in a Biaxial Crystal,” by R. T. Glazebrook.

SOCIETY OF ANTIQUARIES.—(Thursday, June 20.)

LORD CARNARVON, President, in the Chair. Major-General Lane Fox read a paper on some excavations which he has conducted at Mount C. burn, near Lewes, illustrated by drawings and plans. Within the ramparts there are a number of pits, some circular and others oval, about five feet in diameter and five feet in depth, filled with black mould and chalk rubble. A few oyster-shells were found on the surface, but none below. The pottery turned up was of three kinds—the first, coarse hand-made ware, badly baked; the second, red in colour, much finer, with grains of sand interspersed; while the third was turned on a wheel and ornamented with a grooved pattern. In one pit was found an iron armour scale; a piece of Roman tile, the only piece found on the camp, which was, perhaps, used for a pigment; and a bone comb for weaving. In the other pits were found a spindle-whorl and small bar of iron, perhaps used as coinage, a bill-hook, a hammer, an iron knife of Romano-British type, a bronze armour-ring, and a piece of a bronze sword, in addition to the pottery. One human bone only was found, but several specimens of *Bos longifrons*, pig, horse, goat, and roe-deer. The camp is surrounded by two ramparts, of which the upper is the older. In one place a mass of clay was found

bearing the impression of a wattled hurdle, which General Fox believes to have formed part of a hut built over the outside rampart. But few flint-flakes were found, perhaps because the steepness of the hill would allow of their being gradually washed down. From the character of the remains General Fox was of opinion that the camp was formed during the late Bronze period, and was in use until late in the Roman period, though not occupied by that people.

FINE ART.

THE SALON.

(Second Notice.—Sculpture.)

Paris: June 20, 1878.

The sculpture of the Salon is this year less extensive and less brilliant than we have been accustomed to see it. But there is no need for either surprise or anxiety. The Universal Exhibition has employed, for the decoration of its exterior, all our sculptors of talent; and the little time that they have had at their disposal has been employed in works of secondary importance, such as busts, or in superintending the workmen who were executing in marble before their eyes works the models of which they had already exhibited in plaster or terra-cotta. I shall, therefore, take you to-day round about as much as through the Salon.

Our school of sculpture has always seemed to me admirable, in the present as in the past. French mediæval sculpture is one of the most interesting among early schools. It already possessed spirit and sentiment when foreign nations were still in the clumsy stage of infant art. If our artists had had before their eyes, like the Italians, thousands of antique fragments, they would not have waited as long as the Italians to interpret them, and they would have copied them with less harshness. I am a great admirer of the early masters of the fourteenth and fifteenth centuries; but when I speak of the history of Art to foreign critics, who only judge works by a hard-and-fast line of sensation and comparison, and when these critics point out that the Riccios, the Donatellos, always express violent movements, unlovely faces, unattractive subjects, I am forced to admit it. It would be impossible to give these bas-reliefs or these figures—which are so justly admired by cultivated amateurs—to children, to pupils who as yet have no idea of the difference of styles, for the purpose of copying. But we may give them to copy, as safely as antiques, the statues from the porch of Chartres Cathedral, the Evangelists of the *Puits de Moïse*, the figures on our altar-tombs, and a thousand little statuettes of Virgins, of monks, so truly decorative in form, so spiritual in expression, so striking in sentiment, that the soul of the pupil, as well as his pencil, can at once enter into intimate communion with the model. We must profit by the faults caused by the abuse of academic doctrines as applied to the education of youthful artists. We must leave them free to seek instruction for mind, heart, and hand wherever they feel themselves affected and entranced. Greece is an unbounded, though not the only, well-spring of beauty and science. Italy as a well-spring is infinitely less profound and less pure. Her excellences have been a good deal exaggerated during the last twenty years. The rooms devoted to the historical sections of ancient art at the Trocadéro enable us to form the most fruitful comparisons on this point. But unfortunately the French Renaissance, the seventeenth and eighteenth centuries, are hardly represented there at all, and the splendid cases of the lovers of Italian art will but serve to delay the solution of this great question of historical criticism in the minds of many visitors.

Whatever may be thought of its past, our school of sculpture is at the present day far superior to any other. The Chamber for years past has shown it special goodwill. It votes a sum which increases the fund for purchases by more than 100,000 francs. The Municipal Council has made it a point of honour to emulate the

Chamber in this matter, and likewise makes purchases direct from exhibitors. In our squares may be seen some of our best modern works:—opposite Ste.-Clotilde, the *Education Maternelle* of M. Delaplanche; in the Square Montholon, M. Mercié's *Gloria Victis*; in the Square des Arts et Métiers, M. Crauk's *Victoire*; in the Parc Monceaux, bronze statues by several distinguished artists. In the pediment of the pavilion of the Louvre, looking towards the Pont des Saints-Pères, instead of a bas-relief which was the disgrace of Barye's dotage, and which represented Napoleon III. on horseback, nude, in the style of an apotheosis, the authorities have just placed an *alto-relievo* in bronze, by M. Mercié. A plaster cast of it was exhibited at the last Salon. It represents the *Genius of the Arts*, seated on Pegasus, his bridle held by Glory. The figure of Glory is very noble. But Genius is a little too like a circus-rider, and, what seems to me a great mistake logically speaking, he is sitting on one of the wings of the celestial steed. In reality this error of composition rather suggests the idea of an opposite subject. This relief is coloured in several tones of burnished gold or bronze. There is a visible tendency, among the whole of the rising generation of artists, to seek the best possible application of polychromy to the surface of art-works. The present is a very successful instance. This partiality for colouring on exteriors is parallel to the revival of ceramic art. You know that on the Universal Exhibition buildings considerable use has been made of enamelled terra-cotta. This is one of the most characteristic traits of that union of art and industry to which all sincerely democratic minds must tend.

M. Mercié was commissioned by M. Davioud to execute the figure of *Renown* which surmounts the palace of the Trocadéro. Unfortunately, the architect confined the sculptor to dimensions which were too small, considering the great height of the building. The consequence is that from below you seem to see not so much *Renown* as a pretty gilt bird flapping its wings as it settles on the roof. But when you can get a view of it, you are charmed with the youthful grace, the nobility of the figure as a whole. She just touches with her feet the orb of the world. Her drapery floats without her seeming to feel its weight. Her wings are long and slender like those of a swallow. The gesture of the arm holding the trumpet which is to make itself heard to the ends of the earth is easy and natural. The general effect recalls that exquisite figure which forms the vane of the Dogana at Venice. Nothing could have been more successful.

M. Gérôme has given us a brilliant revelation of himself as a sculptor. He had already modelled several statuettes—among others the figure of *Phryne before the Areopagus*—and some sketches, a few of which were executed in bronze, for his friends only. This time he has attacked, with great courage and remarkable tenacity, a group of more than life-size, the group which occupied the centre of the composition in his *Gladiators*. Sculpture is a captivating art. It is easy at first starting. Then, in proportion as difficulties arise, they are much more engrossing than difficulties in painting. The sculptor literally feels the form come to birth beneath the fingers which are kneading the moist clay. M. Gérôme has stuck persistently to his work for more than a year. He has had it cast *à cire perdue* by an old-established founder, M. Gonon, who has spared nothing to achieve a masterpiece. You know the subject—a *mirmillo* (I think that is the exact name) has defeated a *retarius*, and stands with one foot on his neck, gazing at the Vestals' box through the eye-holes of his enormous helmet. The vanquished man is uttering a terrible cry, and stretches out his uplifted fingers in his agony towards the box whence is to come the signal of life or of death. The group is well arranged. The details are scrupulously copied from original pieces of armour, including the helmet and greaves purchased for the

Saint-Germain Museum at the Pourtales sale. This group, on account of its archaeological character, has been placed at the entrance to the Galleries of Ancient Art. It excites keen curiosity, and does great honour to the artist.

Now that we are at the Trocadéro, allow me to recommend to those of my readers who may visit it the series of decorative figures which crown the supports of the outer gallery, half-way up the building, and also the gilt seated figures rising above the basin from which springs the sheet of water that supplies the cascade. Their style is graceful and picturesque. You feel that our school, in its works which are free and not executed under the eye of the Institute, is striving to return to the sound tradition of the eighteenth century. M. Davioud, the architect, is likewise a man of highly-refined taste. The whole of the Trocadéro is infinitely better decorated than the Champ de Mars, which was decorated by M. Lamerre. There the sculptures are heavy and ambitious in style.

But it is time now for us to enter the Salon. I was impressed there by a manifest tendency of the pupils supported by the State at Rome to produce works in the superficial and affected taste of the Italian school of the Decadence—Bernini, for instance. Nothing is more insupportable than this style, for the eyes as well as for the mind. It is as wearisome as the conversation of a set of people who are making poor jokes with a strong foreign accent. Our pupils have nothing to gain by this contact with clever mannerists, and might have everything to lose. The institution of the *prix de Rome* is bearing ever more and more tasteless fruits. The time is approaching when everybody will understand that its methods must be thoroughly recast, and, above all, that to private persons must be left the responsibility for those modes of education which are only good on condition of their being modified according to the times and the temperament of individual pupils. *L'Art*, a Review which, I believe, is as widely read and as highly appreciated in England as in France, has given an excellent example by founding a *prix de Florence*. M. Becker, who won it, has exhibited some very good portraits. But the result is particularly happy in the case of a young sculptor, M. Albert Lefeuve. He made his *début* by a figure of *Meditation* or *Innocence*, which indicated a very individual way of translating a sentiment in a delicate form. This year he sends from Florence—where he is maintained at the cost of *L'Art*—a plaster group, *Après le Travail*. The peasant throws himself flat on the ground to take a handful of water from a brook. His young wife, or possibly sister, is standing by waiting. The group does not exist as a composition. There is nothing to combine the two figures, and the pose of the man is forced. But the female figure is excellent, and redeems these defects, which are chiefly defects of youth, the results of a too-generous nature. She is in the costume of the peasant women so dear to J. F. Millet, with tight corset and petticoat, so that her form is guessed at rather than seen, just as it would appear to us in modern life, together with the special beauties developed in it by her habitual employment, and the costume suitable to her race and occupation. This is a thousand times more interesting to me, and a thousand times more difficult to the artist, than a nude female figure holding a torch, the outlines of which a sculptor has laboriously copied in his studio from a model—outlines beautiful in themselves, but commonplace. Our dear compatriot Dalou, whose cruel exile may not improbably have a speedy ending, has given examples of this modern ideal which have been so much appreciated in England as to render it needless for me to dwell on them here. The peasant woman in M. Albert Lefeuve's picture is closely connected with the tendencies manifest in M. Dalou.

M. Delaplanche, who was the first to give, among us, the signal for the reaction against Academic nudités, and for the return to expressive figures,

has just gained one of the two *médaillles d'honneur* for his marble bust of *Music*, the cast of which he exhibited last year. It is a charming work. A young woman in a long tunic is listening, with face bathed in ecstasy, to the harmony that strays beneath her fingers over the strings of a violin. It would be impossible to find a better expression of the nervous exaltation into which music casts certain souls. The fair child has justly gained the laurel crown with which the artist had prophetically garlanded her hair.

The other *medaille d'honneur* was awarded to M. Barrias, who won the *prix de Rome* a year after M. Delaplanche (1865), but whose talent is of a very different order. He has exhibited a group, not without technical merits, but heavy and belonging to a superannuated style, an *Adam et Eve emportant le Corps d'Abel*.

The *prix du Salon*, which has had little effect on our painters, has been awarded by the jury of the various sections combined to a young sculptor, M. Hector Lemaire, for a *Samson trahi par Dalila*. M. Lemaire will be maintained for a year abroad, wherever he may choose, and for two years in Italy. May he remember that he is a Frenchman, and that it is his duty before all things to saturate himself with the virtues of his forefathers.

Two first-class medals have been awarded: one to M. Dumilâtre, who has represented, side by side, on the same tomb—which is built by subscription in the Cemetery of Père-Lachaise—the bodies of the two aeronauts Croce Spinelli and Théodore Livet. You have not forgotten how these two *savants*, carried away by scientific ardour, made an imprudent ascent in the *Zenith* balloon, beyond the limits at which life is possible. This homage paid to two civil heroes is very noble in character. The other first medal fell to M. Injalbert, to whose very remarkable work for the *prix de Rome*, *Orphée perdant son Eurydice*, I called your attention four years ago. He sends from Rome a *Christ*, in the taste of the Italian altars of the seventeenth century, which suggest the idea of a ball-room far more than of anything connected with religion. This *Christ*, writhing like a gymnast, suggests an idea of physical suffering ridiculous rather than tragical. An artist could scarcely have more completely deceived himself with regard to the dignity of his subject.

I cannot enter into full details regarding works which are noteworthy by their promise rather than their performance. My object always is to keep you *au courant* with reigning ideas by mentioning a small number of characteristic objects. The busts are generally excellent. Our sculptors now treat them with great freedom of composition and workmanship. Without any suspicion of favouritism, I may call your attention to two by the intellectual actress of the Théâtre Français, Mlle. Sarah Bernhardt. She is a pupil of M. Mathieu-Meusnier. She applies herself strenuously to her task, and her nimble wit, her natural taste, often enables her to divine, as if by intuition, what slow and painful study would never have taught her. One is the bust of a vaudevillist, M. Busnach, a round face with moustaches, reminding one of the well-known type of the editor of *Figaro*. The other is the bust of M. Emile de Girardin. M. Emile de Girardin is no longer young save by virtue of his wit and his dauntless courage. Many years and many sorrows have furrowed the face, which was never that of an Adonis, but which glows with the flame of brilliant intellect. He is now like Voltaire at Ferney. Possibly a male artist would never have been frank enough to tell the great journalist these unpleasant truths. Again, it is only women who have an exact, precise, and cruel notion of the ugliness of men. Ask them what that man is like whom they have loved and whom they hate, and you will be astonished at the portrait of him that they will draw in four sentences. I do not think that Mlle. Bernhardt has the least grievance against M. de Girardin, who is one of the most regular

visitors to her studio. But she has seen him such as age and toil have made him, and without disloyalty or the shadow of an epigram she has represented him as the future must seek and find him amid the mists which the stream of time is ever casting up between one generation and another. This wearied yet powerful mask stamps Mlle. Sarah Bernhardt as an artist.

I cannot close these lines without mentioning a remarkable figure of *Eternal Rest*, recumbent on a tomb, and raising his wings with a mechanical gesture which tells its own affecting tale. This little work, which has only gained a mere honourable mention, is signed Jouandot. PH. BURY.

MR. W. B. SCOTT'S ETCHED AND ENGRAVED WORK.

MR. W. B. SCOTT has just presented to the British Museum three large volumes, containing his etched and engraved work.

Mr. Scott is an artist who has never courted popularity, and who, though occupied with art and poetry during the whole of a long life, has been content to wait for the ripening wisdom of age before offering to the world some of the fairest fruits of his mind. His volume of poems, published in 1875, came almost as a revelation, even to his friends; and many, we imagine, will be equally astonished to find by these three volumes what a large amount of thoughtful and fanciful design he has accomplished. In the first volume, for instance, we have ninety-five etchings from his own designs, and first in order a series called "Cavaliers and Roundheads," mostly of historical import, but brightened here and there by a poetic or humorous suggestion. Next come a series of metaphysical imaginings, such as his brother, David Scott, delighted in. They are called "Twelve Scenes from the Life of Prince Legion," and represent the life of the worldly man in its various stages from the moment of his birth, when one of the nurses who receive him is the witch Folly, to the time when as a fearful-looking old man, he crawls along the ground pursuing with frightful eagerness, but in vain, his own soul, or when as a skeleton he steps off from life's stage beneath a curtain held aside for a moment by a mighty hand, while the priests in the orchestra consign "dust to dust."

Besides these, we find in the first volume twenty-five designs for the second part of the *Pilgrim's Progress* (the first part was illustrated by David Scott), illustrations to Hall's *Book of Ballads*, to numerous fairy tales, a number of Scotch views engraved by the father, Robert Scott, and a series of etchings from the wall-paintings executed by W. B. Scott at Wallington Hall.

In the second volume we have forty-seven etchings after his own drawings and pictures; nineteen etchings after David Scott, twenty-four photozincographs from drawings, and fifty-nine wood engravings. These include his remarkably fine illustrations to the Bible, several of which, such as the *Noah entering the Ark*, are extremely suggestive by their new rendering of familiar images and illustrations to Burns, to Keble's *Christian Year*, to Keats's poems, to Bunyan's *Holy War*, and other works.

In the third volume come a series of illustrations to Backhouse's *Witnesses*, one of which, the burning of five martyrs in a market, is almost like Cruikshank in its fine yet spirited drawing; then the charming set of etchings illustrative of his own poems, works that have before been noticed in the ACADEMY; and lastly a few etchings recently executed, one of them being from the beautiful picture of the *Norns watering the tree Igdrasil*, Mr. Scott's latest work in painting. Altogether it will be seen that Mr. W. B. Scott has accomplished no mean amount of work in his lifetime, and this record of it, generously presented by him to the British Museum, will, we hope, induce a wider knowledge of it. M. M. HEATON.

ART SALES.

THE sale at Messrs. Christie's last week of what have recently been known as the "Gregory Heirlooms" afforded to the lovers of French decorative art of the seventeenth and eighteenth centuries an opportunity not often to be had. Mr. Gregory Gregory, of Harlaxton Manor House, Lincolnshire, formed the collection, a great part of which has now been dispersed under the hammer. Nothing was more remarkable than the tapestry, of which five pieces alone were knocked down to an eminent dealer for the sum of 5,100*l*. These were of Beauvais manufacture—probably of the later days of the Beauvais work, which has extended over an enormous period—one of the panels represented *Vulcan forging the Arms of Achilles*; another the *Triumph of Bacchus*; and a third derived much of its interest from the fact that it was designed by Boucher. As at no period was furniture more designedly decorative than in the days of Louis Quinze, it will not be matter of surprise that some of the finest examples of that much-abused period realised high prices at the Gregory sale. A marqueterie writing-table sold for 252*l*.; an old French state bedstead, with hangings of silk tapestry, realised 420*l*.; a cabinet of rosewood mounted with ormolu, 105*l*. Of other periods—of the preceding and the following reign—we may note a Louis Quatorze commode of tulip-wood, Breccia marble slab, 84*l*.; a pair of Louis Seize candelabra, altar-shaped, with branches, on tripod, clawed feet, 609*l*.; a Louis Quatorze chandelier, with branches for eight lights, 409*l*. 10*s*.; and a chandelier of rock crystal, 607*l*. Among the sculpture nothing perhaps was more noteworthy and beautiful than the set of four oval reliefs by Clodion, with children representing the Seasons. These realised 220*l*. 10*s*. Vases in grey porphyry were knocked down at 105*l*. Altogether, nearly twenty thousand pounds was realised by the sale, in which we have mentioned only a few of even the more prominent objects, as there were 172 lots.

FROM the sale of the engravings and woodcuts forming the collection of the late Mr. Michael Caspari, and sold very recently at Messrs. Sotheby, Wilkinson and Hodge's, we note the following lots and prices:—By Albert Altdorfer, the set of woodcuts of the *Fall and the Redemption of Man*, together with the artist's portrait, 4*l*. 4*s*.; *Jael and Sisera*, *The Resurrection*, *The Virgin and Child in an Altar-Piece*, *St. Christopher*, *St. Jerome praying*, and another woodcut attributed to the same Little Master, 7*l*. A lot of three rare woodcuts by Dirk de Bräy sold for 4*l*. 12*s*. By Lucas Cranach, the elder, some designs of Tournaments—the Tournament "of 1505 at Dresden," the Tournament "with the Lances," the Tournament "with Samson and the Lion," the Tournament "with Swords"—sold for 8*l*. The engravings by Israel van Mecken of *The High Priest refusing the offer of Jochim* and *The Massacre of the Innocents* were knocked down at 13*l*. The collection also included both woodcuts and line-engravings by Albert Dürer and other early German masters; and the Italian school of wood-engraving was by no means unrepresented.

THERE was sold last week, at Messrs. Sotheby's, the second portion of the collection of modern etchings and engravings formed by M. Philippe Burty. This portion abounded in the works of Messrs. Seymour Haden, Legros, Bracquemond, and Jacquemart. Among the etchings of Bracquemond, who has been, perhaps, the most variously employed etcher of the present generation, we remark the following pieces and prices:—*Le Haut d'un Battant de Porte*—an extremely rare state—6*l*. 15*s*. (Thibaudeau); the same, second state, 1*l*. 10*s*.; *Margot la Critique*—one of only three impressions known of the first state of this quaint invention—7*l*. 10*s*.; the same, second state, 1*l*. 6*s*.; *Le Corbeau*, first state, 3*l*. 10*s*.; *Les Taupes*, first state, before the verses, 3*l*. 7*s*.; *Le Canard*, before the verses, 4*l*. 10*s*. Many of Bracquemond's pieces failed to excite interest, and the prices

fetched by the greater portion were almost insignificant. The collection of Mr. Seymour Haden's etchings included some in very rare or almost unique states, and the prices were accordingly high. We observe, among others, *Myrton Hall*, first state, printed in brown ink, 6*l*. 12*s*. (Hogarth); the same subject, second state, 2*l*. 15*s*.; *Egham*, first state, with the white boat—one of those etchings in which the artist has made much of seemingly small material—4*l*. (Hogarth); the same, in the second state, 3*l*. (Thibaudeau); *Egham Lock*, a unique trial proof, with a foreground and troubled water and sky, 9*l*. 9*s*. (Hogarth); *Sub Tegenine*, first state, before the plate was reduced, 9*l*. 9*s*. (Hogarth); the same, second state, 2*l*. 10*s*.; third state, 1*l*. 18*s*.; *Out of Study Window*, a trial proof, with an indication of a shower to the left, 6*l*. 10*s*.; the same, with a different effect, the shower being effaced, 4*l*. 7*s*. 6*d*.; third state, 2*l*. 18*s*.; *Fulham*, a trial proof, 7*l*.; the *Mouth of a Brook*, very rare, four impressions only having been taken from the plate, which is now destroyed, 15*l*. 15*s*.; the *Banks of a Brook*, dry point, first state, 12*l*. 12*s*.; the same subject, second state, printed in brown ink, 8*l*. 8*s*.; *Kidwelly Town*, trial proof, 5*l*. 2*s*. 6*d*.; *Shere Mill Pond*, the small study, 10*l*. 10*s*.; *A Byroad in Tipperary*, trial proof, 6*l*. 6*s*.; the same plate, with additional work, 6*l*. 6*s*.; and the same again, at a later stage, 4*l*. 10*s*.; *Tristesse*, a figure subject, of which it is stated that only six impressions have been taken, 10*l*. 10*s*.; *Battersea Reach*, a trial proof, accompanied by a counter-proof of the first state, 8*l*. 8*s*. Of the works of Jules Jacquemart, a few fine and a few ordinary impressions of his etchings were sold separately; the plates engraved by the artist for *L'Histoire de la Bibliophilie*, with some trial and early proofs, fetched 11*l*. 15*s*. (Thibaudeau). The first part of the *Gemmes et Joyaux de la Couronne*, in a choice state, was sold for 8*l*. 15*s*. (Thibaudeau); impressions of some unpublished plates, on which Jules Jacquemart has recorded with his usual exquisite skill the collection of arms formed by the Count de Nieuwerkerke, and now in the possession of Sir Richard Wallace (who is likewise the possessor of the actual plates of Jacquemart, from which as yet but few impressions have been taken), sold for 6*l*. 10*s*. 6*d*. The etchings of M. Legros, which were not, generally speaking, so well represented as in the recent sale of the possessions of the late M. Poulet-Malassis, fell for unimportant prices; and few of the modern etchings by less known men realised any sums worth reporting.

NOTES ON ART AND ARCHAEOLOGY.

MR. ALFRED TIDEY has brought to town with him an agreeable collection of water-colour drawings, mostly landscape sketches from nature; and these have been on view at 7 Percy Street, Rathbone Place. Mr. Tidey is probably less known in London than he deserves to be. He has long resided in the Channel Islands and abroad. Roughly speaking, his present collection of landscape-drawings may be divided into two classes: views in the Channel Islands and views in Corsica. Most of his work is finished out of doors—that is, it is his habit to carry to sufficient completion his outdoor sketch in the presence of nature. He is not an imaginative artist, but he paints what he sees, and he is alive to delicate and sober effects of light and colour. The island of Jersey is, no doubt, peculiarly favourable to the landscape-painter in search of a limited, but, with us in England, a not very familiar, a certainly unhackneyed, range of atmospheric effect. The soft and gentle climate blends colours as they are rarely blended in the sharper air of the North or of much of the Continent. Mr. Tidey has two extremely pleasant views of *Noirmont*, one representing under an effect of evening the orange sandstone and green woods that skirt the tranquil bay, and the other a view in the clear light of morning. There is also *A Sunny Morning on the Jersey Coast*,

with a foreground of granite rocks, peaked and ridged, and beyond them the greenish yellow of the morning sea. Among the Corsican views, many are interesting and vivid representations of little-visited scenes. Few painters have been to Corsica, though our readers may remember Mr. Edward Lear's book on his adventures in that island, illustrated with reproductions of sketches he made there. But Mr. Lear's sojourn was brief; and it is probable that Mr. Tidey's views give a more complete idea of the natural and artificial characteristics of the island. A view of *Ajaccio* is very interesting. There are sketches taken in the garden in which Napoleon must have spent many days of his boyhood. Furthermore, there is more than one pretty indication of Bocagnano, the "Chestnut country," where chestnuts are the only trees; and there is one very large sketch, exceedingly effective and realistic, of a vast tract of open country, seen in the autumn weather—the smoke of the bonfires of underwood rising from a distant hill-side, and a pleasant autumn clearness in the highland air. Elsewhere Mr. Tidey has as skilfully presented the bright-green of the cork-trees and the grey-green of the olive. There is also a view of a strange little hamlet up among the hills—a hamlet ill-built, or rather hardly built at all, so very rudimentary is the character of its houses—but this hamlet is, nevertheless, frequented during three months of the late summer and early autumn by the entire population of a town on the coast: that little town lying beset by marshes, and rendered deathly for a while by *mal'aria*. In addition to these very interesting, if not always perfectly vigorous, sketches, Mr. Tidey has had in Percy Street one or two agreeable portraits which, in a measure, recall the earlier practice of the artist before he betook himself to landscape-painting.

THE Trustees of the National Portrait Gallery have this week issued their twenty-first annual report. From it we learn that seven donations have been received during the past year; these are portraits of—Francis Horner, M.P., 1778–1817, painted by Sir Henry Raeburn; Lord Chancellor Somers, 1650–1716, by Kneller; George Morley, Bishop of Winchester, 1597–1684, by E. Lutterell; R. P. Bonington, 1801–1828, a study in black chalk, heightened with red, by Mrs. Carpenter; Queen Caroline, by Lonsdale; and busts of Thackeray and the late Lord Stanhope, by J. Durham and H. H. Armstead. The purchases included—Sir Kenelm Digby, by Van Dyck, 150*l*.; Edward, Lord Herbert of Chesham, unknown artist, 15*l*.; Henry Kirke White, a small drawing in Indian ink, 5*l*.; Ralph, Lord Hopton of Stratton, d. 1652, 25*l*.; Henry VIII., painted on panel, the size of life, one of the latest portraits known, 103*l*. 14*s*.; the Duchess of Portsmouth, 1647–1734, painted by Mignard in 1682, 105*l*.; William Juxon, Bishop of London, 1582–1663, artist unknown, 30*l*.; the great Duke of Marlborough, painted after 1702 by Closterman, 31*l*. 10*s*.; Hugh Boulter, Archbishop of Armagh, 1671–1742, by Francis Bindon, an amateur, 25*l*. Among the illustrative autographs added to the collection are—a letter of Edm. Burke, to Lady Inchiquin, niece of Sir Joshua Reynolds, and letters of Wilkes, Lord Sidmouth, Sir T. N. Talfourd, Horner, Cobbett, the Duke of Wellington, and Thackeray. The whole number of visitors during 1877 is returned at 79,987.

THE "Summer Number" of the *Graphic* is rendered of some permanent value by the supplement of very clever sketches by Mr. Randolph Caldecott. They have the appearance of being coloured with a light wash, like the Christmas sheet which was so much admired. The piquancy which antiquated costumes and manners, and the artist's evident feeling for them, gave to the latter is of course wanting in the present sketches. Here we have the vulgar and terrible people of today enjoying themselves; and it is curious that Mr. Caldecott, when he depicts the "vulgar and

terrible," falls insensibly out of his own manner into that of Leech. The characterisation of many of the heads is really wonderful, and where the old manner has been kept the originality is undeniable. The best sketch of all is that of the people twiddling their spoons and teacups, while the exasperating waiter *does not* bring in the tea.

A FOURTH and enlarged edition of Lübke's *Outlines of the History of Architecture* has lately been published by E. A. Seemann, of Leipzig. The principal additions to the work lie in a chapter treating of pre-historic monuments, and in an account of Dr. Schliemann's discoveries at Mycenae.

HERR S. SOLDAN, the enterprising art book-eller of Nürnberg, has just published the first number of a large work dealing with the Nürnberg sculptor and carver, Peter Vischer. The text is written by Dr. W. Lübke, and the numerous illustrations are executed, we believe, by some photo-lithographic process. We hope to speak more fully of this work when it is finished.

BESIDE the exhibition of military pictures which we have before mentioned, there may also be seen at M. Durand Ruel's galleries in the Rue le Peletier a considerable number of works by Diaz, Millet, Rousseau, Fromentin, Tassaert, Ricard, and Jourbet—artists who, although they form a noteworthy portion of the modern French school, are yet unrepresented at the palace of the Champ de Mars.

ANOTHER exhibition of French paintings, less distinctive in its character than that of the Rue le Peletier, is open at the Cercle Artistique et Littéraire of the Rue Saint-Arnaud. Here also are to be found several military subjects.

A NUMBER of beautiful terra-cotta medallions have been found, according to the *Chronique des Arts*, at the castle, Chaumont-sur-Loire, near Blois. It is supposed that the spot where they were discovered is the site of a manufactory of this kind of ware in the eighteenth century. Unfortunately many of them were broken by the blows of the pickaxe of the workmen who lighted upon them while digging a trench in the neighbourhood.

SOME well-executed and excellently-preserved wall-paintings, dating between 1520 and 1550, have been discovered in a private house at Kampen in the Zuydersee. If art penetrated in the sixteenth century into these remote districts, there is no knowing where we may next expect to find it. It says something for the soundness of the means employed that these frescoes—if, indeed, they were really executed at the date stated—should have lasted under the frightful influences of a Dutch climate to the present day.

AN interesting lecture on Greek sculpture, the first of a series of three, was given last week by Dr. Waldstein to a number of ladies assembled in the Elgin Room in the British Museum. The lecturer, after giving a brief history of the rise of Greek sculpture and the building of the Parthenon, proceeded with his audience to the examination of some of the great statues of the frieze, pointing out their positions and probable signification. Such lectures as these, supplemented by careful observation of the works described, cannot fail to be of the highest value in the education of women, who, though instructed generally in the practical application of art, are seldom taught to appreciate its highest manifestations.

THE very considerable collection of his own drawings which Mr. Ruskin has now lent to the Fine Art Society in New Bond Street—to be added to his unrivalled collection of Turner drawings still exhibited there—will be seen with interest by the thousand-and-one admirers of the first great English critic of art. It will probably be the general verdict that Mr. Ruskin had not at any time within him the making of a great practical artist, if to be a great artist it is necessary, not only to see and reproduce, but to combine and to compose. These powers, and the power to express

imagination in design instead of in the art of writing, are, it would appear, and always have been, lacking to Mr. Ruskin. But the faculty of seeing keenly, and of reproducing with accurate and sensitive hand, it is clear that the great critic has abundantly possessed, and it is clear, moreover, that he possesses them still. At all events, a drawing of the Ducal Palace and some of those architectural ornaments of Venice that surround it—the columns and the library and the Gothic palace on the side nearer the Riva dei Schiavoni—shows that as lately as the year 1874 Mr. Ruskin had lost nothing of exquisite sensitiveness and exquisite delicacy. We take occasion to say this only because some passages in the recently added notes to his Catalogue appear to imply his own belief in his having lost something. But it seems to us that in this little drawing of the Ducal Palace of the year 1874 he not only has lost nothing in accuracy, but has come nearest of all to the realisation of those other virtues of an artist which he never appears to have wholly possessed. At all events, no one could desire a more exquisite possession in the shape of a sketch that interprets as well as reproduces than this "Ducal Palace" (No. 12, R.). Other drawings show sufficiently how accurate could be his rendering of flower and leaf, either as he saw them in Nature or as he found them in the Gothic architecture to which he has given so much of his best study. And, again, there are plenty of drawings which display Mr. Ruskin's keenness of eye and skill of hand in work among the mountains: sometimes in rock drawing, in which his knowledge of geology has served him in good stead; and sometimes in little designs made obviously rather for colour than form—designs in which he has made more or less successful memoranda of fleeting effects of hue on rock, wood, or snow. In this connexion a remark of Mr. Ruskin's, in this new edition of his catalogue which is under our hand as we write, is worth noting: "It is curious," he says, "(and what our modern school of gymnastic tourists will think of it I know not), that among the Alps, Turner shunned the upper snows, as at Venice the bright palace walls, and drew only the great troubled and surging sea of the pastoral rocky mountains." Much of what Mr. Ruskin has himself drawn, and omitted to draw, throws light on what he has said of Turner, and a careful study of Mr. Ruskin's own aims and achievements in pictorial design for the last forty years—such a study as there is now at the rooms of the Fine Art Society the opportunity of making—will be of real value to those who have been wont to read with care the utterances of the critic. Among other things, no one will fail to be struck with the facility and accuracy attained by Mr. Ruskin in boyhood—almost in childhood. He tells us he was ten years old when he made the map of France "according to the treaty of 1815," and that it was at about the same time that he made the wonderfully precise and artistic copies from Cruikshank's etchings. And, moreover, he was still very young when he made—during his first Continental tour, we believe—the keen and vigorous outline sketch of Fribourg, which in all the range of his later work has been surpassed in no quality but that of tenderness. Nothing but the tender sensitiveness of his mature life was lacking to his very early endeavours.

THE STAGE.

RECENT PLAYS.

THE unfavourable impression which has been produced by the performance of Messrs. Wills and Fitzgerald's *Vanderdecken* at the Lyceum Theatre must be attributed in the main to the shortcomings of the authors, whose work is singularly wanting in qualities indispensable to the success of an acting play. Lamentations over the decay of faith in romance upon the stage; complaints of the debasing influence of the taste for parody and burlesque; reproaches levelled at the assumed in-

difference of audiences to poetry and the higher drama, may be better worth consideration when it can be shown that a new romantic or poetical play, vigorous in conception, skilful in plan, and displaying in its dialogue—whether it be in verse or prose—true dramatic strength, has failed to bring credit to its authors. It would certainly be easier to maintain that audiences are over-indulgent, and inclined to accept with good-will something falling far short of ideal excellence, than to cite an instance of a drama of which the merits have been overlooked. There are, I am aware, one or two English dramatic authors of established reputation who attribute the failure of certain of their productions solely to an inefficient rendering. Mr. Charles Reade is in the habit of proclaiming that in one instance a drunken property-man, or scene-painter, was by his neglect or misjudgment enabled to ruin the prospects of a dramatic work from his pen of a high order. But while good pieces are so much in demand and so little forthcoming, it is difficult to believe that if this were the case no London manager could be found to accept Mr. Reade's public suggestion, that the work in question should be revived under more favourable conditions. The simple fact is that, although the public are often lamentably tolerant of inferior dramatic workmanship, it is equally true that the best plays of recent times have been exceedingly popular, and to the managers who have produced them have proved to be profitable ventures.

The causes of the ill-success of *Vanderdecken* are really too obvious for dispute. It is one of the first conditions of a play depending, as this does, not on comedy or satire or witty dialogue, but mainly on the story it unfolds, that interest should be centred in the hero and heroine. But the exceptional and overwhelming prominence given to the parts sustained by Mr. Irving and Miss Isabel Bateman, in accordance with the disastrous conditions to which authors who write for the Lyceum management appear willing to submit, serves to bring into stronger relief the failure of the story to awaken curiosity or interest. If anything, the good wishes of the spectator are with the honest ill-used lover Olaf, who is represented with much truth and manly dignity by Mr. Bentley, rather than with the spectral disturber of his peace of mind. Nor is the least attempt made to lay a foundation of regard for the unhappy Dutchman, doomed to eternal penance aboard his phantom vessel, or only to be redeemed at the price of a woman's self-sacrifice. Had *Vanderdecken* been shown in one of those periodical intervals of respite which form part of the legend, lingering, like Ogier the Dane in the story in Ariosto, oblivious of fate and wrapt in a dream of passion till the rude awakening should come, and he should shrink with horror from the thought of involving an innocent soul in the dread condition of his salvation; the voluntary and persistent self-sacrifice of the woman might have yielded a *dénouement* sorrowful, it is true, yet not painful or repulsive, because grand and full of those tender soothing influences which are of the essence of tragedy. But nothing of the kind. From his first appearance on the stage, the gloomy melodramatic captain of the ghostly craft is found proclaiming aloud his anxiety to find a partner, still only *in posse*, but willing to take upon herself the onerous task of his redemption. A marriage broker's advertisement could hardly be more explicit than is the hero regarding the sort of lady who will suit his purpose; nor is his habit of describing this ideal woman as "ordained" for "his release" altogether out of keeping with the fatalistic affectations of systematic speculators in the matrimonial market. We have, indeed, been already prepared for the sense of fascination which Miss Isabel Bateman exhibits; but it is not the helpless bewilderment of the hare in the presence of the boa-constrictor, but the free spontaneous gift of heart and soul which is required to give force to the situation. The incident of the duel,

which seems to have been conceived for no other purpose than that of providing a picturesque scene, unquestionably tends to lower still further the claims of the hero to respect; for he invites Olaf to mortal combat well knowing that he is himself not mortal; and when he is run through the body and cast into the sea he nevertheless returns to his work of fascinating the vacillating Swedish maiden. It is not quite clear whether the authors even intended to present their weird hero as an object deserving of the consideration of the spectator. In the last act Thekla is seen aboard the spectral vessel, sitting resignedly upon a coil of rope, while her egotistical abductor addresses her at great length and in language heavily charged with rhetorical ornament. Finally, conducting her to the bulwark and pointing towards the stars, he is understood, as the curtain descends, to be indicating their future home. All this has, no doubt, a poetical side, and the dusky red sails, the dark sky beyond with its unknown constellation, the phantom deck about which the ghostly sailors pass noiselessly to and fro, are like the arm that clutched the brand Excalibur, "mystic, wonderful;" but the prosaic question, who is Vanderdecken that he should pose as a hero while shabbily carrying off an honest man's betrothed, and entrapping into an awful compact a lady too young presumptively to be a consenting party to his cruel proceedings, inevitably obtrudes itself upon the mind of the spectator. Even spectral heroes must not expect to awaken interest while they outrage the rules of honour, and selfishly pursue their own well-being at the expense of others. High praise has—in one quarter at least—been bestowed upon the prose, or verse, in which the play is written. But the dialogue of *Vanderdecken* certainly violates the well established rule of poetical play-writing which enjoins a sober and guarded use of mere descriptive writing. Such passages as the following, for example, are frequent:—

"What is my doom?

Worse than in hell! Eternal loneliness!
Eternal silence! and in that awful silence
The worm of memory gnawing at my heart,
Anguish of thought within my brain! sleepless!
intense.

Just hope enough to keep despair awake!
Around me forests of gigantic weeds
Waving and writhing
As if the skeletons which people them,
But lie dead still, did move them.
Vast ribs of ships, and ribs of monstrous fish
Which look like wrecks! Tall peaks of coral
Rising like pale cathedrals, richly carved,
But where no bell is heard
Or murmuring of prayer to comfort me!
Ships I have seen go down, their crews
Grasping the shrouds with bony hands,
Or, hanging o'er the bulwarks, nod at me.
In their dead eyes—silent upbraiding.
Strange things move by with noiseless crawl
And lift their goblin heads to look at me.
Around my phantom ship long shadows lie.
The sharks, ghouls of the sea,
Watch me with glassy, hungry eyes, knowing their
caterer!

For when the hurricane is loosed above,
Crushing the sea to angry white, and sails
Fly from their bolts, and coward seamen quail,
Then do I rise upon my phantom deck,
Tranced at the helm, fatal decoy to wreck
And to disaster.
Before me seems to stretch a dreary headland;
Beyond it a fixed dawn that never grows to day:
But 'neath the dappled cloud one spring of light
Shapes to thy angel face, like a sweet veiled Ma-
donna.

A fluttering hand then seems to beckon me;
I strive to round the point, but beat about
In vain! in vain!
Then the old frenzy rises to my brain,
Wild curses to my lips, and in the thunder
Sounds that do curse again shriek out—
'Sail on! sail on! until the Judgment Day,
Unless that woman come!'

I do not know whether this passage, which I find

quoted with expressions of approval in the notice of a critic who seems to have had access to the manuscript, was intended by the author to be printed in metrical form; but it is certain that this kind of writing is neither to be admired for dramatic spirit, nor for chaste employment of imagery, nor for decent observance of the laws of rhythm. It is not, perhaps, surprising that the impression produced by Mr. Irving in the part of Vanderdecken, so far as it was pleasing to the audience, was entirely due to his picturesque appearance, and—up to the point at least where the lack of variety of means began to weary—to a certain air of majesty and command which rarely fails to desert this remarkable actor in picturesque and imaginative situations. Beyond this, in the way of praise, it is impossible to go. Mr. Irving's peculiarities of delivery have so often been censured that there is really nothing left to say about them, unless it be to lament that a performer whose influence upon the art of acting in this country must be considerable should fail to feel the paramount importance of that just, sincere intonation and nice observance of the fleeting shades of emphasis, which the best actors of the French stage place above all desirable acquirements, and labour to attain with a degree of patient study and practice that, unhappily, seems upon our stage to be entirely unknown.

Mr. Ross Neil's *Elfinella* is a work of far higher value both as a dramatic poem and an acting play than *Vanderdecken*; but its comparatively brief existence on the stage of the Princess's Theatre is sufficiently explained by the slender thread of its fable and the absence of any strong cumulative interest in the action, which is nevertheless extended to four acts. It tells the story of a fairy who returns to earth with a feeling of half-contemptuous pity for the state of mortals, yet ends by preferring life with its inevitable penalty to the colourless though immortal existence to which it is supposed to be not even yet too late to return. Poetical in conception, the theme is delicately handled; and the dialogue, though sometimes redundant, is not overlaid with mere poetical ornament, but, as a rule, expresses with vigour the sentiments and passions of the characters. Miss Heath and her company are, unfortunately, not equal to the task of adequately rendering a play of this kind; but the shortcomings of the performance would probably not have proved fatal to the success of a piece equally poetical but of a more robustly dramatic kind.

The new play entitled *Love or Life*, written by Mr. Tom Taylor and Mr. Paul Meritt, and produced at the Olympic Theatre, is an old-fashioned drama of rural life—or what passes on the stage for rural life; wherein a gay squire hesitates not to confess aloud his profligate intentions, and poaching affrays, and encounters with smugglers, are things of daily—it might almost be said of hourly—occurrence. The piece is founded on Crabbe's tale, *Smugglers and Poachers*, which may be read with more pleasure than it is possible to feel in witnessing this modified version of the story on the stage. The culminating scene in this play is a kind of *genre* picture after the fashion of the nobler prison-scene between Isabella and her brother in *Measure for Measure*. The genius of Shakspeare has not sufficed to deprive the abject terror of a young man in the contemplation of death of its repulsive complexion; and this later version, wherein the poaching hero is frightened into accepting his betrothed's proposal that he should relinquish her to save his own life, is somewhat repulsive. There is very little of true nature or sound art in Messrs. Taylor and Meritt's play, nor is there much to praise in the acting, with the exception of Mrs. Boucicault's simple, earnest, and touching performance of the part of the heroine—the only personage, it may be observed, in the play who is not depicted as coarse, callous, and immoral to a degree which can hardly be justified by the claim of the writers

to have furnished a picture of life and manners in the south of England *temp.* 1760.

Mr. Byron's *Hornet's Nest*, in which Mr. Sothorn has made his appearance for the first time in this country at the Haymarket Theatre, has manifestly been written with a view chiefly to furnish that actor with a prominent position on the stage throughout four acts, and a liberal supply of jokes to be uttered by him in the careless unconscious manner which added so much to the amusement afforded by his famous performance of Lord Dundreary. The story represents a good-natured and wealthy gentleman, who is surrounded by half a score or so of parasites and plunderers who take him for an easy victim until they find their mistake and discover that they have entered "a hornet's nest." The personages of the play, though easily recognisable as stage types, are skillfully contrasted, and the scenes afford genuine amusement. Unfortunately, though Mr. Sothorn is permitted to say many clever things, he is also provided with not a few observations of a provokingly pointless kind. Thus when somebody observes that "every dog" according to the proverb "has his day," Mr. Sothorn rejoins that that cannot be, because "there are only 365 days in the year, and there must be more than 365 dogs;" and when another says "I am thinking of marrying, myself," Mr. Sothorn, affecting to believe that he is talking to a clergyman who contemplates appearing at once in the character of bridegroom and officiating minister, rejoins that "that is impossible." Half an hour's dialogue rather thickly studded with jests of this sort threatened some danger to the play; but the scenes improve as the story progresses, and in the last act there are touches of true comedy very cleverly interpreted by the leading members of the Haymarket company. The entertainment afforded by a *Hornet's Nest* is certainly not of the highest quality, but it is genuine and abundant.

MOY THOMAS.

THE death of Mr. Charles Mathews deprives the stage of an actor who had really no rival in his way throughout his long career. Though old enough to remember Munden, Dowton, Lewis, and many other famous comedians whose names seem now to carry us back to remote times, he was till lately still vigorous and lively. It was but a few seasons ago that he was entertained in London at a farewell dinner preparatory to starting on a professional tour literally all over the globe; and so far was this arduous round of engagements in all latitudes and longitudes from impairing his powers, that his return was signalled by a series of appearances at the Gaiety Theatre in a new character, which proved to be one of the most popular of his impersonations. His latest appearances in London revealed indeed some abatement of the old elasticity; yet it was really wonderful with what youthfulness of manner he still performed, in the comedy called *Married for Money*, the part of a young husband subjected to the jealous tyranny of a middle-aged wife, represented by a lady certainly young enough to be his daughter. The suggestion of youth, however, was with him in the quickness of movement, the nimble utterance, the easy, graceful self-command, which rendered his style so delightful; for his face, under the cruel test of the opera-glass, had long betrayed the effects of time and hard work. Something of his distinguished father's manner has seen nothing very like Charles Mathews's acting; and it is a significant fact that the characters by which he is best known have rarely been attempted by any other actor. Mr. Mathews, who was born in 1803, was originally articled to an architect and surveyor, and for some years he followed that profession. He made his first public appearance on the stage in 1832, when he per-

formed in his own comedy, *The Wolf and the Lamb*, with Farren, who sustained a leading part in the same piece, with great success.

MUSIC.

THE OPERAS.—GEORGES BIZET'S "CARMEN."

IN the present dearth of opera-composers it is painful to contemplate the premature loss of two men of undoubted genius, able, as it would seem, to have worthily represented and upheld the honour of their respective countries. Hermann Goetz and Georges Bizet lived just long enough to complete each a work of sufficient beauty and power to enable us to estimate the service they might have rendered to lyric art. The German musician will be known and appreciated in this country ere long; the day of the Frenchman has already come. The short career of Bizet was in some respects singular. Affecting to entertain revolutionary ideas on the subject of opera, he displayed in his earlier works an extravagance which militated against their acceptance by the Parisian public. A student of Richard Wagner's writings, he spoke vehemently against the German reformer's canons of art, and, with true Gallic self-sufficiency, undertook to show the real path towards higher principles in the lyric drama. But fortunately, before his death, necessity proved his benefactor, and that of the public who survived him. In composing *Carmen* for the Opéra-Comique, he acted on the maxim *il faut vivre*. Disregarding his own radical opinions—if, indeed, he still possessed them—he followed tradition to such an extent that in the matter of form *Carmen* might have been written by Auber. But over this time-honoured framework Bizet has thrown an individuality truly remarkable, as showing the susceptibility of the old form for receiving fresh treatment at the hands of one gifted with the rare faculty of genius. The influence of Gounod may be observed in the cadences, and that of Wagner in the scoring of a few phrases, but *Carmen* is, in its entirety, a truly original work. This statement will be borne out most emphatically by drawing attention to the conspicuous manner in which the composer has subjugated himself to the task of illustrating with all needful fidelity the subject in hand. In order to appreciate this it is unnecessary to agree with the suitability of the theme for musical treatment. The romance of Prosper Mérimée, as dramatised by Messrs. Meilhac and Halévy, introduces us to types of beings as primitive as those in Wagner's *Ring des Nibelungen*. They are as devoid of conscience and as uncontrolled by the force of local surroundings, notwithstanding their share in the business of modern civilised life. Bizet has happily recognised the advisability of introducing traits of national character in his music. *Carmen* is Spanish from first to last in rhythm, phraseology, and harmonic progressions. And with these characteristics it gives us a ceaseless flow of piquant melody, for the most part singularly fresh. Another opportunity will occur for dwelling in detail on the numbers of the score, but one or two examples will illustrate our meaning. For instance, take the air "Amor misterioso," in the first act, in which a one-bar figure is maintained in the bass throughout, while the voice-part is little more than a series of scale passages, first chromatic and then diatonic. Nothing can be simpler in design or more pleasing in effect. Then, again, the "Canzone Boema" at the commencement of the second act. After four bars in the common chord of E minor, we have a similar number in D minor, C major, and B major, the dominant. From here we descend by similar steps to A minor, G major, F sharp major, F natural major, and finally to E, where the voice at once enters. The delicious phrases for flutes and the monotonous marking of the *tempo* by the castanets aid the effect of this wild movement not less than the graceful motions of the dancers on the stage. To sum up for the

present, Bizet is happiest where he allows his fancy free play, as in the numbers quoted; and least original, though still pleasing, in passages of more tender flowing character, such as the duet between Micaëla and José in the first act, and the air for the former, "Io dico," in the third. Similarly the orchestration is tinged with Gounod and Wagner in these sections of the opera, and in José's air "Il fior che avevi a me" in the second act; but elsewhere the scoring shows individuality, particularly in the treatment of the wood instruments.

In considering the performance at Her Majesty's Theatre primary attention must be given to the lifelike portrait of the gipsy given by Mdle. Minnie Hauk. The character needs boldness, impetuosity, and freedom from the ordinary graces and conventionalities of stage heroines. Thus Mdle. Hauk, who has frequently suffered rebuke for the over-exuberance of her manner, has here a chance for giving rein to her natural instincts without much risk of incurring a charge of exaggeration. Indeed, to imagine any variance in treating such a character seems difficult if not impossible. The attempt to impart artificial refinement and subdued colouring would be ridiculous. Briefly, then, Mdle. Hauk is fully equal in her acting of the part to Mdle. Galli Marié, who created it in Paris, while her voice is of far more agreeable quality. Signor Campanini has strengthened his position by his impersonation of the misguided hero, Don José. That he would sing the music well was anticipated, but the earnestness which he threw into his acting, especially in the tragic final scene, was perhaps more of a surprise. Signor Del Puente looks the handsome *torreador*, Escamillo, to the life, and sings with requisite vigour. Mdle. Alwina Valleria is very quiet and artistic as the peasant girl Micaëla; and the minor parts, with one exception, are in good hands. It should be mentioned that the ballet-music in the last act is interpolated from *La jolie Fille de Perth*, and we cannot but think its introduction a mistake, considering the length of the opera.

The revival of *Le Prophète* at the Royal Italian Opera will be remembered by musicians as one of few interesting events of the season of 1878. Meyerbeer's impressive work has never shared the popularity attained by other operas from the same hand, for in this one instance the German composer made but slight concessions to frivolous tastes. But in the estimation of the cultured minority *Le Prophète* will hold the most elevated position in the catalogue of his works. Memories of Mdme. Viardot must have been uppermost in the minds of many in the house on Monday evening. The presentment of Fides by this grand artist—who perhaps may be considered the most gifted of female musicians the world ever saw—may never be equalled in a dramatic sense. But the vocal organ of Mdme. Viardot was not agreeable, and in this respect Mdle. Scalchi has a great advantage in her arduous task. Few opera-singers have improved so rapidly, and her performance of this part will raise her in the opinion of all who are not blind worshippers of the dead past. Vocally it is beautiful throughout, and dramatically it is not without power, at least in the coronation scene. Signor Gayarré has not the *physique* to give effect to the music of the Prophet; but he sings artistically, notwithstanding his objectionable method of voice-production. On the other hand the three Anabaptists might well be more carefully selected from among the members of Mr. Gye's company.

HENRY F. FROST.

BEETHOVEN'S great quartett in B flat, Op. 130, was performed at the Musical Union *matinée* on Tuesday. For some unassigned reason the third movement was omitted, and the performance of the remainder was not of surpassing excellence, the work requiring a leading violinist of greater breadth of style than Signor Papini. The other concerted pieces—namely, Schumann's pianoforte quartett in E flat, and Mendelssohn's Andante and

Scherzo, Op. 81—were admirably rendered. Signor Alfred Jaell was the pianist, and among his solos was a charming Impromptu in F by Tschai-kowsky.

THE orchestral concert of the Royal Academy of Music, given at St. James's Hall last Wednesday week, was of unusual interest owing to the prominence given in it to the compositions of students at the Academy. Four important works by students were included in the programme. These were two movements from a symphony in D minor, by Miss Oliveria Prescott, entitled "Alkestis;" a concert-overture by Mr. R. H. Löhr; the first movement of a symphony by Mr. Tobias Matthay; and a setting of the 130th Psalm, for soprano solo, chorus, and orchestra, by Mr. Arthur G. Thomas. All these works were of considerable merit, Mr. Thomas's psalm showing special promise. The performances of the students, both vocal and instrumental, were in general of a high degree of excellence. Mr. Walter Macfarren conducted, as usual.

At Mr. Hallé's eighth Recital (the last of the series), yesterday week at St. James's Hall, the programme included Mozart's piano quartett in E flat; Schumann's "Carnaval" for piano-solo; Schubert's fantasia, Op. 159, for piano and violin; and Brahms's quintett, Op. 34, in F minor. An extra Recital was announced for last Wednesday, with an attractive selection, comprising the piano quintetts of Schumann and Brahms, Beethoven's sonata, Op. 90, &c.

HERR ALFRED JAEHL gave a piano Recital yesterday week, at the Steinway Hall, assisted by Mdle. Jane Debillemont and M. Henri Wieniawski. The most important works performed were Rubinstein's sonata in A minor for piano and violin, and Saint-Saëns's variations for two pianos on a theme by Beethoven.

MR. AUGUSTUS L. TAMPLIN announced a Recital on the harmonium and American organ at Messrs. Metzler's new rooms, for Thursday afternoon last.

MR. GEORGE RISELEY, the organist of the Colston Hall, and of the cathedral, Bristol, recently concluded a series of orchestral concerts in that city, which we are glad to learn have been increasingly successful. From a list of the works performed, which has been forwarded to us, we find that Mr. Riseley has brought forward during the season eleven symphonies, thirty-five overtures, eight concertos, &c., for piano with orchestral accompaniment, and forty-six miscellaneous orchestral works, besides dance music, instrumental solos, &c. Such a *résumé* of the season is in the highest degree creditable to Mr. Riseley, the conductor; and Bristol may be congratulated, not merely upon possessing a local orchestra, but upon having in its midst a professor who so energetically strives to promote a knowledge of the highest forms of art.

THE programme of Mdme. Viard-Louis' last orchestral concert, on Wednesday evening, included Massenet's suite, *Scènes pittoresques*, which had been heard under Mr. Weist Hill's direction at the Alexandra Palace. The work is in four movements, of which the second, "Air de ballet," and the third, "Angelus," are fanciful and pleasing. The orchestra also performed Mendelssohn's Scotch symphony and Wagner's *Tannhäuser* overture. The rendering of the latter was wanting in spirit, but the magnificent tone of the strings greatly aided the effect. Mdme. Viard-Louis played Beethoven's concerto in G, and gained greater commendations than at either of her previous performances. Next season there will be eight concerts, four to take place in the winter months and the remaining four in the course of the summer. Commissions have been given for the composition of new works to several English and foreign musicians. Such enterprise demands the warmest sympathy and encouragement from all who take an interest in high-class music.
